1. For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Health Protection Agency Laboratory)
2. For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Health Protection Agency laboratory). Unless there has been direct exposure of the mouth or nose to infectious droplets from a patient with meningococcal disease who has received less than 24 hours of antibacterial treatment, healthcare workers do not generally require chemoprophylaxis

Prevention of secondary case of diphtheria in non-immune patient

Erythromycin[3] 500 mg every 6 hours for 7 days; CHILD up to 2 years 125 mg every 6 hours, 2–8 years 250 mg every 6 hours

Treat for further 10 days if nasopharyngeal swabs positive after first 7 days' treatment. For immunisation against diphtheria see section 14.4

Prevention of pertussis

Clarithromycin[4] ADULT and CHILD over 12 years, 500 mg twice daily for 7 days; CHILD body–weight under 8 kg, 7.5 mg/kg twice daily for 7 days; 8–11 kg, 62.5 mg twice daily for 7 days; 12–19 kg, 125 mg twice daily for 7 days; 20–29 kg, 187.5 mg twice daily for 7 days; 30–40 kg, 250 mg twice daily for 7 days

Within 3 weeks of onset of cough in the index case, give antibacterial prophylaxis to all close contacts if amongst them there is at least one unimmunised or partially immunised child under under 1 year of age, *or* if there is at least one individual who has not received a pertussis-containing vaccine more than 1 week and less than 5 years ago (so long as that individual lives or works with children under 4 months of age, is pregnant at over 32 weeks gestation, or is a healthcare worker who works with children under 1 year of age or with pregnant women). For immunisation against pertussis see section 14.4

Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease

Phenoxymethylpenicillin ADULT and CHILD over 5 years, 250 mg twice daily; CHILD under 1 year 62.5 mg twice daily, 1–5 years 125 mg twice daily—if cover also needed for *H. influenzae* in CHILD give amoxicillin instead (1 month–5 years 125 mg twice daily, 5–12 years 250 mg twice daily, 12–18 years 500 mg twice daily)

If penicillin-allergic, erythromycin ADULT and CHILD over 8 years, 500 mg twice daily; CHILD 1 month–2 years 125 mg twice daily, 2–8 years 250 mg twice daily

Note Antibiotic prophylaxis is not fully reliable; for vaccines in asplenia see p. 831. Antibacterial prophylaxis may be discontinued in those over 5 years of age with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive[5]

Isoniazid 300 mg daily for 6 months; CHILD 10 mg/kg daily (max. 300 mg daily)

or isoniazid 300 mg daily + rifampicin 600 mg daily (450 mg if less than 50 kg) for 3 months; CHILD isoniazid 10 mg/kg daily (max. 300 mg daily) + rifampicin 15 mg/kg daily (max. 450 mg daily if body-weight less than 50 kg; max. 600 mg daily if body-weight over 50 kg)

or (if isoniazid-resistant tuberculosis in patients under 35 years) rifampicin 600 mg daily (450 mg if less than 50 kg) for 6 months; CHILD 15 mg/kg daily (max. 450 mg daily if body-weight less than 50 kg; max. 600 mg daily if body-weight over 50 kg)

3. Where erythromycin is suggested another macrolide (e.g. azithromycin or clarithromycin) may be used
4. Where clarithromycin is suggested azithromycin or erythromycin may be used
5. For details of those who should receive chemoprophylaxis contact the lead clinician for local tuberculosis services (or a consultant in communicable disease control). See also section 5.1.9, for advice on immunocompromised patients and on prevention of tuberculosis

Prevention of infection from animal and human bites

Co-amoxiclav alone (*or* doxycycline + metronidazole if penicillin-allergic)

Cleanse wound thoroughly. For tetanus-prone wound, give human tetanus immunoglobulin (with a tetanus-containing vaccine if necessary, according to immunisation history and risk of infection), see under Tetanus vaccines, section 14.4. Consider rabies prophylaxis (section 14.4) for bites from animals in endemic countries. Assess risk of blood-borne viruses (including HIV, hepatitis B and C) and give appropriate prophylaxis to prevent viral spread. Antibacterial prophylaxis recommended for wounds less than 48–72 hours old when the risk of infection is high (e.g. bites from humans or cats; bites to the hand, foot, face, or genital area; bites involving oedema, crush or puncture injury, or other moderate to severe injury; wounds that cannot be debrided adequately; patients with diabetes mellitus, cirrhosis, asplenia, prosthetic joints or valves, or those who are immunocompromised). Give antibacterial prophylaxis for up to 5 days

Prevention of early-onset neonatal infection

i/v benzylpenicillin (*or* i/v clindamycin if history of allergy to penicillins)

Give intrapartum prophylaxis to women with group B streptococcal colonisation, bacteriuria, or infection in the current pregnancy, or to women who had a previous baby with an invasive group B streptococcal infection. Consider prophylaxis for women in preterm labour if there is prelabour rupture of membranes or if intrapartum rupture of membranes lasting more than 18 hours is suspected.

Prevention of infection in gastro-intestinal procedures

Operations on stomach or oesophagus[1]

Single dose[2] of i/v gentamicin *or* i/v cefuroxime *or* i/v co-amoxiclav

Add i/v teicoplanin[3] if high risk of meticillin-resistant *Staphylococcus aureus*

Open biliary surgery[1]

Single dose[2] of i/v cefuroxime + i/v metronidazole[4] *or* i/v gentamicin + i/v metronidazole[4] *or* i/v co-amoxiclav alone

Add i/v teicoplanin[3] if high risk of meticillin-resistant *Staphylococcus aureus*

Resections of colon and rectum for carcinoma, and resections in inflammatory bowel disease, and appendicectomy[1]

Single dose[2] of i/v gentamicin + i/v metronidazole[4] *or* i/v cefuroxime + i/v metronidazole[4] *or* i/v co-amoxiclav alone

Add i/v teicoplanin[3] if high risk of meticillin-resistant *Staphylococcus aureus*

Endoscopic retrograde cholangiopancreatography[1]

Single dose of i/v gentamicin *or* oral *or* i/v ciprofloxacin

Prophylaxis recommended if pancreatic pseudocyst, immunocompromised, history of liver transplantation, or risk of incomplete biliary drainage. For biliary complications following liver transplantation, add i/v amoxicillin or i/v teicoplanin[3]

Percutaneous endoscopic gastrostomy or jejunostomy[1]

Single dose of i/v co-amoxiclav *or* i/v cefuroxime

Use single dose of i/v teicoplanin[3] if history of allergy to penicillins or cephalosporins, or if high risk of meticillin-resistant *Staphylococcus aureus*

Prevention of infection in orthopaedic surgery

Joint replacement including hip and knee[1]

Single dose[2] of i/v cefuroxime alone *or* i/v flucloxacillin + i/v gentamicin

If history of allergy to penicillins or to cephalosporins or if high risk of meticillin-resistant *Staphylococcus aureus*, use single dose[2] of i/v teicoplanin[3] + i/v gentamicin

Closed fractures[1]

Single dose[2] of i/v cefuroxime *or* i/v flucloxacillin

If history of allergy to penicillins or to cephalosporins or if high risk of meticillin-resistant *Staphylococcus aureus*, use single dose[2] of i/v teicoplanin[3]

Open fractures

i/v co-amoxiclav alone *or* i/v cefuroxime + i/v metronidazole (*or* i/v clindamycin alone if history of allergy to penicillins or to cephalosporins)

Add i/v teicoplanin[3] if high risk of meticillin-resistant *Staphylococcus aureus*. Start prophylaxis within 3 hours of injury and continue until soft tissue closure (max. 72 hours).

At first debridement also use a single dose of i/v cefuroxime + i/v metronidazole + i/v gentamicin *or* i/v co-amoxiclav + i/v gentamicin (*or* i/v clindamycin + i/v gentamicin if history of allergy to penicillins or to cephalosporins).

At time of skeletal stabilisation and definitive soft tissue closure[1] use a single dose of i/v gentamicin + i/v teicoplanin[3]

High lower-limb amputation[1]

i/v co-amoxiclav alone *or* i/v cefuroxime + i/v metronidazole[4]

Continue antibacterial prophylaxis for at least 2 doses after procedure (max. duration of prophylaxis 5 days). If history of allergy to penicillin or to cephalosporins, or if high risk of meticillin-resistant *Staphylococcus aureus*, use i/v teicoplanin[3] + i/v gentamicin + i/v metronidazole[4]

Prevention of infection in urological procedures

Transrectal prostate biopsy[1]

Single dose[2] of oral ciprofloxacin + oral metronidazole *or* i/v gentamicin + i/v metronidazole[4]

Use single dose[2] of i/v gentamicin + i/v metronidazole[4] if high risk of meticillin-resistant *Staphylococcus aureus*

Transurethral resection of prostate[1]

Single dose[2] of oral ciprofloxacin *or* i/v gentamicin *or* i/v cefuroxime

Use single dose[2] of i/v gentamicin if high risk of meticillin-resistant *Staphylococcus aureus*

1. Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure
2. Additional intra-operative or postoperative doses of antibacterial may be given for prolonged procedures or if there is major blood loss
3. Where teicoplanin is suggested vancomycin may be used
4. Metronidazole may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery

Prevention of infection in obstetric and gynaecological surgery

Caesarean section[1]

Single dose[2] of i/v cefuroxime

Substitute i/v clindamycin if history of allergy to penicillins or cephalosporins. Add i/v teicoplanin[3] if high risk of meticillin-resistant *Staphylococcus aureus*

Hysterectomy[1]

Single dose[2] of i/v cefuroxime + i/v metronidazole[4] *or* i/v gentamicin + i/v metronidazole[4] *or* i/v co-amoxiclav alone

Use single dose[2] of i/v gentamicin + i/v metronidazole[4] or add i/v teicoplanin[3] to other regimens if high risk of meticillin-resistant *Staphylococcus aureus*

Termination of pregnancy

Single dose[2] of oral metronidazole

If genital chlamydial infection cannot be ruled out, give doxycycline (section 5.1.3) postoperatively

Prevention of infection in cardiology procedures

Cardiac pacemaker insertion[1]

Single dose[2] of i/v cefuroxime alone *or* i/v flucloxacillin + i/v gentamicin *or* i/v teicoplanin[3] + i/v gentamicin

Use single dose[2] of i/v teicoplanin[3] + i/v cefuroxime *or* i/v teicoplanin[3] + i/v gentamicin if high risk of meticillin-resistant *Staphylococcus aureus*

Prevention of infection in vascular surgery

Reconstructive arterial surgery of abdomen, pelvis or legs[1]

Single dose[2] of i/v cefuroxime alone *or* i/v flucloxacillin + i/v gentamicin

Add i/v metronidazole for patients at risk from anaerobic infections including those with diabetes, gangrene, or undergoing amputation. Use single dose[2] of i/v teicoplanin[3] + i/v gentamicin if history of allergy to penicillins or cephalosporins, or if high risk of meticillin-resistant *Staphylococcus aureus*

1. Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure
2. Additional intra-operative or postoperative doses of antibacterial may be given for prolonged procedures or if there is major blood loss
3. Where teicoplanin is suggested vancomycin may be used
4. Metronidazole may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery

Prevention of endocarditis

NICE guidance

Antimicrobial prophylaxis against infective endocarditis in adults and children undergoing interventional procedures (March 2008)

Antibacterial prophylaxis and chlorhexidine mouthwash are **not** recommended for the prevention of endocarditis in patients undergoing dental procedures.

Antibacterial prophylaxis is **not** recommended for the prevention of endocarditis in patients undergoing procedures of the:

- upper and lower respiratory tract (including ear, nose, and throat procedures and bronchoscopy);
- genito-urinary tract (including urological, gynaecological, and obstetric procedures);
- upper and lower gastro-intestinal tract.

Whilst these procedures can cause bacteraemia, there is no clear association with the development of infective endocarditis. Prophylaxis may expose patients to the adverse effects of antimicrobials when the evidence of benefit has not been proven.

Any infection in patients at risk of endocarditis[5] should be investigated promptly and treated appropriately to reduce the risk of endocarditis.

If patients at risk of endocarditis[5] are undergoing a gastro-intestinal or genito-urinary tract procedure at a site where infection is suspected, they should receive appropriate antibacterial therapy that includes cover against organisms that cause endocarditis.

Patients at risk of endocarditis[5] should be:

- advised to maintain good oral hygiene;
- told how to recognise signs of infective endocarditis, and advised when to seek expert advice.

Dermatological procedures

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who undergo dermatological procedures[6] do not require antibacterial prophylaxis against endocarditis.

5. Patients at risk of endocarditis include those with valve replacement, acquired valvular heart disease with stenosis or regurgitation, structural congenital heart disease (including surgically corrected or palliated structural conditions, but excluding isolated atrial septal defect, fully repaired ventricular septal defect, fully repaired patent ductus arteriosus, and closure devices considered to be endothelialised), hypertrophic cardiomyopathy, or a previous episode of infective endocarditis
6. The British Association of Dermatologists Therapy Guidelines and Audit Subcommittee advise that such dermatological procedures include skin biopsies and excision of moles or of malignant lesions

Joint prostheses and dental treatment

Joint prostheses and dental treatment

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients with prosthetic joint implants (including total hip replacements) do not require antibiotic prophylaxis for dental treatment. The Working Party considers that it is unacceptable to expose patients to the adverse effects of antibiotics when there is no evidence that such prophylaxis is of any benefit, but that those who develop any intercurrent infection require prompt treatment with antibiotics to which the infecting organisms are sensitive.

The Working Party has commented that joint infections have rarely been shown to follow dental procedures and are even more rarely caused by oral streptococci.

Immunosuppression and indwelling intraperitoneal catheters

Immunosuppression and indwelling intraperitoneal catheters

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who are immunosuppressed (including transplant patients) and patients with indwelling intraperitoneal catheters do not require antibiotic prophylaxis for dental treatment provided there is no other indication for prophylaxis.

The Working Party has commented that there is little evidence that dental treatment is followed by infection in immunosuppressed and immunodeficient patients nor is there evidence that dental treatment is followed by infection in patients with indwelling intraperitoneal catheters.

5.1.1 Penicillins

The penicillins are bactericidal and act by interfering with bacterial cell wall synthesis. They diffuse well into body tissues and fluids, but penetration into the cerebrospinal fluid is poor except when the meninges are inflamed. They are excreted in the urine in therapeutic concentrations.

Hypersensitivity reactions The most important side-effect of the penicillins is hypersensitivity which causes rashes and anaphylaxis and can be fatal. Allergic reactions to penicillins occur in 1–10% of exposed individuals; anaphylactic reactions occur in fewer than 0.05% of treated patients. Patients with a history of atopic allergy (e.g. asthma, eczema, hay fever) are at a higher risk of anaphylactic reactions to penicillins. Individuals with a history of anaphylaxis, urticaria, or rash immediately after penicillin administration are at risk of immediate hypersensitivity to a penicillin; these individuals should not receive a penicillin. Patients who are allergic to one penicillin will be allergic to all because the hypersensitivity is related to the basic penicillin structure. As patients with a history of immediate hypersensitivity to penicillins may also react to the cephalosporins and other beta-lactam antibiotics, they should not receive these antibiotics; aztreonam may be less likely to cause hypersensitivity in penicillin-sensitive patients and can be used with caution. If a penicillin (or another beta-lactam antibiotic) is essential in an individual with immediate hypersensitivity to penicillin then specialist advice should be sought on hypersensitivity testing or using a beta-lactam antibiotic with a different structure to the penicillin that caused the hypersensitivity (see also p. 368).

Individuals with a history of a minor rash (i.e. non-confluent, non-pruritic rash restricted to a small area of the body) or a rash that occurs more than 72 hours after penicillin administration are probably not allergic to penicillin and in these individuals a penicillin should not be withheld unnecessarily for serious infections; the possibility of an allergic reaction should, however, be borne in mind. Other beta-lactam antibiotics (including cephalosporins) can be used in these patients.

Other side-effects A rare but serious toxic effect of the penicillins is encephalopathy due to cerebral irritation. This may result from excessively high doses or in patients with severe renal failure. The penicillins should **not** be given by intrathecal injection because they can cause encephalopathy which may be fatal.

Another problem relating to high doses of penicillin, or normal doses given to patients with renal failure, is the accumulation of electrolyte since most injectable penicillins contain either sodium or potassium.

Diarrhoea frequently occurs during oral penicillin therapy. It is most common with broad-spectrum penicillins, which can also cause antibiotic-associated colitis.

5.1.1.1 Benzylpenicillin and phenoxymethylpenicillin

Benzylpenicillin sodium (Penicillin G) remains an important and useful antibiotic but is inactivated by bacterial beta-lactamases. It is effective for many streptococcal (including pneumococcal), gonococcal, and meningococcal infections and also for anthrax (section 5.1.12), diphtheria, gas-gangrene, leptospirosis, and treatment of Lyme disease (section 5.1.1.3). Pneumococci, meningococci, and gonococci which have decreased sensitivity to penicillin have been isolated; benzylpenicillin is no longer the drug of first choice for pneumococcal meningitis. Although benzylpenicillin is effective in the treatment of tetanus, metronidazole (section 5.1.11) is preferred. Benzylpenicillin is inactivated by gastric acid and absorption from the gut is low; therefore it is best given by injection.

Benzathine benzylpenicillin (available from 'special-order' manufacturers or specialist importing companies, see p. 1104) is used for the treatment of early syphilis and late latent syphilis; it is given by intramuscular injection.

Phenoxymethylpenicillin (Penicillin V) has a similar antibacterial spectrum to benzylpenicillin, but is less active. It is gastric acid-stable, so is suitable for oral administration. It should not be used for serious infections because absorption can be unpredictable and plasma concentrations variable. It is indicated princi-

pally for respiratory-tract infections in children, for streptococcal tonsillitis, and for continuing treatment after one or more injections of benzylpenicillin when clinical response has begun. It should not be used for meningococcal or gonococcal infections. Phenoxymethylpenicillin is used for prophylaxis against streptococcal infections following rheumatic fever and against pneumococcal infections following splenectomy or in sickle-cell disease.

Oral infections Phenoxymethylpenicillin is effective for dentoalveolar abscess.

BENZYLPENICILLIN SODIUM

(Penicillin G)

Indications throat infections, otitis media, endocarditis, meningococcal disease, pneumonia, cellulitis (Table 1, section 5.1); anthrax; intrapartum prophylaxis against group B streptococcal infection; see also notes above

Cautions history of allergy; false-positive urinary glucose (if tested for reducing substances); **interactions:** Appendix 1 (penicillins)

Contra-indications penicillin hypersensitivity

Renal impairment reduce dose—consult product literature; high doses may cause cerebral irritation, convulsions, or coma

Pregnancy not known to be harmful

Breast-feeding trace amounts in milk, but appropriate to use

Side-effects hypersensitivity reactions including urticaria, fever, joint pains, rashes, angioedema, anaphylaxis, serum sickness-like reaction; *rarely* CNS toxicity including convulsions (especially with high doses or in severe renal impairment), interstitial nephritis, haemolytic anaemia, leucopenia, thrombocytopenia, and coagulation disorders; also reported diarrhoea (including antibiotic-associated colitis)

Dose

- By intramuscular *or* by slow intravenous injection *or* by infusion, 0.6–1.2 g every 6 hours, increased if necessary in more serious infections (single doses over 1.2 g intravenous route only; see also below); CHILD under 18 years see *BNF for Children*
- Endocarditis (in combination with another antibacterial if necessary, see Table 1, section 5.1), by slow intravenous injection *or* by infusion, 1.2 g every 4 hours, increased if necessary (e.g. in enterococcal endocarditis) to 2.4 g every 4 hours; CHILD 1 month–18 years see *BNF for Children*
- Anthrax (in combination with other antibacterials, see also section 5.1.12), by slow intravenous injection *or* by infusion, 2.4 g every 4 hours; CHILD under 18 years see *BNF for Children*
- Intrapartum prophylaxis against group B streptococcal infection, by slow intravenous injection *or* by infusion, initially 3 g then 1.5 g every 4 hours until delivery
- Meningitis, meningococcal disease, by slow intravenous injection *or* by infusion, 2.4 g every 4 hours; NEONATE under 7 days, 50 mg/kg every 12 hours; NEONATE 7–28 days, 50 mg/kg every 8 hours; CHILD 1 month–18 years, 50 mg/kg every 4–6 hours (max. 2.4 g every 4 hours)

  Important. If meningococcal disease (meningitis with non-blanching rash or meningococcal septicaemia) is suspected, a single dose of benzylpenicillin should be given before transferring the patient to hospital urgently, so long as this does not delay the transfer. If a patient with suspected bacterial meningitis without non-blanching rash cannot be transferred to hospital urgently, a single dose of benzylpenicillin should be given before the transfer. Suitable doses of benzylpenicillin by intravenous injection (or by intramuscular injection) are: ADULT 1.2 g; INFANT under 1 year 300 mg; CHILD 1–9 years 600 mg, 10 years and over as for adult. In **penicillin allergy**, cefotaxime (section 5.1.2) may be an alternative; chloramphenicol (section 5.1.7) may be used if there is a history of anaphylaxis to penicillins
- By intrathecal injection, **not** recommended

Note Benzylpenicillin doses in BNF may differ from those in product literature

Crystapen® (Genus) PoM

Injection, powder for reconstitution, benzylpenicillin sodium (unbuffered), net price 600-mg vial = 95p, 2-vial 'GP pack' = £2.64; 1.2-g vial = £1.89

Electrolytes Na^+ 1.68 mmol/600-mg vial; 3.36 mmol/1.2-g vial

PHENOXYMETHYLPENICILLIN

(Penicillin V)

Indications oral infections (see notes above); tonsillitis, otitis media, erysipelas, cellulitis; group A streptococcal infection, rheumatic fever and pneumococcal infection prophylaxis (Table 2, section 5.1)

Cautions see under Benzylpenicillin; **interactions:** Appendix 1 (penicillins)

Contra-indications see under Benzylpenicillin

Pregnancy not known to be harmful

Breast-feeding trace amounts in milk, but appropriate to use

Side-effects see under Benzylpenicillin

Dose

- 500 mg every 6 hours, increased up to 1 g every 6 hours if necessary; CHILD up to 1 year 62.5 mg every 6 hours, increased up to 12.5 mg/kg every 6 hours if necessary; 1–6 years, 125 mg every 6 hours, increased up to 12.5 mg/kg every 6 hours if necessary; 6–12 years, 250 mg every 6 hours, increased up to 12.5 mg/kg every 6 hours if necessary

Note Phenoxymethylpenicillin doses in the BNF may differ from those in product literature

Phenoxymethylpenicillin (Non-proprietary) PoM

Tablets, phenoxymethylpenicillin (as potassium salt) 250 mg, net price 28-tab pack = £1.14. Label: 9, 23

Dental prescribing on NHS Phenoxymethylpenicillin Tablets may be prescribed

Oral solution, phenoxymethylpenicillin (as potassium salt) for reconstitution with water, net price 125 mg/5 mL, 100 mL = £14.73; 250 mg/5 mL, 100 mL = £14.66. Label: 9, 23

Note Sugar-free versions are available and can be ordered by specifying 'sugar-free' on the prescription

Dental prescribing on NHS Phenoxymethylpenicillin Oral Solution may be prescribed

5.1.1.2 Penicillinase-resistant penicillins

Most staphylococci are now resistant to benzylpenicillin because they produce penicillinases. **Flucloxacillin**, however, is not inactivated by these enzymes and is thus effective in infections caused by penicillin-resistant staphylococci, which is the sole indication for its use. Flucloxacillin is acid-stable and can, therefore, be given by mouth as well as by injection.

Flucloxacillin is well absorbed from the gut. For a warning on hepatic disorders see under Flucloxacillin.

Temocillin is active against Gram-negative bacteria and is stable against a wide range of beta-lactamases. It should be reserved for the treatment of infections caused by beta-lactamase-producing strains of Gram-negative bacteria, including those resistant to third-generation cephalosporins. Temocillin is not active against *Pseudomonas aeruginosa* or *Acinetobacter* spp.

MRSA Infection from *Staphylococcus aureus* strains resistant to meticillin [now discontinued] (meticillin-resistant *Staph. aureus*, MRSA) and to flucloxacillin can be difficult to manage. Treatment is guided by the sensitivity of the infecting strain.

Rifampicin (section 5.1.9) or **sodium fusidate** (section 5.1.7) should **not** be used alone because resistance may develop rapidly. A **tetracycline** alone or a combination of rifampicin and sodium fusidate can be used for *skin* and *soft-tissue infections* caused by MRSA; **clindamycin** alone is an alternative. A **glycopeptide** (e.g. vancomycin, section 5.1.7) can be used for severe skin and soft-tissue infections associated with MRSA; if a glycopeptide is unsuitable, **linezolid** (section 5.1.7) can be used on expert advice. As linezolid is **not** active against Gram-negative organisms, it can be used for mixed skin and soft-tissue infections only when other treatments are not available; linezolid must be given with other antibacterials if the infection also involves Gram-negative organisms. A combination of a glycopeptide and sodium fusidate *or* a glycopeptide and rifampicin can be considered for skin and soft-tissue infections that have failed to respond to a single antibacterial.

Tigecycline (section 5.1.3) and **daptomycin** (section 5.1.7) are licensed for the treatment of complicated skin and soft-tissue infections involving MRSA.

A **tetracycline** or **clindamycin** can be used for *bronchiectasis* caused by MRSA. A **glycopeptide** can be used for *pneumonia* associated with MRSA; if a glycopeptide is unsuitable, **linezolid** can be used on expert advice. Linezolid must be given with other antibacterials if the infection also involves Gram-negative organisms.

A **tetracycline** can be used for *urinary-tract infections* caused by MRSA; **trimethoprim** or **nitrofurantoin** are alternatives. A **glycopeptide** can be used for urinary-tract infections that are severe or resistant to other antibacterials.

A **glycopeptide** can be used for *septicaemia* associated with MRSA.

For the management of *endocarditis*, *osteomyelitis*, or *septic arthritis* associated with MRSA, see Table 1, section 5.1.

Prophylaxis with vancomycin or teicoplanin (alone or in combination with another antibacterial active against other pathogens) is appropriate for patients undergoing surgery if:

- there is a history of MRSA colonisation or infection without documented eradication;
- there is a risk that the patient's MRSA carriage has recurred;
- the patient comes from an area with a high prevalence of MRSA.

For eradication of nasal carriage of MRSA, see section 12.2.3.

FLUCLOXACILLIN

Indications infections due to beta-lactamase-producing staphylococci including otitis externa; adjunct in pneumonia, impetigo, cellulitis, osteomyelitis and in staphylococcal endocarditis (Table 1, section 5.1)

Cautions see under Benzylpenicillin (section 5.1.1.1); risk of kernicterus in jaundiced neonates when high doses given parenterally; **interactions:** Appendix 1 (penicillins)

Hepatic disorders

Cholestatic jaundice and hepatitis may occur very rarely, up to two months after treatment with flucloxacillin has been stopped. Administration for more than 2 weeks and increasing age are risk factors. Healthcare professionals are reminded that:

- flucloxacillin should not be used in patients with a history of hepatic dysfunction associated with flucloxacillin;
- flucloxacillin should be used with caution in patients with hepatic impairment;
- careful enquiry should be made about hypersensitivity reactions to beta-lactam antibacterials.

Contra-indications see under Benzylpenicillin (section 5.1.1.1)

Hepatic impairment see Cautions and Hepatic Disorders above

Renal impairment reduce dose if eGFR less than 10 mL/minute/1.73 m^2

Pregnancy not known to be harmful

Breast-feeding trace amounts in milk, but appropriate to use

Side-effects see under Benzylpenicillin (section 5.1.1.1); also gastro-intestinal disturbances; *very rarely* hepatitis and cholestatic jaundice (see also Hepatic disorders above)

Dose

- By mouth, 250–500 mg every 6 hours, at least 30 minutes before food; NEONATE see *BNF for Children*; CHILD 1 month–2 years, 62.5–125 mg every 6 hours, at least 30 minutes before food; 2–10 years, 125–250 mg every 6 hours, at least 30 minutes before food
- By intramuscular injection, 250–500 mg every 6 hours; CHILD 1 month–18 years see *BNF for Children*
- By slow intravenous injection *or* by intravenous infusion, 0.25–2 g every 6 hours; CHILD under 18 years see *BNF for Children*

  Endocarditis (in combination with another antibacterial if necessary, see Table 1, section 5.1), bodyweight under 85 kg, 8 g daily in 4 divided doses; bodyweight over 85 kg, 12 g daily in 6 divided doses; CHILD 1 month–18 years see *BNF for Children*

  Osteomyelitis (see Table 1, section 5.1), up to 8 g daily in 3–4 divided doses; CHILD under 18 years see *BNF for Children*
- Surgical prophylaxis, by slow intravenous injection *or* by intravenous infusion, 1–2 g up to 30 minutes before the procedure; up to 4 further doses of 500 mg may be given every 6 hours by mouth, *or* by intramuscular injection, *or* by slow intravenous injection *or* by intravenous infusion for high risk procedures

Note Flucloxacillin doses in BNF may differ from those in product literature

Flucloxacillin (Non-proprietary) PoM

Capsules, flucloxacillin (as sodium salt) 250 mg, net price 28 = £1.57; 500 mg, 28 = £2.23. Label: 9, 23

Brands include *Floxapen*®, *Fluclomix*®, *Ladropen*®

Oral solution (= elixir or syrup), flucloxacillin (as sodium salt) for reconstitution with water, 125 mg/5 mL, net price 100 mL = £21.38; 250 mg/5 mL, 100 mL = £26.04. Label: 9, 23

Brands include *Ladropen*®

Note Sugar-free versions are available and can be ordered by specifying 'sugar-free' on the prescription

Injection, powder for reconstitution, flucloxacillin (as sodium salt), net price 250-mg vial = £1.23; 500-mg vial = £2.45; 1-g vial = £4.90

TEMOCILLIN

Indications septicaemia, urinary-tract infections, lower respiratory-tract infections caused by susceptible Gram-negative bacteria

Cautions see under Benzylpenicillin (section 5.1.1.1); **interactions:** Appendix 1 (penicillins)

Contra-indications see under Benzylpenicillin (section 5.1.1.1)

Renal impairment 1 g every 12 hours if eGFR 30–60 mL/minute/1.73 m^2; 1 g every 24 hours if eGFR 10–30 mL/minute/1.73 m^2; 1 g every 48 hours *or* 500 mg every 24 hours if eGFR less than 10 mL/minute/1.73 m^2

Pregnancy not known to be harmful

Breast-feeding trace amounts in milk

Side-effects see under Benzylpenicillin (section 5.1.1.1)

Dose

- ADULT over 18 years, by intramuscular injection *or* by intravenous injection over 3–4 minutes, *or* by intravenous infusion, 1–2 g every 12 hours

Negaban® (Eumedica) PoM

Injection, powder for reconstitution, temocillin (as sodium salt), net price 1-g vial = £25.45

Electrolytes Na^+ 5 mmol/g

5.1.1.3 Broad-spectrum penicillins

Ampicillin is active against certain Gram-positive and Gram-negative organisms but is inactivated by penicillinases including those produced by *Staphylococcus aureus* and by common Gram-negative bacilli such as *Escherichia coli*. Almost all staphylococci, approx. 60% of *E. coli* strains and approx. 20% of *Haemophilus influenzae* strains are now resistant. The likelihood of resistance should therefore be considered before using ampicillin for the 'blind' treatment of infections; in particular, it should not be used for hospital patients without checking sensitivity.

Ampicillin is well excreted in the bile and urine. It is principally indicated for the treatment of exacerbations of chronic bronchitis and middle ear infections, both of which may be due to *Streptococcus pneumoniae* and *H. influenzae*, and for urinary-tract infections (section 5.1.13).

Ampicillin can be given by mouth but less than half the dose is absorbed, and absorption is further decreased by the presence of food in the gut.

Maculopapular rashes commonly occur with ampicillin (and amoxicillin) but are not usually related to true penicillin allergy. They almost always occur in patients with glandular fever; broad-spectrum penicillins should not therefore be used for 'blind' treatment of a sore throat. The risk of rash is also increased in patients with acute or chronic lymphocytic leukaemia or in cytomegalovirus infection.

Amoxicillin is a derivative of ampicillin and has a similar antibacterial spectrum. It is better absorbed than ampicillin when given by mouth, producing higher plasma and tissue concentrations; unlike ampicillin, absorption is not affected by the presence of food in the stomach. Amoxicillin may also be used for the treatment of Lyme disease [not licensed], see below.

Co-amoxiclav consists of amoxicillin with the beta-lactamase inhibitor clavulanic acid. Clavulanic acid itself has no significant antibacterial activity but, by inactivating beta-lactamases, it makes the combination active against beta-lactamase-producing bacteria that are resistant to amoxicillin. These include resistant strains of *Staph. aureus*, *E. coli*, and *H. influenzae*, as well as many *Bacteroides* and *Klebsiella* spp. Co-amoxiclav should be reserved for infections likely, or known, to be caused by amoxicillin-resistant beta-lactamase-producing strains.

A combination of ampicillin with flucloxacillin (as co-fluampicil) is available to treat infections involving either streptococci or staphylococci (e.g. cellulitis).

Lyme disease Lyme disease should generally be treated by those experienced in its management. **Doxycycline** (p. 375), **amoxicillin** [unlicensed indication] or **cefuroxime axetil** are the antibacterials of choice for *early Lyme disease* or *Lyme arthritis*. If these antibacterials are contra-indicated, a **macrolide** (e.g. clarithromycin) can be used for early Lyme disease. Intravenous administration of **ceftriaxone**, **cefotaxime** (p. 368), or **benzylpenicillin** (p. 361) is recommended for Lyme disease associated with cardiac or neurological complications. The duration of treatment is usually 2–4 weeks; Lyme arthritis may require further treatment.

Oral infections Amoxicillin is as effective as phenoxymethylpenicillin (section 5.1.1.1) but is better absorbed; however, it may encourage emergence of resistant organisms. Like phenoxymethylpenicillin, amoxicillin is ineffective against bacteria that produce beta-lactamases. Amoxicillin may be useful for short-course oral regimens. Co-amoxiclav is active against beta-lactamase-producing bacteria that are resistant to amoxicillin. Co-amoxiclav may be used for severe dental infection with spreading cellulitis or dental infection not responding to first-line antibacterial treatment.

AMOXICILLIN

(Amoxycillin)

Indications see under Ampicillin; also oral infections, Lyme disease (see notes above); endocarditis treatment (Table 1, section 5.1); anthrax (section 5.1.12); adjunct in listerial meningitis (Table 1, section 5.1); pneumococcal infection prophylaxis (Table 2, section 5.1); *Helicobacter pylori* eradication (section 1.3)

Cautions see under Ampicillin; maintain adequate hydration with high doses (particularly during parenteral therapy); **interactions:** Appendix 1 (penicillins)

Contra-indications see under Ampicillin

Renal impairment risk of crystalluria with high doses (particularly during parenteral therapy). Reduce dose in severe impairment; rashes more common

Pregnancy not known to be harmful

Breast-feeding trace amounts in milk, but appropriate to use

Side-effects see under Ampicillin

Dose

- By mouth, 500 mg every 8 hours, dose doubled in severe infection; CHILD 1 month–1 year, 125 mg every 8 hours, increased if necessary up to 30 mg/kg every 8 hours; 1–5 years, 250 mg every 8 hours, increased if necessary up to 30 mg/kg every 8 hours; 5–12 years, 500 mg every 8 hours, increased if necessary up to 30 mg/kg (max. 1 g) every 8 hours; 12–18 years, 500 mg every 8 hours, in severe infection 1 g every 8 hours

  Lyme disease (see also notes above), ADULT and CHILD over 5 years, 500 mg every 8 hours for 14–21 days (for 28 days in Lyme arthritis) [unlicensed indication]; CHILD 1 month–5 years see *BNF for Children*

  Anthrax (treatment and post-exposure prophylaxis—see also section 5.1.12), 500 mg every 8 hours; CHILD body-weight under 20 kg, 80 mg/kg daily in 3 divided doses, body-weight over 20 kg, adult dose
- *Short-course oral therapy*

  Dental abscess, ADULT over 18 years, 3 g repeated after 8 hours

  Urinary-tract infections, ADULT over 18 years, 3 g repeated after 10–12 hours
- By intramuscular injection, ADULT over 18 years, 500 mg every 8 hours
- By intravenous injection *or* infusion, 500 mg every 8 hours increased to 1 g every 6 hours in severe infection; CHILD 1 month–18 years, 20–30 mg/kg (max. 500 mg) every 8 hours; dose doubled in severe infection (max. 4 g daily)
- Listerial meningitis (in combination with another antibiotic, see Table 1, section 5.1), by intravenous infusion, ADULT over 18 years, 2 g every 4 hours; CHILD under 18 years see *BNF for Children*
- Endocarditis (in combination with another antibiotic if necessary, see Table 1, section 5.1), by intravenous infusion, ADULT over 18 years, 2 g every 4 hours; CHILD under 18 years see *BNF for Children*

Note Amoxicillin doses in BNF may differ from those in product literature

Amoxicillin (Non-proprietary) PoM

Capsules, amoxicillin (as trihydrate) 250 mg, net price 21 = £1.37; 500 mg, 21 = £1.61. Label: 9

Brands include *Amix®*, *Amoram®*, *Amoxident®*, *Galenamox®*, *Rimoxallin®*

Dental prescribing on NHS Amoxicillin Capsules may be prescribed

Oral suspension, amoxicillin (as trihydrate) for reconstitution with water, 125 mg/5 mL, net price 100 mL = £1.09; 250 mg/5 mL, 100 mL = £1.29. Label: 9

Note Sugar-free versions are available and can be ordered by specifying 'sugar-free' on the prescription

Brands include *Amoram®*, *Galenamox®*, *Rimoxallin®*

Dental prescribing on NHS Amoxicillin Oral Suspension may be prescribed

Sachets, sugar-free, amoxicillin (as trihydrate) 3 g/sachet, net price 2-sachet pack = £9.81, 14-sachet pack = £31.94. Label: 9, 13

Dental prescribing on NHS Amoxicillin Sachets may be prescribed as Amoxicillin Oral Powder

Injection, powder for reconstitution, amoxicillin (as sodium salt), net price 250-mg vial = 32p; 500-mg vial = 55p; 1-g vial = £1.10

Amoxil® (GSK) PoM

Capsules, both maroon/gold, amoxicillin (as trihydrate), 250 mg, net price 21-cap pack = £3.38; 500 mg, 21-cap pack = £6.77. Label: 9

Paediatric suspension, amoxicillin 125 mg (as trihydrate)/1.25 mL when reconstituted with water, net price 20 mL (peach- strawberry- and lemon-flavoured) = £3.18. Label: 9, counselling, use of pipette

Excipients include sucrose 600 mg/1.25 mL

Sachets, sugar-free, amoxicillin (as trihydrate) 3 g/sachet, net price 2-sachet pack (peach- strawberry- and lemon-flavoured) = £2.99. Label: 9, 13

Injection, powder for reconstitution, amoxicillin (as sodium salt), net price 500-mg vial = 55p; 1-g vial = £1.10

Electrolytes Na^+ 3.3 mmol/g

AMPICILLIN

Indications urinary-tract infections, otitis media, sinusitis, bronchitis, low or moderate-severity community-acquired pneumonia (Table 1, section 5.1), invasive salmonellosis; endocarditis treatment (Table 1, section 5.1); listerial meningitis (Table 1, section 5.1)

Cautions history of allergy; erythematous rashes common in glandular fever (see notes above); increased risk of erythematous rashes in cytomegalovirus infection, and acute or chronic lymphocytic leukaemia (see notes above); **interactions:** Appendix 1 (penicillins)

Contra-indications penicillin hypersensitivity

Renal impairment reduce dose if eGFR less than 10 mL/minute/1.73 m^2; rashes more common

Pregnancy not known to be harmful

Breast-feeding trace amounts in milk, but appropriate to use

Side-effects nausea, vomiting, diarrhoea; rashes (discontinue treatment); rarely, antibiotic-associated colitis; see also under Benzylpenicillin (section 5.1.1.1)

Dose

- By mouth, 0.5–1 g every 6 hours; CHILD 1 month–1 year, 125 mg every 6 hours, increased if necessary up to 30 mg/kg every 6 hours; 1–5 years, 250 mg every 6 hours, increased if necessary up to 30 mg/kg every 6 hours; 5–12 years, 500 mg every 6 hours, increased if necessary up to 30 mg/kg (max. 1 g) every 6 hours; 12–18 years, 500 mg every 6 hours, in severe infection 1 g every 6 hours
- By intramuscular injection *or* intravenous injection *or* infusion, 500 mg every 4–6 hours; CHILD under 18 years see *BNF for Children*
- Endocarditis (in combination with another antibiotic if necessary, see Table 1, section 5.1), by intravenous infusion, ADULT over 18 years, 2 g every 4 hours; CHILD under 18 years see *BNF for Children*
- Listerial meningitis (in combination with another antibiotic, see Table 1, section 5.1), by intravenous infusion, ADULT over 18 years, 2 g every 4 hours; CHILD under 18 years see *BNF for Children*

Note Ampicillin doses in BNF may differ from those in product literature

Ampicillin (Non-proprietary) PoM

Capsules, ampicillin 250 mg, net price 28 = £4.75; 500 mg, 28 = £21.37. Label: 9, 23

Brands include *Rimacillin®*

Oral suspension, ampicillin 125 mg/5 mL when reconstituted with water, net price 100 mL = £18.87; 250 mg/5 mL, 100 mL = £11.84. Label: 9, 23

Brands include *Rimacillin*®

Injection, powder for reconstitution, ampicillin (as sodium salt), net price 500-mg vial = £7.83

Penbritin® (Chemidex) PoM

Capsules, grey/red, ampicillin (as trihydrate) 250 mg, net price 28-cap pack = £2.10; 500 mg, 28-cap pack = £5.28. Label: 9, 23

Syrup, apricot- caramel- and peppermint-flavoured, ampicillin (as trihydrate) for reconstitution with water, 250 mg/5 mL, net price 100 mL = £11.84. Label: 9, 23

Excipients include sucrose 3.6 g/5 mL

With flucloxacillin

See Co-fluampicil

CO-AMOXICLAV

A mixture of amoxicillin (as the trihydrate or as the sodium salt) and clavulanic acid (as potassium clavulanate); the proportions are expressed in the form *x*/*y* where *x* and *y* are the strengths in milligrams of amoxicillin and clavulanic acid respectively

Indications infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate) including respiratory-tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis, animal bites, severe dental infection with spreading cellulitis or dental infection not responding to first-line antibacterial

Cautions see under Ampicillin and notes above; maintain adequate hydration with high doses (particularly during parenteral therapy); **interactions:** Appendix 1 (penicillins)

Cholestatic jaundice Cholestatic jaundice can occur either during or shortly after the use of co-amoxiclav. An epidemiological study has shown that the risk of acute liver toxicity was about 6 times greater with co-amoxiclav than with amoxicillin. Cholestatic jaundice is more common in patients above the age of 65 years and in men; these reactions have only rarely been reported in children. Jaundice is usually self-limiting and very rarely fatal. The duration of treatment should be appropriate to the indication and should not usually exceed 14 days

Contra-indications penicillin hypersensitivity, history of co-amoxiclav-associated or penicillin-associated jaundice or hepatic dysfunction

Hepatic impairment monitor liver function in liver disease; see also Cholestatic Jaundice above

Renal impairment risk of crystalluria with high doses (particularly during parenteral therapy).

Co-amoxiclav 250/125 tablets or 500/125 tablets: if eGFR 10–30 mL/minute/1.73 m^2, one *250/125* strength tablet every 12 hours *or* one *500/125* strength tablet every 12 hours; if eGFR less than 10 mL/minute/1.73 m^2, one *250/125* strength tablet every 24 hours *or* one *500/125* strength tablet every 24 hours.

Co-amoxiclav 400/57 suspension: avoid if eGFR less than 30 mL/minute/1.73 m^2.

Co-amoxiclav injection (expressed as co-amoxiclav): if eGFR 10–30 mL/minute/1.73 m^2, 1.2 g initially, then 600 mg every 12 hours; if eGFR less than 10 mL/minute/1.73 m^2, 1.2 g initially, then 600 mg every 24 hours

Pregnancy not known to be harmful

Breast-feeding trace amounts in milk, but appropriate to use

Side-effects see under Ampicillin; hepatitis, cholestatic jaundice (see above); Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative dermatitis, vasculitis reported; rarely prolongation of bleeding time, dizziness, headache, convulsions (particularly with high doses or in renal impairment); superficial staining of teeth with suspension, phlebitis at injection site

Dose

- By mouth, expressed as co-amoxiclav, one *250/125* strength tablet every 8 hours; increased in severe infection to one *500/125* strength tablet every 8 hours; NEONATE 0.25 mL/kg of *125/31* suspension every 8 hours; CHILD 1 month–1 year, 0.25 mL/kg of *125/31* suspension every 8 hours, dose doubled in severe infection; 1–6 years, 5 mL of *125/31* suspension every 8 hours *or* 0.25 mL/kg of *125/31* suspension every 8 hours, dose doubled in severe infection; 6–12 years, 5 mL of *250/62* suspension every 8 hours *or* 0.15 mL/kg of *250/62* suspension every 8 hours, dose doubled in severe infection

  Severe dental infections (but not generally first-line, see notes above), expressed as co-amoxiclav, ADULT and CHILD over 12 years, one *250/125* strength tablet every 8 hours for 5 days

- By intravenous injection over 3–4 minutes *or* by intravenous infusion, expressed as co-amoxiclav, 1.2 g every 8 hours; NEONATE 30 mg/kg every 12 hours; CHILD 1–3 months 30 mg/kg every 12 hours; CHILD 3 months–18 years, 30 mg/kg (max. 1.2 g) every 8 hours

  Surgical prophylaxis, expressed as co-amoxiclav, 1.2 g up to 30 minutes before the procedure; for high risk procedures up to 2–3 further doses of 1.2 g may be given every 8 hours

Co-amoxiclav (Non-proprietary) PoM

Tablets, co-amoxiclav 250/125 (amoxicillin 250 mg as trihydrate, clavulanic acid 125 mg as potassium salt), net price 21-tab pack = £2.62. Label: 9

Dental prescribing on NHS Co-amoxiclav 250/125 Tablets may be prescribed

Tablets, co-amoxiclav 500/125 (amoxicillin 500 mg as trihydrate, clavulanic acid 125 mg as potassium salt), net price 21-tab pack = £4.13. Label: 9

Oral suspension, co-amoxiclav 125/31 (amoxicillin 125 mg as trihydrate, clavulanic acid 31.25 mg as potassium salt)/5 mL when reconstituted with water, net price 100 mL = £1.63. Label: 9

Note Sugar-free versions are available and can be ordered by specifying 'sugar-free' on the prescription

Dental prescribing on NHS Co-amoxiclav 125/31 Suspension may be prescribed

Oral suspension, co-amoxiclav 250/62 (amoxicillin 250 mg as trihydrate, clavulanic acid 62.5 mg as potassium salt)/5 mL when reconstituted with water, net price 100 mL = £1.72. Label: 9

Note Sugar-free versions are available and can be ordered by specifying 'sugar-free' on the prescription

Dental prescribing on NHS Co-amoxiclav 250/62 Suspension may be prescribed

Injection 500/100, powder for reconstitution, co-amoxiclav 500/100 (amoxicillin 500 mg as sodium salt, clavulanic acid 100 mg as potassium salt), net price per vial = £1.21

Injection 1000/200, powder for reconstitution, co-amoxiclav 1000/200 (amoxicillin 1 g as sodium salt, clavulanic acid 200 mg as potassium salt), net price per vial = £2.62

Augmentin® (GSK) PoM

Tablets 375 mg, f/c, co-amoxiclav 250/125 (amoxicillin 250 mg as trihydrate, clavulanic acid 125 mg as potassium salt), net price 21-tab pack = £4.19. Label: 9

Tablets 625 mg, f/c, co-amoxiclav 500/125 (amoxicillin 500 mg as trihydrate, clavulanic acid 125 mg as potassium salt), net price 21-tab pack = £8.00. Label: 9

Suspension '125/31 SF', sugar-free, co-amoxiclav 125/31 (amoxicillin 125 mg as trihydrate, clavulanic acid 31.25 mg as potassium salt)/5 mL when reconstituted with water, net price 100 mL (raspberry-and orange-flavoured) = £2.95. Label: 9

Excipients include aspartame 12.5 mg/5 mL (section 9.4.1)

Suspension '250/62 SF', sugar-free, co-amoxiclav 250/62 (amoxicillin 250 mg as trihydrate, clavulanic acid 62.5 mg as potassium salt)/5 mL when reconstituted with water, net price 100 mL (raspberry-and orange-flavoured) = £3.00. Label: 9

Excipients include aspartame 12.5 mg/5 mL (section 9.4.1)

Injection 600 mg, powder for reconstitution, co-amoxiclav 500/100 (amoxicillin 500 mg as sodium salt, clavulanic acid 100 mg as potassium salt), net price per vial = £1.06

Electrolytes Na^+ 1.35 mmol, K^+ 0.5 mmol/600-mg vial

Injection 1.2 g, powder for reconstitution, co-amoxiclav 1000/200 (amoxicillin 1 g as sodium salt, clavulanic acid 200 mg as potassium salt), net price per vial = £1.06

Electrolytes Na^+ 2.7 mmol, K^+ 1 mmol/1.2-g vial

Other oral preparations

Co-amoxiclav (Non-proprietary) PoM

Suspension '400/57', co-amoxiclav 400/57 (amoxicillin 400 mg as trihydrate, clavulanic acid 57 mg as potassium salt)/5 mL when reconstituted with water, net price 35 mL = £4.13, 70 mL = £5.79. Label: 9

Excipients may include aspartame (section 9.4.1)

Note Sugar-free versions are available and can be ordered by specifying 'sugar-free' on the prescription

Brands include *Augmentin-Duo®*

Dose ADULT and CHILD over 40 kg 10 mL twice daily, increased to 10 mL three times daily in severe infection; CHILD 2 months–2 years 0.15 mL/kg twice daily, 2–6 years (13–21 kg) 2.5 mL twice daily, 7–12 years (22–40 kg) 5 mL twice daily, doubled in severe infection

CO-FLUAMPICIL

A mixture of equal parts by mass of flucloxacillin and ampicillin

Indications mixed infections involving beta-lactamase-producing staphylococci

Cautions see under Ampicillin and Flucloxacillin; **interactions:** Appendix 1 (penicillins)

Contra-indications see under Ampicillin and Flucloxacillin

Hepatic impairment see under Flucloxacillin

Renal impairment see under Ampicillin and Flucloxacillin

Pregnancy not known to be harmful

Breast-feeding trace amounts in milk, but appropriate to use

Side-effects see under Ampicillin and Flucloxacillin

Dose

- By mouth, co-fluampicil, 250/250 every 6 hours, dose doubled in severe infections; CHILD under 10 years half adult dose, dose doubled in severe infections
- By intramuscular *or* slow intravenous injection *or* by intravenous infusion, co-fluampicil 250/250 every 6 hours, dose doubled in severe infections; CHILD under 2 years quarter adult dose, 2–10 years half adult dose, dose doubled in severe infections

Co-fluampicil (Non-proprietary) PoM

Capsules, co-fluampicil 250/250 (flucloxacillin 250 mg as sodium salt, ampicillin 250 mg as trihydrate), net price 28-cap pack = £3.29. Label: 9, 22

Brands include *Flu-Amp®*

Syrup, co-fluampicil 125/125 (flucloxacillin 125 mg as magnesium salt, ampicillin 125 mg as trihydrate)/5 mL when reconstituted with water, net price 100 mL = £22.86. Label: 9, 22

Magnapen® (Wockhardt) PoM

Injection 500 mg, powder for reconstitution, co-fluampicil 250/250 (flucloxacillin 250 mg as sodium salt, ampicillin 250 mg as sodium salt), net price per vial = £1.33

Electrolytes Na^+ 1.3 mmol/vial

5.1.1.4 Antipseudomonal penicillins

Piperacillin, a ureidopenicillin, is only available in combination with the beta-lactamase inhibitor tazobactam. **Ticarcillin**, a carboxypenicillin, is only available in combination with the beta-lactamase inhibitor clavulanic acid (section 5.1.1.3). Both preparations have a broad spectrum of activity against a range of Gram-positive and Gram-negative bacteria, and anaerobes. Piperacillin with tazobactam has activity against a wider range of Gram-negative organisms than ticarcillin with clavulanic acid and it is more active against *Pseudomonas aeruginosa*. These antibacterials are not active against MRSA. They are used in the treatment of septicaemia, hospital-acquired pneumonia, and complicated infections involving the urinary tract, skin and soft tissues, or intra-abdomen.

For severe pseudomonas infections these antipseudomonal penicillins can be given with an aminoglycoside (e.g. gentamicin section 5.1.4) since they have a synergistic effect.

Owing to the sodium content of many of these antibiotics, high doses may lead to hypernatraemia.

PIPERACILLIN WITH TAZOBACTAM

Indications see under Dose

Cautions see under Benzylpenicillin (section 5.1.1.1); **interactions:** Appendix 1 (penicillins)

Contra-indications see under Benzylpenicillin (section 5.1.1.1)

Renal impairment max. 4.5 g every 8 hours if eGFR 20–40 mL/minute/1.73 m^2; max. 4.5 g every 12 hours if eGFR less than 20 mL/minute/1.73 m^2

Pregnancy manufacturers advise use only if potential benefit outweighs risk

Breast-feeding trace amounts in milk, but appropriate to use

Side-effects see under Benzylpenicillin (section 5.1.1.1); also nausea, vomiting, diarrhoea; *less commonly* stomatitis, dyspepsia, constipation, jaundice, hypotension, headache, insomnia, injection-site reactions; *rarely* abdominal pain, hepatitis, eosinophilia; *very rarely* hypoglycaemia, hypokalaemia, pancytopenia, Stevens-Johnson syndrome, toxic epidermal necrolysis

Dose

Note Expressed as a combination of piperacillin and tazobactam (both as sodium salts) in a ratio of 8:1

- Hospital-acquired pneumonia, septicaemia, complicated intra-abdominal infections, complicated infections involving the urinary tract or skin and soft tissues, ADULT and CHILD over 12 years, by intravenous infusion, 4.5 g every 8 hours, increased to 4.5 g every 6 hours in severe infections
- Complicated intra-abdominal infections, by intravenous infusion, CHILD 2–12 years, 112.5 mg/kg (max. 4.5 g) every 8 hours
- Infections in neutropenic patients, by intravenous infusion, ADULT and CHILD over 12 years, 4.5 g every 6 hours; CHILD 2–12 years, 90 mg/kg (max. 4.5 g) every 6 hours

Piperacillin with tazobactam (Non-proprietary) PoM

Injection 2.25 g, powder for reconstitution, piperacillin 2 g (as sodium salt), tazobactam 250 mg (as sodium salt), net price 2.25-g vial = £3.10

Injection 4.5 g, powder for reconstitution, piperacillin 4 g (as sodium salt), tazobactam 500 mg (as sodium salt), net price 4.5-g vial = £12.90

Tazocin® (Pfizer) PoM

Injection 2.25 g, powder for reconstitution, piperacillin 2 g (as sodium salt), tazobactam 250 mg (as sodium salt), net price 2.25-g vial = £7.65

Electrolytes Na^+ 5.58 mmol/2.25-g vial

Injection 4.5 g, powder for reconstitution, piperacillin 4 g (as sodium salt), tazobactam 500 mg (as sodium salt), net price 4.5-g vial = £15.17

Electrolytes Na^+ 11.16 mmol/4.5-g vial

TICARCILLIN WITH CLAVULANIC ACID

Indications infections due to *Pseudomonas* and *Proteus* spp, see notes above

Cautions see under Benzylpenicillin (section 5.1.1.1); **interactions:** Appendix 1 (penicillins)

Cholestatic jaundice For a warning on cholestatic jaundice possibly associated with clavulanic acid, see under Co-amoxiclav, p. 365.

Contra-indications see under Benzylpenicillin (section 5.1.1.1)

Hepatic impairment manufacturer advises caution in severe impairment; also cholestatic jaundice, see under Co-amoxiclav, p. 365

Renal impairment reduce dose to 3.2 g every eight hours if eGFR 30–60 mL/minute/1.73 m^2; 1.6 g every eight hours if eGFR 10–30 mL/minute/1.73 m^2; 1.6 g every twelve hours if eGFR less than 10 mL/minute/1.73 m^2

Pregnancy not known to be harmful

Breast-feeding trace amounts in milk, but appropriate to use

Side-effects see under Benzylpenicillin (section 5.1.1.1); also nausea, vomiting, coagulation disorders, haemorrhagic cystitis (more frequent in children), injection-site reactions, Stevens-Johnson syndrome, toxic epidermal necrolysis, hypokalaemia, eosinophilia

Dose

Note Expressed as a combination of ticarcillin (as sodium salt) and clavulanic acid (as potassium salt) in a ratio of 15:1

- By intravenous infusion, 3.2 g every 6–8 hours increased to every 4 hours in more severe infections; CHILD 1 month–18 years, body-weight under 40 kg, 80 mg/kg every 8 hours, increased to every 6 hours in more severe infections; body-weight over 40 kg, adult dose

Timentin (GSK) PoM

Injection 3.2 g, powder for reconstitution, ticarcillin 3 g (as sodium salt), clavulanic acid 200 mg (as potassium salt). Net price per vial = £5.33

Electrolytes Na^+ 16 mmol, K^+ 1 mmol /3.2-g vial

5.1.1.5 Mecillinams

Pivmecillinam has significant activity against many Gram-negative bacteria including *Escherichia coli*, klebsiella, enterobacter, and salmonellae. It is not active against *Pseudomonas aeruginosa* or enterococci. Pivmecillinam is hydrolysed to mecillinam, which is the active drug.

PIVMECILLINAM HYDROCHLORIDE

Indications see under Dose below

Cautions see under Benzylpenicillin (section 5.1.1.1); also liver and renal function tests required in long-term use; avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (penicillins)

Contra-indications see under Benzylpenicillin (section 5.1.1.1); also carnitine deficiency, oesophageal strictures, gastro-intestinal obstruction, infants under 3 months

Pregnancy not known to be harmful, but manufacturer advises avoid

Breast-feeding trace amounts in milk, but appropriate to use

Side-effects see under Benzylpenicillin (section 5.1.1.1); nausea, vomiting, abdominal pain, headache, dizziness; also reported mouth ulcers, oesophagitis, reduced serum and total body carnitine (especially with long-term or repeated use)

Dose

- Acute uncomplicated cystitis, ADULT and CHILD over 40 kg, initially 400 mg then 200 mg every 8 hours for 3 days
- Chronic or recurrent bacteriuria, ADULT and CHILD over 40 kg, 400 mg every 6–8 hours
- Urinary-tract infections, CHILD under 40 kg, 20–40 mg/kg daily in 3–4 divided doses
- Salmonellosis, not recommended therefore no dose stated

Counselling Tablets should be swallowed whole with plenty of fluid during meals while sitting or standing

Selexid® (LEO) PoM

Tablets, f/c, pivmecillinam hydrochloride 200 mg, net price 10-tab pack = £4.50. Label 9, 21, 27, counselling, posture (see Dose above)

5.1.2 Cephalosporins, carbapenems, and other beta-lactams

Antibiotics in this section include the **cephalosporins**, such as cefotaxime, ceftazidime, cefuroxime, cefalexin and cefradine, the **monobactam**, aztreonam, and the **carbapenems**, imipenem (a thienamycin derivative), meropenem, and ertapenem.

5.1.2.1 Cephalosporins

The cephalosporins are broad-spectrum antibiotics which are used for the treatment of septicaemia, pneumonia, meningitis, biliary-tract infections, peritonitis, and urinary-tract infections. The pharmacology of the cephalosporins is similar to that of the penicillins, excretion being principally renal. Cephalosporins penetrate the cerebrospinal fluid poorly unless the meninges are inflamed; cefotaxime is a suitable cephalosporin for infections of the CNS (e.g meningitis).

The principal side-effect of the cephalosporins is hypersensitivity and about 0.5–6.5% of penicillin-sensitive patients will also be allergic to the cephalosporins. Patients with a history of immediate hypersensitivity to penicillin should not receive a cephalosporin. If a cephalosporin is essential in these patients because a suitable alternative antibacterial is not available, then cefixime, cefotaxime, ceftazidime, ceftriaxone, or cefuroxime can be used with caution; cefaclor, cefadroxil, cefalexin, cefradine, and ceftaroline fosamil should be avoided.

Antibiotic-associated colitis may occur with the use of broad-spectrum cephalosporins, particularly second- and third-generation cephalosporins.

Cefuroxime is a 'second generation' cephalosporin that is less susceptible than the earlier cephalosporins to inactivation by beta-lactamases. It is, therefore, active against certain bacteria which are resistant to the other drugs and has greater activity against *Haemophilus influenzae*.

Cefotaxime, **ceftazidime** and **ceftriaxone** are 'third generation' cephalosporins with greater activity than the 'second generation' cephalosporins against certain Gram-negative bacteria. However, they are less active than cefuroxime against Gram-positive bacteria, most notably *Staphylococcus aureus*. Their broad antibacterial spectrum may encourage superinfection with resistant bacteria or fungi.

Ceftazidime has good activity against pseudomonas. It is also active against other Gram-negative bacteria.

Ceftriaxone has a longer half-life and therefore needs to be given only once daily. Indications include serious infections such as septicaemia, pneumonia, and meningitis. The calcium salt of ceftriaxone forms a precipitate in the gall bladder which may rarely cause symptoms but these usually resolve when the antibiotic is stopped.

Ceftaroline fosamil is a 'fifth generation' cephalosporin with bactericidal activity similar to cefotaxime; however, ceftaroline fosamil has an extended spectrum of activity against Gram-positive bacteria that includes meticillin-resistant *Staphylococcus aureus* and multi-drug resistant *Streptococcus pneumoniae*. Ceftaroline fosamil is licensed for the treatment of community-acquired pneumonia and complicated skin and soft-tissue infections, but there is no experience of its use in pneumonia caused by meticillin-resistant *S. aureus*.

The *Scottish Medicines Consortium*, p. 4 has advised (Dec 2012) that ceftaroline fosamil (*Zinforo*®) is accepted for restricted use within NHS Scotland when meticillin-resistant *S. aureus* is suspected in complicated skin and soft-tissue infection and vancomycin cannot be used.

Orally active cephalosporins The orally active 'first generation' cephalosporins, **cefalexin**, **cefradine**, and **cefadroxil** and the 'second generation' cephalosporin, **cefaclor**, have a similar antimicrobial spectrum. They are useful for urinary-tract infections which do not respond to other drugs or which occur in pregnancy, respiratory-tract infections, otitis media, sinusitis, and skin and soft-tissue infections. Cefaclor has good activity against *H. influenzae*, but it is associated with protracted skin reactions especially in children. Cefadroxil has a long duration of action and can be given twice daily; it has poor activity against *H. influenzae*. **Cefuroxime axetil**, an ester of the 'second generation' cephalosporin cefuroxime, has the same antibacterial spectrum as the parent compound; it is poorly absorbed.

Cefixime is an orally active 'third generation' cephalosporin. It has a longer duration of action than the other cephalosporins that are active by mouth. It is only licensed for acute infections.

For treatment of Lyme disease, see section 5.1.1.3.

Oral infections The cephalosporins offer little advantage over the penicillins in dental infections, often being less active against anaerobes. Infections due to oral streptococci (often termed viridans streptococci) which become resistant to penicillin are usually also resistant to cephalosporins. This is of importance in the case of patients who have had rheumatic fever and are on long-term penicillin therapy. Cefalexin and cefradine have been used in the treatment of oral infections.

CEFACLOR

Indications infections due to sensitive Gram-positive and Gram-negative bacteria, but see notes above

Cautions sensitivity to beta-lactam antibacterials (avoid if history of immediate hypersensitivity reaction, see also notes above and p. 360); false positive urinary glucose (if tested for reducing substances) and false positive Coombs' test; **interactions:** Appendix 1 (cephalosporins)

Contra-indications cephalosporin hypersensitivity

Renal impairment no dose adjustment required—manufacturer advises caution

Pregnancy not known to be harmful

Breast-feeding present in milk in low concentration, but appropriate to use

Side-effects diarrhoea (rarely antibiotic-associated colitis), nausea and vomiting, abdominal discomfort, headache; allergic reactions including rashes, pruritus, urticaria, serum sickness-like reactions with rashes, fever and arthralgia, and anaphylaxis; Stevens-Johnson syndrome, toxic epidermal necrolysis reported; disturbances in liver enzymes, transient

hepatitis and cholestatic jaundice; other side-effects reported include eosinophilia and blood disorders (including thrombocytopenia, leucopenia, agranulocytosis, aplastic anaemia and haemolytic anaemia); reversible interstitial nephritis, hyperactivity, nervousness, sleep disturbances, hallucinations, confusion, hypertonia, and dizziness

Dose

- 250 mg every 8 hours, doubled for severe infections; max. 4 g daily; CHILD over 1 month, 20 mg/kg daily in 3 divided doses, doubled for severe infections, max. 1 g daily; *or* 1 month–1 year, 62.5 mg every 8 hours; 1–5 years, 125 mg; over 5 years, 250 mg; doses doubled for severe infections

Cefaclor (Non-proprietary) PoM

Capsules, cefaclor (as monohydrate) 250 mg, net price 21-cap pack = £6.80; 500 mg, 50-cap pack = £24.00. Label: 9

Brands include *Keftid*®

Suspension, cefaclor (as monohydrate) for reconstitution with water, 125 mg/5 mL, net price 100 mL = £5.16; 250 mg/5 mL, 100 mL = £10.32. Label: 9

Note Sugar-free versions are available and can be ordered by specifying 'sugar-free' on the prescription

Brands include *Keftid*®

Distaclor® (Flynn) PoM

Capsules, cefaclor (as monohydrate) 500 mg (violet/grey), net price 21-cap pack = £7.50. Label: 9

Suspension, both pink, cefaclor (as monohydrate) for reconstitution with water, 125 mg/5 mL, net price 100 mL = £4.13; 250 mg/5 mL, 100 mL = £8.26. Label: 9

Modified release

Distaclor MR® (Flynn) PoM

Tablets, m/r, both blue, cefaclor (as monohydrate) 375 mg. Net price 14-tab pack = £9.10. Label: 9, 21, 25

Dose 375 mg every 12 hours with food, dose doubled for pneumonia

Lower urinary-tract infections, 375 mg every 12 hours with food

CEFADROXIL

Indications see under Cefaclor; see also notes above

Cautions see under Cefaclor; **interactions:** Appendix 1 (cephalosporins)

Contra-indications see under Cefaclor

Renal impairment 1 g initially, then 500 mg every 12 hours if eGFR 26–50 mL/minute/1.73 m^2; 1 g initially, then 500 mg every 24 hours if eGFR 11–26 mL/minute/1.73 m^2; 1 g initially, then 500 mg every 36 hours if eGFR less than 11 mL/minute/1.73 m^2

Pregnancy see under Cefaclor

Breast-feeding see under Cefaclor

Side-effects see under Cefaclor

Dose

- 0.5–1 g twice daily; skin, soft-tissue, and uncomplicated urinary-tract infections, 1 g daily; CHILD 6–18 years, body-weight under 40 kg, 500 mg twice daily; body-weight over 40 kg, adult dose

Cefadroxil (Non-proprietary) PoM

Capsules, cefadroxil (as monohydrate) 500 mg, net price 20-cap pack = £20.89. Label: 9

CEFALEXIN

(Cephalexin)

Indications see under Cefaclor

Cautions see under Cefaclor; **interactions:** Appendix 1 (cephalosporins)

Contra-indications see under Cefaclor

Renal impairment max. 3 g daily if eGFR 40–50 mL/minute/1.73 m^2; max. 1.5 g daily if eGFR 10–40 mL/minute/1.73 m^2; max. 750 mg daily if eGFR less than 10 mL/minute/1.73 m^2

Pregnancy see under Cefaclor

Breast-feeding see under Cefaclor

Side-effects see under Cefaclor

Dose

- 250 mg every 6 hours *or* 500 mg every 8–12 hours increased to 1–1.5 g every 6–8 hours for severe infections; CHILD 25 mg/kg daily in divided doses, doubled for severe infections, max. 100 mg/kg daily; *or* under 1 year 125 mg every 12 hours, 1–5 years 125 mg every 8 hours, 5–12 years 250 mg every 8 hours
- Prophylaxis of recurrent urinary-tract infection, ADULT 125 mg at night

Cefalexin (Non-proprietary) PoM

Capsules, cefalexin 250 mg, net price 28-cap pack = £1.67; 500 mg, 21-cap pack = £1.77. Label: 9

Dental prescribing on NHS Cefalexin Capsules may be prescribed

Tablets, cefalexin 250 mg, net price 28-tab pack = £2.02; 500 mg, 21-tab pack = £2.53. Label: 9

Dental prescribing on NHS Cefalexin Tablets may be prescribed

Oral suspension, cefalexin for reconstitution with water, 125 mg/5 mL, net price 100 mL = £1.40; 250 mg/5 mL, 100 mL = £1.89. Label: 9

Dental prescribing on NHS Cefalexin Oral Suspension may be prescribed

Ceporex® (Co-Pharma) PoM

Capsules, both caramel/grey, cefalexin 250 mg, net price 28-cap pack = £4.02; 500 mg, 28-cap pack = £7.85. Label: 9

Tablets, all pink, f/c, cefalexin 250 mg, net price 28-tab pack = £4.02; 500 mg, 28-tab pack = £7.85. Label: 9

Syrup, all orange, cefalexin for reconstitution with water, 125 mg/5 mL, net price 100 mL = £1.43; 250 mg/5 mL, 100 mL = £2.87; 500 mg/5 mL, 100 mL = £5.57. Label: 9

Keflex® (Flynn) PoM

Capsules, cefalexin 250 mg (green/white), net price 28-cap pack = £1.46; 500 mg (pale green/dark green), 21-cap pack = £1.98. Label: 9

Tablets, both peach, cefalexin 250 mg, net price 28-tab pack = £1.60; 500 mg (scored), 21-tab pack = £2.08. Label: 9

Suspension, cefalexin for reconstitution with water, 125 mg/5 mL, net price 100 mL = 84p; 250 mg/5 mL, 100 mL = £1.40. Label: 9

CEFIXIME

Indications see under Cefaclor (acute infections only); gonorrhoea [unlicensed indication] (see also Table 1, section 5.1)

Cautions see under Cefaclor; **interactions:** Appendix 1 (cephalosporins)

Contra-indications see under Cefaclor
Renal impairment reduce dose if eGFR less than 20 mL/minute/1.73 m^2 (max. 200 mg once daily)
Pregnancy see under Cefaclor
Breast-feeding manufacturer advises avoid unless essential—no information available
Side-effects see under Cefaclor
Dose
- ADULT and CHILD over 10 years, 200–400 mg daily in 1–2 divided doses; CHILD over 6 months 8 mg/kg daily in 1–2 divided doses *or* 6 months–1 year 75 mg daily; 1–4 years 100 mg daily; 5–10 years 200 mg daily
- Uncomplicated gonorrhoea [unlicensed indication] (see also Table 1, section 5.1), 400 mg as a single dose

Suprax® (Sanofi-Aventis) PoM
Tablets, f/c, scored, cefixime 200 mg. Net price 7-tab pack = £13.23. Label: 9
Paediatric oral suspension, cefixime 100 mg/5 mL when reconstituted with water, net price 100 mL (with spoon for measuring 3.75 mL or 5 mL) = £18.91. Label: 9

CEFRADINE
(Cephradine)

Indications see under Cefaclor; surgical prophylaxis
Cautions see under Cefaclor; **interactions:** Appendix 1 (cephalosporins)
Contra-indications see under Cefaclor
Renal impairment use half normal dose if eGFR 5–20 mL/minute/1.73 m^2; use one-quarter normal dose if eGFR less than 5 mL/minute/1.73 m^2
Pregnancy see under Cefaclor
Breast-feeding see under Cefaclor
Side-effects see under Cefaclor
Dose
- 250–500 mg every 6 hours *or* 0.5–1 g every 12 hours; up to 1 g every 6 hours in severe infections; CHILD 7–12 years, 25–50 mg/kg daily in 2–4 divided doses

Cefradine (Non-proprietary) PoM
Capsules, cefradine 250 mg, net price 20-cap pack = £2.34; 500 mg, 20-cap pack = £3.47. Label: 9
Brands include *Nicef®*
Dental prescribing on NHS Cefradine Capsules may be prescribed

CEFOTAXIME

Indications see under Cefaclor; gonorrhoea; surgical prophylaxis; Haemophilus epiglottitis and meningitis (Table 1, section 5.1); see also notes above
Cautions see under Cefaclor; **interactions:** Appendix 1 (cephalosporins)
Contra-indications see under Cefaclor
Renal impairment if eGFR less than 5 mL/minute/1.73 m^2, initial dose of 1 g then use half normal dose
Pregnancy see under Cefaclor
Breast-feeding see under Cefaclor
Side-effects see under Cefaclor; rarely arrhythmias following rapid injection reported
Dose
- By intramuscular *or* intravenous injection *or* by intravenous infusion, 1 g every 12 hours increased in severe infections (e.g. meningitis) to 8 g daily in 4 divided doses; higher doses (up to 12 g daily in 3–4 divided doses) may be required; intramuscular doses over 1 g divided between more than one site; NEONATE 50 mg/kg daily in 2–4 divided doses increased to 150–200 mg/kg daily in severe infections; CHILD 100–150 mg/kg daily in 2–4 divided doses increased up to 200 mg/kg daily in very severe infections
- Uncomplicated gonorrhoea, by intramuscular injection, 500 mg as a single dose

Important. If meningococcal disease (meningitis with non-blanching rash or meningococcal septicaemia) is suspected, and the patient cannot be given benzylpenicillin (e.g. because of an allergy), a single dose of cefotaxime can be given (if available) before urgent transfer to hospital, so long as this does not delay the transfer. If a patient with suspected bacterial meningitis without non-blanching rash cannot be transferred to hospital urgently and cannot be given benzylpenicillin, a single dose of cefotaxime can be given before transfer. Suitable doses of cefotaxime by intravenous injection (or by intramuscular injection) are ADULT and CHILD over 12 years 1 g; CHILD under 12 years 50 mg/kg; chloramphenicol (section 5.1.7) may be used if there is a history of anaphylaxis to penicillins or cephalosporins

Cefotaxime (Non-proprietary) PoM
Injection, powder for reconstitution, cefotaxime (as sodium salt), net price 500-mg vial = £2.25; 1-g vial = £4.20; 2-g vial = £8.57

CEFTAROLINE FOSAMIL

Indications community-acquired pneumonia; complicated skin and soft-tissue infections; see also notes above
Cautions see under Cefaclor; also seizure disorders; **interactions**: Appendix 1 (cephalosporins)
Contra-indications see under Cefaclor
Renal impairment 400 mg every 12 hours if eGFR 30–50 mL/minute/1.73 m^2; manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m^2
Pregnancy manufacturer advises avoid unless essential—no information available
Breast-feeding manufacturer advises avoid—no information available
Side-effects see under Cefaclor
Dose
- By intravenous infusion, ADULT over 18 years 600 mg every 12 hours for 5–7 days in community-acquired pneumonia *or* 5–14 days in complicated skin and soft-tissue infections

Zinforo® (AstraZeneca) ▼ PoM
Intravenous infusion, powder for reconstitution, ceftaroline fosamil (as acetate), net price 600-mg vial = £37.50

CEFTAZIDIME

Indications see under Cefaclor; see also notes above
Cautions see under Cefaclor; **interactions:** Appendix 1 (cephalosporins)
Contra-indications see under Cefaclor
Hepatic impairment manufacturer advises caution in severe impairment
Renal impairment reduce dose if eGFR less than 50 mL/minute/1.73 m^2—consult product literature
Pregnancy see under Cefaclor
Breast-feeding see under Cefaclor
Side-effects see under Cefaclor; also taste disturbances, paraesthesia

Dose

- By intravenous injection *or* infusion (*or* by deep intramuscular injection if intravenous administration not possible) 1–2 g every 8 hours; in meningitis, septicaemia, hospital-acquired pneumonia, or in febrile patients with neutropenia, 2 g every 8 hours; single doses over 1 g intravenous route only; ELDERLY over 80 years usual max. 3 g daily

  Complicated urinary-tract infection, 1–2 g every 8–12 hours; single doses over 1 g intravenous route only; ELDERLY over 80 years usual max. 3 g daily

  Pseudomonal lung infection in cystic fibrosis, ADULT 100–150 mg/kg daily (max. 9 g daily) in 3 divided doses; single doses over 1 g intravenous route only

  Prophylaxis for transurethral resection of prostate, 1 g up to 30 minutes before the procedure, repeated if necessary when catheter removed
- CHILD under 18 years see *BNF for Children*

Ceftazidime (Non-proprietary) PoM

Injection, powder for reconstitution, ceftazidime (as pentahydrate), with sodium carbonate, net price 1-g vial = £8.95; 2-g vial = £17.90

Fortum® (GSK) PoM

Injection, powder for reconstitution, ceftazidime (as pentahydrate), with sodium carbonate, net price 500-mg vial = £4.40, 1-g vial = £8.79, 2-g vial = £17.59, 3-g vial = £25.76

Electrolytes Na^+ 2.3 mmol/g

Kefadim® (Flynn) PoM

Injection, powder for reconstitution, ceftazidime (as pentahydrate), with sodium carbonate, net price 1-g vial = £7.92; 2-g vial = £15.84

Electrolytes Na^+ 2.3 mmol/g

CEFTRIAXONE

Indications see under Cefaclor and notes above; surgical prophylaxis; prophylaxis of meningococcal meningitis and *Haemophilus influenzae* type b disease [unlicensed indications] (Table 2, section 5.1)

Cautions see under Cefaclor; may displace bilirubin from serum albumin, administer over 60 minutes in neonates (see also Contra-indications); treatment longer than 14 days, renal failure, dehydration—risk of ceftriaxone precipitation in gall bladder; **interactions:** Appendix 1 (cephalosporins)

Contra-indications see under Cefaclor; neonates less than 41 weeks corrected gestational age; neonates over 41 weeks corrected gestational age with jaundice, hypoalbuminaemia, or acidosis; concomitant treatment with intravenous calcium (including total parenteral nutrition containing calcium) in neonates over 41 weeks corrected gestational age—risk of precipitation in urine and lungs

Hepatic impairment reduce dose and monitor plasma concentration if both hepatic and severe renal impairment

Renal impairment reduce dose if eGFR less than 10 mL/minute/1.73 m^2 (max. 2 g daily); monitor plasma concentration if both hepatic and severe renal impairment

Pregnancy see under Cefaclor

Breast-feeding see under Cefaclor

Side-effects see under Cefaclor; calcium ceftriaxone precipitates in urine (particularly in very young, dehydrated or those who are immobilised) or in gall bladder—consider discontinuation if symptomatic; rarely prolongation of prothrombin time, pancreatitis

Dose

- By deep intramuscular injection, *or* by intravenous injection over at least 2–4 minutes, *or* by intravenous infusion, 1 g daily; 2–4 g daily in severe infections; intramuscular doses over 1 g divided between more than one site; single intravenous doses above 1 g by intravenous infusion only

  NEONATE, by intravenous infusion over 60 minutes, 20–50 mg/kg daily (max. 50 mg/kg daily); INFANT and CHILD under 50 kg, by deep intramuscular injection, *or* by intravenous injection over 2–4 minutes, *or* by intravenous infusion, 20–50 mg/kg daily; up to 80 mg/kg daily in severe infections; doses of 50 mg/kg and over by intravenous infusion only; 50 kg and over, adult dose
- Endocarditis caused by haemophilus, actinobacillus, cardiobacterium, eikenella, and kingella species ('HACEK organisms') (in combination with another antibacterial, see Table 1, section 5.1; [unlicensed indication]), by intravenous infusion, 2–4 g daily
- Early syphilis [unlicensed indication], by deep intramuscular injection, 500 mg daily for 10 days
- Uncomplicated gonorrhoea, pelvic inflammatory disease (see also Table 1, section 5.1), by deep intramuscular injection, 500 mg as a single dose [unlicensed dose]
- Surgical prophylaxis, by deep intramuscular injection *or* by intravenous injection over at least 2–4 minutes, 1 g up to 30 minutes before the procedure; colorectal surgery, by deep intramuscular injection *or* by intravenous infusion, 2 g up to 30 minutes before the procedure; intramuscular doses over 1 g divided between more than one site

Ceftriaxone (Non-proprietary) PoM

Injection, powder for reconstitution, ceftriaxone (as sodium salt), net price 1-g vial = £9.58; 2-g vial = £19.18

Rocephin® (Roche) PoM

Injection, powder for reconstitution, ceftriaxone (as sodium salt), net price 250-mg vial = £2.40; 1-g vial = £9.58; 2-g vial = £19.18

Electrolytes Na^+ 3.6 mmol /g

CEFUROXIME

Indications see under Cefaclor; surgical prophylaxis; more active against *Haemophilus influenzae*; Lyme disease

Cautions see under Cefaclor; **interactions:** Appendix 1 (cephalosporins)

Contra-indications see under Cefaclor

Renal impairment use parenteral dose of 750 mg twice daily if eGFR 10–20 mL/minute/1.73 m^2; use parenteral dose of 750 mg once daily if eGFR less than 10 mL/minute/1.73 m^2

Pregnancy see under Cefaclor

Breast-feeding see under Cefaclor

Side-effects see under Cefaclor

Dose

- By mouth (as cefuroxime axetil), 250 mg twice daily in most infections including mild to moderate lower respiratory-tract infections (e.g. bronchitis); doubled for more severe lower respiratory-tract infections or if pneumonia suspected

Urinary-tract infection, 125 mg twice daily, doubled in pyelonephritis

CHILD over 3 months, 125 mg twice daily, if necessary doubled in child over 2 years with otitis media

Lyme disease (see also section 5.1.1.3), ADULT and CHILD over 12 years, 500 mg twice daily for 14–21 days (for 28 days in Lyme arthritis) [unlicensed duration]

- By intramuscular injection *or* intravenous injection *or* infusion, 750 mg every 6–8 hours; 1.5 g every 6–8 hours in severe infections; single doses over 750 mg intravenous route only

  CHILD usual dose 60 mg/kg daily (range 30–100 mg/kg daily) in 3–4 divided doses (2–3 divided doses in neonates)
- Surgical prophylaxis, 1.5 g by intravenous injection up to 30 minutes before the procedure; up to 3 further doses of 750 mg may be given by intramuscular *or* intravenous injection every 8 hours for high-risk procedures
- Open fractures, prophylaxis (see also Table 2, section 5.1), by intravenous injection *or* infusion, 1.5 g every 8 hours until soft-tissue closure (max. duration 72 hours)

Cefuroxime (Non-proprietary) PoM

Tablets, cefuroxime (as axetil) 250 mg, net price 14-tab pack = £14.72. Label: 9, 21, 25

Injection, powder for reconstitution, cefuroxime (as sodium salt), net price 750-mg vial =£2.52; 1.5-g vial = £5.05

Zinacef® (GSK) PoM

Injection, powder for reconstitution, cefuroxime (as sodium salt). Net price 250-mg vial = 94p; 750-mg vial = £2.34; 1.5-g vial = £4.70

Electrolytes Na^+ 1.8 mmol/750-mg vial

Zinnat® (GSK) PoM

Tablets, both f/c, cefuroxime (as axetil) 125 mg, net price 14-tab pack = £4.56; 250 mg, 14-tab pack = £9.11. Label: 9, 21, 25

Suspension, cefuroxime (as axetil) 125 mg/5 mL when reconstituted with water, net price 70 mL (tutti-frutti-flavoured) = £5.20. Label: 9, 21

Excipients include aspartame (section 9.4.1), sucrose 3.1 g/5 mL

5.1.2.2 Carbapenems

The carbapenems are beta-lactam antibacterials with a broad-spectrum of activity which includes many Gram-positive and Gram-negative bacteria, and anaerobes; **imipenem** and **meropenem** have good activity against *Pseudomonas aeruginosa*. The carbapenems are not active against meticillin-resistant *Staphylococcus aureus* and *Enterococcus faecium*.

Imipenem and meropenem are used for the treatment of severe hospital-acquired infections and polymicrobial infections including septicaemia, hospital-acquired pneumonia, intra-abdominal infections, skin and soft-tissue infections, and complicated urinary-tract infections.

Ertapenem is licensed for treating abdominal and gynaecological infections and for community-acquired pneumonia, but it is not active against atypical respiratory pathogens and it has limited activity against penicillin-resistant pneumococci. It is also licensed for treating foot infections of the skin and soft tissue in patients with diabetes. Unlike the other carbapenems, ertapenem is not active against *Pseudomonas* or against *Acinetobacter* spp.

Imipenem is partially inactivated in the kidney by enzymatic activity and is therefore administered in combination with **cilastatin**, a specific enzyme inhibitor, which blocks its renal metabolism. Meropenem and ertapenem are stable to the renal enzyme which inactivates imipenem and therefore can be given without cilastatin.

Side-effects of imipenem with cilastatin are similar to those of other beta-lactam antibiotics; neurotoxicity has been observed at very high dosage, in renal failure, or in patients with CNS disease. Ertapenem has been associated with seizures uncommonly. Meropenem has less seizure-inducing potential and can be used to treat central nervous system infection.

ERTAPENEM

Indications abdominal infections; acute gynaecological infections; community-acquired pneumonia; diabetic foot infections of the skin and soft-tissue; prophylaxis for colorectal surgery

Cautions sensitivity to beta-lactam antibacterials (avoid if history of immediate hypersensitivity reaction, see also p. 360); elderly, CNS disorders—risk of seizures; **interactions:** Appendix 1 (ertapenem)

Renal impairment risk of seizures; max. 500 mg daily if eGFR less than 30 mL/minute/1.73 m^2

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk

Breast-feeding present in milk—manufacturer advises avoid

Side-effects diarrhoea, nausea, vomiting, headache, injection-site reactions, rash (also reported with eosinophilia and systemic symptoms), pruritus, raised platelet count; *less commonly* dry mouth, taste disturbances, dyspepsia, abdominal pain, anorexia, constipation, melaena, antibiotic-associated colitis, bradycardia, hypotension, chest pain, oedema, pharyngeal discomfort, dyspnoea, dizziness, sleep disturbances, confusion, asthenia, seizures, raised glucose, petechiae; *rarely* dysphagia, cholecystitis, liver disorder (including jaundice), arrhythmia, increase in blood pressure, syncope, nasal congestion, cough, wheezing, anxiety, depression, agitation, tremor, pelvic peritonitis, renal impairment, muscle cramp, scleral disorder, blood disorders (including neutropenia, thrombocytopenia, haemorrhage), hypoglycaemia, electrolyte disturbances; also reported hallucinations, dyskinesia

Dose

- By intravenous infusion, ADULT and ADOLESCENT over 13 years, 1 g once daily; CHILD 3 months–13 years, 15 mg/kg every 12 hours (max. 1 g daily)

  Surgical prophylaxis, colorectal surgery, ADULT over 18 years, 1 g completed within 1 hour before surgery

Invanz® (MSD) PoM

Intravenous infusion, powder for reconstitution, ertapenem (as sodium salt), net price 1-g vial = £31.65

Electrolytes Na^+ 6 mmol/1-g vial

IMIPENEM WITH CILASTATIN

Indications aerobic and anaerobic Gram-positive and Gram-negative infections; hospital-acquired septicaemia (Table 1, section 5.1); not indicated for CNS infections

Cautions sensitivity to beta-lactam antibacterials (avoid if history of immediate hypersensitivity reaction, see also p. 360); CNS disorders (e.g. epilepsy); **interactions:** Appendix 1 (imipenem with cilastatin)

Renal impairment risk of CNS side-effects; reduce dose if eGFR less than 70 mL/minute/1.73 m^2—consult product literature

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk (toxicity in *animal* studies)

Breast-feeding present in milk but unlikely to be absorbed

Side-effects nausea (may reduce rate of infusion), vomiting, diarrhoea (rarely antibiotic-associated colitis), eosinophilia, rash (rarely toxic epidermal necrolysis and Stevens-Johnson syndrome); *less commonly* hypotension, seizures, myoclonic activity, dizziness, drowsiness, hallucinations, confusion, leucopenia, thrombocytopenia, thrombocytosis, positive Coombs' test; *rarely* taste disturbances, hepatitis, encephalopathy, anaphylactic reactions, paraesthesia, tremor, acute renal failure, polyuria, tooth, tongue or urine discoloration, hearing loss; *very rarely*, abdominal pain, heartburn, glossitis, tachycardia, palpitation, flushing, cyanosis, dyspnoea, hyperventilation, headache, asthenia, haemolytic anaemia, aggravation of myasthenia gravis, polyarthralgia, tinnitus, hypersalivation, hyperhidrosis

Dose

- By intravenous infusion, in terms of imipenem, 500 mg every 6 hours *or* 1 g every 8 hours; infection caused by *Pseudomonas* or other less sensitive organisms, life-threatening infection, or empirical treatment of infection in febrile patients with neutropenia, 1 g every 6 hours; CHILD under 1 year see *BNF for Children*; 1 year and older, 15 mg/kg (max. 500 mg) every 6 hours; infection caused by *Pseudomonas* or other less sensitive organisms, life-threatening infection, or empirical treatment of infection in febrile patients with neutropenia, 25 mg/kg (max. 1 g) every 6 hours

Imipenem with cilastatin (Non-proprietary) PoM
Intravenous infusion, powder for reconstitution, imipenem (as monohydrate) 500 mg with cilastatin (as sodium salt) 500 mg, net price per vial = £12.00

Primaxin® (MSD) PoM
Intravenous infusion, powder for reconstitution, imipenem (as monohydrate) 500 mg with cilastatin (as sodium salt) 500 mg, net price per vial = £12.00
Electrolytes Na^+ 1.6 mmol/vial

MEROPENEM

Indications aerobic and anaerobic Gram-positive and Gram-negative infections (see notes above); hospital-acquired septicaemia (Table 1, section 5.1)

Cautions sensitivity to beta-lactam antibacterials (avoid if history of immediate hypersensitivity reaction, see also p. 360); **interactions:** Appendix 1 (meropenem)

Hepatic impairment monitor liver function

Renal impairment use normal dose every 12 hours if eGFR 26–50 mL/minute/1.73 m^2; use half normal dose every 12 hours if eGFR 10–25 mL/minute/1.73 m^2; use half normal dose every 24 hours if eGFR less than 10 mL/minute/1.73 m^2

Pregnancy use only if potential benefit outweighs risk—no information available

Breast-feeding unlikely to be absorbed (however, manufacturer advises avoid)

Side-effects nausea, vomiting, diarrhoea (antibiotic-associated colitis reported), abdominal pain, disturbances in liver function tests, headache, thrombocythaemia, rash, pruritus; *less commonly* paraesthesia, eosinophilia, thrombocytopenia, leucopenia; *rarely* convulsions; also reported haemolytic anaemia, positive Coombs' test, Stevens-Johnson syndrome, toxic epidermal necrolysis

Dose

- By intravenous injection over 5 minutes *or* by intravenous infusion, 0.5–1 g every 8 hours; CHILD 3 months–12 years 10–20 mg/kg every 8 hours, bodyweight over 50 kg, adult dose

  Exacerbations of chronic lower respiratory-tract infection in cystic fibrosis, meningitis, 2 g every 8 hours; CHILD 3 months–12 years 40 mg/kg every 8 hours, body-weight over 50 kg, adult dose

  Endocarditis (in combination with another antibacterial [unlicensed], see Table 1, section 5.1), ADULT over 18 years, 2 g every 8 hours

Meropenem (Non-proprietary) PoM
Injection, powder for reconstitution, meropenem (as trihydrate), net price 500-mg vial = £8.00; 1-g vial = £16.00

Meronem® (AstraZeneca) PoM
Injection, powder for reconstitution, meropenem (as trihydrate), net price 500-mg vial = £10.31; 1-g vial = £20.63
Electrolytes Na^+ 3.9 mmol/g

5.1.2.3 Other beta-lactam antibiotics

Aztreonam is a monocyclic beta-lactam ('monobactam') antibiotic with an antibacterial spectrum limited to Gram-negative aerobic bacteria including *Pseudomonas aeruginosa*, *Neisseria meningitidis*, and *Haemophilus influenzae*; it should not be used alone for 'blind' treatment since it is not active against Gram-positive organisms. Aztreonam is also effective against *Neisseria gonorrhoeae* (but not against concurrent chlamydial infection). Side-effects are similar to those of the other beta-lactams although aztreonam may be less likely to cause hypersensitivity in penicillin-sensitive patients.

Aztreonam may be administered by nebuliser for the treatment of chronic *Ps. aeruginosa* infection in cystic fibrosis. The *Scottish Medicines Consortium* (p. 4) has advised (January 2012) that aztreonam powder for nebuliser solution (*Cayston®*) is **not** recommended for use within NHS Scotland.

AZTREONAM

Indications Gram-negative infections including *Pseudomonas aeruginosa*, *Haemophilus influenzae*, and *Neisseria meningitidis*

Cautions hypersensitivity to beta-lactam antibiotics; **interactions:** Appendix 1 (aztreonam)

Specific cautions for inhaled treatment Other inhaled drugs should be administered before aztreonam; a bronchodilator should be administered before each dose. Measure lung function before and after initial dose of aztreonam and monitor for bronchospasm. Haemoptysis—risk of further haemorrhage

Contra-indications aztreonam hypersensitivity

Hepatic impairment use injection with caution and monitor liver function

Renal impairment if eGFR 10–30 mL/minute/1.73 m^2, usual initial dose of injection, then half normal dose; if eGFR less than 10 mL/minute/1.73 m^2, usual initial dose of injection, then one-quarter normal dose

Pregnancy no information available; manufacturer of injection advises avoid; manufacturer of powder for nebuliser solution advises avoid unless essential

Breast-feeding amount in milk probably too small to be harmful

Side-effects

Specific side-effects for parenteral treatment *Rarely* gastro-intestinal bleeding, antibiotic-associated colitis, jaundice, hepatitis, hypotension, chest pain, dyspnoea, seizures, paraesthesia, confusion, dizziness, asthenia, headache, insomnia, breast tenderness, blood disorders (including thrombocytopenia and neutropenia), myalgia, diplopia, tinnitus, halitosis; also reported nausea, vomiting, abdominal pain, diarrhoea, mouth ulcers, taste disturbances, flushing, bronchospasm, rash (including toxic epidermal necrolysis and erythema multiforme)

Specific side-effects for inhaled treatment Wheezing, bronchospasm, cough, haemoptysis, pyrexia, arthralgia, rash, rhinorrhoea, pharyngolaryngeal pain

Dose

- By deep intramuscular injection *or* by intravenous injection over 3–5 minutes *or* by intravenous infusion, 1 g every 8 hours *or* 2 g every 12 hours; 2 g every 6–8 hours for severe infections (including systemic *Pseudomonas aeruginosa* and lung infections in cystic fibrosis); single doses over 1 g intravenous route only

  Urinary-tract infections, 0.5–1 g every 8–12 hours
- CHILD over 1 week, by intravenous injection *or* infusion, 30 mg/kg every 6–8 hours increased in severe infections for child of 2 years or older to 50 mg/kg every 6–8 hours; max. 8 g daily
- Gonorrhoea, cystitis, by intramuscular injection, 1 g as a single dose
- Chronic pulmonary *Pseudomonas aeruginosa* infection in patients with cystic fibrosis, by inhalation of nebulised solution, ADULT and CHILD over 6 years, 75 mg 3 times daily (at least 4 hours apart) for 28 days, subsequent courses repeated after 28-day interval without aztreonam nebuliser solution

Parenteral

Azactam® (Squibb) PoM

Injection, powder for reconstitution, aztreonam, net price 1-g vial = £9.40; 2-g vial = £18.82

Inhalation

Cayston® (Gilead) PoM

Powder for nebuliser solution, aztreonam (as lysine), net price 84 × 75 mg vials (with solvent and nebuliser handset) = £2181.53

5.1.3 Tetracyclines

The tetracyclines are broad-spectrum antibiotics whose value has decreased owing to increasing bacterial resistance. They remain, however, the treatment of choice for infections caused by chlamydia (trachoma, psittacosis, salpingitis, urethritis, and lymphogranuloma venereum), rickettsia (including Q-fever), brucella (doxycycline with either streptomycin or rifampicin), and the spirochaete, *Borrelia burgdorferi* (Lyme disease—see section 5.1.1.3). They are also used in respiratory and genital mycoplasma infections, in acne, in destructive (refractory) periodontal disease, in exacerbations of chronic bronchitis (because of their activity against *Haemophilus influenzae*), and for leptospirosis in penicillin hypersensitivity (as an alternative to erythromycin).

For the role of tetracyclines in the management of meticillin-resistant *Staphylococcus aureus* (MRSA) infection, see p. 362.

Microbiologically, there is little to choose between the various tetracyclines, the only exception being **minocycline** which has a broader spectrum; it is active against *Neisseria meningitidis* and has been used for meningococcal prophylaxis but is no longer recommended because of side-effects including dizziness and vertigo (see section 5.1, table 2 for current recommendations). Compared to other tetracyclines, minocycline is associated with a greater risk of lupus-erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation.

Oral infections In adults, tetracyclines can be effective against oral anaerobes but the development of resistance (especially by oral streptococci) has reduced their usefulness for the treatment of acute oral infections; they may still have a role in the treatment of destructive (refractory) forms of periodontal disease. Doxycycline has a longer duration of action than tetracycline or oxytetracycline and need only be given once daily; it is reported to be more active against anaerobes than some other tetracyclines.

For the use of doxycycline in the treatment of recurrent aphthous ulceration, or as an adjunct to gingival scaling and root planing for periodontitis, see section 12.3.1.

Cautions Tetracyclines may increase muscle weakness in patients with myasthenia gravis, and exacerbate systemic lupus erythematosus. Antacids, and aluminium, calcium, iron, magnesium and zinc salts decrease the absorption of tetracyclines; milk also reduces the absorption of demeclocycline, oxytetracycline, and tetracycline. Other **interactions:** Appendix 1 (tetracyclines).

Contra-indications Deposition of tetracyclines in growing bone and teeth (by binding to calcium) causes staining and occasionally dental hypoplasia, and they should **not** be given to children under 12 years, or to pregnant or breast-feeding women. However, doxycycline may be used in children for treatment and post-exposure prophylaxis of anthrax when an alternative antibacterial cannot be given [unlicensed indication].

Hepatic impairment Tetracyclines should be avoided or used with caution in patients with hepatic impairment. Tetracyclines should also be used with caution in those receiving potentially hepatotoxic drugs.

Renal impairment With the exception of **doxycycline** and **minocycline**, the tetracyclines may exacerbate renal failure and should **not** be given to patients with renal impairment.

Pregnancy Tetracyclines should **not** be given to pregnant women. Effects on skeletal development have been documented when tetracyclines have been used in the first trimester in *animal* studies. Administration during the second or third trimester may cause discoloration of the child's teeth, and maternal hepatotoxicity has been reported with large parenteral doses. However, when travel to malarious areas is unavoidable during pregnancy, doxycycline can be used for malaria prophylaxis if other regimens are unsuitable (section

5.4.1), and if the entire course of doxycycline can be completed before 15 weeks' gestation [unlicensed].

Breast-feeding Tetracyclines should **not** be given to women who are breast-feeding (although absorption and therefore discoloration of teeth in the infant is probably usually prevented by chelation with calcium in milk).

Side-effects Side-effects of the tetracyclines include nausea, vomiting, diarrhoea (antibiotic-associated colitis reported occasionally), dysphagia, and oesophageal irritation. Other rare side-effects include hepatotoxicity, pancreatitis, blood disorders, photosensitivity (particularly with demeclocycline), and hypersensitivity reactions (including rash, exfoliative dermatitis, Stevens-Johnson syndrome, urticaria, angioedema, anaphylaxis, pericarditis). Headache and visual disturbances may indicate benign intracranial hypertension (discontinue treatment); bulging fontanelles have been reported in infants.

TETRACYCLINE

Indications see notes above; acne vulgaris, rosacea (section 13.6)

Cautions see notes above

Contra-indications see notes above

Hepatic impairment see notes above; max. 1 g daily in divided doses

Renal impairment see notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above; also acute renal failure, skin discoloration

Dose

- 250 mg every 6 hours, increased in severe infections to 500 mg every 6–8 hours
- Acne, see section 13.6.2
- Non-gonococcal urethritis, 500 mg every 6 hours for 7–14 days (21 days if failure or relapse after first course)

Counselling Tablets should be swallowed whole with plenty of fluid while sitting or standing

Tetracycline (Non-proprietary) PoM

Tablets, coated, tetracycline hydrochloride 250 mg, net price 28-tab pack = £2.73. Label: 7, 9, 23, counselling, posture

Dental prescribing on NHS Tetracycline Tablets may be prescribed

DEMECLOCYCLINE HYDROCHLORIDE

Indications see notes above; also inappropriate secretion of antidiuretic hormone, section 6.5.2

Cautions see notes above, but photosensitivity more common (avoid exposure to sunlight or sun lamps)

Contra-indications see notes above

Hepatic impairment see notes above; max. 1 g daily in divided doses

Renal impairment see notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above; also reversible nephrogenic diabetes insipidus, acute renal failure

Dose

- 150 mg every 6 hours *or* 300 mg every 12 hours

Demeclocycline hydrochloride (Non-proprietary) PoM

Capsules, demeclocycline hydrochloride 150 mg, net price 28-cap pack = £81.49. Label: 7, 9, 11, 23

DOXYCYCLINE

Indications see notes above; chronic prostatitis; sinusitis, syphilis, pelvic inflammatory disease (Table 1, section 5.1); treatment and prophylaxis of anthrax [unlicensed indication]; malaria treatment and prophylaxis (section 5.4.1); recurrent aphthous ulceration, adjunct to gingival scaling and root planing for periodontitis (section 12.3.1); rosacea, acne vulgaris (section 13.6)

Cautions see notes above; alcohol dependence; photosensitivity reported (avoid exposure to sunlight or sun lamps)

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment use with caution (avoid excessive doses)

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above; also anorexia, dry mouth, flushing, anxiety, and tinnitus

Dose

- 200 mg on first day, then 100 mg daily; severe infections (including refractory urinary-tract infections), 200 mg daily
- Early syphilis, 100 mg twice daily for 14 days; late latent syphilis, 100 mg twice daily for 28 days; neurosyphilis, 200 mg twice daily for 28 days
- Uncomplicated genital chlamydia, non-gonococcal urethritis, 100 mg twice daily for 7 days (14 days in pelvic inflammatory disease, see also Table 1, section 5.1)
- Lyme disease (see also section 5.1.1.3), 100 mg twice daily for 10–14 days (28 days in Lyme arthritis)
- Anthrax (treatment or post-exposure prophylaxis; see also section 5.1.12), 100 mg twice daily; CHILD (only if alternative antibacterial cannot be given) [unlicensed dose] 5 mg/kg daily in 2 divided doses (max. 200 mg daily)

Counselling Capsules should be swallowed whole with plenty of fluid during meals while sitting or standing

Note Doxycycline doses in BNF may differ from those in product literature

Doxycycline (Non-proprietary) PoM

Capsules, doxycycline (as hyclate) 50 mg, net price 28-cap pack = £1.50; 100 mg, 8-cap pack = £1.05. Label: 6, 9, 11, 27, counselling, posture

Brands include *Doxylar*®

Dental prescribing on NHS Doxycycline Capsules 100 mg may be prescribed

Vibramycin-D® (Pfizer) PoM

Dispersible tablets, yellow, scored, doxycycline 100 mg, net price 8-tab pack = £4.91. Label: 6, 9, 11, 13

Dental prescribing on NHS May be prescribed as Dispersible Doxycycline Tablets

Modified-release

Efracea® (Galderma) PoM

Capsules, m/r, beige, doxycycline (as monohydrate) 40 mg, net price 56-cap pack = £29.78. Label: 6, 11, 27, counselling, posture

Dose papulopustular, facial rosacea (without ocular involvement), 40 mg daily in the morning for 16 weeks; consider discontinuing treatment if no response after 6 weeks

LYMECYCLINE

Indications see notes above
Cautions see notes above
Contra-indications see notes above
Hepatic impairment see notes above
Renal impairment see notes above
Pregnancy see notes above
Breast-feeding see notes above
Side-effects see notes above
Dose
- 408 mg every 12 hours, increased to 1.224–1.632 g daily in severe infections
- Acne, 408 mg daily for at least 8 weeks

Lymecycline (Non-proprietary) PoM
Capsules, lymecycline 408 mg (= tetracycline 300 mg), net price 28-cap pack = £5.71. Label: 6, 9

Tetralysal 300® (Galderma) PoM
Capsules, red/yellow, lymecycline 408 mg (= tetracycline 300 mg), net price 28-cap pack = £4.98, 56-cap pack = £9.58. Label: 6, 9

MINOCYCLINE

Indications see notes above; meningococcal carrier state; acne vulgaris (section 13.6.2)
Cautions see notes above; if treatment continued for longer than 6 months, monitor every 3 months for hepatotoxicity, pigmentation and for systemic lupus erythematosus—discontinue if these develop or if pre-existing systemic lupus erythematosus worsens
Contra-indications see notes above
Hepatic impairment see notes above
Renal impairment use with caution (avoid excessive doses)
Pregnancy see notes above
Breast-feeding see notes above
Side-effects see notes above; also dizziness and vertigo (more common in women); *rarely* anorexia, tinnitus, impaired hearing, hyperaesthesia, paraesthesia, acute renal failure, pigmentation (sometimes irreversible), and alopecia; *very rarely* systemic lupus erythematosus, discoloration of conjunctiva, tears, and sweat
Dose
- 100 mg twice daily
- Acne, see section 13.6.2 and under preparations, below
- Prophylaxis of asymptomatic meningococcal carrier state (but no longer recommended, see notes above), 100 mg twice daily for 5 days usually followed by rifampicin

Counselling Tablets or capsules should be swallowed whole with plenty of fluid while sitting or standing

Minocycline (Non-proprietary) PoM
Capsules, minocycline (as hydrochloride) 50 mg, net price 56-cap pack = £15.27; 100 mg, 28-cap pack = £13.09. Label: 6, 9, counselling, posture
Brands include *Aknemin®*
Tablets, minocycline (as hydrochloride) 50 mg, net price 28-tab pack = £5.63, 100 mg, 28-tab pack = £11.65. Label: 6, 9, counselling, posture

Modified release

Minocycline m/r preparations PoM
Capsules, m/r, minocycline (as hydrochloride) 100 mg, net price 56-cap pack = £20.08. Label: 6, 25
Brands include *Acnamino®* MR, *Minocin MR®*, *Sebomin MR®*
Dose acne, 100 mg daily

OXYTETRACYCLINE

Indications see notes above; acne vulgaris, rosacea (section 13.6)
Cautions see notes above
Contra-indications see notes above
Hepatic impairment see notes above
Renal impairment see notes above
Pregnancy see notes above
Breast-feeding see notes above
Side-effects see notes above
Dose
- 250–500 mg every 6 hours
- Acne, see section 13.6.2

Oxytetracycline (Non-proprietary) PoM
Tablets, coated, oxytetracycline dihydrate 250 mg, net price 28-tab pack = £1.10. Label: 7, 9, 23
Brands include *Oxymycin®*
Dental prescribing on NHS Oxtetracycline Tablets may be prescribed

Tigecycline

Tigecycline is a glycylcycline antibacterial structurally related to the tetracyclines; side-effects similar to those of the tetracyclines can potentially occur. Tigecycline is active against Gram-positive and Gram-negative bacteria, including tetracycline-resistant organisms, and some anaerobes. It is also active against meticillin-resistant *Staphylococcus aureus* and vancomycin-resistant enterococci, but *Pseudomonas aeruginosa* and many strains of *Proteus spp* are resistant to tigecycline. Tigecycline should be reserved for the treatment of complicated skin and soft-tissue infections and complicated abdominal infections caused by multiple-antibacterial resistant organisms when other antibacterials cannot be used; it is not recommended for the treatment of foot infections in patients with diabetes.

TIGECYCLINE

Indications see notes above
Cautions cholestasis; **interactions:** Appendix 1 (tigecycline)
Contra-indications hypersensitivity to tetracyclines
Hepatic impairment initially 100 mg then 25 mg every 12 hours in severe impairment
Pregnancy see under Tetracyclines, p. 374
Breast-feeding manufacturer advises caution—present in milk in *animal* studies
Side-effects see notes above; also nausea, vomiting, abdominal pain, dyspepsia, diarrhoea, anorexia, bilirubinaemia, dizziness, headache, hypoglycaemia, prolonged prothrombin time, prolonged activated partial thromboplastin time, rash, pruritus, and injec-

tion-site reactions; *less commonly* pancreatitis, cholestatic jaundice, and hypoproteinaemia; also reported, antibiotic-associated colitis, hepatic failure, thrombocytopenia, Stevens-Johnson syndrome

Dose

- By intravenous infusion, ADULT over 18 years, initially 100 mg, then 50 mg every 12 hours for 5–14 days

Tygacil® (Pfizer) ▼ PoM

Intravenous infusion, powder for reconstitution, tigecycline, net price 50-mg vial = £32.31

5.1.4 Aminoglycosides

These include amikacin, gentamicin, neomycin, streptomycin, and tobramycin. All are bactericidal and active against some Gram-positive and many Gram-negative organisms. Amikacin, gentamicin, and tobramycin are also active against *Pseudomonas aeruginosa*; streptomycin is active against *Mycobacterium tuberculosis* and is now almost entirely reserved for tuberculosis (section 5.1.9).

The aminoglycosides are not absorbed from the gut (although there is a risk of absorption in inflammatory bowel disease and liver failure) and must therefore be given by injection for systemic infections.

The important side-effects of aminoglycosides are ototoxicity and nephrotoxicity; they occur most commonly in the elderly and in patients with renal failure.

Gentamicin is the aminoglycoside of choice in the UK and is used widely for the treatment of serious infections. It has a broad spectrum but is inactive against anaerobes and has poor activity against haemolytic streptococci and pneumococci. When used for the 'blind' therapy of undiagnosed serious infections it is usually given in conjunction with a penicillin or metronidazole (or both). Gentamicin is used together with another antibiotic for the treatment of endocarditis (see below and Table 1, section 5.1).

Loading and maintenance doses of gentamicin may be calculated on the basis of the patient's weight and renal function (e.g. using a nomogram); adjustments are then made according to serum-gentamicin concentrations. High doses are occasionally indicated for serious infections, especially in the neonate, in the patient with cystic fibrosis, or in the immunocompromised patient. Whenever possible treatment should not exceed 7 days.

Amikacin is more stable than gentamicin to enzyme inactivation. Amikacin is used in the treatment of serious infections caused by gentamicin-resistant Gram-negative bacilli.

Tobramycin has similar activity to gentamicin. It is slightly more active against *Ps. aeruginosa* but shows less activity against certain other Gram-negative bacteria. Tobramycin can be administered by nebuliser or by inhalation of powder on a cyclical basis (28 days of tobramycin followed by a 28–day tobramycin-free interval) for the treatment of chronic pulmonary *Ps. aeruginosa* infection in cystic fibrosis; however, resistance may develop and some patients do not respond to treatment.

NICE guidance

Tobramycin by dry powder inhalation for pseudomonal lung infection in cystic fibrosis (March 2013)

Tobramycin dry powder for inhalation is recommended for chronic pulmonary infection caused by *Pseudomonas aeruginosa* in patients with cystic fibrosis only if there is an inadequate response to colistimethate sodium, or if colistimethate sodium cannot be used because of contra-indications or intolerance. The manufacturer must provide tobramycin dry powder for inhalation at the discount agreed as part of the patient access scheme to primary, secondary and tertiary care in the NHS.

Patients currently receiving tobramycin dry powder for inhalation can continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA276

Neomycin is too toxic for parenteral administration and can only be used for infections of the skin or mucous membranes or to reduce the bacterial population of the colon prior to bowel surgery or in hepatic failure. Oral administration may lead to malabsorption. Small amounts of neomycin may be absorbed from the gut in patients with hepatic failure and, as these patients may also be uraemic, cumulation may occur with resultant ototoxicity.

Endocarditis **Gentamicin** is used in combination with other antibiotics for the treatment of bacterial endocarditis (Table 1, section 5.1). Serum-gentamicin concentration should be measured after 3 or 4 doses, then at least every 3 days and after a dose change (more frequently in renal impairment). **Streptomycin** may be used as an alternative in gentamicin-resistant enterococcal endocarditis.

Once daily dosage *Once daily administration* of aminoglycosides is more convenient, provides adequate serum concentrations, and in many cases has largely superseded *multiple daily dose regimens* (given in 2–3 divided doses during the 24 hours). Local guidelines on dosage and serum concentrations should be consulted. A once-daily, high-dose regimen of an aminoglycoside should be avoided in patients with endocarditis due to Gram-positive bacteria, HACEK endocarditis, burns of more than 20% of the total body surface area, or creatinine clearance less than 20 mL/minute. There is insufficient evidence to recommend a once daily, high-dose regimen of an aminoglycoside in pregnancy.

Serum concentrations Serum concentration monitoring avoids both excessive and subtherapeutic concentrations thus preventing toxicity and ensuring efficacy. Serum-aminoglycoside concentrations should be measured in all patients receiving parenteral aminoglycosides, and **must** be determined in the elderly, in obesity, and in cystic fibrosis, *or* if high doses are being given, *or* if there is renal impairment.

In patients with normal renal function, aminoglycoside concentrations should be measured after 3 or 4 doses of a multiple daily dose regimen and after a dose change; patients with renal impairment may require earlier and more frequent measurement of aminoglycoside concentration.

For multiple daily dose regimens, blood samples should be taken approximately 1 hour after intramuscular or

intravenous administration ('peak' concentration) and also just before the next dose ('trough' concentration). If the pre-dose ('trough') concentration is high, the interval between doses must be increased. If the post-dose ('peak') concentration is high, the dose must be decreased. For once daily dose regimens, consult local guidelines on serum concentration monitoring.

Cautions The main side-effects of the aminoglycosides are dose-related, therefore, care must be taken with dosage, and, whenever possible, parenteral treatment should not exceed 7 days. Renal function should be assessed before starting an aminoglycoside and during treatment. If possible, dehydration should be corrected before starting an aminoglycoside. Auditory and vestibular function should also be monitored during treatment. In order to optimise the dose and avoid toxicity, serum-aminoglycoside concentrations should be monitored in patients receiving parenteral aminoglycosides (see also Serum Concentrations). Ototoxicity and nephrotoxicity occur most commonly in the elderly; therefore, monitoring is particularly important in these patients, who may require reduced doses.

Aminoglycosides should be used with caution in those with conditions characterised by muscular weakness (avoid in myasthenia gravis). If possible, aminoglycosides should not be given with potentially ototoxic drugs (e.g. cisplatin). Administration of an aminoglycoside and of an ototoxic diuretic (e.g. furosemide) should be separated by as long a period as practicable. **Interactions**: Appendix 1 (aminoglycosides)

Contra-indications Aminoglycosides may impair neuromuscular transmission and should not be given to patients with myasthenia gravis

Renal impairment Excretion of aminoglycosides is principally via the kidney and accumulation occurs in renal impairment. Ototoxicity and nephrotoxicity occur commonly in patients with renal failure. If there is impairment of renal function, the interval between doses must be increased; if the renal impairment is severe, the dose itself should be reduced as well. Serum-aminoglycoside concentrations **must** be monitored in patients with renal impairment, see Serum Concentrations above; renal, auditory, and vestibular function should also be monitored. A once-daily, high-dose regimen of an aminoglycoside should be avoided in patients with a creatinine clearance less than 20 mL/minute.

Pregnancy There is a risk of auditory or vestibular nerve damage in the infant when aminoglycosides are used in the second and third trimesters of pregnancy. The risk is greatest with streptomycin (section 5.1.9). The risk is probably very small with gentamicin and tobramycin, but their use should be avoided unless essential (if given, serum-aminoglycoside concentration monitoring is essential).

Side-effects The important side-effects of the aminoglycosides are nephrotoxicity and irreversible ototoxicity (including vestibular and auditory damage). Rash occurs commonly with streptomycin, but less frequently with the other aminoglycosides. Rare side-effects include nausea, vomiting, antibiotic-associated colitis, peripheral neuropathy, electrolyte disturbances (notably hypomagnesaemia on prolonged therapy, but also hypocalcaemia and hypokalaemia), and stomatitis. Side-effects reported very rarely include blood disorders and CNS effects (including headache, encephalopathy, and convulsions). Aminoglycosides may impair neuromuscular transmission; large doses given during surgery have been responsible for a transient myasthenic syndrome in patients with normal neuromuscular function.

GENTAMICIN

Indications septicaemia and neonatal sepsis; meningitis and other CNS infections; biliary-tract infection, acute pyelonephritis or prostatitis, endocarditis (see notes above); pneumonia in hospital patients, adjunct in listerial meningitis (Table 1, section 5.1); eye (section 11.3.1); ear (section 12.1.1)

Cautions see notes above; **interactions:** Appendix 1 (aminoglycosides)

Contra-indications see notes above

Renal impairment see notes above

Pregnancy see notes above

Side-effects see notes above

Dose

To avoid excessive dosage in obese patients, use ideal weight for height to calculate dose and monitor serum-gentamicin concentration closely

- Multiple daily dose regimen, by intramuscular *or* by slow intravenous injection over at least 3 minutes *or* by intravenous infusion, 3–5 mg/kg daily (in divided doses every 8 hours), see also notes above; CHILD under 18 years see *BNF for Children*

  Gram-positive bacterial endocarditis or HACEK endocarditis (in combination with other antibacterials, see Table 1, section 5.1), ADULT 1 mg/kg every 12 hours; CHILD under 18 years see *BNF for Children*
- Once daily dose regimen (see notes above and also consult local guidelines), by intravenous infusion, initially 5–7 mg/kg, then adjust according to serum-gentamicin concentration; CHILD under 18 years see *BNF for Children*
- Surgical prophylaxis, ADULT over 18 years, by slow intravenous injection over at least 3 minutes, 1.5 mg/kg up to 30 minutes before the procedure (up to 3 further doses of 1.5 mg/kg may be given every 8 hours for high-risk procedures) *or* (for joint replacement surgery) by intravenous infusion, 5 mg/kg as a single dose up to 30 minutes before the procedure
- By intrathecal injection, seek specialist advice, 1 mg daily (increased if necessary to 5 mg daily); only preservative-free, intrathecal preparation should be used; CHILD under 18 years see *BNF for Children*

Note For multiple daily dose regimen, one-hour ('peak') serum concentration should be 5–10 mg/litre (3–5 mg/litre for endocarditis); pre-dose ('trough') concentration should be less than 2 mg/litre (less than 1 mg/litre for endocarditis). For once-daily dose regimen, consult local guidelines on monitoring serum-gentamicin concentration

Gentamicin (Non-proprietary) PoM

Injection, gentamicin (as sulfate), net price 40 mg/mL, 1-mL amp = £1.40, 2-mL amp = £1.00, 2-mL vial = £4.00

Paediatric injection, gentamicin (as sulfate) 10 mg/mL, net price 2-mL vial = £2.25

Intrathecal injection, gentamicin (as sulfate) 5 mg/mL, net price 1-mL amp = 74p

Intravenous infusion, gentamicin (as sulfate) 1 mg/mL in sodium chloride intravenous infusion 0.9%, net price 80-mL (80 mg) bottle = £1.95; 3 mg/mL, 80-mL (240 mg) bottle = £5.95, 120-mL (360 mg) bottle = £8.45

Cidomycin® (Sanofi-Aventis) PoM
Injection, gentamicin (as sulfate) 40 mg/mL. Net price 2-mL amp or vial = £1.38

Genticin® (AMCo) PoM
Injection, gentamicin (as sulfate) 40 mg/mL. Net price 2-mL amp = £1.00

Isotonic Gentamicin Injection (Baxter) PoM
Intravenous infusion, gentamicin (as sulfate) 800 micrograms/mL in sodium chloride intravenous infusion 0.9%. Net price 100-mL (80-mg) *Viaflex®* bag = £1.61
Electrolytes Na^+ 15.4 mmol/100-mL bag

AMIKACIN

Indications serious Gram-negative infections resistant to gentamicin
Cautions see notes above; **interactions:** Appendix 1 (aminoglycosides)
Contra-indications see notes above
Renal impairment see notes above
Pregnancy see notes above
Side-effects see notes above
Dose

To avoid excessive dosage in obese patients, use ideal weight for height to calculate dose and monitor serum-amikacin concentration closely

- Multiple daily dose regimen, by intramuscular *or* by slow intravenous injection *or* by infusion, 15 mg/kg daily in 2 divided doses, increased to 22.5 mg/kg daily in 3 divided doses in severe infections; max. 1.5 g daily for up to 10 days (max. cumulative dose 15 g); CHILD under 18 years see *BNF for Children*
- Once daily dose regimen (not for endocarditis, febrile neutropenia, or meningitis; see notes above and also consult local guidelines), by intravenous infusion, initially 15 mg/kg (max. 1.5 g), then adjust according to serum-amikacin concentration; max. cumulative dose 15 g; CHILD under 18 years see *BNF for Children*

Note For multiple daily dose regimen, one-hour ('peak') serum concentration should not exceed 30 mg/litre; pre-dose ('trough') concentration should be less than 10 mg/litre. For once daily dose regimen, pre-dose ('trough') concentration should be less than 5 mg/litre

Amikacin (Non-proprietary) PoM
Injection, amikacin (as sulfate) 250 mg/mL. Net price 2-mL vial = £9.64
Electrolytes Na^+ 0.56 mmol/500-mg vial

Amikin® (Bristol-Myers Squibb) PoM
Injection, amikacin (as sulfate) 50 mg/mL. Net price 2-mL vial = £2.07
Electrolytes $Na^+ < 0.5$ mmol/vial

NEOMYCIN SULFATE

Indications bowel sterilisation before surgery, see also notes above
Cautions see notes above, but too toxic for systemic use; **interactions:** Appendix 1 (aminoglycosides)
Contra-indications see notes above; also intestinal obstruction
Hepatic impairment absorbed from gastro-intestinal tract in liver disease—increased risk of ototoxicity
Renal impairment avoid; ototoxic; nephrotoxic
Pregnancy see notes above
Side-effects see notes above, but poorly absorbed on oral administration; increased salivation, impaired intestinal absorption with steatorrhoea and diarrhoea
Dose

- By mouth, pre-operative bowel sterilisation, 1 g every hour for 4 hours, then 1 g every 4 hours for 2–3 days
  Hepatic coma, up to 4 g daily in divided doses usually for 5–7 days

Neomycin (Non-proprietary) PoM
Tablets, neomycin sulfate 500 mg. Net price 100= £24.78
Brands include *Nivemycin®*

TOBRAMYCIN

Indications see under Gentamicin and notes above
Cautions see notes above; **interactions:** Appendix 1 (aminoglycosides)
Specific cautions for inhaled treatment Other inhaled drugs should be administered before tobramycin. Measure lung function before and after initial dose of tobramycin and monitor for bronchospasm; if bronchospasm occurs in a patient not using a bronchodilator, repeat test using bronchodilator. Monitor renal function before treatment and then annually. Severe haemoptysis—risk of further haemorrhage.
Contra-indications see notes above
Renal impairment see notes above
Pregnancy see notes above
Side-effects see notes above; *on inhalation*, cough (more frequent by inhalation of powder), bronchospasm (see Cautions), dysphonia, taste disturbances, pharyngitis, mouth ulcers, salivary hypersecretion, laryngitis, haemoptysis, epistaxis
Dose

To avoid excessive dosage in obese patients, use ideal weight for height to calculate parenteral dose and monitor serum-tobramycin concentration closely

- By intramuscular injection *or* by slow intravenous injection *or* by intravenous infusion, 3 mg/kg daily in divided doses every 8 hours, see also notes above; in severe infections up to 5 mg/kg daily in divided doses every 6–8 hours (reduced to 3 mg/kg as soon as clinically indicated); CHILD under 18 years see *BNF for Children*
- Urinary-tract infection, by intramuscular injection, 2–3 mg/kg daily as a single dose

Note One-hour ('peak') serum concentration should not exceed 10 mg/litre; pre-dose ('trough') concentration should be less than 2 mg/litre

- Chronic pulmonary *Pseudomonas aeruginosa* infection in patients with cystic fibrosis, by inhalation of nebulised solution, ADULT and CHILD over 6 years, 300 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin nebuliser solution
  By inhalation of powder, ADULT and CHILD over 6 years, 112 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin inhalation powder

Parenteral

Tobramycin (Non-proprietary) PoM
Injection, tobramycin (as sulfate) 40 mg/mL, net price 1-mL (40-mg) vial = £3.70, 2-mL (80-mg) vial = £3.77, 6-mL (240-mg) vial = £45.00

Inhalation

Bramitob® (Chiesi) PoM
Nebuliser solution, tobramycin 75 mg/mL, net price 56 × 4-mL (300-mg) unit = £1187.00

Tobi® (Novartis) PoM

Nebuliser solution, tobramycin 60 mg/mL, net price 56 × 5-mL (300-mg) unit = £1187.20

Podhaler (dry powder for inhalation), tobramycin 28 mg/capsule, net price 56-cap pack (with *Tobi® Podhaler* device) = £447.50, 224-cap pack (with 5 *Tobi® Podhaler* devices) = £1790.00. Counselling, administration

5.1.5 Macrolides

The macrolides have an antibacterial spectrum that is similar but not identical to that of penicillin; they are thus an alternative in penicillin-allergic patients. They are active against many-penicillin-resistant staphylococci, but some are now also resistant to the macrolides.

Indications for the macrolides include campylobacter enteritis, respiratory infections (including pneumonia, whooping cough, Legionella, chlamydia, and mycoplasma infection), and skin infections.

Erythromycin is also used in the treatment of early syphilis, uncomplicated genital chlamydial infection, and non-gonococcal urethritis. Erythromycin has poor activity against *Haemophilus influenzae*. Erythromycin causes nausea, vomiting, and diarrhoea in some patients; in mild to moderate infections this can be avoided by giving a lower dose (250 mg 4 times daily), but if a more serious infection, such as Legionella pneumonia, is suspected higher doses are needed.

Azithromycin is a macrolide with slightly less activity than erythromycin against Gram-positive bacteria, but enhanced activity against some Gram-negative organisms including *H. influenzae*. Plasma concentrations are very low, but tissue concentrations are much higher. It has a long tissue half-life and once daily dosage is recommended. Azithromycin is also used in the treatment of uncomplicated genital chlamydial infection, non-gonococcal urethritis, uncomplicated gonorrhoea, typhoid [unlicensed indication], and trachoma [unlicensed indication] (section 11.3.1).

Clarithromycin is an erythromycin derivative with slightly greater activity than the parent compound. Tissue concentrations are higher than with erythromycin. It is given twice daily. Clarithromycin is also used in regimens for *Helicobacter pylori* eradication (section 1.3).

For the role of erythromycin, azithromycin, and clarithromycin in the treatment of Lyme disease, see section 5.1.1.3

Spiramycin is also a macrolide (section 5.4.7).

Oral infections The macrolides are an alternative for oral infections in penicillin-allergic patients or where a beta-lactamase producing organism is involved. However, many organisms are now resistant to macrolides or rapidly develop resistance; their use should therefore be limited to short courses. Metronidazole (section 5.1.11) may be preferred as an alternative to a penicillin.

Cautions Macrolides should be used with caution in patients with a predisposition to QT interval prolongation (including electrolyte disturbances and concomitant use of drugs that prolong the QT interval). Macrolides may aggravate myasthenia gravis. **Interactions**: Appendix 1 (macrolides).

Side-effects Nausea, vomiting, abdominal discomfort, and diarrhoea are the most common side-effects of the macrolides, but they are mild and less frequent with azithromycin and clarithromycin than with erythromycin. Hepatotoxicity (including cholestatic jaundice) and rash occur less frequently. Other side-effects reported rarely or very rarely include pancreatitis, antibiotic-associated colitis, QT interval prolongation, arrhythmias, Stevens-Johnson syndrome, and toxic epidermal necrolysis. Generally reversible hearing loss (sometimes with tinnitus) can occur after large doses of a macrolide; it occurs commonly after long-term therapy with azithromycin. Intravenous infusion may cause local tenderness and phlebitis.

AZITHROMYCIN

Indications respiratory-tract infections; otitis media; skin and soft-tissue infections; uncomplicated gonorrhoea [unlicensed indication], uncomplicated genital chlamydial infections and non-gonococcal urethritis (see also Table 1, section 5.1); mild or moderate typhoid due to multiple-antibacterial-resistant organisms [unlicensed indication]; Lyme disease (see also section 5.1.1.3 [unlicensed indication]); prophylaxis of group A streptococcal infection (Table 2, section 5.1)

Cautions see notes above; **interactions:** Appendix 1 (macrolides)

Hepatic impairment manufacturers advise avoid in severe liver disease—no information available

Renal impairment use with caution if eGFR less than 10 mL/minute/1.73 m^2

Pregnancy manufacturers advise use only if adequate alternatives not available

Breast-feeding present in milk; use only if no suitable alternatives

Side-effects see notes above; also anorexia, dyspepsia, flatulence, dizziness, headache, malaise, paraesthesia, arthralgia, disturbances in taste and vision; *less commonly* constipation, gastritis, chest pain, oedema, anxiety, sleep disturbances, hypoaesthesia, leucopenia, photosensitivity; *rarely* agitation; also reported syncope, convulsions, smell disturbances, interstitial nephritis, acute renal failure, thrombocytopenia, haemolytic anaemia, tongue discoloration

Dose

- 500 mg once daily for 3 days *or* 500 mg on first day then 250 mg once daily for 4 days; CHILD over 6 months 10 mg/kg once daily for 3 days; *or* bodyweight 15–25 kg, 200 mg once daily for 3 days; bodyweight 26–35 kg, 300 mg once daily for 3 days; bodyweight 36–45 kg, 400 mg once daily for 3 days
- Uncomplicated gonorrhoea [unlicensed indication] (see also Table 1, section 5.1), uncomplicated genital chlamydial infections and non-gonococcal urethritis, 1 g as a single dose
- Lyme disease (see also section 5.1.1.3), typhoid [unlicensed indications], 500 mg once daily for 7–10 days (7 days in typhoid)

Azithromycin (Non-proprietary) PoM

Capsules, azithromycin (as dihydrate) 250 mg, net price 4-cap pack = £9.83, 6-cap pack = £14.85. Label: 5, 9, 23

Dental prescribing on NHS Azithromycin Capsules may be prescribed

Tablets, azithromycin (as monohydrate hemi-ethanolate) 250 mg, net price 4-tab pack = £2.17; 500 mg, 3-tab pack = £1.74. Label: 5, 9

Dental prescribing on NHS Azithromycin Tablets may be prescribed

Note Azithromycin tablets can be sold to the public for the treatment of confirmed, asymptomatic *Chlamydia trachomatis* genital infection in those over 16 years of age, and for the epidemiological treatment of their sexual partners, subject to max. single dose of 1 g, max. daily dose 1 g, and a pack size of 1 g

Oral suspension, azithromycin (as monohydrate) 200 mg/5 mL when reconstituted with water, net price 15-mL pack = £4.06, 30-mL pack = £11.04. Label: 5, 9

Dental prescribing on NHS Azithromycin Oral Suspension 200 mg/5 mL may be prescribed

Zithromax® (Pfizer) PoM

Capsules, azithromycin (as dihydrate) 250 mg, net price 4-cap pack = £7.16, 6-cap pack = £10.74. Label: 5, 9, 23

Oral suspension, cherry/banana-flavoured, azithromycin (as dihydrate) 200 mg/5 mL when reconstituted with water. Net price 15-mL pack = £4.06, 22.5-mL pack = £6.10, 30-mL pack = £11.04. Label: 5, 9

CLARITHROMYCIN

Indications respiratory-tract infections, mild to moderate skin and soft-tissue infections, otitis media; Lyme disease (see also section 5.1.1.3); prevention of pertussis (Table 2, section 5.1); *Helicobacter pylori* eradication (section 1.3)

Cautions see notes above; **interactions:** Appendix 1 (macrolides)

Hepatic impairment hepatic dysfunction including jaundice reported; avoid in severe impairment if renal impairment also present

Renal impairment use half normal dose if eGFR less than 30 mL/minute/1.73 m^2, max. duration 14 days; avoid *Klaricid XL®* or clarithromycin m/r preparations if eGFR less than 30 mL/minute/1.73 m^2

Pregnancy manufacturer advises avoid, particularly in the first trimester, unless potential benefit outweighs risk

Breast-feeding manufacturer advises avoid unless potential benefit outweighs risk—present in milk

Side-effects see notes above; also dyspepsia, taste disturbances, headache, insomnia, hyperhidrosis; *less commonly* gastritis, flatulence, constipation, dry mouth, stomatitis, glossitis, anorexia, chest pain, anxiety, dizziness, tremor, malaise, blood disorders (including leucopenia), myalgia, tinnitus; *also reported* confusion, psychotic disorders, depression, abnormal dreams, convulsions, paraesthesia, hypoglycaemia, renal failure, interstitial nephritis, myopathy, tooth and tongue discoloration, smell disturbances

Dose

- By mouth, ADULT and CHILD over 12 years, 250 mg every 12 hours, increased in pneumonia or severe infections to 500 mg every 12 hours; usual duration 7–14 days (see also Table 1, section 5.1); CHILD bodyweight under 8 kg, 7.5 mg/kg twice daily; 8–11 kg, 62.5 mg twice daily; 12–19 kg, 125 mg twice daily; 20–29 kg, 187.5 mg twice daily; 30–40 kg, 250 mg twice daily

  Lyme disease (see also section 5.1.1.3), ADULT and CHILD over 12 years, 500 mg every 12 hours for 14–21 days; CHILD 1 month–12 years see *BNF for Children*

- By intravenous infusion into larger proximal vein, ADULT and CHILD over 12 years, 500 mg twice daily; max. duration 5 days (switch to oral route when appropriate); CHILD 1 month–12 years see *BNF for Children*

Clarithromycin (Non-proprietary) PoM

Tablets, clarithromycin 250 mg, net price 14-tab pack = £1.64; 500 mg, 14-tab pack = £2.63. Label: 9

Dental prescribing on NHS Clarithromycin Tablets may be prescribed

Oral suspension, clarithromycin for reconstitution with water 125 mg/5 mL, net price 70 mL = £4.05; 250 mg/5 mL, 70 mL = £6.91. Label: 9

Dental prescribing on NHS Clarithromycin Oral Suspension may be prescribed

Intravenous infusion, powder for reconstitution, clarithromycin, net price 500-mg vial = £9.45

Klaricid® (Abbott Healthcare) PoM

Tablets, both yellow, f/c, clarithromycin 250 mg, net price 14-tab pack = £7.00; 500 mg, 14-tab pack = £11.30, 20-tab pack = £16.15. Label: 9

Paediatric suspension, clarithromycin for reconstitution with water 125 mg/5 mL, net price 70 mL = £5.26, 100 mL = £9.04; 250 mg/5 mL, 70 mL = £10.51. Label: 9

Granules, clarithromycin 250 mg/sachet, net price 14-sachet pack = £11.68. Label: 9, 13

Intravenous infusion, powder for reconstitution, clarithromycin. Net price 500-mg vial = £9.45

Electrolytes $Na^+ < 0.5$ mmol/500-mg vial

Modified release

Clarithromycin m/r preparations PoM

Tablets, m/r, clarithromycin 500 mg, net price 7 = £6.72, 14 = £13.23. Label: 9, 21, 25

Brands include *Mycifor XL®*

Dose ADULT and CHILD over 12 years, 500 mg once daily (doubled in severe infections) for 7–14 days

Klaricid XL® (Abbott Healthcare) PoM

Tablets, m/r, yellow, clarithromycin 500 mg, net price 7-tab pack = £6.72, 14-tab pack = £13.23. Label: 9, 21, 25

Dose ADULT and CHILD over 12 years, 500 mg once daily (doubled in severe infections) for 7–14 days

ERYTHROMYCIN

Indications susceptible infections in patients with penicillin hypersensitivity; oral infections (see notes above); campylobacter enteritis, syphilis, non-gonococcal urethritis, respiratory-tract infections (including Legionella infection), skin infections (Table 1, section 5.1); chronic prostatitis; prophylaxis of diphtheria, group A streptococcal infection, and pneumococcal infection (Table 2, section 5.1), and pertussis; acne vulgaris and rosacea (section 13.6)

Cautions see notes above; neonate under 2 weeks (risk of hypertrophic pyloric stenosis); avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (macrolides)

Hepatic impairment may cause idiosyncratic hepatotoxicity

Renal impairment max. 1.5 g daily in severe renal impairment (ototoxicity)

Pregnancy not known to be harmful

Breast-feeding only small amounts in milk—not known to be harmful

Side-effects see notes above

Dose

- By mouth, ADULT and CHILD over 8 years, 250–500 mg every 6 hours *or* 0.5–1 g every 12 hours (see notes above); up to 4 g daily in divided doses in severe infections; NEONATE 12.5 mg/kg every 6 hours; CHILD 1 month–2 years 125 mg every 6 hours *or* 250 mg every 12 hours, 2–8 years 250 mg every 6 hours *or* 500 mg every 12 hours, doses doubled for severe infections

  Early syphilis, 500 mg 4 times daily for 14 days; CHILD 12–18 years see *BNF for Children*

  Uncomplicated genital chlamydia, non-gonococcal urethritis, 500 mg twice daily for 14 days; CHILD under 18 years see *BNF for Children*

  Lyme disease (see also section 5.1.1.3), 500 mg 4 times daily for 14–21 days; CHILD under 18 years see *BNF for Children*
- By intravenous infusion, ADULT and CHILD severe infections, 12.5 mg/kg every 6 hours; mild infections (when oral treatment not possible), 6.25 mg/kg every 6 hours; NEONATE see *BNF for Children*

Erythromycin (Non-proprietary) PoM

Capsules, enclosing e/c microgranules, erythromycin 250 mg, net price 28-cap pack = £5.61. Label: 5, 9, 25

Brands include *Tiloryth*®

Tablets, e/c, erythromycin 250 mg, net price 28 = £1.61. Label: 5, 9, 25

Dental prescribing on NHS Erythromycin Tablets e/c may be prescribed

Erythromycin Ethyl Succinate (Non-proprietary) PoM

Oral suspension, erythromycin (as ethyl succinate) for reconstitution with water 125 mg/5 mL, net price 100 mL = £2.79; 250 mg/5 mL, 100 mL = £4.20; 500 mg/5 mL, 100 mL = £7.14. Label: 9

Note Sugar-free versions are available and can be ordered by specifying 'sugar-free' on the prescription

Brands include *Primacine*®

Dental prescribing on NHS Erythromycin Ethyl Succinate Oral Suspension may be prescribed

Erythromycin Lactobionate (Non-proprietary) PoM

Intravenous infusion, powder for reconstitution, erythromycin (as lactobionate), net price 1-g vial = £10.98

Erymax® (TEVA UK) PoM

Capsules, opaque orange/clear orange, enclosing orange and white e/c pellets, erythromycin 250 mg, net price 28-cap pack = £5.61, 112-cap pack = £22.44. Label: 5, 9, 25

Dose 1 capsule every 6 hours *or* 2 capsules every 12 hours; acne, 1 capsule twice daily for 1 month then 1 capsule daily

Erythrocin® (AMCo) PoM

Tablets, both f/c, erythromycin (as stearate), 250 mg, net price 100 = £18.20; 500 mg, 100 = £36.40. Label: 9

Dental prescribing on NHS May be prescribed as Erythromycin Stearate Tablets

Erythroped® (AMCo) PoM

Suspension SF, sugar-free, banana-flavoured, erythromycin (as ethyl succinate) for reconstitution with water, 125 mg/5 mL (*Suspension PI SF*), net price 140 mL = £3.06; 250 mg/5 mL, 140 mL = £5.95; 500 mg/5 mL (*Suspension SF Forte*), 140 mL = £10.56. Label: 9

Erythroped A® (AMCo) PoM

Tablets, yellow, f/c, erythromycin 500 mg (as ethyl succinate). Net price 28-tab pack = £10.78. Label: 9

Dental prescribing on NHS May be prescribed as Erythromycin Ethyl Succinate Tablets

Telithromycin

The ketolide **telithromycin** is a derivative of erythromycin. The antibacterial spectrum of telithromycin is similar to that of macrolides and it is also active against penicillin- and erythromycin-resistant *Streptococcus pneumoniae*. Telithromycin should only be used to treat beta-haemolytic streptococcal pharyngitis and tonsillitis, sinusitis, community-acquired pneumonia, and exacerbations of chronic bronchitis if caused by organisms resistant to beta-lactam antibacterials and other macrolides, or if conventional treatment is contra-indicated.

TELITHROMYCIN

Indications see notes above

Cautions coronary heart disease, ventricular arrhythmias, bradycardia, hypokalaemia, hypomagnesaemia—risk of QT interval prolongation; concomitant administration of drugs that prolong QT-interval; avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (telithromycin)

Hepatic disorders Patients should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, abdominal pain, jaundice, or dark urine develop

Driving Visual disturbances or transient loss of consciousness may affect performance of skilled tasks (e.g. driving); effects may occur after the first dose. Administration at bedtime may reduce these side-effects. Patients should be advised not to drive or operate machinery if affected

Contra-indications myasthenia gravis; history of telithromycin-associated hepatitis or jaundice; prolongation of QT interval; congenital or family history of QT interval prolongation (if not excluded by ECG)

Hepatic impairment manufacturer advises caution; see also Hepatic Disorders above

Renal impairment manufacturer advises avoid if possible if eGFR less than 30 mL/minute/1.73 m^2—if no alternative, use alternating daily doses of 800 mg and 400 mg, starting with 800 mg dose

Pregnancy toxicity in *animal* studies—manufacturer advises use only if potential benefit outweighs risk

Breast-feeding manufacturer advises avoid—present in milk in *animal* studies

Side-effects diarrhoea, nausea, vomiting, flatulence, abdominal pain, taste disturbances; dizziness, headache; *less commonly* constipation, stomatitis, anorexia, hepatitis, flushing, palpitations, drowsiness, insomnia, nervousness, eosinophilia, blurred vision, rash, urticaria, and pruritus; *rarely* cholestatic jaundice, arrhythmias, hypotension, transient loss of consciousness, paraesthesia, and diplopia; *very rarely* antibiotic-associated colitis, altered sense of smell, muscle cramp, erythema multiforme; also reported pancreatitis, confusion, hallucinations and arthralgia

Dose

- 800 mg once daily for 5 days for sinusitis or exacerbation of chronic bronchitis *or* for 7–10 days in community-acquired pneumonia; CHILD under 18 years safety and efficacy not established
- Tonsillitis or pharyngitis caused by *Streptococcus pyogenes*, ADULT and CHILD over 12 years, 800 mg once daily for 5 days

Ketek® (Sanofi-Aventis) PoM

Tablets, orange, f/c, telithromycin 400 mg, net price 10-tab pack = £18.56. Label: 9, counselling, driving, hepatic disorders

5.1.6 Clindamycin

Clindamycin is active against Gram-positive cocci, including streptococci and penicillin-resistant staphylococci, and also against many anaerobes, especially *Bacteroides fragilis*. It is well concentrated in bone and excreted in bile and urine.

Clindamycin is recommended for staphylococcal joint and bone infections such as osteomyelitis, and intra-abdominal sepsis; it is an alternative to macrolides for erysipelas or cellulitis in penicillin-allergic patients. Clindamycin can also be used for infections associated with meticillin-resistant *Staphylococcus aureus* (MRSA) in bronchiectasis, bone and joint infections, and skin and soft-tissue infections.

Clindamycin has been associated with antibiotic-associated colitis (section 1.5), which may be fatal; it is most common in middle-aged and elderly women, especially following an operation. Although antibiotic-associated colitis can occur with most antibacterials, it occurs more frequently with clindamycin. Patients should therefore discontinue treatment immediately if diarrhoea develops.

Oral infections Clindamycin should not be used routinely for the treatment of oral infections because it may be no more effective than penicillins against anaerobes and there may be cross-resistance with erythromycin-resistant bacteria. Clindamycin can be used for the treatment of dentoalveolar abscess that has not responded to penicillin or to metronidazole.

CLINDAMYCIN

Indications see notes above; staphylococcal bone and joint infections, peritonitis; falciparum malaria (section 5.4.1)

Cautions discontinue immediately if diarrhoea or colitis develops; monitor liver and renal function if treatment exceeds 10 days, and in neonates and infants; avoid rapid intravenous administration; avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (clindamycin)

Contra-indications diarrhoeal states; avoid injections containing benzyl alcohol in neonates (see under preparations below)

Pregnancy not known to be harmful

Breast-feeding amount probably too small to be harmful but bloody diarrhoea reported in 1 infant

Side-effects diarrhoea (discontinue treatment), abdominal discomfort, oesophagitis, oesophageal ulcers, taste disturbances, nausea, vomiting, antibiotic-associated colitis; jaundice; leucopenia, eosinophilia, and thrombocytopenia reported; polyarthritis reported; rash, pruritus, urticaria, anaphylactoid reactions, Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative and vesiculobullous dermatitis reported; pain, induration, and abscess after intramuscular injection; thrombophlebitis after intravenous injection

Dose

- By mouth, 150–300 mg every 6 hours; up to 450 mg every 6 hours in severe infections; NEONATE see *BNF for Children*; CHILD 1 month–18 years, 3–6 mg/kg (max. 450 mg) every 6 hours

  Counselling Patients should discontinue immediately and contact doctor if diarrhoea develops; capsules should be swallowed with a glass of water.

- By deep intramuscular injection *or* by intravenous infusion, 0.6–2.7 g daily (in 2–4 divided doses); life-threatening infection, up to 4.8 g daily; single doses above 600 mg by intravenous infusion only; single doses by intravenous infusion not to exceed 1.2 g; CHILD over 1 month, see *BNF for Children*

Clindamycin (Non-proprietary) PoM

Capsules, clindamycin (as hydrochloride) 150 mg, net price 24-cap pack = £5.08. Label: 9, 27, counselling, see above (diarrhoea)

Dental prescribing on NHS Clindamycin Capsules may be prescribed

Injection, clindamycin (as phosphate) 150 mg/mL, net price 2-mL amp = £5.90, 4-mL amp = £11.80

Dalacin C® (Pharmacia) PoM

Capsules, clindamycin (as hydrochloride) 75 mg (green/white), net price 24-cap pack = £7.45; 150 mg, (white), 24-cap pack = £13.72. Label: 9, 27, counselling, see above (diarrhoea)

Dental prescribing on NHS May be prescribed as Clindamycin Capsules

Injection, clindamycin (as phosphate) 150 mg/mL, net price 2-mL amp = £6.20, 4-mL amp = £12.35

Excipients include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

5.1.7 Some other antibacterials

Antibacterials discussed in this section include chloramphenicol, fusidic acid, glycopeptide antibiotics (vancomycin and teicoplanin), daptomycin, linezolid, fidaxomicin, the polymyxin, colistimethate sodium, and the rifamycin, rifaximin.

Chloramphenicol

Chloramphenicol is a potent broad-spectrum antibiotic; however, it is associated with serious haematological side-effects when given systemically and should therefore be reserved for the treatment of life-threatening infections, particularly those caused by *Haemophilus influenzae*, and also for typhoid fever.

Chloramphenicol eye drops (section 11.3.1) and chloramphenicol ear drops (section 12.1.1) are also available.

CHLORAMPHENICOL

Indications see notes above

Cautions avoid repeated courses and prolonged treatment; blood counts required before and periodically during treatment; monitor plasma-chloramphenicol concentration in neonates (see below); **interactions:** Appendix 1 (chloramphenicol)

Contra-indications acute porphyria (section 9.8.2)

Hepatic impairment avoid if possible—increased risk of bone-marrow depression; reduce dose and monitor plasma-chloramphenicol concentration

Renal impairment avoid in severe renal impairment unless no alternative; dose-related depression of haematopoiesis

Pregnancy manufacturer advises avoid; neonatal 'grey syndrome' if used in third trimester

Breast-feeding manufacturer advises avoid; use another antibiotic; may cause bone-marrow toxicity in infant; concentration in milk usually insufficient to cause 'grey syndrome'

Side-effects blood disorders including reversible and irreversible aplastic anaemia (with reports of resulting leukaemia), peripheral neuritis, optic neuritis, headache, depression, urticaria, erythema multiforme, nausea, vomiting, diarrhoea, stomatitis, glossitis, dry mouth; nocturnal haemoglobinuria reported; grey syndrome (abdominal distension, pallid cyanosis, circulatory collapse) may follow excessive doses in neonates with immature hepatic metabolism

Dose

- By mouth *or* by intravenous injection *or* infusion, 12.5 mg/kg every 6 hours (exceptionally, can be doubled for severe infections such as septicaemia and meningitis, providing high doses reduced as soon as clinically indicated); CHILD over 1 month, haemophilus epiglottitis and pyogenic meningitis, 12.5–25 mg/kg every 6 hours (high dosages decreased as soon as clinically indicated); NEONATE under 2 weeks, 12.5 mg/kg twice daily; 2 weeks–1 month, 12.5 mg/kg 2–4 times daily

  Note Plasma concentration monitoring required in neonates and preferred in those under 4 years of age, in the elderly, and in hepatic impairment; recommended peak plasma concentration (approx. 2 hours after administration by mouth, intravenous injection or infusion) 10–25 mg/litre; pre-dose ('trough') concentration should not exceed 15 mg/litre

Chloramphenicol (Non-proprietary) PoM

Capsules, chloramphenicol 250 mg. Net price 60 = £377.00

Kemicetine® (Pharmacia) PoM

Injection, powder for reconstitution, chloramphenicol (as sodium succinate). Net price 1-g vial = £1.39

Electrolytes Na^+ 3.14 mmol/g

Fusidic acid

Fusidic acid and its salts are narrow-spectrum antibiotics. The only indication for their use is in infections caused by penicillin-resistant staphylococci, especially osteomyelitis, as they are well concentrated in bone; they are also used for staphylococcal endocarditis. A second antistaphylococcal antibiotic is usually required to prevent emergence of resistance.

SODIUM FUSIDATE

Indications penicillin-resistant staphylococcal infection including osteomyelitis; staphylococcal endocarditis in combination with other antibacterials (Table 1, section 5.1)

Cautions monitor liver function with high doses or on prolonged therapy; elimination may be reduced in biliary disease or biliary obstruction; **interactions:** Appendix 1 (fusidic acid)

Hepatic impairment impaired biliary excretion; possibly increased risk of hepatotoxicity; avoid or reduce dose; monitor liver function

Pregnancy not known to be harmful; manufacturer advises use only if potential benefit outweighs risk

Breast-feeding present in milk—manufacturer advises caution

Side-effects nausea, vomiting, abdominal pain, dyspepsia, diarrhoea, drowsiness, dizziness; *less commonly* anorexia, headache, malaise, rash, pruritus; also reported reversible jaundice especially after high dosage (withdraw therapy if persistent), acute renal failure (usually with jaundice), blood disorders

Dose

- See under Preparations, below

Fucidin® (LEO) PoM

Tablets, f/c, sodium fusidate 250 mg, net price 10-tab pack = £6.02. Label: 9

Dose as sodium fusidate, 500 mg every 8 hours, doubled for severe infections

Skin infection, as sodium fusidate, 250 mg every 12 hours for 5–10 days

Suspension, off-white, banana- and orange-flavoured, fusidic acid 250 mg/5 mL, net price 50 mL = £6.73. Label: 9, 21

Dose as fusidic acid, ADULT 750 mg every 8 hours; CHILD up to 1 year 50 mg/kg daily (in 3 divided doses), 1–5 years 250 mg every 8 hours, 5–12 years 500 mg every 8 hours

Note Fusidic acid is incompletely absorbed and doses recommended for suspension are proportionately higher than those for sodium fusidate tablets

Vancomycin and teicoplanin

The glycopeptide antibiotics **vancomycin** and **teicoplanin** have bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides. There are increasing reports of glycopeptide-resistant enterococci.

They are used *parenterally* in the treatment of endocarditis and other serious infections caused by Gram-positive cocci. Vancomycin has a long duration of action and can therefore be given every 12 hours. Teicoplanin is similar to vancomycin, but has a significantly longer duration of action, allowing once daily administration after the loading dose. Teicoplanin is associated with a lower incidence of nephrotoxicity than vancomycin.

Either vancomycin or teicoplanin (added to dialysis fluid) is used in the treatment of peritonitis associated with peritoneal dialysis (Table 1, section 5.1); this is an [unlicensed route] for vancomycin.

They are also used for surgical prophylaxis when there is a high risk of MRSA (Table 2, section 5.1).

Vancomycin given *by mouth* for 10–14 days is effective in the treatment of *Clostridium difficile* infection (see also section 1.5); low doses are considered adequate (higher dose may be considered if the infection fails to respond or it is life threatening). Teicoplanin given *by mouth* is licensed for the treatment of *Clostridium difficile* infection. Vancomycin and teicoplanin should **not** be given by mouth for systemic infections because they are not absorbed significantly.

VANCOMYCIN

Indications see notes above

Cautions avoid rapid infusion (risk of anaphylactoid reactions, see Side-effects); rotate infusion sites; elderly; avoid if history of deafness; all patients require plasma-vancomycin measurement (after 3 or 4 doses if renal function normal, earlier if renal impairment), blood counts, urinalysis, and renal function tests; monitor auditory function in elderly or if renal impairment; teicoplanin sensitivity; systemic absorption may follow oral administration especially in inflammatory bowel disorders or following multiple doses; **interactions:** Appendix 1 (vancomycin)

Renal impairment reduce dose—monitor plasma-vancomycin concentration and renal function regularly; see also Cautions above

Pregnancy manufacturer advises use only if potential benefit outweighs risk—plasma-vancomycin concentration monitoring essential to reduce risk of fetal toxicity

Breast-feeding present in milk—significant absorption following oral administration unlikely

Side-effects after parenteral administration: nephrotoxicity including renal failure and interstitial nephritis; ototoxicity (discontinue if tinnitus occurs); blood disorders including neutropenia (usually after 1 week or cumulative dose of 25 g), rarely agranulocytosis and thrombocytopenia; nausea; chills, fever; eosinophilia, anaphylaxis, rashes (including exfoliative dermatitis, Stevens-Johnson syndrome, toxic epidermal necrolysis, and vasculitis); phlebitis (irritant to tissue); on rapid infusion, severe hypotension (including shock and cardiac arrest), wheezing, dyspnoea, urticaria, pruritus, flushing of the upper body ('red man' syndrome), pain and muscle spasm of back and chest

Dose

- By mouth, *Clostridium difficile* infection, (see also notes above), 125 mg every 6 hours for 10–14 days (increased up to 500 mg every 6 hours if infection fails to respond or is life-threatening)
- By intravenous infusion, 1–1.5 g every 12 hours; ELDERLY over 65 years, 500 mg every 12 hours *or* 1 g once daily

  Note Plasma concentration monitoring required (see Cautions above); pre-dose ('trough') concentration should be 10–15 mg/litre (15–20 mg/litre for endocarditis or less sensitive strains of meticillin-resistant *Staphylococcus aureus* or for complicated infections caused by *S. aureus*). An initial loading dose, by intravenous infusion, may be considered—consult local guidelines
- Surgical prophylaxis, by intravenous infusion, 1 g
- CHILD under 18 years see *BNF for Children*

Note Vancomycin doses in BNF may differ from those in product literature

Vancomycin (Non-proprietary) PoM

Capsules, vancomycin (as hydrochloride) 125 mg, net price 28-cap pack = £132.47; 250 mg, 28-cap pack = £132.47. Label: 9

Injection, powder for reconstitution, vancomycin (as hydrochloride), for use as an infusion, net price 500-mg vial = £6.25; 1-g vial = £12.99

Note Can be used to prepare solution for oral administration

Vancocin® (Flynn) PoM

Matrigel capsules, vancomycin (as hydrochloride) 125 mg, net price 28-cap pack = £88.31. Label: 9

Injection, powder for reconstitution, vancomycin (as hydrochloride), for use as an infusion, net price 500-mg vial = £6.25; 1-g vial = £12.50

Note Can be used to prepare solution for oral administration

TEICOPLANIN

Indications see notes above and under Dose

Cautions vancomycin sensitivity; blood counts and liver and kidney function tests required; monitor renal and auditory function during prolonged treatment in renal impairment or if other nephrotoxic or neurotoxic drugs given; monitor plasma-teicoplanin concentration during parenteral maintenance treatment if severe sepsis or burns, deep-seated staphylococcal infection (including bone and joint infection), endocarditis, renal impairment, in elderly, and in intravenous drug abusers; **interactions:** Appendix 1 (teicoplanin)

Renal impairment use normal dose regimen on days 1–4, then use normal maintenance dose every 48 hours if eGFR 30–80 mL/minute/1.73 m^2 and use normal maintenance dose every 72 hours if eGFR less than 30 mL/minute/1.73 m^2; see also Cautions above

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Breast-feeding no information available

Side-effects rash, pruritus; *less commonly* nausea, vomiting, diarrhoea, bronchospasm, dizziness, headache, fever, leucopenia, thrombocytopenia, eosinophilia, tinnitus, mild hearing loss, vestibular disorders, thrombophlebitis; *also reported* renal failure, exfoliative dermatitis, Stevens-Johnson syndrome, toxic epidermal necrolysis

Dose

- By mouth, *Clostridium difficile* infection, ADULT, 100–200 mg twice daily for 10–14 days
- By intravenous injection *or* infusion *or* by intramuscular injection, ADULT body-weight under 70 kg, initially 400 mg every 12 hours for 3 doses, subsequently 400 mg once daily; body-weight over 70 kg, initially 6 mg/kg every 12 hours for 3 doses, then 6 mg/kg once daily
- Streptococcal or enterococcal endocarditis (in combination with another antibacterial, see Table 1, section 5.1), by intravenous injection *or* infusion, ADULT initially 10 mg/kg every 12 hours for 3–5 doses, subsequently 10 mg/kg once daily (subsequent doses can be given by intramuscular injection)
- Bone and joint infections, by intravenous injection *or* by intravenous infusion, ADULT, initially 12 mg/kg every 12 hours for 3–5 doses, subsequently 12 mg/kg once daily (subsequent doses can be given by intramuscular injection); increased risk of fever and rash with doses of 12 mg/kg
- Surgical prophylaxis [unlicensed indication], ADULT, by intravenous injection, 400 mg up to 30 minutes before the procedure; open fractures, by intravenous infusion, 800 mg up to 30 minutes before skeletal stabilisation and definitive soft-tissue closure
- CHILD under 18 years see *BNF for Children*

Note To avoid excessive dosage in obese patients, parenteral dose should be calculated on the basis of ideal weight for height. Plasma-teicoplanin concentration is not measured routinely because a relationship between plasma concentration and toxicity has not been established. However, the plasma-teicoplanin concentration can be used to optimise parenteral treatment in some patients (see Cautions). Pre-dose ('trough') concentrations should be greater than 15 mg/litre (greater than 20 mg/litre in endocarditis or deep-seated infection such as bone and joint infection), but less than 60 mg/litre. Teicoplanin doses in BNF may differ from those in product literature

Targocid® (Sanofi-Aventis) ▼ PoM

Injection, powder for reconstitution, teicoplanin, net price 200-mg vial (with diluent) = £3.93; 400-mg vial (with diluent) = £7.32

Electrolytes $Na^+ < 0.5$ mmol/200- and 400-mg vial

Note Can be used to prepare solution for oral administration

Daptomycin

Daptomycin is a lipopeptide antibacterial with a spectrum of activity similar to vancomycin but its efficacy against enterococci has not been established. Daptomycin should be reserved for complicated skin and soft-tissue infections caused by resistant Gram-positive bacteria including meticillin-resistant *Staphylococcus aureus* (MRSA). It needs to be given with other antibacterials for mixed infections involving Gram-negative bacteria and some anaerobes. Daptomycin is used (in combination with other antibacterials) for staphylococcal endocarditis caused by organisms resistant to vancomycin or in patients intolerant of vancomycin.

The *Scottish Medicines Consortium* (p. 4) has advised (February 2008) that daptomycin (*Cubicin*®) is accepted for restricted use within NHS Scotland for the treatment of MRSA bacteraemia associated with right-sided endocarditis or with complicated skin and soft-tissue infections.

DAPTOMYCIN

Indications see under Dose

Cautions interference with assay for prothrombin time and INR—take blood sample immediately before daptomycin dose; **interactions:** Appendix 1 (daptomycin)

Muscle effects Myalgia, muscle weakness, and myositis may occur uncommonly; rhabdomyolysis is very rare. Monitor creatine kinase before treatment and then weekly during treatment (more frequently if creatine kinase elevated more than 5 times upper limit of normal before treatment, or if receiving another drug known to cause myopathy (preferably avoid concomitant use), or if eGFR less than 80 mL/minute/1.73 m^2). If unexplained muscle pain, tenderness, weakness, or cramps develop during treatment, measure creatine kinase every 2 days; discontinue if unexplained muscular symptoms and creatine kinase elevated markedly

Hepatic impairment manufacturer advises caution in severe hepatic impairment—no information available

Renal impairment see Muscle Effects above; also monitor renal function if eGFR less than 80 mL/minute/1.73 m^2; use normal dose every 48 hours if eGFR less than 30 mL/minute/1.73 m^2

Pregnancy manufacturer advises use only if potential benefit outweighs risk—no information available

Breast-feeding present in milk in small amounts, but absorption from gastro-intestinal tract negligible

Side-effects nausea, vomiting, abdominal pain, flatulence, diarrhoea (antibiotic-associated colitis reported), constipation, hypertension, hypotension, headache, anxiety, insomnia, dizziness, asthenia, anaemia, arthralgia, rash, pruritus, injection-site reactions; *less commonly* dyspepsia, anorexia, taste disturbance, glossitis, flushing, arrhythmias, tremor, paraesthesia, hyperglycaemia, renal failure, eosinophilia, thrombocythaemia, electrolyte disturbances, muscle effects (see Cautions); *rarely* jaundice; also reported syncope, wheezing, eosinophilic pneumonia, peripheral neuropathy

Dose

- By slow intravenous injection over 2 minutes *or* by intravenous infusion, complicated skin and soft-tissue infections caused by Gram-positive bacteria, ADULT over 18 years, 4 mg/kg once daily; increased to 6 mg/kg once daily if associated with *Staphylococcus aureus* bacteraemia

  Staphylococcal endocarditis, ADULT over 18 years, 6 mg/kg once daily

  Note not licensed for use in left-sided endocarditis

Cubicin® (Novartis) PoM

Intravenous infusion, powder for reconstitution, daptomycin, net price 350-mg vial = £62.00; 500-mg vial = £88.57

Linezolid

Linezolid, an oxazolidinone antibacterial, is active against Gram-positive bacteria including meticillin-resistant *Staphylococcus aureus* (MRSA), and vancomycin-resistant enterococci. Resistance to linezolid can develop with prolonged treatment or if the dose is less than that recommended. Linezolid is an option if a glycopeptide, such as vancomycin, cannot be used to treat pneumonia or severe skin and soft-tissue infections caused by MRSA. Linezolid is **not** active against Gram-negative organisms and must be given with other antibacterials if the infection also involves Gram-negative organisms (the combination should be used for mixed skin and soft tissue infections only when other treatments are not available). A higher incidence of blood disorders and optic neuropathy have been reported in patients receiving linezolid for more than the maximum recommended duration of 28 days.

LINEZOLID

Indications pneumonia, complicated skin and soft-tissue infections caused by Gram-positive bacteria (initiated under expert supervision)

Cautions monitor full blood count (including platelet count) weekly (see also Blood disorders below); history of seizures; unless close observation and blood-pressure monitoring possible, avoid in uncontrolled hypertension, phaeochromocytoma, carcinoid tumour, thyrotoxicosis, bipolar depression, schizophrenia, or acute confusional states; **interactions:** Appendix 1 (MAOIs)

Blood disorders

Haematopoietic disorders (including thrombocytopenia, anaemia, leucopenia, and pancytopenia) have been reported in patients receiving linezolid, particularly the elderly. It is recommended that full blood counts are monitored weekly. Close monitoring is recommended in patients who:

- receive treatment for more than 10–14 days;
- have pre-existing myelosuppression;
- are receiving drugs that may have adverse effects on haemoglobin, blood counts, or platelet function;
- have severe renal impairment.

If significant myelosuppression occurs, treatment should be stopped unless it is considered essential, in which case intensive monitoring of blood counts and appropriate management should be implemented.

CHM advice (optic neuropathy)

Severe optic neuropathy may occur rarely, particularly if linezolid is used for longer than 28 days. The CHM recommends that:

- patients should be warned to report symptoms of visual impairment (including blurred vision, visual field defect, changes in visual acuity and colour vision) immediately;
- patients experiencing new visual symptoms (regardless of treatment duration) should be evaluated promptly, and referred to an ophthalmologist if necessary;
- visual function should be monitored regularly if treatment is required for longer than 28 days.

Monoamine oxidase inhibition Linezolid is a reversible, non-selective monoamine oxidase inhibitor (MAOI). Patients should avoid consuming large amounts of tyramine-rich foods (such as mature cheese, yeast extracts, undistilled alcoholic beverages, and fermented soya bean products). In addition, linezolid should not be given with another MAOI or within 2 weeks of stopping another MAOI. Unless close observation and blood-pressure monitoring is possible, avoid in those receiving SSRIs, $5HT_1$ agonists ('triptans'), tricyclic antidepressants, sympathomimetics, dopaminergics, buspirone, pethidine and possibly other opioid analgesics. For other interactions see Appendix 1 (MAOIs)

Contra-indications see Monoamine Oxidase Inhibition above

Hepatic impairment in severe hepatic impairment manufacturer advises use only if potential benefit outweighs risk

Renal impairment manufacturer advises metabolites may accumulate if eGFR less than 30 mL/minute/1.73 m^2; see also Blood Disorders, above

Pregnancy manufacturer advises use only if potential benefit outweighs risk—no information available

Breast-feeding manufacturer advises avoid—present in milk in *animal* studies

Side-effects diarrhoea (antibiotic-associated colitis reported), nausea, vomiting, taste disturbances, headache; *less commonly* thirst, dry mouth, glossitis, stomatitis, tongue discoloration, abdominal pain, dyspepsia, gastritis, constipation, pancreatitis, hypertension, fever, fatigue, dizziness, insomnia, hypoaesthesia, paraesthesia, tinnitus, polyuria, leucopenia, thrombocytopenia, eosinophilia, electrolyte disturbances, blurred vision, rash, pruritus, diaphoresis, injection-site reactions; *rarely* tachycardia, transient ischaemic attacks, renal failure; also reported tooth discoloration, convulsions, lactic acidosis, hyponatraemia, pancytopenia, anaemia, Stevens-Johnson syndrome, toxic epidermal necrolysis; peripheral and optic neuropathy reported on prolonged therapy (see also CHM advice above)

Dose

- By mouth, 600 mg every 12 hours usually for 10–14 days (max. duration of treatment 28 days); CHILD [unlicensed] 1 week–12 years, 10 mg/kg every 8 hours; 12–18 years, adult dose
- By intravenous infusion over 30–120 minutes, 600 mg every 12 hours; CHILD [unlicensed] 1 week–12 years, 10 mg/kg every 8 hours; 12–18 years, adult dose

Zyvox® (Pharmacia) PoM

Tablets, f/c, linezolid 600 mg, net price 10-tab pack = £445.00. Label: 9, 10, patient information leaflet

Suspension, yellow, linezolid 100 mg/5 mL when reconstituted with water, net price 150 mL (orange-flavoured) = £222.50. Label: 9, 10 patient information leaflet

Excipients include aspartame 20 mg/5 mL (section 9.4.1)

Intravenous infusion, linezolid 2 mg/mL, net price 300-mL *Excel*® bag = £44.50

Excipients include Na^+ 5 mmol/300-mL bag, glucose 13.71 g/300-mL bag

Polymyxins

The polymyxin antibiotic, **colistimethate sodium** (colistin sulfomethate sodium), is active against Gram-negative organisms including *Pseudomonas aeruginosa*, *Acinetobacter baumanii*, and *Klebsiella pneumoniae*. It is **not** absorbed by mouth and thus needs to be given by injection for a systemic effect. Intravenous administration of colistimethate sodium should be reserved for Gram-negative infections resistant to other antibacterials; its major adverse effects are dose-related neurotoxicity and nephrotoxicity.

Colistimethate sodium is also given by inhalation as an adjunct to standard antibacterial therapy in patients with cystic fibrosis.

NICE guidance

Colistimethate sodium by dry powder inhalation for pseudomonal lung infection in cystic fibrosis (March 2013)

Colistimethate sodium dry powder for inhalation is recommended for chronic pulmonary infection caused by *Pseudomonas aeruginosa* in patients with cystic fibrosis who would benefit from continued treatment, but do not tolerate the drug in its nebulised form. The manufacturer must provide colistimethate sodium dry powder for inhalation at the discount agreed as part of the patient access scheme to primary, secondary and tertiary care in the NHS.

Patients currently receiving colistimethate sodium dry powder for inhalation can continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA276

Both colistimethate sodium and polymyxin B are included in some preparations for topical application.

COLISTIMETHATE SODIUM

(Colistin sulfomethate sodium)

Indications see notes above

Cautions acute porphyria (section 9.8.2); **interactions:** Appendix 1 (polymyxins)

Specific cautions for parenteral treatment Monitor renal function

Specific cautions for inhaled treatment Other inhaled drugs should be administered before colistimethate sodium. Measure lung function before and after initial dose of colistimethate sodium and monitor for bronchospasm; if bronchospasm occurs in a patient not using a bronchodilator, repeat test using a bronchodilator before the dose of colistimethate sodium. Severe haemoptysis—risk of further haemorrhage

Contra-indications myasthenia gravis

Renal impairment reduce dose and monitor plasma-colistimethate sodium concentration during parenteral treatment—consult product literature

Pregnancy clinical use suggests probably safe when used by inhalation; use parenteral treatment only if potential benefit outweighs risk

Breast-feeding present in milk but poorly absorbed from gut; manufacturers advise avoid (or use only if potential benefit outweighs risk)

Side-effects

Specific side-effects for parenteral treatment
Neurotoxicity reported especially with excessive doses (including apnoea, perioral and peripheral paraesthesia, vertigo, headache, muscle weakness; rarely vasomotor instability, slurred speech, confusion, psychosis, visual disturbances), nephrotoxicity, rash

Specific side-effects for inhaled treatment Sore throat, sore mouth, taste disturbances, nausea, vomiting, cough, bronchospasm, dysphonia; *less commonly* thirst, hypersalivation

Dose

- By slow intravenous injection into a totally implantable venous access device, *or* by intravenous infusion (but see notes above), ADULT and CHILD bodyweight under 60 kg, 50 000–75 000 units/kg daily in 3 divided doses; body-weight over 60 kg, 1–2 million units every 8 hours

Note Plasma concentration monitoring recommended in renal impairment; recommended 'peak' plasma-colistimethate sodium concentration (approx. 1 hour after intravenous injection or infusion) 5–15 mg/litre, pre-dose ('trough') concentration 2–6 mg/litre

- By inhalation of nebulised solution, ADULT and CHILD over 2 years, 1–2 million units twice daily; increased to 2 million units 3 times daily for subsequent respiratory isolates of *Ps. aeruginosa*; CHILD 1 month–2 years, 0.5–1 million units twice daily; increased to 1 million units 3 times daily for subsequent respiratory isolates of *Ps. aeruginosa*
- By inhalation of powder, ADULT and CHILD over 6 years, 1.66 million units twice daily

Colistimethate sodium (Non-proprietary) PoM
Injection, powder for reconstitution, colistimethate sodium, net price 1 million-unit vial = £1.68

Colomycin® (Forest) PoM
Injection, powder for reconstitution, colistimethate sodium, net price 1 million-unit vial = £1.80; 2 million-unit vial = £3.24
Electrolytes (before reconstitution) $Na^+ < 0.5$ mmol/1 million-unit and 2 million-unit vial
Note *Colomycin®* Injection may be used for nebulisation; administer required dose in 2-4 mL of sodium chloride 0.9%, (*or* water for injections) *or* a 1:1 mixture of sodium chloride 0.9% and water for injection

Promixin® (Profile) PoM
Powder for nebuliser solution, colistimethate sodium, net price 1 million-unit vial = £4.60
Injection, powder for reconstitution, colistimethate sodium, net price 1 million unit-vial = £2.30
Electrolytes (before reconstitution) $Na^+ < 0.5$ mmol/1 million-unit vial

Colobreathe® (Forest) PoM
Dry powder for inhalation, hard capsule, colistimethate sodium 1.66 million units/capsule, net price 56-cap pack (with *Turbospin®* inhaler device) = £968.80. Counselling, administration
Counselling Rinse mouth with water after each dose

Rifaximin

Rifaximin is a rifamycin that is poorly absorbed from the gastro-intestinal tract, and, therefore, should not be used to treat systemic infections. It is licensed for the treatment of travellers' diarrhoea that is not complicated by fever and blood in the stools, but see section 1.4. It is not recommended for diarrhoea associated with invasive organisms such as *Campylobacter* and *Shigella*. Rifaximin is also licensed to reduce the risk of recurrence of hepatic encephalopathy.

RIFAXIMIN

Indications see under Dose
Contra-indications rifamycin hypersensitivity; intestinal obstruction
Hepatic impairment manufacturer advises caution when used for hepatic encephalopathy in patients with severe hepatic impairment
Pregnancy manufacturer advises avoid—toxicity in *animal* studies
Breast-feeding unlikely to be present in milk in significant amounts, but manufacturer advises avoid
Side-effects nausea, vomiting, abdominal pain, flatulence, diarrhoea, dyspnoea, headache, depression, dizziness, muscle spasm, rash, pruritus; *less commonly* anorexia, taste disturbances, dry mouth, peripheral oedema, sleep disturbances, anxiety, memory impairment, convulsions, hypoaesthesia, paraesthesia, antibiotic-associated colitis, influenza-like symptoms, dysuria, polyuria, glycosuria, polymenorrhoea, blood disorders, hyperkalaemia; *rarely* blood pressure changes, constipation; also reported syncope
Dose
- Travellers' diarrhoea that is not associated with fever, bloody diarrhoea, blood or leucocytes in the stool, or 8 or more unformed stools in the previous 24 hours, ADULT over 18 years, 200 mg every 8 hours for 3 days
- Reduction in recurrence of hepatic encephalopathy, ADULT over 18 years, 550 mg twice daily

Targaxan® (Norgine) PoM
Tablets, pink, f/c, rifaximin 550 mg, net price 56-tab pack = £259.23. Label: 14

Xifaxanta® (Norgine) PoM
Tablets, pink, f/c, rifaximin 200 mg, net price 9-tab pack = £15.15. Label: 9

Fidaxomicin

Fidaxomicin is a macrocyclic antibacterial that is poorly absorbed from the gastro-intestinal tract, and, therefore, it should not be used to treat systemic infections. It is licensed for the treatment of *Clostridium difficile* infection (see also section 1.5), but limited clinical data is available on the use of fidaxomicin in severe or life-threatening *C. difficile* infection.

The *Scottish Medicines Consortium* (p. 4) has advised (June 2012) that fidaxomicin (*Dificlir®*) is accepted for restricted use within NHS Scotland to treat the first recurrence of *C. difficile* infection, on the advice of a microbiologist or specialist in infectious diseases.

FIDAXOMICIN

Indications *Clostridium difficile* infection
Cautions macrolide hypersensitivity; severe or life-threatening *C. difficile* infection; inflammatory bowel disease; **interactions**: Appendix 1 (fidaxomicin)
Hepatic impairment manufacturer advises caution in moderate to severe impairment—no information available
Renal impairment manufacturer advises caution in severe impairment—no information available
Pregnancy manufacturer advises avoid—no information available
Breast-feeding manufacturer advises avoid—no information available
Side-effects nausea, vomiting, constipation; *less commonly* taste disturbance, abdominal distension, flatulence, headache, dizziness, decreased appetite, dry mouth
Dose
- ADULT over 18 years, 200 mg every 12 hours for 10 days

Dificlir® (Astellas) ▼ PoM
Tablets, f/c, fidaxomicin 200 mg, net price 20-tab pack = £1350.00. Label: 9

5.1.8 Sulfonamides and trimethoprim

The importance of the sulfonamides has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic.

Sulfamethoxazole and trimethoprim are used in combination (as **co-trimoxazole**) because of their synergistic activity. However, co-trimoxazole is associated with rare but serious side-effects (e.g. Stevens-Johnson syndrome and blood dyscrasias, notably bone marrow depression and agranulocytosis) especially in the elderly (see Restrictions on the use of Co-trimoxazole below)

Restrictions on the use of co-trimoxazole

Co-trimoxazole is the drug of choice in the prophylaxis and treatment of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia; it is also indicated for nocardiasis, *Stenotrophomonas maltophilia* infection [unlicensed indication], and toxoplasmosis. It should only be considered for use in *acute exacerbations of chronic bronchitis* and *infections of the urinary tract* when there is bacteriological evidence of sensitivity to co-trimoxazole and good reason to prefer this combination to a single antibacterial; similarly it should only be used in *acute otitis media in children* when there is good reason to prefer it. Co-trimoxazole is also used for the treatment of infections caused by *Burkholderia cepacia* in cystic fibrosis [unlicensed indication].

Trimethoprim can be used alone for urinary- and respiratory-tract infections and for prostatitis, shigellosis, and invasive salmonella infections. Trimethoprim has side-effects similar to co-trimoxazole but they are less severe and occur less frequently.

For *topical preparations* of sulfonamides used in the treatment of burns see section 13.10.1.1.

CO-TRIMOXAZOLE

A mixture of trimethoprim and sulfamethoxazole (sulphamethoxazole) in the proportions of 1 part to 5 parts

Indications see restrictions above

Cautions maintain adequate fluid intake; avoid in blood disorders (unless under specialist supervision); monitor blood counts on prolonged treatment; discontinue immediately if blood disorders or rash develop; predisposition to folate deficiency or hyperkalaemia; elderly (see Restrictions on the use of Co-trimoxazole above); asthma; G6PD deficiency (section 9.1.5); avoid in infants under 6 weeks (except for treatment or prophylaxis of pneumocystis pneumonia); **interactions:** Appendix 1 (trimethoprim, sulfamethoxazole)

Contra-indications acute porphyria (section 9.8.2)

Hepatic impairment manufacturer advises avoid in severe liver disease

Renal impairment use half normal dose if eGFR 15–30 mL/minute/1.73 m^2; avoid if eGFR less than 15 mL/minute/1.73 m^2 and if plasma-sulfamethoxazole concentration cannot be monitored

Pregnancy teratogenic risk in first trimester (trimethoprim a folate antagonist). Neonatal haemolysis and methaemoglobinaemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded

Breast-feeding small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants (due to sulfamethoxazole)

Side-effects nausea, diarrhoea; headache; hyperkalaemia; rash (very rarely including Stevens-Johnson syndrome, toxic epidermal necrolysis, photosensitivity)—discontinue immediately; *less commonly* vomiting; *very rarely* glossitis, stomatitis, anorexia, liver damage (including jaundice and hepatic necrosis), pancreatitis, antibiotic-associated colitis, myocarditis, cough and shortness of breath, pulmonary infiltrates, aseptic meningitis, depression, convulsions, peripheral neuropathy, ataxia, tinnitus, vertigo, hallucinations, hypoglycaemia, blood disorders (including leucopenia, thrombocytopenia, megaloblastic anaemia, eosinophilia), hyponatraemia, renal disorders including interstitial nephritis, arthralgia, myalgia, vasculitis, systemic lupus erythematosus and uveitis; rhabdomyolysis reported in HIV-infected patients

Dose

- By mouth, 960 mg every 12 hours; CHILD, every 12 hours, 6 weeks–5 months, 120 mg; 6 months–5 years, 240 mg; 6–12 years, 480 mg
- By intravenous infusion, 960 mg every 12 hours increased to 1.44 g every 12 hours in severe infections; CHILD 36 mg/kg daily in 2 divided doses increased to 54 mg/kg daily in severe infections
- Treatment of *Pneumocystis jirovecii* (*Pneumocystis carinii*) infections (undertaken where facilities for appropriate monitoring available—consult microbiologist and product literature), by mouth *or* by intravenous infusion, ADULT and CHILD over 4 weeks, 120 mg/kg daily in 2–4 divided doses for 14–21 days
- Prophylaxis of *Pneumocystis jirovecii* (*Pneumocystis carinii*) infections, by mouth, 960 mg once daily (may be reduced to 480 mg once daily to improve tolerance) *or* 960 mg on alternate days (3 times a week) *or* 960 mg twice daily on alternate days (3 times a week); CHILD 6 weeks–5 months, 120 mg twice daily on 3 consecutive or alternate days per week *or* on 7 days per week; 6 months–5 years, 240 mg; 6–12 years, 480 mg

Note 480 mg of co-trimoxazole consists of sulfamethoxazole 400 mg and trimethoprim 80 mg

Co-trimoxazole (Non-proprietary) PoM

Tablets, co-trimoxazole 480 mg, net price 28-tab pack = £3.74, 960 mg, 100 = £23.46. Label: 9

Brands include *Fectrim®, Fectrim® Forte*

Paediatric oral suspension, co-trimoxazole 240 mg/5 mL, net price 100 mL = £1.12. Label: 9

Oral suspension, co-trimoxazole 480 mg/5 mL. Net price 100 mL = £4.41. Label: 9

Septrin® (Aspen) PoM

Tablets, co-trimoxazole 480 mg, net price 100-tab pack= £15.52. Label: 9

Forte tablets, scored, co-trimoxazole 960 mg, net price 100-tab pack = £23.46. Label: 9

Adult suspension, co-trimoxazole 480 mg/5 mL, net price 100 mL (vanilla-flavoured) = £4.41. Label: 9

Paediatric suspension, sugar-free, co-trimoxazole 240 mg/5 mL, net price 100 mL (banana- and vanilla-flavoured) = £2.45. Label: 9

Intravenous infusion, co-trimoxazole 96 mg/mL. To be diluted before use. Net price 5-mL amp = £1.78

Electrolytes Na^+ 1.7 mmol/5 mL

Excipients include alcohol 13.2%, propylene glycol, sulfites

SULFADIAZINE

(Sulphadiazine)

Indications prevention of rheumatic fever recurrence, toxoplasmosis [unlicensed]—see section 5.4.7

Cautions see under Co-trimoxazole; **interactions:** Appendix 1 (sulfonamides)

Contra-indications see under Co-trimoxazole

Hepatic impairment use with caution in mild to moderate impairment; avoid in severe impairment

Renal impairment use with caution in mild to moderate impairment; avoid in severe impairment; high risk of crystalluria

Pregnancy neonatal haemolysis and methaemoglobinaemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded

Breast-feeding small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants

Side-effects see under Co-trimoxazole; also hypothyroidism, benign intracranial hypertension, optic neuropathy

Dose

- Prevention of rheumatic fever, *by mouth*, 1 g daily (500 mg daily for patients less than 30 kg)

Sulfadiazine (Non-proprietary) PoM

Tablets, sulfadiazine 500 mg, net price 56-tab pack = £57.15. Label: 9, 27

TRIMETHOPRIM

Indications urinary-tract infections, acute and chronic bronchitis; pneumocystis pneumonia (section 5.4.8)

Cautions predisposition to folate deficiency; elderly; manufacturer recommends blood counts on long-term therapy (but evidence of practical value unsatisfactory); neonates (specialist supervision required); acute porphyria (section 9.8.2); **interactions:** Appendix 1 (trimethoprim)

Blood disorders On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop

Contra-indications blood dyscrasias

Renal impairment use half normal dose after 3 days if eGFR 15–30 mL/minute/1.73 m^2; use half normal dose if eGFR less than 15 mL/minute/1.73 m^2 (monitor plasma-trimethoprim concentration if eGFR less than 10 mL/minute/1.73 m^2)

Pregnancy teratogenic risk in first trimester (folate antagonist); manufacturers advise avoid

Breast-feeding present in milk—short-term use not known to be harmful

Side-effects gastro-intestinal disturbances including nausea and vomiting, pruritus, rashes, hyperkalaemia, depression of haematopoiesis; rarely erythema multiforme, toxic epidermal necrolysis, photosensitivity and other allergic reactions including angioedema and anaphylaxis; aseptic meningitis and uveitis reported

Dose

- Acute infections, 200 mg every 12 hours; CHILD 1 month–12 years, 4 mg/kg (max. 200 mg) every 12 hours; *or* 6 weeks–6 months 25 mg every 12 hours, 6 months–6 years 50 mg every 12 hours, 6–12 years 100 mg every 12 hours
- Prophylaxis, 100 mg at night; CHILD under 12 years, 2 mg/kg (max.100 mg) at night; *or* [unlicensed dose] 6 weeks–6 months 12.5 mg at night, 6 months–6 years 25 mg at night, 6–12 years 50 mg at night

Trimethoprim (Non-proprietary) PoM

Tablets, trimethoprim 100 mg, net price 28 = £1.02; 200 mg, 14-tab pack = 90p. Label: 9

Brands include *Trimopan*®

Suspension, trimethoprim 50 mg/5 mL, net price 100 mL = £1.95. Label: 9

5.1.9 Antituberculosis drugs

Tuberculosis is treated in two phases—an *initial phase* using 4 drugs and a *continuation phase* using 2 drugs in fully sensitive cases. Treatment requires specialised knowledge, particularly where the disease involves resistant organisms or non-respiratory organs.

The regimens given below are recommended for the treatment of tuberculosis in the UK; variations occur in other countries. Either the unsupervised regimen or the supervised regimen described below should be used; the two regimens should **not** be used concurrently.

Initial phase The concurrent use of 4 drugs during the initial phase is designed to reduce the bacterial population as rapidly as possible and to prevent the emergence of drug-resistant bacteria. The drugs are best given as combination preparations unless one of the components cannot be given because of resistance or intolerance. The treatment of choice for the initial phase is the daily use of isoniazid, rifampicin, pyrazinamide and ethambutol. Treatment should be started without waiting for culture results if clinical features or histology results are consistent with tuberculosis; treatment should be continued even if initial culture results are negative. The initial phase drugs should be continued for 2 months. Where a positive culture for *M. tuberculosis* has been obtained, but susceptibility results are not available after 2 months, treatment with rifampicin, isoniazid, pyrazinamide and ethambutol should be continued until full susceptibility is confirmed, even if this is for longer than 2 months.

Streptomycin is rarely used in the UK but it may be used in the initial phase of treatment if resistance to isoniazid has been established before therapy is commenced.

Continuation phase After the initial phase, treatment is continued for a further 4 months with isoniazid and rifampicin (preferably given as a combination preparation). Longer treatment is necessary for meningitis, direct spinal cord involvement, and for resistant organisms which may also require modification of the regimen.

Unsupervised treatment The following regimen should be used for patients who are likely to take antituberculous drugs reliably **without supervision**. Patients who are unlikely to comply with daily administration of antituberculous drugs should be treated with

the regimen described under Supervised Treatment.

Recommended dosage for standard unsupervised 6-month treatment

2-month initial phase

Rifater® [rifampicin, isoniazid, and pyrazinamide]	ADULT body-weight under 40 kg 3 tablets daily; body-weight 40–49 kg 4 tablets daily; body-weight 50–64 kg 5 tablets daily; body-weight over 65 kg 6 tablets daily
Ethambutol	ADULT 15 mg/kg daily

4-month continuation phase following initial treatment with Rifater® and ethambutol

Rifinah®[rifampicin and isoniazid]	ADULT body-weight under 50 kg 3 tablets daily of *Rifinah® 150/100*; body-weight 50 kg and over 2 tablets daily of *Rifinah® 300/150*

or (if combination preparations not appropriate):

Isoniazid (for 6 months)	ADULT 300 mg daily; CHILD 10 mg/kg (max. 300 mg) daily
Rifampicin (for 6 months)	ADULT body-weight under 50 kg 450 mg daily; body-weight 50 kg and over 600 mg daily; CHILD 15 mg/kg daily (max. 450 mg daily if body-weight under 50 kg; max. 600 mg daily if body-weight 50 kg and over)
Pyrazinamide (for 2-month initial phase only)	ADULT body-weight under 50 kg 1.5 g daily; body-weight 50 kg and over 2 g daily; CHILD 35 mg/kg daily (max. 1.5 g daily if body-weight under 50 kg; max. 2 g daily if body-weight 50 kg and over)
Ethambutol (for 2-month initial phase only)	ADULT 15 mg/kg daily; CHILD 20 mg/kg daily

Pregnancy The standard regimen (above) may be used during pregnancy. Streptomycin should not be given in pregnancy.

Breast-feeding The standard regimen (above) may be used during breast-feeding

Children Children are given isoniazid, rifampicin, pyrazinamide, and ethambutol for the first 2 months followed by isoniazid and rifampicin during the next 4 months. However, care is needed in young children receiving ethambutol because of the difficulty in testing eyesight and in obtaining reports of visual symptoms (see below).

Supervised treatment Drug administration needs to be **fully supervised** (directly observed therapy, DOT) in patients who cannot comply reliably with the treatment regimen. These patients are given isoniazid, rifampicin, pyrazinamide and ethambutol (or streptomycin) 3 times a week under supervision for the first 2 months followed by isoniazid and rifampicin 3 times a week for a further 4 months.

Recommended dosage for intermittent supervised 6-month treatment

Isoniazid (for 6 months)	ADULT and CHILD 15 mg/kg (max. 900 mg) 3 times a week
Rifampicin (for 6 months)	ADULT 600–900 mg 3 times a week; CHILD 15 mg/kg (max. 900 mg) 3 times a week
Pyrazinamide (for 2-month initial phase only)	ADULT body-weight under 50 kg 2 g 3 times a week; body-weight 50 kg and over 2.5 g 3 times a week; CHILD 50 mg/kg 3 times a week (max. 2 g 3 times a week if body-weight under 50 kg; max. 2.5 g 3 times a week if body-weight 50 kg and over)
Ethambutol (for 2-month initial phase only)	ADULT and CHILD 30 mg/kg 3 times a week

Immunocompromised patients Multi-resistant *Mycobacterium tuberculosis* may be present in immunocompromised patients. The organism should always be cultured to confirm its type and drug sensitivity. Confirmed *M. tuberculosis* infection sensitive to first-line drugs should be treated with a standard 6-month regimen; after completing treatment, patients should be closely monitored. The regimen may need to be modified if infection is caused by resistant organisms, and specialist advice is needed.

Specialist advice should be sought about tuberculosis treatment or chemoprophylaxis in a HIV-positive individual; care is required in choosing the regimen and in avoiding potentially serious interactions. Starting antiretroviral treatment in the first 2 months of antituberculosis treatment increases the risk of immune reconstitution syndrome.

Infection may also be caused by other mycobacteria e.g. *M. avium* complex in which case specialist advice on management is needed.

Corticosteroids In meningeal or pericardial tuberculosis, a corticosteroid should be started at the same time as antituberculosis therapy.

Prevention of tuberculosis Some individuals may develop tuberculosis owing to reactivation of previously latent disease. Chemoprophylaxis may be required in those who have evidence of latent tuberculosis and are receiving treatment with immunosuppressants (including cytotoxics and possibly long-term treatment with systemic corticosteroids). In these cases, chemoprophylaxis involves use of either isoniazid alone for 6 months or of isoniazid and rifampicin for 3 months, see Table 2, section 5.1; longer chemoprophylaxis is not recommended.

For prevention of tuberculosis in susceptible close contacts or those who have become tuberculin-positive, see Table 2, section 5.1. For advice on immunisation against tuberculosis, see section 14.4

Monitoring Since isoniazid, rifampicin and pyrazinamide are associated with liver toxicity, *hepatic function*

should be checked before treatment with these drugs. Those with pre-existing liver disease or alcohol dependence should have frequent checks particularly in the first 2 months. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment. In view of the need to comply fully with antituberculous treatment on the one hand and to guard against serious liver damage on the other, patients and their carers should be informed carefully how to recognise signs of liver disorders and advised to discontinue treatment and seek **immediate** medical attention should symptoms of liver disease occur.

Renal function should be checked before treatment with antituberculous drugs and appropriate dosage adjustments made. Streptomycin or ethambutol should preferably be avoided in patients with renal impairment, but if used, the dose should be reduced and the plasma-drug concentration monitored.

Visual acuity should be tested before ethambutol is used (see below).

Major causes of treatment failure are incorrect prescribing by the physician and inadequate compliance by the patient. Monthly tablet counts and urine examination (rifampicin imparts an orange-red coloration) may be useful indicators of compliance with treatment. Avoid both excessive and inadequate dosage. Treatment should be supervised by a specialist physician.

Isoniazid is cheap and highly effective. Like rifampicin it should always be included in any antituberculous regimen unless there is a specific contra-indication. Its only common side-effect is peripheral neuropathy which is more likely to occur where there are pre-existing risk factors such as diabetes, alcohol dependence, chronic renal failure, pregnancy, malnutrition and HIV infection. In these circumstances pyridoxine 10 mg daily (or 20 mg daily if suitable product not available) (section 9.6.2) should be given prophylactically from the start of treatment. The risk of peripheral neuropathy may also be increased by high doses of isoniazid; pyridoxine should, therefore, be considered for those receiving *Voractiv*®(p. 395) 5 tablets daily. Other side-effects such as hepatitis (important: see Monitoring above) and psychosis are rare.

Rifampicin, a rifamycin, is a key component of any antituberculous regimen. Like isoniazid it should always be included unless there is a specific contra-indication.

During the first two months ('initial phase') of rifampicin administration transient disturbance of liver function with elevated serum transaminases is common but generally does not require interruption of treatment. Occasionally more serious liver toxicity requires a change of treatment particularly in those with pre-existing liver disease (important: see Monitoring above).

On intermittent treatment six toxicity syndromes have been recognised—influenza-like, abdominal, and respiratory symptoms, shock, renal failure, and thrombocytopenic purpura—and can occur in 20 to 30% of patients.

Rifampicin induces hepatic enzymes which accelerate the metabolism of several drugs including oestrogens, corticosteroids, phenytoin, sulfonylureas, and anticoagulants; **interactions:** Appendix 1 (rifamycins). **Important:** the effectiveness of hormonal contraceptives is reduced and alternative family planning advice should be offered (section 7.3.1).

Rifabutin, another rifamycin, is indicated for *prophylaxis* against *M. avium* complex infections in patients with a low CD4 count; it is also licensed for the *treatment* of non-tuberculous mycobacterial disease and pulmonary tuberculosis. **Important:** as with rifampicin it induces hepatic enzymes and the effectiveness of hormonal contraceptives is reduced requiring alternative family planning methods.

Pyrazinamide is a bactericidal drug only active against intracellular dividing forms of *Mycobacterium tuberculosis*; it exerts its main effect only in the first two or three months. It is particularly useful in tuberculous meningitis because of good meningeal penetration. It is not active against *M. bovis*. Serious liver toxicity may occasionally occur (important: see Monitoring above).

Ethambutol is included in a treatment regimen if isoniazid resistance is suspected; it can be omitted if the risk of resistance is low.

Side-effects of ethambutol are largely confined to visual disturbances in the form of loss of acuity, colour blindness, and restriction of visual fields. These toxic effects are more common where excessive dosage is used or if the patient's renal function is impaired. The earliest features of ocular toxicity are subjective and patients should be advised to discontinue therapy immediately if they develop deterioration in vision and promptly seek further advice. Early discontinuation of the drug is almost always followed by recovery of eyesight. Patients who cannot understand warnings about visual side-effects should, if possible, be given an alternative drug. In particular, ethambutol should be used with caution in children until they are at least 5 years old and capable of reporting symptomatic visual changes accurately.

Visual acuity should be tested by Snellen chart before treatment with ethambutol.

Streptomycin [unlicensed] is now rarely used in the UK except for resistant organisms. Plasma-drug concentration should be measured in patients with impaired renal function in whom streptomycin must be used with great care.

Drug-resistant tuberculosis should be treated by a specialist physician with experience in such cases, and where appropriate facilities for infection-control exist. Second-line drugs available for infections caused by resistant organisms, or when first-line drugs cause unacceptable side-effects, include amikacin, capreomycin, cycloserine, newer macrolides (e.g. azithromycin and clarithromycin), moxifloxacin and protionamide (prothionamide; no longer on UK market).

CAPREOMYCIN

Indications in combination with other drugs, tuberculosis resistant to first-line drugs

Cautions auditory impairment; monitor renal, hepatic, auditory, and vestibular function and electrolytes; **interactions:** Appendix 1 (capreomycin)

Hepatic impairment use with caution

Renal impairment reduce dose—consult product literature; nephrotoxic; ototoxic

Pregnancy manufacturer advises use only if potential benefit outweighs risk—teratogenic in *animal* studies

Breast-feeding manufacturer advises caution—no information available

Side-effects hypersensitivity reactions including urticaria and rashes; leucocytosis or leucopenia, rarely thrombocytopenia; changes in liver function tests; nephrotoxicity, electrolyte disturbances; hearing loss with tinnitus and vertigo; neuromuscular block after large doses, pain and induration at injection site

Dose

- By deep intramuscular injection, 1 g daily (not more than 20 mg/kg) for 2–4 months, then 1 g 2–3 times each week

Capreomycin (King) PoM

Injection, powder for reconstitution, capreomycin sulfate 1 million units (= capreomycin approx. 1 g). Net price per vial = £16.01

CYCLOSERINE

Indications in combination with other drugs, tuberculosis resistant to first-line drugs

Cautions monitor haematological, renal, and hepatic function; **interactions:** Appendix 1 (cycloserine)

Contra-indications epilepsy, depression, severe anxiety, psychotic states, alcohol dependence

Renal impairment increase interval between doses if creatinine clearance less than 50 mL/minute and monitor blood-cycloserine concentration

Pregnancy manufacturer advises use only if potential benefit outweighs risk—crosses the placenta

Breast-feeding amount too small to be harmful

Side-effects mainly neurological, including headache, dizziness, vertigo, drowsiness, tremor, convulsions, confusion, psychosis, depression (discontinue or reduce dose if symptoms of CNS toxicity); rashes, allergic dermatitis (discontinue or reduce dose); megaloblastic anaemia; changes in liver function tests; heart failure at high doses reported

Dose

- Initially 250 mg every 12 hours for 2 weeks increased according to blood concentration and response to max. 500 mg every 12 hours; CHILD 2–18 years see *BNF for Children*

  Note Blood concentration monitoring required especially in renal impairment or if dose exceeds 500 mg daily or if signs of toxicity; blood concentration should not exceed 30 mg/litre

Cycloserine (King) PoM

Capsules, red/grey cycloserine 250 mg, net price 100-cap pack = £402.63. Label: 2, 8

ETHAMBUTOL HYDROCHLORIDE

Indications tuberculosis, in combination with other drugs

Cautions elderly; test visual acuity before treatment and warn patients to report visual changes—see Monitoring in notes above; young children (see notes above)—routine ophthalmological monitoring recommended

Contra-indications optic neuritis, poor vision

Renal impairment if creatinine clearance less than 30 mL/minute, use 15–25 mg/kg (max. 2.5 g) 3 times a week and monitor plasma-ethambutol concentration; optic nerve damage

Pregnancy not known to be harmful; see also p. 391

Breast-feeding amount too small to be harmful; see also p. 391

Side-effects optic neuritis, red/green colour blindness, peripheral neuritis, rarely rash, pruritus, urticaria, thrombocytopenia

Dose

- See notes above

  Note 'Peak' concentration (2–2.5 hours after dose) should be 2–6 mg/litre (7–22 micromol/litre); 'trough' (pre-dose) concentration should be less than 1 mg/litre (4 micromol/litre); see Renal Impairment above

Ethambutol (Non-proprietary) PoM

Tablets, ethambutol hydrochloride 100 mg, net price 56-tab pack = £11.52; 400 mg, 56-tab pack = £42.74. Label: 8

ISONIAZID

Indications tuberculosis, in combination with other drugs; prophylaxis—Table 2, section 5.1

Cautions see Monitoring in notes above; also slow acetylator status (increased risk of side-effects); epilepsy; history of psychosis; alcohol dependence, malnutrition, diabetes mellitus, HIV infection (risk of peripheral neuritis); acute porphyria (section 9.8.2); **interactions:** Appendix 1 (isoniazid)

Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop

Contra-indications drug-induced liver disease

Hepatic impairment use with caution; monitor liver function regularly and particularly frequently in first 2 months; see also Hepatic Disorders above

Renal impairment risk of ototoxicity and peripheral neuropathy; prophylactic pyridoxine recommended, see notes above

Pregnancy not known to be harmful; prophylactic pyridoxine recommended; see also p. 391

Breast-feeding monitor infant for possible toxicity; theoretical risk of convulsions and neuropathy; prophylactic pyridoxine advisable in mother; see also p. 391

Side-effects nausea, vomiting, constipation, dry mouth; peripheral neuritis with high doses (pyridoxine prophylaxis, see notes above), optic neuritis, convulsions, psychotic episodes, vertigo; hypersensitivity reactions including fever, Stevens-Johnson syndrome, purpura; blood disorders including agranulocytosis, haemolytic anaemia, aplastic anaemia; hepatitis (especially over age of 35 years); pancreatitis; interstitial pneumonitis; systemic lupus erythematosus-like syndrome, pellagra, hyperreflexia, difficulty with micturition, hyperglycaemia, and gynaecomastia reported; hearing loss and tinnitus (in patients with end-stage renal impairment); when used with tyramine or histamine rich foods, tachycardia, palpitation, hypotension, flushing, headache, dizziness, and sweating also reported

Dose

- By mouth *or* by intramuscular *or* intravenous injection, see notes above

Isoniazid (Non-proprietary) PoM

Tablets, isoniazid 50 mg, net price 56-tab pack = £13.75; 100 mg, 28-tab pack = £13.75. Label: 8, 22

Injection, isoniazid 25 mg/mL, net price 2-mL amp = £24.11

PYRAZINAMIDE

Indications tuberculosis in combination with other drugs

Cautions see Monitoring in notes above; also diabetes; gout (avoid in acute attack); **interactions:** Appendix 1 (pyrazinamide)

Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop

Hepatic impairment monitor hepatic function—idiosyncratic hepatotoxicity more common; avoid in severe hepatic impairment; see also Hepatic Disorders above

Renal impairment monitor for gout; 25–30 mg/kg 3 times a week if eGFR less than 30 mL/minute/1.73 m^2

Pregnancy manufacturer advises use only if potential benefit outweighs risk; see also p. 391

Breast-feeding amount too small to be harmful; see also p. 391

Side-effects hepatotoxicity including fever, anorexia, hepatomegaly, splenomegaly, jaundice, liver failure; nausea, vomiting, flushing, dysuria, arthralgia, sideroblastic anaemia, thrombocytopenia, rash and occasionally photosensitivity

Dose

- See notes above

Zinamide® (Genus) PoM

Tablets, scored, pyrazinamide 500 mg, net price 30-tab pack = £31.35. Label: 8

RIFABUTIN

Indications see under Dose

Cautions see under Rifampicin; acute porphyria (section 9.8.2)

Contra-indications rifamycin hypersensitivity

Hepatic impairment reduce dose in severe impairment

Renal impairment use half normal dose if eGFR less than 30 mL/minute/1.73 m^2

Pregnancy manufacturer advises avoid—no information available

Breast-feeding manufacturer advises avoid—no information available

Side-effects nausea, pyrexia, blood disorders (including leucopenia, anaemia, thrombocytopenia, and rarely haemolysis), myalgia, rash; *less commonly* vomiting, raised liver enzymes, jaundice, arthralgia, corneal deposits, uveitis especially following high doses or concomitant use with drugs that increase plasma concentration—see also **interactions:** Appendix 1 (rifamycins), hypersensitivity reactions (including eosinophilia, bronchospasm), skin, urine, saliva and other body secretions coloured orange-red; *also reported* hepatitis, influenza-like symptoms, chest pain, dyspnoea

Dose

- Prophylaxis of *Mycobacterium avium* complex infections in immunosuppressed patients with low CD4 count (see product literature), 300 mg daily as a single dose
- Treatment of non-tuberculous mycobacterial disease, in combination with other drugs, 450–600 mg daily as a single dose for up to 6 months after cultures negative
- Treatment of pulmonary tuberculosis, in combination with other drugs, 150–450 mg daily as a single dose for at least 6 months
- CHILD not recommended

Mycobutin® (Pharmacia) PoM

Capsules, red-brown, rifabutin 150 mg. Net price 30-cap pack = £90.38. Label: 8, 14, counselling, lenses, see under Rifampicin

RIFAMPICIN

Indications see under Dose

Cautions see Monitoring in notes above; also liver function tests and blood counts in hepatic disorders, alcohol dependence, and on prolonged therapy, see also below; **important:** effectiveness of hormonal contraceptives is reduced and alternative family planning advice should be offered (see also section 7.3.1); discolours soft contact lenses; see also notes above; **interactions:** Appendix 1 (rifamycins)

Note If treatment interrupted re-introduce with low dosage and increase gradually; discontinue permanently if serious side-effects develop

Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop

Contra-indications jaundice; rifamycin hypersensitivity; acute porphyria (section 9.8.2)

Hepatic impairment impaired elimination; monitor liver function; avoid or do not exceed 8 mg/kg daily; see also Cautions above

Renal impairment use with caution if dose above 600 mg daily

Pregnancy manufacturers advise very high doses teratogenic in *animal* studies in first trimester; risk of neonatal bleeding may be increased in third trimester; see also p. 391

Breast-feeding amount too small to be harmful; see also p. 391

Side-effects gastro-intestinal symptoms including anorexia, nausea, vomiting, diarrhoea (antibiotic-associated colitis reported); headache, drowsiness; those occurring mainly on intermittent therapy include influenza-like symptoms (with chills, fever, dizziness, bone pain), respiratory symptoms (including shortness of breath), collapse and shock, haemolytic anaemia, thrombocytopenic purpura, disseminated intravascular coagulation, and acute renal failure; alterations of liver function, jaundice; flushing, urticaria, and rashes; other side-effects reported include oedema, psychoses, adrenal insufficiency, muscular weakness and myopathy, exfoliative dermatitis, toxic epidermal necrolysis, Stevens-Johnson syndrome, pemphigoid reactions, leucopenia, eosinophilia, menstrual disturbances; urine, saliva, and other body secretions coloured orange-red; thrombophlebitis reported if infusion used for prolonged period

Dose

- Brucellosis, legionnaires' disease, endocarditis and serious staphylococcal infections, in combination with other drugs, by mouth *or* by intravenous infusion, 0.6–1.2 g daily (in 2–4 divided doses)
- Tuberculosis, in combination with other drugs, see notes above

- Leprosy, section 5.1.10
- Prophylaxis of meningococcal meningitis and *Haemophilus influenzae* (type b) infection, Table 2, section 5.1

Rifampicin (Non-proprietary) PoM

Capsules, rifampicin 150 mg, net price 100 = £14.04; 300 mg, 100 = £44.80. Label: 8, 14, 22, counselling, see lenses above

Rifadin® (Sanofi-Aventis) PoM

Capsules, rifampicin 150 mg (blue/red), net price 100-cap pack= £18.32; 300 mg (red), 100-cap pack= £36.63. Label: 8, 14, 22, counselling, see lenses above

Syrup, red, rifampicin 100 mg/5 mL (raspberry-flavoured), net price 120 mL = £3.56. Label: 8, 14, 22, counselling, see lenses above

Intravenous infusion, powder for reconstitution, rifampicin, net price 600-mg vial (with solvent) = £7.67

Electrolytes $Na^+ < 0.5$ mmol/vial

Rimactane® (Sandoz) PoM

Capsules, rifampicin 150 mg (red), net price 60-cap pack = £15.83; 300 mg (red/brown), 60-cap pack = £25.92. Label: 8, 14, 22, counselling, see lenses above

Combined preparations

Rifater® (Sanofi-Aventis) PoM

Tablets, pink, s/c, rifampicin 120 mg, isoniazid 50 mg, pyrazinamide 300 mg, net price 100-tab pack= £21.95. Label: 8, 14, 22, counselling, see lenses above

Dose initial treatment of pulmonary tuberculosis, patients up to 40 kg 3 tablets daily preferably before breakfast, 40–49 kg 4 tablets daily, 50–64 kg 5 tablets daily, 65 kg or more, 6 tablets daily; not suitable for use in children

Rifinah® 150/100 (Sanofi-Aventis) PoM

Tablets, pink, s/c, rifampicin 150 mg, isoniazid 100 mg, net price 84-tab pack = £15.91. Label: 8, 14, 22, counselling, see lenses above

Dose ADULT under 50 kg, 3 tablets daily, preferably before breakfast

Rifinah® 300/150 (Sanofi-Aventis) PoM

Tablets, orange, s/c, rifampicin 300 mg, isoniazid 150 mg, net price 56-tab pack = £26.24. Label: 8, 14, 22, counselling, see lenses above

Dose ADULT 50 kg and over, 2 tablets daily, preferably before breakfast

Note Some stock packaged as *Rifinah 150/300*

Voractiv® (Sandoz) PoM

Tablets, brown, f/c, rifampicin 150 mg, isoniazid 75 mg, pyrazinamide 400 mg, ethambutol hydrochloride 275 mg, net price 60-tab pack = £39.50. Label: 8, 14, 22, counselling, see lenses above

Dose initial treatment of tuberculosis ADULT 30–39 kg 2 tablets daily, 40–54 kg 3 tablets daily, 55–70 kg 4 tablets daily, over 70 kg 5 tablets daily

Note Risk of peripheral neuropathy may be increased by high doses of isoniazid—consider prescribing pyridoxine for those receiving *Voractiv®* 5 tablets daily (see also Isoniazid prescribing notes, p. 392)

STREPTOMYCIN

Indications tuberculosis, in combination with other drugs; adjunct to doxycycline in brucellosis; enterococcal endocarditis (Table 1, section 5.1)

Cautions see under Aminoglycosides, section 5.1.4; **interactions:** Appendix 1 (aminoglycosides)

Contra-indications see under Aminoglycosides, section 5.1.4

Renal impairment see under Aminoglycosides, section 5.1.4

Pregnancy see under Aminoglycosides, section 5.1.4

Side-effects see under Aminoglycosides, section 5.1.4; also hypersensitivity reactions, paraesthesia of mouth

Dose

- By deep intramuscular injection, tuberculosis [unlicensed], 15 mg/kg (max. 1 g) daily (reduced in those under 50 kg, those over 40 years, or those with renal impairment)

  Brucellosis, expert advice essential

Important Side-effects increase after a cumulative dose of 100 g, which should only be exceeded in exceptional circumstances

Note One-hour ('peak') concentration should be 15–40 mg/litre; pre-dose ('trough') concentration should be less than 5 mg/litre (less than 1 mg/litre in renal impairment or in those over 50 years)

Streptomycin Sulfate (Non-proprietary) PoM

Injection, powder for reconstitution, streptomycin (as sulfate), net price 1-g vial = £15.00

Available from 'special-order' manufacturers or specialist importing companies, see p. 1104

5.1.10 Antileprotic drugs

Advice from a member of the Panel of Leprosy Opinion is essential for the treatment of leprosy (Hansen's disease). Details can be obtained from the Hospital for Tropical Diseases, (telephone (020) 3456 7890).

The World Health Organization has made recommendations to overcome the problem of dapsone resistance and to prevent the emergence of resistance to other antileprotic drugs. Drugs recommended are **dapsone**, **rifampicin** (section 5.1.9), and **clofazimine**. Other drugs with significant activity against *Mycobacterium leprae* include ofloxacin, minocycline and clarithromycin, but none of these are as active as rifampicin; at present they should be reserved as second-line drugs for leprosy.

A three-drug regimen is recommended for *multibacillary leprosy* (lepromatous, borderline-lepromatous, and borderline leprosy) and a two-drug regimen for *paucibacillary leprosy* (borderline-tuberculoid, tuberculoid, and indeterminate). The following regimens are widely used throughout the world (with minor local variations):

Multibacillary leprosy (3-drug regimen)

Rifampicin	600 mg once-monthly, supervised (450 mg for adults weighing less than 35 kg)
Dapsone	100 mg daily, self-administered (50 mg daily or 1–2 mg/kg daily for adults weighing less than 35 kg)
Clofazimine	300 mg once-monthly, supervised, *and* 50 mg daily (or 100 mg on alternate days), self-administered

Multibacillary leprosy should be treated for at least 2 years. Treatment should be continued unchanged during both type I (reversal) or type II (erythema nodosum leprosum) reactions. During reversal reactions neuritic pain or weakness can herald the rapid onset of perma-

nent nerve damage. Treatment with prednisolone (initially 40–60 mg daily) should be instituted at once. Mild type II reactions may respond to aspirin. Severe type II reactions may require corticosteroids; thalidomide [unlicensed] is also useful in patients who have become corticosteroid dependent, but it should be used only under **specialist supervision**. Thalidomide is teratogenic and, therefore, contra-indicated in pregnancy; it must **not** be given to women of child-bearing potential unless they comply with a pregnancy prevention programme (see section 8.2.4). Increased doses of clofazimine 100 mg 3 times daily for the first month with subsequent reductions, are also useful but may take 4–6 weeks to attain full effect.

Paucibacillary leprosy (2-drug regimen)

Rifampicin	600 mg once-monthly, supervised (450 mg for those weighing less than 35 kg)
Dapsone	100 mg daily, self-administered (50 mg daily or 1–2 mg/kg daily for adults weighing less than 35 kg)

Paucibacillary leprosy should be treated for 6 months. If treatment is interrupted the regimen should be recommenced where it was left off to complete the full course.

Neither the multibacillary nor the paucibacillary antileprosy regimen is sufficient to treat tuberculosis.

DAPSONE

Indications leprosy, dermatitis herpetiformis; *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia (section 5.4.8)

Cautions cardiac or pulmonary disease; anaemia (treat severe anaemia before starting); susceptibility to haemolysis including G6PD deficiency (section 9.1.5); avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (dapsone)

Blood disorders On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop

Pregnancy folic acid 5 mg daily should be given to mother throughout pregnancy; neonatal haemolysis and methaemoglobinaemia reported in third trimester

Breast-feeding haemolytic anaemia; although significant amount in milk, risk to infant very small unless infant is G6PD deficient

Side-effects (dose-related and uncommon at doses used for leprosy), haemolysis, methaemoglobinaemia, neuropathy, allergic dermatitis (rarely including toxic epidermal necrolysis and Stevens-Johnson syndrome), anorexia, nausea, vomiting, tachycardia, headache, insomnia, psychosis, hepatitis, agranulocytosis; dapsone syndrome (rash with fever and eosinophilia)—discontinue immediately (may progress to exfoliative dermatitis, hepatitis, hypoalbuminaemia, psychosis and death)

Dose

- Leprosy, 1–2 mg/kg daily, see notes above
- Dermatitis herpetiformis, see specialist literature

Dapsone (Non-proprietary) PoM

Tablets, dapsone 50 mg, net price 28-tab pack = £46.69; 100 mg, 28-tab pack = £92.70 Label: 8

CLOFAZIMINE

Indications leprosy

Cautions may discolour soft contact lenses; avoid if persistent abdominal pain and diarrhoea

Hepatic impairment use with caution

Renal impairment use with caution

Pregnancy use with caution

Breast-feeding may alter colour of milk; skin discoloration of infant

Side-effects nausea, vomiting (hospitalise if persistent), abdominal pain; headache, tiredness; brownish-black discoloration of lesions and skin including areas exposed to light; reversible hair discoloration; dry skin; red discoloration of faeces, urine and other body fluids; also rash, pruritus, photosensitivity, acne-like eruptions, anorexia, eosinophilic enteropathy, bowel obstruction, dry eyes, dimmed vision, macular and subepithelial corneal pigmentation; elevation of blood sugar, weight loss, splenic infarction, lymphadenopathy

Dose

- Leprosy, see notes above
- Lepromatous lepra reactions, dosage increased to 300 mg daily for max. of 3 months

Clofazimine (Non-proprietary) PoM

Capsules, clofazimine 100 mg. Label: 8, 14, 21

Available on named-patient basis

5.1.11 Metronidazole and tinidazole

Metronidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa; indications include trichomonal vaginitis (section 5.4.3), bacterial vaginosis (notably *Gardnerella vaginalis* infections), and *Entamoeba histolytica* and *Giardia lamblia* infections (section 5.4.2). It is also used for surgical and gynaecological sepsis in which its activity against colonic anaerobes, especially *Bacteroides fragilis*, is important. Metronidazole by the rectal route is an effective alternative to the intravenous route when oral administration is not possible. Intravenous metronidazole is used for the treatment of established cases of tetanus; diazepam (section 10.2.2) and tetanus immunoglobulin (section 14.5.2) are also used.

Metronidazole by mouth is effective for the treatment of *Clostridium difficile* infection , see also section 1.5; it can be given by intravenous infusion if oral treatment is inappropriate.

Topical metronidazole (section 13.10.1.2) reduces the odour produced by anaerobic bacteria in fungating tumours; it is also used in the management of rosacea (section 13.6).

Tinidazole is similar to metronidazole but has a longer duration of action.

Oral infections Metronidazole is an alternative to a penicillin for the treatment of many oral infections where the patient is allergic to penicillin or the infection is due to beta-lactamase-producing anaerobes (Table 1, section 5.1). It is the drug of first choice for the treatment of acute necrotising ulcerative gingivitis (Vincent's infection) and pericoronitis; amoxicillin is a suitable alternative (section 5.1.1.3). For these purposes metronidazole in a dose of 200 mg 3 times daily for 3 days is sufficient, but the duration of treatment may need to be

longer in pericoronitis. Tinidazole is licensed for the treatment of acute ulcerative gingivitis.

METRONIDAZOLE

Indications anaerobic infections (including dental), see under Dose below; protozoal infections (section 5.4.2); *Helicobacter pylori* eradication (section 1.3); fistulating Crohn's disease (section 1.5); skin (section 13.10.1.2)

Cautions disulfiram-like reaction with alcohol; clinical and laboratory monitoring advised if treatment exceeds 10 days; **interactions:** Appendix 1 (metronidazole)

Hepatic impairment in severe liver disease reduce total daily dose to one-third, and give once daily; use with caution in hepatic encephalopathy

Pregnancy manufacturer advises avoidance of high-dose regimens

Breast-feeding significant amount in milk; manufacturer advises avoid large single doses

Side-effects gastro-intestinal disturbances (including nausea and vomiting), taste disturbances, furred tongue, oral mucositis, anorexia; *very rarely* hepatitis, jaundice, pancreatitis, drowsiness, dizziness, headache, ataxia, psychotic disorders, darkening of urine, thrombocytopenia, pancytopenia, myalgia, arthralgia, visual disturbances, rash, pruritus, and erythema multiforme; on prolonged or intensive therapy peripheral neuropathy, transient epileptiform seizures, and leucopenia; also reported aseptic meningitis, optic neuropathy

Dose

- Anaerobic infections (usually treated for 7 days and for 10–14 days in *Clostridium difficile* infection), by mouth, *either* 400 mg every 8 hours *or* 500 mg every 8 hours, CHILD 1–2 months 7.5 mg/kg every 12 hours, 2 months–12 years 7.5 mg/kg (max. 400 mg) every 8 hours; by rectum, 1 g every 8 hours for 3 days, then 1 g every 12 hours, CHILD every 8 hours for 3 days, then every 12 hours, 1 month–1 year 125 mg, 1–5 years 250 mg, 5–10 years 500 mg, over 10 years, adult dose; by intravenous infusion over 20 minutes, 500 mg every 8 hours; CHILD under 18 years see *BNF for Children*
- Leg ulcers and pressure sores, by mouth, 400 mg every 8 hours for 7 days
- Bacterial vaginosis, by mouth, 400–500 mg twice daily for 5–7 days *or* 2 g as a single dose
- Pelvic inflammatory disease (see also Table 1, section 5.1), by mouth, 400 mg twice daily for 14 days; CHILD 12–18 years see *BNF for Children*
- Acute ulcerative gingivitis, by mouth, 200–250 mg every 8 hours for 3 days; CHILD 1–3 years 50 mg every 8 hours for 3 days; 3–7 years 100 mg every 12 hours; 7–10 years 100 mg every 8 hours
- Acute oral infections, by mouth, 200 mg every 8 hours for 3–7 days (see also notes above); CHILD 1–3 years 50 mg every 8 hours for 3–7 days; 3–7 years 100 mg every 12 hours; 7–10 years 100 mg every 8 hours
- Surgical prophylaxis, by mouth, 400–500 mg 2 hours before surgery; up to 3 further doses of 400–500 mg may be given every 8 hours for high-risk procedures; CHILD 1 month–18 years see *BNF for Children*

  By rectum, 1 g 2 hours before surgery; up to 3 further doses of 1 g may be given every 8 hours for high-risk procedures; CHILD 5–18 years see *BNF for Children*

  By intravenous infusion (if rectal administration inappropriate), 500 mg up to 30 minutes before the procedure; up to 3 further doses of 500 mg may be given every 8 hours for high-risk procedures; CHILD under 18 years see *BNF for Children*

Note Metronidazole doses in BNF may differ from those in product literature

Metronidazole (Non-proprietary) PoM

Tablets, metronidazole 200 mg, net price 21-tab pack = £1.13; 400 mg, 21-tab pack = £1.21. Label: 4, 9, 21, 25, 27

Brands include *Vaginyl*®

Dental prescribing on NHS Metronidazole Tablets may be prescribed

Tablets, metronidazole 500 mg, net price 21-tab pack = £35.75. Label: 4, 9, 21, 25, 27

Dental prescribing on NHS Metronidazole Tablets may be prescribed

Suspension, metronidazole (as benzoate) 200 mg/5 mL. Net price 100 mL = £28.63. Label: 4, 9

Brands include *Norzol*®

Dental prescribing on NHS Metronidazole Oral Suspension may be prescribed

Intravenous infusion, metronidazole 5 mg/mL. Net price 20-mL amp = £1.56, 100-mL container = £3.10

Flagyl® (Zentiva) PoM

Tablets, both f/c, ivory, metronidazole 200 mg, net price 21-tab pack = £4.49; 400 mg, 14-tab pack = £6.34. Label: 4, 9, 21, 25, 27

Suppositories, metronidazole 500 mg, net price 10 = £15.18; 1 g, 10 = £23.06. Label: 4, 9

Metrolyl® (Sandoz) PoM

Intravenous infusion, metronidazole 5 mg/mL, net price 100-mL Steriflex® bag = £1.22

Electrolytes Na^+ 14.53 mmol/100-mL bag

Suppositories, metronidazole 500 mg, net price 10 = £12.34; 1 g, 10 = £18.34. Label: 4, 9

TINIDAZOLE

Indications anaerobic infections, see under Dose below; protozoal infections (section 5.4.2); *Helicobacter pylori* eradication (section 1.3)

Cautions see under Metronidazole; avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (tinidazole)

Pregnancy manufacturer advises avoid in first trimester

Breast-feeding present in milk—manufacturer advises avoid breast-feeding during and for 3 days after stopping treatment

Side-effects see under Metronidazole

Dose

- Anaerobic infections, 2 g initially, followed by 1 g daily *or* 500 mg twice daily, usually for 5–6 days
- Bacterial vaginosis and acute ulcerative gingivitis, a single 2-g dose
- Abdominal surgery prophylaxis, a single 2-g dose approximately 12 hours before surgery

Fasigyn® (Pfizer) PoM

Tablets, f/c, tinidazole 500 mg. Net price 16-tab pack = £11.04. Label: 4, 9, 21, 25

5.1.12 Quinolones

Nalidixic acid and **norfloxacin** are effective in uncomplicated urinary-tract infections (section 5.1.13).

Ciprofloxacin is active against both Gram-positive and Gram-negative bacteria. It is particularly active against Gram-negative bacteria, including salmonella, shigella, campylobacter, neisseria, and pseudomonas. Ciprofloxacin has only moderate activity against Gram-positive bacteria such as *Streptococcus pneumoniae* and *Enterococcus faecalis*; it should not be used for pneumococcal pneumonia. It is active against chlamydia and some mycobacteria. Most anaerobic organisms are not susceptible. Ciprofloxacin can be used for respiratory tract infections (but not for pneumococcal pneumonia), urinary-tract infections (section 5.1.13), infections of the gastro-intestinal system (including typhoid fever), bone and joint infections, gonorrhoea and septicaemia caused by sensitive organisms.

Ofloxacin is used for urinary-tract infections (section 5.1.13), lower respiratory-tract infections, gonorrhoea, and non-gonococcal urethritis and cervicitis.

Levofloxacin is active against Gram-positive and Gram-negative organisms. It has greater activity against pneumococci than ciprofloxacin. Levofloxacin is licensed for the treatment of acute sinusitis, acute exacerbations of chronic bronchitis, and community-acquired pneumonia, but it should only be considered for these infections when first-line treatment cannot be used or is ineffective. Levofloxacin is also licensed for the treatment of urinary-tract infections (section 5.1.13).

Although ciprofloxacin, levofloxacin, moxifloxacin, and ofloxacin are licensed for skin and soft-tissue infections, many staphylococci are resistant to the quinolones and their use should be avoided in MRSA infections.

Moxifloxacin should be reserved for the treatment of sinusitis, community-acquired pneumonia, exacerbations of chronic bronchitis, mild to moderate pelvic inflammatory disease, or complicated skin and soft-tissue infections which have failed to respond to other antibacterials or for patients who cannot be treated with other antibacterials. It has been associated with QT interval prolongation and life-threatening hepatotoxicity. Moxifloxacin is active against Gram-positive and Gram-negative organisms. It has greater activity against Gram-positive organisms, including pneumococci, than ciprofloxacin. Moxifloxacin is not active against *Pseudomonas aeruginosa* or meticillin-resistant *Staphylococcus aureus* (MRSA).

Anthrax *Inhalation* or *gastro-intestinal anthrax* should be treated initially with either **ciprofloxacin** [not licensed for gastro-intestinal anthrax] or **doxycycline** [unlicensed indication] (section 5.1.3) combined with one or two other antibacterials (such as amoxicillin, benzylpenicillin, chloramphenicol, clarithromycin, clindamycin, imipenem with cilastatin, rifampicin [unlicensed indication], and vancomycin). When the condition improves and the sensitivity of the *Bacillus anthracis* strain is known, treatment may be switched to a single antibacterial. Treatment should continue for 60 days because germination may be delayed.

Cutaneous anthrax should be treated with either ciprofloxacin [unlicensed indication] or doxycycline [unlicensed indication] (section 5.1.3) for 7 days. Treatment may be switched to amoxicillin (section 5.1.1.3) if the infecting strain is susceptible. Treatment may need to be extended to 60 days if exposure is due to aerosol. A combination of antibacterials for 14 days is recommended for cutaneous anthrax with systemic features, extensive oedema, or lesions of the head or neck.

Ciprofloxacin or doxycycline may be given for *post-exposure prophylaxis*. If exposure is confirmed, antibacterial prophylaxis should continue for 60 days. Antibacterial prophylaxis may be switched to amoxicillin after 10–14 days if the strain of *B. anthracis* is susceptible. Vaccination against anthrax (section 14.4) may allow the duration of antibacterial prophylaxis to be shortened.

Cautions Quinolones should be used with caution in patients with a history of epilepsy or conditions that predispose to seizures, in G6PD deficiency (section 9.1.5), myasthenia gravis (risk of exacerbation), and in children or adolescents (arthropathy has developed in weight-bearing joints in young *animals*—see below). Exposure to excessive sunlight should be avoided (discontinue if photosensitivity occurs). Quinolones can prolong the QT interval. Moxifloxacin is contra-indicated in patients with risk factors for QT interval prolongation (e.g. electrolyte disturbances, acute myocardial infarction, heart failure with reduced left ventricular ejection fraction, bradycardia, congenital long QT syndrome, concomitant use with other drugs known to prolong the QT interval, history of symptomatic arrhythmias) and the other quinolones should be used with caution in these patients. The CSM has warned that quinolones may induce **convulsions** in patients with or without a history of convulsions; taking NSAIDs at the same time may also induce them. Other **interactions:** Appendix 1 (quinolones).

Use in children Quinolones cause arthropathy in the weight-bearing joints of immature *animals* and are therefore generally not recommended in children and growing adolescents. However, the significance of this effect in humans is uncertain and in some specific circumstances short-term use of either ciprofloxacin or nalidixic acid may be justified in children. For further details see *BNF for Children*.

Tendon damage

Tendon damage (including rupture) has been reported rarely in patients receiving quinolones. Tendon rupture may occur within 48 hours of starting treatment; cases have also been reported several months after stopping a quinolone. Healthcare professionals are reminded that:

- quinolones are contra-indicated in patients with a history of tendon disorders related to quinolone use;
- patients over 60 years of age are more prone to tendon damage;
- the risk of tendon damage is increased by the concomitant use of corticosteroids;
- if tendinitis is suspected, the quinolone should be discontinued immediately.

Contra-indications quinolone hypersensitivity. See also Cautions above.

Pregnancy Quinolones should be avoided in pregnancy because they have been shown to cause arthropathy in *animal* studies; safer alternatives are available; however, a single dose of ciprofloxacin may be used for the prevention of a secondary case of meningococcal meningitis

Side-effects Side-effects of the quinolones include nausea, vomiting, diarrhoea (rarely antibiotic-associated

colitis), headache, and dizziness. Less frequent side-effects include dyspepsia, abdominal pain, anorexia, sleep disturbances, asthenia, confusion, anxiety, depression, hallucinations, tremor, blood disorders (including eosinophilia, leucopenia, thrombocytopenia), arthralgia, myalgia, rash (very rarely Stevens-Johnson syndrome and toxic epidermal necrolysis), disturbances in vision and taste. Other side-effects reported rarely or very rarely include hepatic dysfunction (including jaundice and hepatitis), hypotension, vasculitis, dyspnoea (more frequent with levofloxacin and moxifloxacin), convulsions, psychoses, symptoms of peripheral neuropathy (sometimes irreversible), renal failure, interstitial nephritis, tendon inflammation and damage (see also Tendon Damage above), photosensitivity, disturbances in hearing and smell. The drug should be **discontinued** if psychiatric, neurological or hypersensitivity reactions (including severe rash) occur.

CIPROFLOXACIN

Indications see notes above and under Dose; fistulating Crohn's disease (section 1.5); eye infections (section 11.3.1)

Cautions see notes above; avoid excessive alkalinity of urine and ensure adequate fluid intake (risk of crystalluria); **interactions:** Appendix 1 (quinolones)
Driving May impair performance of skilled tasks (e.g. driving); effects enhanced by alcohol

Contra-indications see notes above

Renal impairment by mouth, 250–500 mg every 12 hours if eGFR 30–60 mL/minute/1.73 m^2 (every 24 hours if eGFR less than 30 mL/minute/1.73 m^2); by intravenous infusion (200 mg over 30 minutes), 200–400 mg every 12 hours if eGFR 30–60 mL/minute/1.73 m^2 (every 24 hours if eGFR less than 30 mL/minute/1.73 m^2)

Pregnancy see notes above

Breast-feeding amount too small to be harmful but manufacturer advises avoid

Side-effects see notes above; also flatulence, pain and phlebitis at injection site; *rarely* dysphagia, pancreatitis, chest pain, tachycardia, syncope, oedema, hot flushes, abnormal dreams, sweating, hyperglycaemia, hypoglycaemia, and erythema nodosum; *very rarely* movement disorders, tinnitus, intracranial hypertension, and tenosynovitis; *also reported* peripheral neuropathy and polyneuropathy

Dose

- By mouth, respiratory-tract infections, 500–750 mg twice daily (750 mg twice daily in pseudomonal lower respiratory-tract infection in cystic fibrosis)
  Urinary-tract infections, 250–750 mg twice daily (250 mg twice daily for 3 days usually adequate for acute uncomplicated cystitis in women)
  Acute or chronic prostatitis, 500 mg twice daily for 28 days
  Gonorrhoea (see also Table 1, section 5.1), 500 mg as a single dose
  Most other infections, 500 mg twice daily (increased to 750 mg twice daily in severe or deep-seated infection)
  Surgical prophylaxis [unlicensed], 750 mg 60 minutes before procedure
  Prophylaxis of meningococcal meningitis, Table 2, section 5.1
- By intravenous infusion over 60 minutes, 400 mg every 8–12 hours
- Anthrax (treatment and post-exposure prophylaxis, see notes above), by mouth, 500 mg twice daily
  By intravenous infusion over 60 minutes, 400 mg every 12 hours
- CHILD under 18 years see *BNF for Children*

Ciprofloxacin (Non-proprietary) PoM
Tablets, ciprofloxacin (as hydrochloride) 100 mg, net price 6-tab pack = £1.26; 250 mg, 10-tab pack = 84p, 20-tab pack = £1.48; 500 mg, 10-tab pack = 98p, 20-tab pack = £1.47; 750 mg, 10-tab pack = £8.00. Label: 7, 9, 25, counselling, driving
Intravenous infusion, ciprofloxacin (as lactate) 2 mg/mL, net price 50-mL bottle = £7.57, 100-mL bottle = £14.49, 200-mL bottle = £19.79

Ciproxin® (Bayer) PoM
Tablets, all f/c, ciprofloxacin (as hydrochloride) 250 mg (scored), net price 10-tab pack = £6.59; 500 mg (scored), 10-tab pack = £12.49; 750 mg, 10-tab pack = £17.78. Label: 7, 9, 25, counselling, driving
Suspension, strawberry-flavoured, ciprofloxacin for reconstitution with diluent provided, 250 mg/5 mL, net price 100 mL = £19.80. Label: 7, 9, 25, counselling, driving
Intravenous infusion, ciprofloxacin (as lactate) 2 mg/mL, in sodium chloride 0.9%, net price 50-mL bottle = £7.61, 100-mL bottle = £15.01, 200-mL bottle = £22.85
Electrolytes Na^+ 15.4 mmol/100-mL bottle

LEVOFLOXACIN

Indications see notes above and under Dose

Cautions see notes above; history of psychiatric illness; **interactions:** Appendix 1 (quinolones)
Driving May impair performance of skilled tasks (e.g. driving)

Contra-indications see notes above

Renal impairment usual initial dose then use half normal dose if eGFR 20–50 mL/minute/1.73 m^2; consult product literature if eGFR less than 20 mL/minute/1.73 m^2

Pregnancy see notes above

Breast-feeding manufacturer advises avoid

Side-effects see notes above; also flatulence, constipation, hyperhidrosis; *rarely* tachycardia, palpitation, abnormal dreams, tinnitus, hypoglycaemia; also reported potentially life-threatening hepatic failure, syncope, benign intracranial hypertension, pneumonitis, peripheral neuropathy, extrapyramidal symptoms, hyperglycaemia, rhabdomyolysis, stomatitis; local reactions and transient hypotension reported with infusion

Dose

- By mouth, acute sinusitis, 500 mg once daily for 10–14 days
  Acute exacerbation of chronic bronchitis, 500 mg once daily for 7–10 days
  Community-acquired pneumonia, 500 mg once or twice daily for 7–14 days
  Urinary-tract infections, 500 mg once daily for 7–14 days (250 mg once daily for 3 days in uncomplicated infection)
  Chronic prostatitis, 500 mg once daily for 28 days
  Complicated skin and soft tissue infections, 500 mg once or twice daily for 7–14 days
  Inhalation anthrax (treatment and post-exposure

prophylaxis), 500 mg once daily for 8 weeks

- By intravenous infusion (over at least 60 minutes for 500 mg), community-acquired pneumonia, 500 mg once or twice daily

Complicated urinary-tract infections, chronic prostatitis, 500 mg once daily

Complicated skin and soft tissue infections, 500 mg once or twice daily

Inhalation anthrax (treatment and post-exposure prophylaxis), 500 mg once daily

Levofloxacin (Non-proprietary) PoM

Tablets, levofloxacin 250 mg, net price 5-tab pack = £4.00, 10-tab pack = £10.79; 500 mg, 5-tab pack = £6.80, 10-tab pack = £16.13. Label: 6, 9, 25, counselling, driving

Brands include *Evoxil*®

Intravenous infusion, levofloxacin 5 mg/mL, net price 100-mL bottle = £25.00, 100-mL infusion bag = £23.75

Tavanic® (Sanofi-Aventis) PoM

Tablets, yellow-red, f/c, scored, levofloxacin 250 mg, net price 5-tab pack = £7.23, 10-tab pack = £14.45; 500 mg, 5-tab pack = £12.93, 10-tab pack = £25.85. Label: 6, 9, 25, counselling, driving

Intravenous infusion, levofloxacin 5 mg/mL, net price 100-mL bottle = £26.40

Electrolytes Na^+ 15.8 mmol/100-mL bottle

MOXIFLOXACIN

Indications sinusitis, community-acquired pneumonia, exacerbations of chronic bronchitis, mild to moderate pelvic inflammatory disease, or complicated skin and soft-tissue infections which have failed to respond to other antibacterials or for patients who cannot be treated with other antibacterials

Cautions see notes above; **interactions:** Appendix 1 (quinolones)

Driving May impair performance of skilled tasks (e.g. driving)

Contra-indications see notes above

Hepatic impairment manufacturer advises avoid in severe impairment

Pregnancy see notes above

Breast-feeding manufacturer advises avoid—present in milk in *animal* studies

Side-effects see notes above; also gastritis, flatulence, constipation, arrhythmias, palpitation, angina, vasodilatation, hyperlipidaemia, sweating; *rarely* oedema, hypertension, syncope, dysphagia, abnormal dreams, incoordination, amnesia, peripheral neuropathy, hyperglycaemia, hyperuricaemia, myopathy, stomatitis; *very rarely* rhabdomyolysis, potentially life-threatening hepatic failure; *on intravenous infusion*, pain and phlebitis at injection site

Dose

- By mouth, 400 mg once daily
- By intravenous infusion over 60 minutes, community-acquired pneumonia, complicated skin and soft-tissue infections, 400 mg once daily

Note Recommended duration of treatment is 7–14 days for community-acquired pneumonia, 5–10 days in exacerbations of chronic bronchitis, 7 days in sinusitis, 14 days in pelvic inflammatory disease, 7–21 days for complicated skin and soft-tissue infections

Avelox® (Bayer) PoM

Tablets, red, f/c, moxifloxacin (as hydrochloride) 400 mg, net price 5-tab pack = £12.43. Label: 6, 9, counselling, driving

Intravenous infusion, moxifloxacin (as hydrochloride) 1.6 mg/mL, net price 250-mL bottle (400 mg) = £39.95

Electrolytes Na^+ 34 mmol/250-mL bottle

NALIDIXIC ACID

Indications urinary-tract infections

Cautions see notes above; avoid in acute porphyria (section 9.8.2); false positive urinary glucose (if tested for reducing substances); monitor blood counts, renal and liver function if treatment exceeds 2 weeks; **interactions:** Appendix 1 (quinolones)

Contra-indications see notes above

Hepatic impairment manufacturer advises caution in liver disease

Renal impairment use with caution; avoid if eGFR less than 20 mL/minute/1.73 m^2

Pregnancy see notes above

Breast-feeding risk to infant very small but one case of haemolytic anaemia reported

Side-effects see notes above; also reported toxic psychosis, increased intracranial pressure, cranial nerve palsy, peripheral neuropathy, and metabolic acidosis

Dose

- 900 mg every 6 hours for 7 days, reduced in chronic infections to 600 mg every 6 hours; CHILD 3 months–18 years see *BNF for Children*

Nalidixic Acid (Rosemont) PoM

Suspension, pink, nalidixic acid 300 mg/5 mL, net price 150 mL (raspberry- and strawberry-flavoured) = £17.00. Label: 9, 11

Excipients include sucrose 450 mg/5 mL

NORFLOXACIN

Indications see under Dose

Cautions see notes above; **interactions:** Appendix 1 (quinolones)

Driving May impair performance of skilled tasks (e.g. driving)

Contra-indications see notes above

Renal impairment use 400 mg once daily if eGFR less than 30 mL/minute/1.73 m^2

Pregnancy see notes above

Breast-feeding no information available—manufacturer advises avoid

Side-effects see notes above; also tinnitus, epiphora; *rarely* pancreatitis; *very rarely* arrhythmias; also reported, polyneuropathy and exfoliative dermatitis

Dose

- 'Lower' urinary-tract infections, 400 mg twice daily for 7–10 days (for 3 days for uncomplicated infections in women)
- Chronic relapsing 'lower' urinary-tract infections, 400 mg twice daily for up to 12 weeks; may be reduced to 400 mg once daily if adequate suppression within first 4 weeks
- Chronic prostatitis, 400 mg twice daily for 28 days

Norfloxacin (Non-proprietary) PoM

Tablets, norfloxacin 400 mg, net price 6-tab pack = £5.40, 14-tab pack = £12.00. Label: 7, 9, 23, counselling, driving

OFLOXACIN

Indications see under Dose

Cautions see notes above; history of psychiatric illness; **interactions:** Appendix 1 (quinolones)

Driving May affect performance of skilled tasks (e.g. driving); effects enhanced by alcohol

Contra-indications see notes above

Hepatic impairment use with caution; elimination may be reduced in severe impairment

Renal impairment usual initial dose, then use half normal dose if eGFR 20–50 mL/minute/1.73 m^2; 100 mg every 24 hours if eGFR less than 20 mL/minute/1.73 m^2

Pregnancy see notes above

Breast-feeding amount probably too small to be harmful but manufacturer advises avoid

Side-effects see notes above; also cough, nasopharyngitis, eye irritation; *rarely* arrhythmias, bronchospasm, abnormal dreams, hot flushes, hyperhidrosis; *very rarely* neuropathy, extrapyramidal symptoms, tinnitus; also reported pneumonitis, changes in blood sugar, myopathy, rhabdomyolysis; on intravenous infusion, hypotension and local reactions (including thrombophlebitis)

Dose

- By mouth, urinary-tract infections, 200–400 mg daily preferably in the morning, increased if necessary in upper urinary-tract infections to 400 mg twice daily

  Acute or chronic prostatitis, 200 mg twice daily for 28 days

  Lower respiratory-tract infections, 400 mg daily preferably in the morning, increased if necessary to 400 mg twice daily

  Skin and soft-tissue infections, 400 mg twice daily

  Uncomplicated gonorrhoea, 400 mg as a single dose

  Uncomplicated genital chlamydial infection, non-gonococcal urethritis, 400 mg daily in single or divided doses for 7 days

  Pelvic inflammatory disease (see also section 5.1, table 1), 400 mg twice daily for 14 days
- By intravenous infusion (over at least 30 minutes for each 200 mg), complicated urinary-tract infection, 200 mg daily

  Lower respiratory-tract infection, 200 mg twice daily

  Septicaemia, 200 mg twice daily

  Skin and soft-tissue infections, 400 mg twice daily

  Severe or complicated infections, dose may be increased to 400 mg twice daily

Ofloxacin (Non-proprietary) PoM

Tablets, ofloxacin 200 mg, net price 10-tab pack = £7.64; 400 mg, 5-tab pack = £12.67, 10-tab pack = £4.59. Label: 6, 9, 11, counselling, driving

Tarivid® (Sanofi-Aventis) PoM

Tablets, f/c, scored, ofloxacin 200 mg, net price 10-tab pack = £7.53, 20-tab pack = £15.05; 400 mg (yellow), 5-tab pack = £7.52, 10-tab pack = £14.99. Label: 6, 9, 11, counselling, driving

Intravenous infusion, ofloxacin (as hydrochloride) 2 mg/mL, net price 100-mL bottle = £16.16 (hosp. only)

5.1.13 Urinary-tract infections

Urinary-tract infection is more common in women than in men; when it occurs in men there is frequently an underlying abnormality of the renal tract. Recurrent episodes of infection are an indication for radiological investigation especially in children in whom untreated pyelonephritis may lead to permanent kidney damage.

Escherichia coli is the most common cause of urinary-tract infection; *Staphylococcus saprophyticus* is also common in sexually active young women. Less common causes include Proteus and Klebsiella spp. *Pseudomonas aeruginosa* infections usually occur in the hospital setting and may be associated with functional or anatomical abnormalities of the renal tract. *Staphylococcus epidermidis* and *Enterococcus faecalis* infection may complicate catheterisation or instrumentation.

A specimen of urine should be collected for culture and sensitivity testing before starting antibacterial therapy;

- in men;
- in pregnant women;
- in children under 3 years of age;
- in patients with suspected upper urinary-tract infection, complicated infection, or recurrent infection;
- if resistant organisms are suspected;
- if urine dipstick testing gives a single positive result for leucocyte esterase or nitrite;
- if clinical symptoms are not consistent with results of dipstick testing.

Treatment should not be delayed while waiting for results. The antibacterial chosen should reflect current local bacterial sensitivity to antibacterials.

Uncomplicated lower urinary-tract infections often respond to trimethoprim, nitrofurantoin, or amoxicillin given for 7 days (3 days may be adequate for infections in women; see also Table 1, section 5.1); those caused by fully sensitive bacteria respond to two 3-g doses of amoxicillin (section 5.1.1.3). Widespread bacterial resistance to ampicillin, amoxicillin, and trimethoprim has been reported. Alternatives for resistant organisms include co-amoxiclav (amoxicillin with clavulanic acid), an oral cephalosporin, nitrofurantoin, pivmecillinam, or a quinolone.

Fosfomycin [unlicensed] can be used, on the advice of a microbiologist, for the treatment of uncomplicated lower urinary-tract infections caused by multiple-antibacterial resistant organisms when other antibacterials cannot be used; in adults, it is given as a single oral dose of 3 g.

Long-term low dose therapy may be required in selected patients to prevent *recurrence of infection*; indications include frequent relapses and significant kidney damage. Trimethoprim, nitrofurantoin and cefalexin have been recommended for long-term therapy.

Methenamine (hexamine) should **not** generally be used because it requires an acidic urine for its antimicrobial activity and it is ineffective for upper urinary-tract infections; it may, however, have a role in the prophylaxis and treatment of chronic or recurrent uncomplicated lower urinary-tract infections.

Acute pyelonephritis can lead to septicaemia and is treated initially by injection of a broad-spectrum antibacterial such as cefuroxime or a quinolone if the patient is severely ill; gentamicin can also be used.

Prostatitis can be difficult to cure and requires treatment for several weeks with an antibacterial which penetrates prostatic tissue such as trimethoprim, or some quinolones.

Where infection is localised and associated with an indwelling *catheter* a bladder instillation is often effective (section 7.4.4).

Pregnancy Urinary-tract infection in pregnancy may be asymptomatic and requires prompt treatment to prevent progression to acute pyelonephritis. Penicillins and cephalosporins are suitable for treating urinary-tract infection during pregnancy. Nitrofurantoin may also be used but it should be avoided at term. Sulfonamides and quinolones should be avoided during pregnancy; trimethoprim should also preferably be avoided particularly in the first trimester.

Renal impairment In renal failure antibacterials normally excreted by the kidney accumulate with resultant toxicity unless the dose is reduced. This applies especially to the aminoglycosides which should be used with great caution; tetracyclines, methenamine, and nitrofurantoin should be avoided altogether.

Children Urinary-tract infections in children require prompt antibacterial treatment to minimise the risk of renal scarring. Uncomplicated 'lower' urinary-tract infections in *children over 3 months of age* can be treated with trimethoprim, nitrofurantoin, a first generation cephalosporin (e.g. cefalexin), or amoxicillin for 3 days; children should be reassessed if they continue to be unwell 24–48 hours after the initial assessment. Amoxicillin should only be used if the organism causing the infection is sensitive to it.

Acute pyelonephritis in children over 3 months of age can be treated with a first generation cephalosporin or co-amoxiclav for 7–10 days. If the patient is severely ill, then the infection is best treated initially by injection of a broad-spectrum antibacterial such as cefotaxime or co-amoxiclav; gentamicin is an alternative.

Children under 3 months of age should be transferred to hospital and treated initially with intravenous antibacterial drugs such as ampicillin with gentamicin, or cefotaxime alone, until the infection responds; full doses of oral antibacterials are then given for a further period.

Recurrent episodes of infection are an indication for imaging tests. *Antibacterial prophylaxis* with low doses of trimethoprim or nitrofurantoin may be considered for children with recurrent infection, significant urinary-tract anomalies, or significant kidney damage.

NITROFURANTOIN

Indications urinary-tract infections

Cautions anaemia; diabetes mellitus; electrolyte imbalance; vitamin B and folate deficiency; pulmonary disease; on long-term therapy, monitor liver function and monitor for pulmonary symptoms, especially in the elderly (discontinue if deterioration in lung function); susceptibility to peripheral neuropathy; false positive urinary glucose (if tested for reducing substances); urine may be coloured yellow or brown; **interactions:** Appendix 1 (nitrofurantoin)

Contra-indications infants less than 3 months old, G6PD deficiency (section 9.1.5); acute porphyria (section 9.8.2)

Hepatic impairment use with caution; cholestatic jaundice and chronic active hepatitis reported

Renal impairment avoid if eGFR less than 60 mL/minute/1.73 m^2; risk of peripheral neuropathy; ineffective because of inadequate urine concentrations

Pregnancy avoid at term—may produce neonatal haemolysis

Breast-feeding avoid; only small amounts in milk but could be enough to produce haemolysis in G6PD-deficient infants (section 9.1.5)

Side-effects anorexia, nausea, vomiting, and diarrhoea; acute and chronic pulmonary reactions (pulmonary fibrosis reported; possible association with lupus erythematosus-like syndrome); peripheral neuropathy; also reported, hypersensitivity reactions (including angioedema, anaphylaxis, sialadenitis, urticaria, rash and pruritus); rarely, cholestatic jaundice, hepatitis, exfoliative dermatitis, erythema multiforme, pancreatitis, arthralgia, blood disorders (including agranulocytosis, thrombocytopenia, and aplastic anaemia), benign intracranial hypertension, and transient alopecia

Dose

- Acute uncomplicated infection, 50 mg every 6 hours with food for 7 days (3 days usually adequate in women); CHILD over 3 months, 750 micrograms/kg every 6 hours
- Severe chronic recurrent infection, 100 mg every 6 hours with food for 7 days (dose reduced or discontinued if severe nausea)
- Prophylaxis (but see Cautions), 50–100 mg at night; CHILD over 3 months, 1 mg/kg at night

Nitrofurantoin (Non-proprietary) PoM

Tablets, nitrofurantoin 50 mg, net price 28-tab pack = £24.35; 100 mg, 28-tab pack = £8.47. Label: 9, 14, 21

Oral suspension, nitrofurantoin 25 mg/5 mL, net price 300 mL = £195.83. Label: 9, 14, 21

Note Sugar-free versions are available and can be ordered by specifying 'sugar-free' on the prescription

Modified release

Macrobid® (AMCo) PoM

Capsules, m/r, blue/yellow, nitrofurantoin 100 mg (as nitrofurantoin macrocrystals and nitrofurantoin monohydrate), net price 14-cap pack = £9.50. Label: 9, 14, 21, 25

Dose uncomplicated urinary-tract infection, 1 capsule twice daily with food

Genito-urinary surgical prophylaxis, 1 capsule twice daily on day of procedure and for 3 days after

METHENAMINE HIPPURATE

(Hexamine hippurate)

Indications prophylaxis and long-term treatment of chronic or recurrent lower urinary-tract infections

Cautions avoid concurrent administration with sulfonamides (risk of crystalluria) or urinary alkalinising agents; **interactions:** Appendix 1 (methenamine)

Contra-indications severe dehydration, gout, metabolic acidosis

Hepatic impairment avoid

Renal impairment avoid if eGFR less than 10 mL/minute/1.73 m^2—risk of hippurate crystalluria

Pregnancy use with caution

Breast-feeding amount too small to be harmful

Side-effects gastro-intestinal disturbances, bladder irritation, rash

Dose

- 1 g every 12 hours (may be increased in patients with catheters to 1 g every 8 hours); CHILD 6–12 years 500 mg every 12 hours

Hiprex® (Meda)

Tablets, scored, methenamine hippurate 1 g, net price 60-tab pack = £19.74. Label: 9

5.2 Antifungal drugs

Treatment of fungal infections

The systemic treatment of common fungal infections is outlined below; specialist treatment is required in most forms of systemic or disseminated fungal infections. For local treatment of fungal infections, see section 7.2.2 (genital), section 7.4.4 (bladder), section 11.3.2 (eye), section 12.1.1 (ear), section 12.3.2 (oropharynx), and section 13.10.2 (skin).

Aspergillosis Aspergillosis most commonly affects the respiratory tract but in severely immunocompromised patients, invasive forms can affect the heart, brain, and skin. **Voriconazole** (section 5.2.1) is the treatment of choice for aspergillosis; **liposomal amphotericin** (section 5.2.3) is an alternative first-line treatment when voriconazole cannot be used. **Caspofungin** (section 5.2.4), **itraconazole** (section 5.2.1), or **posaconazole** (section 5.2.1) can be used in patients who are refractory to, or intolerant of voriconazole and liposomal amphotericin. Itraconazole is also used for the treatment of chronic pulmonary aspergillosis or as an adjunct in the treatment of allergic bronchopulmonary aspergillosis [unlicensed indication].

Candidiasis Many superficial candidal infections including infections of the skin (section 13.10.2) are treated locally; widespread or intractable infection requires systemic antifungal treatment. Vaginal candidiasis (section 7.2.2) may be treated with locally acting antifungals or with **fluconazole** (section 5.2.1) given by mouth; for resistant organisms, **itraconazole** (section 5.2.1) can be given by mouth.

Oropharyngeal candidiasis generally responds to topical therapy (section 12.3.2); fluconazole is given by mouth for unresponsive infections; it is effective and is reliably absorbed. Itraconazole may be used for infections that do not respond to fluconazole. Topical therapy may not be adequate in immunocompromised patients and an oral triazole antifungal is preferred.

For *invasive or disseminated candidiasis*, an **echinocandin** (section 5.2.4) can be used. **Fluconazole** (section 5.2.1) is an alternative for *Candida albicans* infection in clinically stable patients who have not received an azole antifungal recently. **Amphotericin** (section 5.2.3) is an alternative when an echinocandin or fluconazole cannot be used, however, amphotericin should be considered for the initial treatment of CNS candidiasis. **Voriconazole** (section 5.2.1) can be used for infections caused by fluconazole-resistant *Candida* spp. when oral therapy is required, or in patients intolerant of amphotericin or an echinocandin. In refractory cases, **flucytosine** (section 5.2.5) can be used with intravenous amphotericin.

Cryptococcosis Cryptococcosis is uncommon but infection in the immunocompromised, especially in HIV-positive patients, can be life-threatening; cryptococcal meningitis is the most common form of fungal meningitis. The treatment of choice in cryptococcal meningitis is **amphotericin** (section 5.2.3) by intravenous infusion and **flucytosine** (section 5.2.5) by intravenous infusion for 2 weeks, followed by **fluconazole** (section 5.2.1) by mouth for 8 weeks or until cultures are negative. In cryptococcosis, **fluconazole** is sometimes given alone as an alternative in HIV-positive patients with mild, localised infections or in those who cannot tolerate amphotericin. Following successful treatment, fluconazole can be used for prophylaxis against relapse until immunity recovers.

Histoplasmosis Histoplasmosis is rare in temperate climates; it can be life-threatening, particularly in HIV-infected persons. **Itraconazole** (section 5.2.1) can be used for the treatment of immunocompetent patients with indolent non-meningeal infection, including chronic pulmonary histoplasmosis. **Amphotericin** (section 5.2.3) by intravenous infusion is used for the initial treatment of fulminant or severe infections, followed by a course of itraconazole by mouth. Following successful treatment, itraconazole can be used for prophylaxis against relapse until immunity recovers.

Skin and nail infections Mild localised fungal infections of the skin (including tinea corporis, tinea cruris, and tinea pedis) respond to topical therapy (section 13.10.2). Systemic therapy is appropriate if topical therapy fails, if many areas are affected, or if the site of infection is difficult to treat such as in infections of the nails (onychomycosis) and of the scalp (tinea capitis). Oral imidazole or triazole antifungals (particularly **itraconazole**) and **terbinafine** are used more frequently than griseofulvin because they have a broader spectrum of activity and require a shorter duration of treatment.

Tinea capitis is treated systemically; additional topical application of an antifungal (section 13.10.2) may reduce transmission. **Griseofulvin** (section 5.2.5) is used for tinea capitis in adults and children; it is effective against infections caused by *Trichophyton tonsurans* and *Microsporum* spp. **Terbinafine** (section 5.2.5) is used for tinea capitis caused by *T. tonsurans* [unlicensed indication]. The role of terbinafine in the management of *Microsporum* infections is uncertain.

Pityriasis versicolor (section 13.10.2) may be treated with **itraconazole** (section 5.2.1) by mouth if topical therapy is ineffective; **fluconazole** (section 5.2.1) by mouth is an alternative. Oral **terbinafine** is **not** effective for pityriasis versicolor.

Antifungal treatment may not be necessary in asymptomatic patients with tinea infection of the nails. If treatment is necessary, a systemic antifungal is more effective than topical therapy. **Terbinafine** (section 5.2.5) and **itraconazole** (section 5.2.1) have largely replaced griseofulvin for the systemic treatment of *onychomycosis*, particularly of the toenail; terbinafine is considered to be the drug of choice. Itraconazole can be administered as intermittent 'pulse' therapy. For the role of topical antifungals in the treatment of onychomycosis, see section 13.10.2.

Immunocompromised patients Immunocompromised patients are at particular risk of fungal infections

and may receive antifungal drugs prophylactically; oral triazole antifungals are the drugs of choice for prophylaxis. **Fluconazole** (section 5.2.1) is more reliably absorbed than **itraconazole** (section 5.2.1), but fluconazole is not effective against *Aspergillus* spp. Itraconazole is preferred in patients at risk of invasive aspergillosis. **Posaconazole** (section 5.2.1) can be used for prophylaxis in patients who are undergoing haematopoietic stem cell transplantation or receiving chemotherapy for acute myeloid leukaemia and myelodysplastic syndrome, if they are intolerant of fluconazole or itraconazole. **Micafungin** (section 5.2.4) can be used for prophylaxis of candidiasis in patients undergoing haematopoietic stem cell transplantation when fluconazole, itraconazole or posaconazole cannot be used.

Amphotericin (section 5.2.3) by intravenous infusion or **caspofungin** (section 5.2.4) is used for the empirical *treatment* of serious fungal infections; caspofungin is not effective against fungal infections of the CNS.

5.2.1 Triazole antifungals

For the role of triazole antifungal drugs in the prevention and systemic treatment of fungal infections, see p. 403.

Fluconazole is very well absorbed after oral administration. It also achieves good penetration into the cerebrospinal fluid to treat fungal meningitis. Fluconazole is excreted largely unchanged in the urine and can be used to treat candiduria.

Itraconazole is active against a wide range of dermatophytes. Itraconazole capsules require an acid environment in the stomach for optimal absorption.

Itraconazole has been associated with liver damage and should be avoided or used with caution in patients with liver disease; fluconazole is less frequently associated with hepatotoxicity.

Posaconazole is licensed for the treatment of invasive fungal infections unresponsive to conventional treatment.

Voriconazole is a broad-spectrum antifungal drug which is licensed for use in life-threatening infections.

FLUCONAZOLE

Indications see under Dose

Cautions concomitant use with hepatotoxic drugs, monitor liver function with high doses or extended courses—discontinue if signs or symptoms of hepatic disease (risk of hepatic necrosis); susceptibility to QT interval prolongation; **interactions:** Appendix 1 (antifungals, triazole)

Contra-indications acute porphyria (section 9.8.2)

Hepatic impairment toxicity with related drugs

Renal impairment usual initial dose then halve subsequent doses if eGFR less than 50 mL/minute/1.73 m^2

Pregnancy manufacturer advises avoid—multiple congenital abnormalities reported with long-term high doses

Breast-feeding present in milk but amount probably too small to be harmful

Side-effects nausea, abdominal discomfort, diarrhoea, flatulence, headache, rash (discontinue treatment or monitor closely if infection invasive or systemic); less frequently dyspepsia, vomiting, taste disturbance, hepatic disorders, hypersensitivity reactions, anaphylaxis, dizziness, seizures, alopecia, pruritus, toxic epidermal necrolysis, Stevens-Johnson syndrome (severe cutaneous reactions more likely in HIV-positive patients), hyperlipidaemia, leucopenia, thrombocytopenia, and hypokalaemia reported

Dose

- Vaginal candidiasis (see also Recurrent Vulvovaginal Candidiasis, section 7.2.2) and candidal balanitis, ADULT and CHILD over 16 years, by mouth, a single dose of 150 mg
- Mucosal candidiasis (except genital), by mouth, 50 mg daily (100 mg daily in unusually difficult infections) given for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14 days in atrophic oral candidiasis associated with dentures; for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections); CHILD by mouth *or* by intravenous infusion, 3–6 mg/kg on first day then 3 mg/kg daily (every 72 hours in NEONATE up to 2 weeks old, every 48 hours in neonate 2–4 weeks old)
- Tinea pedis, corporis, cruris, pityriasis versicolor, and dermal candidiasis, by mouth, 50 mg daily for 2–4 weeks (for up to 6 weeks in tinea pedis); max. duration of treatment 6 weeks
- Invasive candidal infections (including candidaemia and disseminated candidiasis) and cryptococcal infections (including meningitis), by mouth *or* intravenous infusion, 400 mg on first day then 200–400 mg daily; max. 800 mg daily in severe infections [unlicensed dose]; treatment continued according to response (at least 8 weeks for cryptococcal meningitis); CHILD 6–12 mg/kg daily (every 72 hours in NEONATE up to 2 weeks old, every 48 hours in NEONATE 2–4 weeks old); max. 800 mg daily [unlicensed dose]
- Prevention of relapse of cryptococcal meningitis in HIV-infected patients after completion of primary therapy, by mouth *or* by intravenous infusion, 200 mg daily
- Prevention of fungal infections in immunocompromised patients, by mouth *or* by intravenous infusion, 50–400 mg daily adjusted according to risk; 400 mg daily if high risk of systemic infections e.g. following bone-marrow transplantation; commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range; CHILD according to extent and duration of neutropenia, 3–12 mg/kg daily (every 72 hours in NEONATE up to 2 weeks old, every 48 hours in NEONATE 2–4 weeks old); max. 400 mg daily

Fluconazole (Non-proprietary) PoM

[1]Capsules, fluconazole 50 mg, net price 7-cap pack = £1.00; 150 mg, single-capsule pack = 94p; 200 mg, 7-cap pack = £8.06. Label: 9, (50 and 200 mg)

Dental prescribing on NHS Fluconazole Capsules 50 mg may be prescribed

Intravenous infusion, fluconazole 2 mg/mL, net price 25-mL bottle = £7.31; 100-mL bottle = £27.45; 50-mL infusion bag = £2.70; 100-mL infusion bag = £27.82

1. Capsules can be sold to the public for vaginal candidiasis and associated candidal balanitis in those aged 16–60 years, in a container or packaging containing not more than 150 mg and labelled to show a max. dose of 150 mg

Diflucan® (Pfizer) PoM

[1]Capsules, fluconazole 50 mg (blue/white), net price 7-cap pack = £16.61; 150 mg (blue), single-capsule pack = £7.12; 200 mg (purple/white), 7-cap pack = £66.42. Label: 9, (50 and 200 mg)

Oral suspension, orange-flavoured, fluconazole for reconstitution with water, 50 mg/5 mL, net price 35 mL = £16.61; 200 mg/5 mL, 35 mL = £66.42. Label: 9

Dental prescribing on NHS May be prescribed as Fluconazole Oral Suspension 50 mg/5 mL

Intravenous infusion, fluconazole 2 mg/mL in sodium chloride intravenous infusion 0.9%, net price 100-mL bottle = £29.28

Electrolytes Na^+ 15 mmol/100-mL bottle

ITRACONAZOLE

Indications see under Dose

Cautions absorption reduced in HIV-infection and neutropenia (monitor plasma-itraconazole concentration and increase dose if necessary); susceptibility to congestive heart failure (see also Heart Failure, below); **interactions:** Appendix 1 (antifungals, triazole)

Hepatotoxicity Potentially life-threatening hepatotoxicity reported very rarely—discontinue if signs of hepatitis develop. Avoid or use with caution if history of hepatotoxicity with other drugs or in active liver disease. Monitor liver function if treatment continues for longer than one month, if receiving other hepatotoxic drugs, if history of hepatotoxicity with other drugs, or in hepatic impairment

Counselling Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain or dark urine develop

Heart failure

Following reports of heart failure, caution is advised when prescribing itraconazole to patients at high risk of heart failure. Those at risk include:

- patients receiving high doses and longer treatment courses;
- older patients and those with cardiac disease;
- patients with chronic lung disease (including chronic obstructive pulmonary disease) associated with pulmonary hypertension;
- patients receiving treatment with negative inotropic drugs, e.g. calcium channel blockers.

Itraconazole should be avoided in patients with ventricular dysfunction or a history of heart failure unless the infection is serious.

Contra-indications acute porphyria (section 9.8.2)

Hepatic impairment use only if potential benefit outweighs risk of hepatotoxicity (see Hepatotoxicity above); dose reduction may be necessary

Renal impairment risk of congestive heart failure; bioavailability of oral formulations possibly reduced; use intravenous infusion with caution if eGFR 30–80 mL/minute/1.73 m^2; avoid intravenous infusion if eGFR less than 30 mL/minute/1.73m^2

Pregnancy manufacturer advises use only in life-threatening situations (toxicity at high doses in *animal* studies); ensure effective contraception during treatment and until the next menstrual period following end of treatment

Breast-feeding small amounts present in milk—may accumulate; manufacturer advises avoid

Side-effects nausea, vomiting, taste disturbances, abdominal pain, diarrhoea, hepatitis (see Hepatotoxicity above), dyspnoea, headache, hypokalaemia, rash; *less commonly* dyspepsia, flatulence, constipation, oedema, dizziness, peripheral neuropathy (discontinue treatment), menstrual disorder, myalgia; *rarely* pancreatitis, heart failure (see Cautions above), hypertriglyceridaemia, erectile dysfunction, urinary frequency, leucopenia, visual disturbances, tinnitus, deafness, alopecia, photosensitivity, toxic epidermal necrolysis, Stevens-Johnson syndrome; also reported, blood pressure changes, confusion, drowsiness, tremor, thrombocytopenia, renal impairment, arthralgia; *with intravenous injection* hyperglycaemia

Dose

- By mouth, oropharyngeal candidiasis, see under *Sporanox®* oral liquid below

  Vulvovaginal candidiasis (see also Recurrent Vulvovaginal Candidiasis, section 7.2.2), 200 mg twice daily for 1 day

  Pityriasis versicolor, 200 mg once daily for 7 days

  Tinea corporis and tinea cruris, *either* 100 mg once daily for 15 days *or* 200 mg once daily for 7 days

  Tinea pedis and tinea manuum, *either* 100 mg once daily for 30 days *or* 200 mg twice daily for 7 days

  Onychomycosis, *either* 200 mg once daily for 3 months *or* course ('pulse') of 200 mg twice daily for 7 days, subsequent courses repeated after 21-day interval; fingernails 2 courses, toenails 3 courses

  Aspergillosis, 200 mg twice daily

  Histoplasmosis, 200 mg 3 times daily for 3 days, then 200 mg once or twice daily

  Systemic candidiasis and cryptococcosis including cryptococcal meningitis where other antifungal drugs inappropriate or ineffective, 200 mg once daily (candidiasis 100–200 mg once daily) increased in invasive or disseminated disease and in cryptococcal meningitis to 200 mg twice daily

  Maintenance in HIV-infected patients to prevent relapse of underlying fungal infection and prophylaxis in neutropenia when standard therapy inappropriate, 200 mg once daily, increased to 200 mg twice daily if low plasma-itraconazole concentration (see Cautions)

  Prophylaxis in patients with haematological malignancy or undergoing bone-marrow transplant, see under *Sporanox®* oral liquid below
- By intravenous infusion, systemic aspergillosis, candidiasis and cryptococcosis including cryptococcal meningitis where other antifungal drugs inappropriate or ineffective, histoplasmosis, 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days
- CHILD under 18 years see *BNF for Children*

Note Itraconazole doses in BNF may differ from those in product literature

Itraconazole (Non-proprietary) PoM

Capsules, enclosing coated beads, itraconazole 100 mg, net price 15-cap pack = £4.30. Label: 5, 9, 21, 25, counselling, hepatotoxicity

Sporanox® (Janssen) PoM

Capsules, blue/pink, enclosing coated beads, itraconazole 100 mg, net price 4-cap pack = £3.67; 15-cap pack = £13.77; 28-cap pack (*Sporanox®-Pulse*) = £25.72; 60-cap pack = £55.10. Label: 5, 9, 21, 25, counselling, hepatotoxicity

1. Capsules can be sold to the public for vaginal candidiasis and associated candidal balanitis in those aged 16–60 years, in a container or packaging containing not more than 150 mg and labelled to show a max. dose of 150 mg

Oral liquid, sugar-free, cherry-flavoured, itraconazole 10 mg/mL, net price 150 mL (with 10-mL measuring cup) = £58.34. Label: 9, 23, counselling, administration, hepatotoxicity

Dose oral or oesophageal candidiasis in HIV-positive or other immunocompromised patients, 20 mL (2 measuring cups) daily in 1–2 divided doses for 1 week (continue for another week if no response)

Oral or oesophageal candidiasis that has not responed to fluconazole, 10–20 mL (1–2 measuring cups) twice daily for 2 weeks (continue for another 2 weeks if no response; the higher dose should not be used for longer than 2 weeks if no signs of improvement)

Prophylaxis of deep fungal infections (when standard therapy is inappropriate) in patients with haematological malignancy or undergoing bone-marrow transplantation who are expected to become neutropenic, 5 mg/kg daily in 2 divided doses; starting before transplantation or before chemotherapy (taking care to avoid interaction with cytotoxic drugs) and continued until neutrophil count recovers; CHILD and ELDERLY safety and efficacy not established

Counselling Do not take with food; swish around mouth and swallow, do not rinse afterwards

Concentrate for intravenous infusion, itraconazole 10 mg/mL. For dilution before use. Net price 25-mL amp (with infusion bag and filter) = £79.71

Excipients include propylene glycol

POSACONAZOLE

Indications invasive aspergillosis (see notes above); fusariosis either unresponsive to, or in patients intolerant of, amphotericin; chromoblastomycosis and mycetoma either unresponsive to, or in patients intolerant of, itraconazole; coccidioidomycosis either unresponsive to, or in patients intolerant of, amphotericin, itraconazole, or fluconazole; see also under preparations below

Cautions cardiomyopathy, bradycardia, symptomatic arrhythmias, history of QT interval prolongation, concomitant use with other drugs known to cause QT-interval prolongation; monitor electrolytes (including potassium, magnesium, and calcium) before and during therapy, monitor liver function before and during therapy; body-weight under 60 kg—risk of side-effects increased; body-weight over 120 kg—risk of treatment failure possibly increased; **interactions**: Appendix 1 (antifungals, triazole)

Contra-indications acute porphyria (section 9.8.2)

Hepatic impairment monitor liver function; manufacturer advises caution

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk and recommends effective contraception during treatment; toxicity in *animal* studies

Breast-feeding manufacturer advises avoid—present in milk in *animal* studies

Side-effects gastro-intestinal disturbances (including nausea, vomiting, abdominal pain, diarrhoea, constipation, dyspepsia, and flatulence); dizziness, headache, paraesthesia, drowsiness, fatigue, fever, anorexia; blood disorders (including anaemia, neutropenia, and thrombocytopenia), electrolyte disturbances; dry mouth; rash, pruritus; *less commonly* pancreatitis, hepatic disorders, gastro-oesophageal reflux, arrhythmias, bradycardia, tachycardia, palpitation, changes in blood pressure, oedema, vasculitis, cough, hiccups, convulsions, neuropathy, tremor, aphasia, insomnia, hyperglycaemia, menstrual disorders, renal failure, musculoskeletal pain, visual disturbances, mouth ulcers, and alopecia; *rarely* ileus, cardiac failure, myocardial infarction, stroke, thrombosis, syncope, pneumonitis, psychosis, depression, encephalopathy, adrenal insufficiency, breast pain, hearing impairment, and Stevens-Johnson syndrome

Dose

- See under preparations below

Noxafil® (MSD) PoM

Tablets, yellow, e/c, posaconazole 100 mg, net price 24-tab pack = £596.96, 96-tab pack = £2387.85. Label: 3, 9, 25

Note Tablets not licensed for oropharyngeal candidiasis

Dose ADULT over 18 years, 300 mg twice daily on first day, then 300 mg once daily

Prophylaxis of invasive fungal infections in patients undergoing bone-marrow transplantation or receiving chemotherapy for acute myeloid leukaemia and myelodysplastic syndrome who are expected to become neutropenic, and who are intolerant of fluconazole or itraconazole, ADULT over 18 years, 300 mg twice daily on first day, then 300 mg once daily, starting before transplantation or before chemotherapy and continued until neutrophil count recovers

Suspension, posaconazole 200 mg/5 mL, net price 105 mL (cherry-flavoured) = £491.20. Label: 3, 9, 21

Dose ADULT over 18 years, 400 mg twice daily with food *or* if food not tolerated, 200 mg 4 times daily

Oropharyngeal candidiasis (severe infection or in immunocompromised patients only), ADULT over 18 years, 200 mg with food on first day, then 100 mg once daily with food for 13 days

Prophylaxis of invasive fungal infections in patients undergoing bone-marrow transplantation or receiving chemotherapy for acute myeloid leukaemia and myelodysplastic syndrome who are expected to become neutropenic, and who are intolerant of fluconazole or itraconazole, ADULT over 18 years, 200 mg 3 times daily with food, starting before transplantation or before chemotherapy and continued until neutrophil count recovers

Note Where possible, *Noxafil®* tablets should be used in preference to the suspension because the tablets have a higher bioavailability; the suspension is not interchangeable with the tablets on a milligram-for-milligram basis

VORICONAZOLE

Indications invasive aspergillosis; serious infections caused by *Scedosporium* spp., *Fusarium* spp., or invasive fluconazole-resistant *Candida* spp. (including *C. krusei*)

Cautions electrolyte disturbances, cardiomyopathy, bradycardia, symptomatic arrhythmias, history of QT interval prolongation, concomitant use with other drugs that prolong QT interval; patients at risk of pancreatitis; monitor renal function; **interactions**: Appendix 1 (antifungals, triazole)

Hepatotoxicity Hepatitis, cholestasis, and fulminant hepatic failure reported uncommonly; risk increased in patients with haematological malignancy. Monitor liver function before starting treatment, then at least weekly for 1 month, and then monthly during treatment. Consider treatment discontinuation if severe abnormalities in liver function tests. Patients should be told how to recognise signs of liver disorder, and advised to seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop

Phototoxicity Phototoxicity occurs commonly. Patients should be advised to avoid intense or prolonged exposure to direct sunlight, and to avoid use of sunbeds. In sunlight, patients should cover sun-exposed areas of skin and use a sunscreen with a high sun protection factor. Patients should seek medical attention if they experience sunburn or a severe skin reaction following exposure to light or sun. If phototoxicity occurs, consider treatment discontinuation; if

treatment is continued, monitor for pre-malignant skin lesions and squamous cell carcinoma, and discontinue treatment if they occur. Patients should be advised to keep the Alert Card with them at all times

Contra-indications acute porphyria (section 9.8.2)

Hepatic impairment in mild to moderate hepatic cirrhosis use usual loading dose then halve maintenance dose; no information available for severe hepatic cirrhosis—manufacturer advises use only if potential benefit outweighs risk. See also Hepatotoxicity above

Renal impairment intravenous vehicle may accumulate if eGFR less than 50 mL/minute/1.73 m^2—use intravenous infusion only if potential benefit outweighs risk, and monitor renal function; alternatively, use tablets or oral suspension (no dose adjustment required)

Pregnancy toxicity in *animal* studies—manufacturer advises avoid unless potential benefit outweighs risk; effective contraception required during treatment

Breast-feeding manufacturer advises avoid—no information available

Side-effects nausea, vomiting, abdominal pain, diarrhoea, jaundice (see Hepatotoxicity above), oedema, hypotension, chest pain, respiratory distress syndrome, sinusitis, headache, dizziness, asthenia, anxiety, depression, confusion, agitation, hallucinations, paraesthesia, tremor, influenza-like symptoms, hypoglycaemia, haematuria, blood disorders (including anaemia, thrombocytopenia, leucopenia, pancytopenia), acute renal failure, hypokalaemia, visual disturbances (including altered perception, blurred vision, and photophobia), rash, pruritus, photosensitivity, alopecia, cheilitis, injection-site reactions; *less commonly* dyspepsia, duodenitis, cholecystitis, pancreatitis, hepatitis (see Hepatotoxicity above), constipation, arrhythmias (including QT interval prolongation), syncope, hyponatraemia, raised serum cholesterol, hypersensitivity reactions (including flushing), ataxia, nystagmus, hypoaesthesia, adrenocortical insufficiency, arthritis, blepharitis, optic neuritis, scleritis, glossitis, gingivitis, psoriasis, Stevens-Johnson syndrome; *rarely* pseudomembranous colitis, taste disturbances (more common with oral suspension), convulsions, extrapyramidal effects, insomnia, tinnitus, hearing disturbances, hypertonia, hypothyroidism, hyperthyroidism, discoid lupus erythematosus, toxic epidermal necrolysis, pseudoporphyria, retinal haemorrhage, optic atrophy; also reported on long-term treatment squamous cell carcinoma of skin (particularly in presence of phototoxicity) and periostitis (particularly in transplant patients)

Dose

- By mouth, ADULT over 18 years, body-weight over 40 kg, 400 mg every 12 hours for 2 doses then 200 mg every 12 hours, increased if necessary to 300 mg every 12 hours; body-weight under 40 kg, 200 mg every 12 hours for 2 doses then 100 mg every 12 hours, increased if necessary to 150 mg every 12 hours; CHILD 2–18 years see *BNF for Children*
- By intravenous infusion, 6 mg/kg every 12 hours for 2 doses, then 4 mg/kg every 12 hours (reduced to 3 mg/kg every 12 hours if not tolerated) for max. 6 months; CHILD 2–18 years see *BNF for Children*

Vfend® (Pfizer) (PoM)

Tablets, f/c, voriconazole 50 mg, net price 28-tablet pack = £275.68; 200 mg, 28-tab pack = £1102.74. Label: 9, 11, 23, counselling, hepatotoxicity, phototoxicity

Oral suspension, voriconazole 200 mg/5 mL when reconstituted with water, net price 75 mL (orange-flavoured) = £551.37. Label: 9, 11, 23, counselling, hepatotoxicity, phototoxicity

Intravenous infusion, powder for reconstitution, voriconazole, net price 200-mg vial = £77.14; 200-mg vial (with solvent) = £77.14

Excipients include sulfobutylether beta cyclodextrin sodium (risk of accumulation in renal impairment)

Electrolytes Na^+ 9.47 mmol/vial

5.2.2 Imidazole antifungals

The imidazole antifungals include clotrimazole, econazole, ketoconazole, and tioconazole. They are used for the local treatment of vaginal candidiasis (section 7.2.2) and for dermatophyte infections (section 13.10.2).

CHMP advice

Ketoconazole (July 2013)

The CHMP has recommended that the marketing authorisation for oral ketoconazole should be suspended. The CHMP concluded that the risk of hepatotoxicity associated with oral ketoconazole is greater than the benefit in treating fungal infections.

Doctors should review patients who are being treated with oral ketoconazole for fungal infections, with a view to stopping treatment or choosing an alternative treatment. Patients with a prescription of oral ketoconazole for fungal infections should be referred back to their doctors.

Topical products containing ketoconazole are not affected by this advice.

Miconazole (section 12.3.2) can be used locally for oral infections; it is also effective in intestinal infections. Systemic absorption may follow use of miconazole oral gel and may result in significant drug interactions.

5.2.3 Polyene antifungals

The polyene antifungals include amphotericin and nystatin; neither drug is absorbed when given by mouth. Nystatin is used for oral, oropharyngeal, and perioral infections by local application in the mouth (section 12.3.2). Nystatin is also used for *Candida albicans* infection of the skin (section 13.10.2).

Amphotericin by intravenous infusion is used for the treatment of systemic fungal infections and is active against most fungi and yeasts. It is highly protein bound and penetrates poorly into body fluids and tissues. When given parenterally amphotericin is toxic and side-effects are common. Lipid formulations of amphotericin (*Abelcet®* and *AmBisome®*) are significantly less toxic and are recommended when the conventional formulation of amphotericin is contra-indicated because of toxicity, especially nephrotoxicity or when response to conventional amphotericin is inadequate; lipid formulations are more expensive. For the role of amphotericin in the systemic treatment of fungal infections, see p. 403.

AMPHOTERICIN

(Amphotericin B)

Indications See under Dose

Cautions when given parenterally, toxicity common (close supervision necessary and test dose

required; see Anaphylaxis below); hepatic and renal function tests, blood counts, and plasma electrolyte (including plasma-potassium and magnesium concentration) monitoring required; corticosteroids (avoid except to control reactions); avoid rapid infusion (risk of arrhythmias); **interactions:** Appendix 1 (amphotericin)

Anaphylaxis Anaphylaxis can occur with any intravenous amphotericin product and a test dose is advisable before the first infusion; the patient should be carefully observed for at least 30 minutes after the test dose. Prophylactic antipyretics or hydrocortisone should only be used in patients who have previously experienced acute adverse reactions (in whom continued treatment with amphotericin is essential)

Renal impairment use only if no alternative; nephrotoxicity may be reduced with use of lipid formulation

Pregnancy not known to be harmful but manufacturers advise avoid unless potential benefit outweighs risk

Breast-feeding no information available

Side-effects nausea, vomiting, abdominal pain, diarrhoea, cardiovascular effects (including arrhythmias, blood pressure changes, chest pain), dyspnoea, headache, febrile reactions, electrolyte disturbances (including hypokalaemia and hypomagnesaemia), disturbances in renal function (including renal tubular acidosis), abnormal liver function (discontinue treatment), blood disorders (including anaemia, thrombocytopenia), rash; *less commonly* anaphylactoid reactions (see Anaphylaxis, above), bronchospasm, neurological disorders (including convulsions, peripheral neuropathy, tremor, encephalopathy, hearing loss, diplopia); also reported anorexia, myalgia, arthralgia, toxic epidermal necrolysis, Stevens-Johnson syndrome

Dose

- By intravenous infusion, see preparations

Note Different preparations of intravenous amphotericin vary in their pharmacodynamics, pharmacokinetics, dosage, and administration; these preparations should **not** be considered interchangeable. To avoid confusion, prescribers should specify the brand to be dispensed.

Fungizone® (Squibb) PoM

Intravenous infusion, powder for reconstitution, amphotericin (as sodium deoxycholate complex), net price 50-mg vial = £3.88

Electrolytes $Na^+ < 0.5$ mmol/vial

Dose by intravenous infusion, systemic fungal infections, initial test dose of 1 mg over 20–30 minutes then 250 micrograms/kg daily, gradually increased over 2–4 days, if tolerated, to 1 mg/kg daily; max. (severe infection) 1.5 mg/kg daily or on alternate days; CHILD under 18 years see *BNF for Children*

Note Prolonged treatment usually necessary; if interrupted for longer than 7 days recommence at 250 micrograms/kg daily and increase gradually

Lipid formulations

Abelcet® (TEVA UK) PoM

Intravenous infusion, amphotericin 5 mg/mL as lipid complex with L-α-dimyristoylphosphatidylcholine and L-α-dimyristoylphosphatidylglycerol, net price 20-mL vial = £77.50 (hosp. only)

Electrolytes Na^+ 3.12 mmol/vial

Dose by intravenous infusion, severe invasive candidiasis; severe systemic fungal infections in patients not responding to conventional amphotericin or to other antifungal drugs or where toxicity or renal impairment precludes conventional amphotericin, including invasive aspergillosis, cryptococcal meningitis and disseminated cryptococcosis in HIV patients, initial test dose 1 mg over 15 minutes then 5 mg/kg once daily for at least 14 days; CHILD under 18 years see *BNF for Children*

AmBisome® (Gilead) PoM

Intravenous infusion, powder for reconstitution, amphotericin 50 mg encapsulated in liposomes, net price 50-mg vial = £96.69

Electrolytes $Na^+ < 0.5$ mmol/vial

Excipients include sucrose 900 mg/vial

Dose by intravenous infusion, severe systemic or deep mycoses where toxicity (particularly nephrotoxicity) precludes use of conventional amphotericin; suspected or proven infection in febrile neutropenic patients unresponsive to broad-spectrum antibacterials; aspergillosis, initial test dose 1 mg over 10 minutes then 3 mg/kg once daily; max. 5 mg/kg once daily [unlicensed dose]; CHILD under 18 years see *BNF for Children*

Visceral leishmaniasis, see section 5.4.5 and product literature

5.2.4 Echinocandin antifungals

The echinocandin antifungals include **anidulafungin**, **caspofungin** and **micafungin**. They are only active against *Aspergillus* spp. and *Candida* spp.; however, anidulafungin and micafungin are not used for the treatment of aspergillosis. Echinocandins are not effective against fungal infections of the CNS. For the role of echinocandin antifungals in the prevention and systemic treatment of fungal infections, see p. 403.

ANIDULAFUNGIN

Indications invasive candidiasis (see notes above)

Pregnancy manufacturer advises avoid—no information available

Breast-feeding manufacturer advises avoid unless potential benefit outweighs risk—present in milk in *animal* studies

Side-effects diarrhoea, nausea, vomiting, flushing, convulsion, headache, coagulopathy, hypokalaemia, raised serum creatinine, rash, pruritus; *less commonly* abdominal pain, cholestasis, hypertension, hyperglycaemia, urticaria, injection-site pain; also reported, hypotension, dyspnoea, bronchospasm, hepatitis

Dose

- By intravenous infusion, ADULT over 18 years, 200 mg on first day then 100 mg once daily

Ecalta® (Pfizer) PoM

Intravenous infusion, powder for reconstitution, anidulafungin, net price 100-mg vial = £299.99

CASPOFUNGIN

Indications invasive aspergillosis (see notes above); invasive candidiasis (see notes above); empirical treatment of systemic fungal infections in patients with neutropenia

Cautions **interactions:** Appendix 1 (caspofungin)

Hepatic impairment 70 mg on first day then 35 mg once daily in moderate impairment; no information available for severe impairment

Pregnancy manufacturer advises avoid unless essential—toxicity in *animal* studies

Breast-feeding present in milk in *animal* studies—manufacturer advises avoid

Side-effects nausea, diarrhoea, vomiting; dyspnoea; headache; hypokalaemia; arthralgia; rash, pruritus, sweating, injection-site reactions; *less commonly* abdominal pain, dyspepsia, dry mouth, dysphagia, taste disturbances, anorexia, constipation, flatulence,

cholestasis, hepatic dysfunction, ascites, palpitation, arrhythmia, chest pain, heart failure, thrombophlebitis, flushing, hypotension, hypertension, bronchospasm, cough, dizziness, fatigue, paraesthesia, hypoaesthesia, sleep disturbances, tremor, anxiety, disorientation, hyperglycaemia, renal failure, hypomagnesaemia, hypocalcaemia, metabolic acidosis, anaemia, thrombocytopenia, leucopenia, myalgia, muscular weakness, blurred vision, and erythema multiforme; also reported, adult respiratory distress syndrome and anaphylaxis

Dose

- By intravenous infusion, 70 mg on first day then 50 mg once daily (70 mg once daily if body-weight over 80 kg); CHILD under 18 years see *BNF for Children*

Cancidas® (MSD) PoM

Intravenous infusion, powder for reconstitution, caspofungin (as acetate), net price 50-mg vial = £327.67; 70-mg vial = £416.78

MICAFUNGIN

Indications see under Dose

Cautions monitor renal function; **interactions:** Appendix 1 (micafungin)

Hepatotoxicity Potentially life-threatening hepatotoxicity reported. Monitor liver function—discontinue if significant and persistent abnormalities in liver function tests develop. Use with caution in hepatic impairment (avoid if severe) or if receiving other hepatotoxic drugs. Risk of hepatic side-effects greater in children under 1 year of age

Hepatic impairment use with caution in mild to moderate impairment; avoid in severe impairment; see also Hepatotoxicity above

Renal impairment use with caution; renal function may deteriorate

Pregnancy manufacturer advises avoid unless essential—toxicity in *animal* studies

Breast-feeding manufacturer advises use only if potential benefit outweighs risk—present in milk in *animal* studies

Side-effects nausea, vomiting, diarrhoea, abdominal pain; headache, fever; hypokalaemia, hypomagnesaemia, hypocalcaemia, leucopenia, anaemia; rash, phlebitis; *less commonly* dyspepsia, constipation, hepatomegaly, hepatitis and cholestasis (see also Hepatotoxicity above), taste disturbances, anorexia, tachycardia, palpitation, bradycardia, blood pressure changes, flushing, dyspnoea, sleep disturbances, anxiety, confusion, dizziness, tremor, pancytopenia, thrombocytopenia, eosinophilia, hyponatraemia, hypophosphataemia, hyperkalaemia, hyperhidrosis, and pruritus; *rarely* haemolytic anaemia; also reported disseminated intravascualr coagulation, renal failure (more frequent in children), Stevens-Johnson syndrome, toxic epidermal necrolysis

Dose

- By intravenous infusion, invasive candidiasis, ADULT body-weight over 40 kg, 100 mg once daily (increased to 200 mg daily if inadequate response) for at least 14 days; body-weight under 40 kg, 2 mg/kg once daily (increased to 4 mg/kg daily if inadequate response) for at least 14 days; CHILD under 18 years see *BNF for Children*

  Oesophageal candidiasis, ADULT body-weight over 40 kg, 150 mg once daily; body-weight under 40 kg, 3 mg/kg once daily; CHILD 16–18 years see *BNF for Children*

  Prophylaxis of candidiasis in patients undergoing bone-marrow transplantation or who are expected to become neutropenic for over 10 days, ADULT body-weight over 40 kg, 50 mg once daily; body-weight under 40 kg, 1 mg/kg once daily; continue for at least 7 days after neutrophil count in desirable range; CHILD under 18 years see *BNF for Children*

Mycamine® (Astellas) PoM

Intravenous infusion, powder for reconstitution, micafungin (as sodium), net price 50-mg vial = £196.08; 100-mg vial = £341.00

5.2.5 Other antifungals

Flucytosine is used with amphotericin in a synergistic combination. Bone marrow depression can occur which limits its use, particularly in HIV-positive patients; weekly blood counts are necessary during prolonged therapy. Resistance to flucytosine can develop during therapy and sensitivity testing is essential before and during treatment. For the role of flucytosine in the treatment of systemic candidiasis and cryptococcal meningitis, see p. 403.

Griseofulvin is effective for widespread or intractable dermatophyte infections but has been superseded by newer antifungals, particularly for nail infections. It is the drug of choice for trichophyton infections in children. Duration of therapy is dependent on the site of the infection and may extend to a number of months. For the role of griseofulvin in the treatment of tinea capitis, see p. 403.

Terbinafine is the drug of choice for fungal nail infections and is also used for ringworm infections where oral treatment is considered appropriate (see p. 403).

FLUCYTOSINE

Indications systemic yeast and fungal infections; adjunct to amphotericin in cryptococcal meningitis (see Cryptococcosis, p. 403), adjunct to amphotericin in severe systemic candidiasis and in other severe or long-standing infections

Cautions elderly; blood disorders; liver- and kidney-function tests and blood counts required (weekly in blood disorders); **interactions:** Appendix 1 (flucytosine)

Renal impairment liver- and kidney-function tests and blood counts required weekly; use 50 mg/kg every 12 hours if creatinine clearance 20–40 mL/minute; use 50 mg/kg every 24 hours if creatinine clearance 10–20 mL/minute; use initial dose of 50 mg/kg if creatinine clearance less than 10 mL/minute and then adjust dose according to plasma-flucytosine concentration

Pregnancy teratogenic in *animal* studies; manufacturer advises use only if potential benefit outweighs risk

Breast-feeding manufacturer advises avoid

Side-effects nausea, vomiting, diarrhoea, rashes; less frequently cardiotoxicity, confusion, hallucinations, convulsions, headache, sedation, vertigo, alterations in liver function tests (hepatitis and hepatic necrosis reported), and toxic epidermal necrolysis; blood disorders including thrombocytopenia, leucopenia, and aplastic anaemia reported

Dose

- By intravenous infusion over 20–40 minutes, 200 mg/kg daily in 4 divided doses usually for not more than 7 days; extremely sensitive organisms, 100–150 mg/kg daily may be sufficient; CHILD under 18 years see *BNF for Children*

  Cryptococcal meningitis (adjunct to amphotericin, see Cryptococcosis, p. 403) 100 mg/kg daily in 4 divided doses for 2 weeks [unlicensed duration]; CHILD under 18 years see *BNF for Children*

  Note For plasma concentration monitoring, blood should be taken shortly before starting the next infusion; plasma concentration for optimum response 25–50 mg/litre (200–400 micromol/litre)—should not be allowed to exceed 80 mg/litre (620 micromol/litre)

Ancotil® (Meda) PoM

Intravenous infusion, flucytosine 10 mg/mL, net price 250-mL infusion bottle = £30.33 (hosp. only)

Electrolytes Na^+ 34.5 mmol/250-mL bottle

Note Flucytosine tablets [unlicensed] may be available from 'special-order' manufacturers or specialist-importing companies, see p. 1104

GRISEOFULVIN

Indications dermatophyte infections of the skin, scalp, hair and nails where topical therapy has failed or is inappropriate

Cautions **interactions:** Appendix 1 (griseofulvin)

Driving May impair performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Contra-indications severe liver disease; systemic lupus erythematosus (risk of exacerbation); acute porphyria (section 9.8.2)

Hepatic impairment avoid in severe liver disease

Pregnancy avoid (fetotoxicity and teratogenicity in *animals*); effective contraception required during and for at least 1 month after administration to women (**important:** effectiveness of oral contraceptives may be reduced, additional contraceptive precautions e.g. barrier method, required); also men should avoid fathering a child during and for at least 6 months after administration

Breast-feeding avoid—no information available

Side-effects nausea, vomiting, diarrhoea; headache; also reported, abdominal pain, dyspepsia, hepatotoxicity, glossitis, taste disturbances, sleep disturbances, dizziness, fatigue, confusion, agitation, depression, impaired coordination and hearing, peripheral neuropathy, menstrual disturbances, renal failure, leucopenia, systemic lupus erythematosus, rash (including rarely erythema multiforme, toxic epidermal necrolysis), and photosensitivity

Dose

- Dermatophyte infections, 500 mg once daily or in divided doses; in severe infection dose may be doubled, reducing when response occurs; CHILD under 50 kg, 10 mg/kg once daily or in divided doses
- Tinea capitis caused by *Trichophyton tonsurans*, 1 g once daily or in divided doses; CHILD under 50 kg, 15–20 mg/kg once daily or in divided doses

Note Griseofulvin doses in BNF may differ from those in product literature

Griseofulvin (Non-proprietary) PoM

Tablets, griseofulvin 125 mg, net price 100 = £35.39; 500 mg, 100= £90.41. Label: 9, 21, counselling, driving

TERBINAFINE

Indications dermatophyte infections of the nails, ringworm infections (including tinea pedis, cruris, and corporis) where oral therapy appropriate (due to site, severity or extent)

Cautions psoriasis (risk of exacerbation); autoimmune disease (risk of lupus-erythematosus-like effect); monitor hepatic function before treatment and then every 4–6 weeks during treatment — discontinue if abnormalities in liver function tests; **interactions:** Appendix 1 (terbinafine)

Hepatic impairment manufacturer advises avoid—elimination reduced

Renal impairment use half normal dose if eGFR less than 50 mL/minute/1.73 m^2 and no suitable alternative available

Pregnancy manufacturer advises use only if potential benefit outweighs risk—no information available

Breast-feeding avoid—present in milk

Side-effects abdominal discomfort, anorexia, nausea, diarrhoea, dyspepsia, headache, arthralgia, myalgia, rash, urticaria; *less commonly* taste disturbance; *rarely* liver toxicity (including jaundice, cholestasis, and hepatitis)—discontinue treatment, dizziness, malaise, paraesthesia, hypoaesthesia; *very rarely* blood disorders (including neutropenia and thrombocytopenia), lupus erythematosus-like effect, photosensitivity, alopecia, serious skin reactions (including Stevens-Johnson syndrome and toxic epidermal necrolysis)—discontinue treatment if progressive skin rash; also reported, pancreatitis, vasculitis, influenza-like symptoms, rhabdomyolysis, disturbances in smell, hearing disturbances, exacerbation of psoriasis

Dose

- By mouth, 250 mg daily usually for 2–6 weeks in tinea pedis, 2–4 weeks in tinea cruris, 4 weeks in tinea corporis, 6 weeks–3 months in nail infections (occasionally longer in toenail infections); CHILD [unlicensed] usually for 4 weeks, tinea capitis, over 1 year, body-weight 10–20 kg, 62.5 mg once daily; body-weight 20–40 kg, 125 mg once daily; body-weight over 40 kg, 250 mg once daily

Terbinafine (Non-proprietary) PoM

Tablets, terbinafine (as hydrochloride) 250 mg, net price 14-tab pack = £1.47, 28-tab pack = £2.63. Label: 9

Lamisil® (Novartis) PoM

Tablets, off-white, scored, terbinafine (as hydrochloride) 250 mg, net price 14-tab pack = £21.30, 28-tab pack = £41.09. Label: 9

5.3 Antiviral drugs

The majority of virus infections resolve spontaneously in immunocompetent subjects. A number of specific treatments for viral infections are available, particularly for the immunocompromised. This section includes notes on herpes simplex and varicella-zoster, human immunodeficiency virus, cytomegalovirus, respiratory syncytial virus, viral hepatitis and influenza.

5.3.1 HIV infection

There is no cure for infection caused by the human immunodeficiency virus (HIV) but a number of drugs slow or halt disease progression. Drugs for HIV infection (antiretrovirals) may be associated with serious side-effects. Although antiretrovirals increase life expectancy considerably and decrease the risk of complications associated with premature ageing, mortality and morbidity remain slightly higher than in uninfected individuals. Treatment should be undertaken only by those experienced in their use.

Principles of treatment Treatment aims to prevent the mortality and morbidity associated with chronic HIV infection whilst minimising drug toxicity. Although it should be started before the immune system is irreversibly damaged, the need for early drug treatment should be balanced against the risk of toxicity. Commitment to treatment and strict adherence over many years are required; the regimen chosen should take into account convenience and patient tolerance. The development of drug resistance is reduced by using a combination of drugs; such combinations should have synergistic or additive activity while ensuring that their toxicity is not additive. It is recommended that viral sensitivity to antiretroviral drugs is established before starting treatment or before switching drugs if the infection is not responding.

Treatment also reduces the risk of HIV transmission to sexual partners, but the risk is not eliminated completely, therefore, other methods to reduce transmission should continue to be recommended.

Initiation of treatment The optimum time for initiating antiretroviral treatment depends primarily on the CD4 cell count. The timing and choice of treatment should also take account of clinical symptoms, co-morbidities, and the possible effect of antiretroviral drugs on factors such as the risk of cardiovascular events. Treatment includes a combination of drugs known as 'highly active antiretroviral therapy'. Treatment of HIV-1 infection is initiated with 2 nucleoside reverse transcriptase inhibitors and *either* a non-nucleoside reverse transcriptase inhibitor, *or* a boosted protease inhibitor, *or* an integrase inhibitor; the regimens of choice contain tenofovir and emtricitabine with *either* efavirenz *or* ritonavir-boosted atazanavir, *or* ritonavir-boosted darunavir, *or* raltegravir. Alternative regimens contain abacavir and lamivudine with *either* ritonavir-boosted lopinavir, *or* ritonavir-boosted fosamprenavir, *or* nevirapine, *or* rilpivirine. Patients who require treatment for both HIV and chronic hepatitis B should be treated with antivirals active against both diseases (section 5.3.3.1).

Switching therapy Deterioration of the condition (including clinical and virological changes) may require a change in therapy. The choice of an alternative regimen depends on factors such as the response to previous treatment, tolerance and the possibility of cross-resistance.

Pregnancy Treatment of HIV infection in pregnancy aims to reduce the risk of toxicity to the fetus (although information on the teratogenic potential of most antiretroviral drugs is limited), to minimise the viral load and disease progression in the mother, and to prevent transmission of infection to the neonate. **All treatment options require careful assessment by a specialist.** Combination antiretroviral therapy maximises the chance of preventing transmission and represents optimal therapy for the mother. However, it may be associated with a greater risk of preterm delivery. Pregnancies in HIV-positive women and babies born to them should be reported prospectively to the National Study of HIV in Pregnancy and Childhood at www.nshpc.ucl.ac.uk **and** to the Antiretroviral Pregnancy Registry at www.apregistry.com.

Mitochondrial dysfunction has been reported in infants exposed to nucleoside reverse transcriptase inhibitors in utero; the main effects include haematological, metabolic, and neurological disorders; all infants whose mothers received nucleoside reverse transcriptase inhibitors during pregnancy should be monitored for relevant signs or symptoms.

Breast-feeding Breast-feeding by HIV-positive mothers may cause HIV infection in the infant and should be avoided.

Children HIV disease in children has a different natural progression to adults. Children infected with HIV should be managed within a formal paediatric HIV clinical network by specialists with access to guidelines and information on antiretroviral drugs for children.

Post-exposure prophylaxis Prophylaxis with antiretroviral drugs [unlicensed indication] may be appropriate following exposure to HIV-contaminated material. Immediate expert advice should be sought in such cases; national guidelines on post-exposure prophylaxis for healthcare workers have been developed (by the Chief Medical Officer's Expert Advisory Group on AIDS, www.gov.uk/dh) and local ones may also be available. Antiretrovirals for prophylaxis are chosen on the basis of efficacy and potential for toxicity. Prompt prophylaxis with antiretroviral drugs [unlicensed indication] is also appropriate following potential sexual exposure to HIV; recommendations have been developed by the British Association for Sexual Health and HIV, www.bashh.org

Drugs for HIV infection **Zidovudine**, a nucleoside reverse transcriptase inhibitor (or 'nucleoside analogue'), was the first anti-HIV drug to be introduced. Other nucleoside reverse transcriptase inhibitors include **abacavir**, **didanosine**, **emtricitabine**, **lamivudine**, **stavudine**, and **tenofovir**.

The protease inhibitors include **atazanavir**, **darunavir**, **fosamprenavir** (a pro-drug of amprenavir), **indinavir**, **lopinavir**, **ritonavir**, **saquinavir**, and **tipranavir**. Indinavir is rarely used in the treatment of HIV-infection because it is associated with nephrolithiasis. Ritonavir in low doses boosts the activity of atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, saquinavir, and tipranavir increasing the persistence of plasma concentrations of these drugs; at such a low dose, ritonavir has no intrinsic antiviral activity. A combination of lopinavir with low-dose ritonavir is available. The protease inhibitors are metabolised by cytochrome P450 enzyme systems and therefore have a significant potential for drug interactions. Protease inhibitors are associated with lipodystrophy and metabolic effects (see below).

The non-nucleoside reverse transcriptase inhibitors **efavirenz**, **etravirine**, **nevirapine,** and **rilpivirine** are used in the treatment of HIV-1 infection, but not against the subtype HIV-2, a subtype that is rare in the UK. Nevirapine is associated with a high incidence of rash (includ-

ing Stevens-Johnson syndrome) and occasionally fatal hepatitis. Rash is also associated with efavirenz and etravirine but it is usually milder. Psychiatric or CNS disturbances are common with efavirenz; CNS disturbances are often self-limiting and can be reduced by taking the dose at bedtime (especially in the first 2–4 weeks of treatment). Efavirenz has also been associated with an increased plasma-cholesterol concentration. Etravirine is used in regimens containing a boosted protease inhibitor for HIV infection resistant to other non-nucleoside reverse transcriptase inhibitors and protease inhibitors.

Enfuvirtide, which inhibits the fusion of HIV to the host cell, is licensed for managing infection that has failed to respond to a regimen of other antiretroviral drugs; enfuvirtide should be combined with other potentially active antiretroviral drugs.

Maraviroc is an antagonist of the CCR5 chemokine receptor. It is licensed for patients exclusively infected with CCR5-tropic HIV. The *Scottish Medicines Consortium* (p. 4) has advised (March 2008) that maraviroc (*Celsentri*®) is **not** recommended for use within NHS Scotland.

Dolutegravir and **raltegravir** are inhibitors of HIV integrase. They are licensed for the treatment of HIV infection in combination with other antiretroviral drugs. The *Scottish Medicines Consortium* (p. 4) has advised (April 2010) that raltegravir (*Isentress*®) is accepted for restricted use within NHS Scotland for the treatment of HIV infection when non-nucleoside reverse transcriptase inhibitors or protease inhibitors cannot be used because of intolerance, drug interactions, or resistance.

Elvitegravir is also an inhibitor of HIV integrase that is only available as a component of a fixed-dose combination product containing **cobicistat**, emtricitabine, and tenofovir disoproxil. Cobicistat is a pharmacokinetic enhancer that boosts the concentrations of other antiretrovirals, but it has no antiretroviral activity itself.

Immune reconstitution syndrome Improvement in immune function as a result of antiretroviral treatment may provoke a marked inflammatory reaction against residual opportunistic organisms; these reactions may occur within the first few weeks or months of initiating treatment. Autoimmune disorders (such as Graves' disease) have also been reported many months after initiation of treatment.

Lipodystrophy syndrome Metabolic effects associated with antiretroviral treatment include *fat redistribution*, *insulin resistance*, and *dyslipidaemia*; collectively these have been termed *lipodystrophy syndrome*. The usual risk factors for cardiovascular disease should be taken into account before starting antiretroviral therapy and patients should be advised about lifestyle changes to reduce their cardiovascular risk. Plasma lipids and blood glucose should be measured before starting antiretroviral therapy, after 3–6 months of treatment, and then annually.

Fat redistribution (with loss of subcutaneous fat, increased abdominal fat, 'buffalo hump' and breast enlargement) is associated with regimens containing protease inhibitors and nucleoside reverse transcriptase inhibitors. Stavudine (especially in combination with didanosine), and to a lesser extent zidovudine, are associated with a higher risk of lipoatrophy and should be used only if alternative regimens are not suitable.

Dyslipidaemia is associated with antiretroviral treatment, particularly with protease inhibitors. Protease inhibitors and some nucleoside reverse transcriptase inhibitors are associated with insulin resistance and hyperglycaemia. Of the protease inhibitors, atazanavir and darunavir may be less likely to cause dyslipidaemia, while saquinavir and atazanavir may be less likely to impair glucose tolerance.

Osteonecrosis Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

Nucleoside reverse transcriptase inhibitors

Cautions

Lactic acidosis Life-threatening lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with nucleoside reverse transcriptase inhibitors. They should be used with caution in patients (particularly obese women) with hepatomegaly, hepatitis (especially hepatitis C treated with interferon alfa and ribavirin), liver-enzyme abnormalities and with other risk factors for liver disease and hepatic steatosis (including alcohol abuse). Treatment with the nucleoside reverse transcriptase inhibitor should be **discontinued** in case of symptomatic hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function. Stavudine, especially with didanosine, is associated with a higher risk of lactic acidosis and should be used only if alternative regimens are not suitable.

Hepatic impairment Nucleoside reverse transcriptase inhibitors should be used with caution in patients with chronic hepatitis B or C (greater risk of hepatic side-effects); see also Lactic acidosis above.

Pregnancy see p. 411

Breast-feeding see p. 411

Side-effects Side-effects of the nucleoside reverse transcriptase inhibitors include gastro-intestinal disturbances (such as nausea, vomiting, abdominal pain, flatulence and diarrhoea), anorexia, pancreatitis, liver damage (see also Lactic Acidosis, above), dyspnoea, cough, headache, insomnia, dizziness, fatigue, blood disorders (including anaemia, neutropenia, and thrombocytopenia), myalgia, arthralgia, rash, urticaria, and fever. See notes above for metabolic effects and lipodystrophy (Lipodystrophy Syndrome), and Osteonecrosis.

ABACAVIR

Indications HIV infection in combination with other antiretroviral drugs

Cautions see notes above; also test for HLA-B*5701 allele before treatment or if restarting treatment and HLA-B*5701 status not known—increased risk of hypersensitivity reaction in presence of HLA-B*5701 allele; HIV load greater than 100 000 copies/mL; patients at high risk of cardiovascular disease (especially if 10-year cardiovascular risk greater than 20%); **interactions:** Appendix 1 (abacavir)

Hypersensitivity reactions Life-threatening hypersensitivity reactions reported—characterised by fever or rash and possibly nausea, vomiting, diarrhoea, abdominal pain, dyspnoea, cough, lethargy, malaise, headache, and

myalgia; less frequently mouth ulceration, oedema, hypotension, sore throat, acute respiratory distress syndrome, anaphylaxis, paraesthesia, arthralgia, conjunctivitis, lymphadenopathy, lymphocytopenia and renal failure; rarely myolysis; laboratory abnormalities may include raised liver function tests (see Lactic Acidosis p. 412) and creatine kinase; symptoms usually appear in the first 6 weeks, but may occur at any time; monitor for symptoms every 2 weeks for 2 months; discontinue immediately if any symptom of hypersensitivity develops and do not rechallenge (risk of more severe hypersensitivity reaction); discontinue if hypersensitivity cannot be ruled out, even when other diagnoses possible—if rechallenge necessary it must be carried out in hospital setting; if abacavir is stopped for any reason other than hypersensitivity, exclude hypersensitivity reaction as the cause and rechallenge only if medical assistance is readily available; care needed with concomitant use of drugs which cause skin toxicity

Counselling Patients should be told the importance of regular dosing (intermittent therapy may increase the risk of sensitisation), how to recognise signs of hypersensitivity, and advised to seek immediate medical attention if symptoms develop or before re-starting treatment; patients should be advised to keep Alert Card with them at all times

Hepatic impairment see notes above; also avoid in moderate impairment unless essential; avoid in severe impairment

Renal impairment manufacturer advises avoid in end-stage renal disease; avoid *Kivexa*® or *Trizivir*® if eGFR less than 50 mL/minute/1.73 m^2 (consult product literature)

Pregnancy see p. 411

Breast-feeding see p. 411

Side-effects see notes above; also hypersensitivity reactions (see above); *very rarely* Stevens-Johnson syndrome and toxic epidermal necrolysis; rash and gastro-intestinal disturbances more common in children

Dose

- 600 mg daily in 1–2 divided doses; CHILD 3 months–18 years see *BNF for Children*

Ziagen® (ViiV) PoM

Tablets, yellow, f/c, scored, abacavir (as sulfate) 300 mg, net price 60-tab pack = £177.60. Counselling, hypersensitivity reactions

Oral solution, sugar-free, banana and strawberry flavoured, abacavir (as sulfate) 20 mg/mL, net price 240-mL = £47.36. Counselling, hypersensitivity reactions

With lamivudine

For **cautions**, **contra-indications**, **side-effects**, and other prescribing information see under individual drugs

Kivexa® (ViiV) PoM

Tablets, orange, f/c, abacavir (as sulfate) 600 mg, lamivudine 300 mg, net price 30-tab pack = £299.41. Counselling, hypersensitivity reactions

Dose ADULT body-weight over 40 kg, 1 tablet once daily; CHILD 12–18 years see *BNF for Children*

With lamivudine and zidovudine

Note For patients stabilised (for 6–8 weeks) on the individual components in the same proportions. For **cautions**, **contra-indications**, **side-effects**, and other prescribing information see under individual drugs

Trizivir® (ViiV) PoM

Tablets, blue-green, f/c, abacavir (as sulfate) 300 mg, lamivudine 150 mg, zidovudine 300 mg, net price 60-tab pack = £432.70. Counselling, hypersensitivity reactions

Dose 1 tablet twice daily; CHILD under 18 years, body-weight over 30 kg see *BNF for Children*

DIDANOSINE

(ddI, DDI)

Indications HIV infection in combination with other antiretroviral drugs

Cautions see notes above; also history of pancreatitis (preferably avoid, otherwise extreme caution, see also below); peripheral neuropathy or hyperuricaemia (see under Side-effects); ophthalmological examination (including visual acuity, colour vision, and dilated fundus examination) recommended annually or if visual changes occur; **interactions:** Appendix 1 (didanosine)

Pancreatitis Suspend treatment if serum lipase raised (even if asymptomatic) or if symptoms of pancreatitis develop; discontinue if pancreatitis confirmed. Whenever possible avoid concomitant treatment with other drugs known to cause pancreatic toxicity (e.g. intravenous pentamidine isetionate); monitor closely if concomitant therapy unavoidable. Since significant elevations of triglycerides cause pancreatitis monitor closely if elevated

Hepatic impairment see notes above; also insufficient information but monitor for toxicity

Renal impairment reduce dose if eGFR less than 60 mL/minute/1.73 m^2; consult product literature

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Breast-feeding see p. 411

Side-effects see notes above; also pancreatitis (see also under Cautions), liver failure, non-cirrhotic portal hypertension, anaphylactic reactions, peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops), diabetes mellitus, hypoglycaemia, acute renal failure, rhabdomyolysis, dry eyes, retinal and optic nerve changes, dry mouth, parotid gland enlargement, sialadenitis, alopecia, hyperuricaemia (suspend if raised significantly)

Dose

- ADULT under 60 kg, 250 mg daily in 1–2 divided doses; 60 kg and over, 400 mg daily in 1–2 divided doses; CHILD under 18 years see *BNF for Children*

Videx® (Bristol-Myers Squibb) PoM

Tablets, with calcium and magnesium antacids, didanosine 25 mg, net price 60-tab pack = £25.06. Label: 23, counselling, administration, see below

Excipients include aspartame equivalent to phenylalanine 36.5 mg per tablet (section 9.4.1)

Note Antacids in formulation may affect absorption of other drugs—see **interactions:** Appendix 1 (antacids)

Counselling To ensure sufficient antacid, each dose to be taken as at least 2 tablets chewed thoroughly, crushed or dispersed in water; clear apple juice may be added for flavouring; tablets to be taken 2 hours after lopinavir with ritonavir capsules and oral solution or atazanavir with ritonavir

Videx® EC capsules, enclosing e/c granules, didanosine 125 mg, net price 30-cap pack = £48.18; 200 mg, 30-cap pack = £77.09; 250 mg, 30-cap pack = £96.37; 400 mg, 30-cap pack = £154.19. Label: 25, counselling, administration, see below

Counselling Capsules to be taken at least 2 hours before or 2 hours after food

EMTRICITABINE

(FTC)

Indications HIV infection in combination with other antiretroviral drugs

Cautions see notes above; also on discontinuation, monitor patients with hepatitis B (risk of exacerbation of hepatitis); **interactions:** Appendix 1 (emtricitabine)

Hepatic impairment see notes above and Cautions above

Renal impairment reduce dose if eGFR less than 50 mL/minute/1.73 m^2; consult product literature

Pregnancy see p. 411

Breast-feeding see p. 411

Side-effects see notes above; also abnormal dreams, pruritus, and hyperpigmentation

Dose

- See preparations

Emtriva® (Gilead) PoM

Capsules, white/blue, emtricitabine 200 mg, net price 30-cap pack = £163.50

Dose 200 mg once daily; CHILD body-weight over 33 kg see *BNF for Children*

Oral solution, orange, emtricitabine 10 mg/mL, net price 170-mL pack (candy-flavoured) = £46.50

Electrolytes Na^+ 460 micromol/mL

Dose 240 mg once daily; CHILD 4 months–18 years see *BNF for Children*

Note 240 mg oral solution ≡ 200 mg capsule; where appropriate the capsule may be used instead of the oral solution

Missed dose If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time

With tenofovir

See under Tenofovir

With efavirenz and tenofovir

See under Tenofovir

With rilpivirine and tenofovir

See under Tenofovir

With cobicistat, elvitegravir, and tenofovir

See under Tenofovir

LAMIVUDINE

(3TC)

Indications see preparations below

Cautions see notes above; **interactions:** Appendix 1 (lamivudine)

Chronic hepatitis B Recurrent hepatitis in patients with chronic hepatitis B may occur on discontinuation of lamivudine. When treating chronic hepatitis B with lamivudine, monitor liver function tests every 3 months, and viral markers of hepatitis B every 3–6 months, more frequently in patients with advanced liver disease or following transplantation (monitoring to continue for at least 1 year after discontinuation)

Hepatic impairment see notes above and Cautions above

Renal impairment reduce dose if eGFR less than 50 mL/minute/1.73 m^2; consult product literature

Pregnancy see p. 411

Breast-feeding can be used with caution in women infected with chronic hepatitis B alone, providing that adequate measures are taken to prevent hepatitis B infection in infants; for women infected with HIV, see p. 411

Side-effects see notes above; also peripheral neuropathy, muscle disorders including rhabdomyolysis, nasal symptoms, alopecia

Dose

- See preparations below

Epivir® (ViiV) PoM

Tablets, f/c, lamivudine 150 mg (scored, white), net price 60-tab pack = £121.82; 300 mg (grey), 30-tab pack = £133.89

Oral solution, banana- and strawberry-flavoured, lamivudine 50 mg/5 mL, net price 240-mL pack = £33.16

Excipients include sucrose 1 g/5 mL

Dose HIV infection in combination with other antiretroviral drugs, 150 mg every 12 hours *or* 300 mg once daily; CHILD 1 month–18 years see *BNF for Children*

Zeffix® (ViiV) PoM

Tablets, brown, f/c, lamivudine 100 mg, net price 28-tab pack = £78.09

Dose chronic hepatitis B infection *either* with compensated liver disease (with evidence of viral replication and histology of active liver inflammation or fibrosis) when first-line treatments cannot be used, *or* (in combination with another antiviral drug without cross-resistance to lamivudine) with decompensated liver disease, 100 mg daily; CHILD [unlicensed indication] 2–11 years, 3 mg/kg once daily (max. 100 mg daily); 12–17 years, adult dose

Note Patients receiving lamivudine for concomitant HIV infection should continue to receive lamivudine in a dose appropriate for HIV infection

With abacavir

See under Abacavir

With zidovudine

See under Zidovudine

With abacavir and zidovudine

See under Abacavir

STAVUDINE

(d4T)

Indications HIV infection in combination with other antiretroviral drugs when no suitable alternative available and when prescribed for shortest period possible

Cautions see notes above; also history of peripheral neuropathy, excessive alcohol intake, concomitant use of isoniazid—risk of peripheral neuropathy (see under Side-effects); history of pancreatitis or concomitant use with other drugs associated with pancreatitis; **interactions:** Appendix 1 (stavudine)

Hepatic impairment see notes above

Renal impairment risk of peripheral neuropathy; use half normal dose every 12 hours if eGFR 25–50 mL/minute/1.73 m^2; use half normal dose every 24 hours if eGFR less than 25 mL/minute/1.73 m^2

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Breast-feeding see p. 411

Side-effects see notes above; also peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops), abnormal dreams, cognitive dysfunction, drowsiness, depression, pruritus; *less commonly* anxiety, gynaecomastia

Dose

- ADULT under 60 kg, 30 mg every 12 hours preferably at least 1 hour before food; 60 kg and over, 40 mg every 12 hours; CHILD 1 month–18 years see *BNF for Children*

Zerit® (Bristol-Myers Squibb) PoM

Capsules, stavudine 20 mg (brown), net price 56-cap pack = £139.46; 30 mg (light orange/dark orange), 56-cap pack = £146.25; 40 mg (dark orange), 56-cap pack = £150.66 (all hosp. only)

Oral solution, cherry-flavoured, stavudine for reconstitution with water, 1 mg/mL, net price 200 mL = £22.94

TENOFOVIR DISOPROXIL

Indications HIV infection in combination with other antiretroviral drugs; chronic hepatitis B infection with *either* compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis) *or* decompensated liver disease

Cautions see notes above; also test renal function and serum phosphate before treatment, then every 4 weeks (more frequently if at increased risk of renal impairment) for 1 year and then every 3 months, interrupt treatment if renal function deteriorates or serum phosphate decreases; concomitant or recent use of nephrotoxic drugs; **interactions:** Appendix 1 (tenofovir)

Chronic hepatitis B When treating chronic hepatitis B with tenofovir, monitor liver function tests every 3 months and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation)

Hepatic impairment see notes above and Cautions above; manufacturer of *Atripla®* advises caution in mild impairment; avoid *Atripla®* in moderate to severe impairment; manufacturer of *Eviplera®* advises caution in moderate impairment; avoid *Eviplera®* or *Stribild®* in severe impairment

Renal impairment monitor renal function—interrupt treatment if further deterioration.

Granules: 132 mg once daily if eGFR 30–50 mL/minute/1.73 m^2; 66 mg once daily if eGFR 20–30 mL/minute/1.73 m^2; 33 mg once daily if eGFR 10–20 mL/minute/1.73 m^2.

Tablets: 245 mg every 2 days if eGFR 30–50 mL/minute/1.73 m^2; 245 mg every 3–4 days if eGFR 10–30 mL/minute/1.73 m^2.

Avoid *Atripla®* if eGFR less than 50 mL/minute/1.73 m^2; avoid *Eviplera®* if eGFR less than 50 mL/minute/1.73m^2; use normal dose of *Truvada®* every 2 days if eGFR 30–50 mL/minute/1.73 m^2; avoid *Truvada®* if eGFR less than 30 mL/minute/1.73 m^2; if eGFR less than 90 mL/minute/1.73 m^2, only *initiate Stribild®* if other treatments cannot be used (avoid *initiating Stribild®* if eGFR less than 70 mL/minute/1.73 m^2); if eGFR less than 70 mL/minute/1.73 m^2, only *continue Stribild®* if potential benefit outweighs risk (discontinue *Stribild®* if eGFR less than 50 mL/minute/1.73 m^2)

Pregnancy see p. 411

Breast-feeding see p. 411

Side-effects see notes above; also hypophosphataemia; *rarely* renal failure, proximal renal tubulopathy, nephrogenic diabetes insipidus; also reported reduced bone density

Dose

- ADULT over 18 years, 245 mg once daily; CHILD 2–18 years see *BNF for Children*

  Missed dose If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time

Viread® (Gilead) PoM

Tablets, f/c, blue, tenofovir disoproxil (as fumarate) 245 mg, net price 30-tab pack = £240.46. Label: 21

Granules, sugar-free, tenofovir disoproxil (as fumarate) 33 mg/g, net price 60 g (with 1-g scoop) = £54.50. Label: 21, counselling, administration

Note 7.5 scoops of granules contains approx. 245 mg tenofovir disoproxil (as fumarate)

Counselling Mix 1 scoop of granules with 1 tablespoon of soft food (e.g. yoghurt, apple sauce) and take immediately without chewing. Do **not** mix granules with liquids

With emtricitabine

For **cautions**, **contra-indications**, **side-effects**, and other prescribing information see under individual drugs

Truvada® (Gilead) PoM

Tablets, blue, f/c, tenofovir disoproxil (as fumarate) 245 mg, emtricitabine 200 mg, net price 30-tab pack = £418.50. Label: 21, counselling, administration

Counselling Patients with swallowing difficulties may disperse tablet in half a glass of water, orange juice, or grape juice (but bitter taste)

Dose HIV infection in combination with other antiretroviral drugs, ADULT over 18 years, 1 tablet once daily

Missed dose If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time

With efavirenz and emtricitabine

For **cautions**, **contra-indications**, **side-effects**, and other prescribing information see under individual drugs

Atripla® (Gilead) PoM

Tablets, pink, f/c, efavirenz 600 mg, emtricitabine 200 mg, tenofovir disoproxil (as fumarate) 245 mg, net price 30-tab pack = £626.90. Label: 23, 25

Dose HIV infection stabilised on antiretroviral therapy for more than 3 months, ADULT over 18 years, 1 tablet once daily

Missed dose If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time

With emtricitabine and rilpivirine

For **cautions**, **contra-indications**, **side-effects**, and other prescribing information see under individual drugs

Eviplera® (Gilead) ▼ PoM

Tablets, purple-pink, f/c, emtricitabine 200 mg, rilpivirine (as hydrochloride) 25 mg, tenofovir disoproxil (as fumarate) 245 mg, net price 30-tab pack = £618.77. Label: 21, 25, counselling, antacids

Counselling avoid antacids 2 hours before or 4 hours after taking *Eviplera®*

Dose HIV infection in patients with plasma HIV-1 RNA concentration less than 100 000 copies/mL, ADULT over 18 years, 1 tablet once daily

Missed dose If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time

With cobicistat, elvitegravir, and emtricitabine

Stribild® (Gilead) ▼ PoM

Tablets, green, f/c, cobicistat 150 mg, elvitegravir 150 mg, emtricitabine 200 mg, tenofovir disoproxil (as fumarate) 245 mg, net price 30-tab pack = £1034.72. Label: 21, counselling, antacids

Counselling Avoid antacids 4 hours before or 4 hours after taking *Stribild®*

Cautions see notes above and also Cautions under Emtricitabine and Tenofovir Disoproxil; also test urine

glucose before treatment, then every 4 weeks for 1 year and then every 3 months; women of child-bearing potential should use effective contraception during treatment (if using a hormonal contraceptive, it must contain norgestimate as the progestogen and at least 30 micrograms ethinylestradiol); **interactions**: Appendix 1 (cobicistat, elvitegravir, emtricitabine, and tenofovir)

Hepatic impairment see notes above and also Cautions under Tenofovir Disoproxil

Renal impairment see Tenofovir Disoproxil

Pregnancy see also Cautions; manufacturer advises use only if potential benefit outweighs risk

Breast-feeding see p. 411

Side-effects see notes above and also Side-effects under Emtricitabine and Tenofovir Disoproxil; also *less commonly* depression and suicidal ideation (in patients with history of psychiatric illness)

Dose HIV infection, ADULT over 18 years, 1 tablet once daily

Missed dose If a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time

Note Dispense in original container (contains desiccant)

ZIDOVUDINE

(Azidothymidine, AZT)

Note The abbreviation AZT which is sometimes used for zidovudine has also been used for another drug

Indications HIV infection in combination with other antiretroviral drugs; prevention of maternal-fetal HIV transmission (see notes above under Pregnancy and Breast-feeding)

Cautions see notes above; also haematological toxicity particularly with high dose and advanced disease—monitor full blood count after 4 weeks of treatment, then every 3 months; vitamin B_{12} deficiency (increased risk of neutropenia); if anaemia or myelosuppression occur, reduce dose or interrupt treatment according to product literature, or consider other treatment; elderly; **interactions:** Appendix 1 (zidovudine)

Contra-indications abnormally low neutrophil counts or haemoglobin concentration (consult product literature); neonates with hyperbilirubinaemia requiring treatment other than phototherapy, or with raised transaminase (consult product literature); acute porphyria (section 9.8.2)

Hepatic impairment see notes above; also accumulation may occur

Renal impairment reduce oral dose to 300–400 mg daily in divided doses or intravenous dose to 1 mg/kg 3–4 times daily if eGFR is less than 10 mL/minute/1.73 m^2; avoid *Combivir*® (or non-proprietary equivalents) if eGFR less than 50 mL/minute/1.73m^2 (consult product literature)

Pregnancy see p. 411

Breast-feeding see p. 411

Side-effects see notes above; also anaemia (may require transfusion), taste disturbance, chest pain, influenza-like symptoms, paraesthesia, neuropathy, convulsions, dizziness, drowsiness, anxiety, depression, loss of mental acuity, myopathy, gynaecomastia, urinary frequency, sweating, pruritus, pigmentation of nails, skin and oral mucosa

Dose

- By mouth, 250–300 mg twice daily; CHILD 1 month–18 years see *BNF for Children*
- Prevention of maternal-fetal HIV transmission, seek specialist advice (combination therapy preferred)
- Patients temporarily unable to take zidovudine by mouth, by intravenous infusion over 1 hour, 0.8–1 mg/kg every 4 hours (approximating to 1.2–1.5 mg/kg every 4 hours by mouth) usually for not more than 2 weeks; CHILD 3 months–18 years see *BNF for Children*

Zidovudine (Non-proprietary) PoM

Capsules, zidovudine 100 mg, net price 60-cap pack = £50.17; 250 mg, 60-cap pack = £125.44

Retrovir® (ViiV) PoM

Capsules, zidovudine 100 mg (white), net price 100-cap pack = £88.86; 250 mg (blue/white), 40-cap pack = £88.86

Oral solution, sugar-free, strawberry-flavoured, zidovudine 50 mg/5 mL, net price 200-mL pack with 10-mL oral syringe = £17.78

Injection, zidovudine 10 mg/mL. For dilution and use as an intravenous infusion. Net price 20-mL vial = £8.92

With lamivudine

For **cautions**, **contra-indications**, **side-effects**, and other prescribing information see under individual drugs

Zidovudine and lamivudine (Non-proprietary) PoM

Tablets, f/c, scored, zidovudine 300 mg, lamivudine 150 mg, net price 60-tab pack = £70.61

Dose 1 tablet twice daily; CHILD body-weight over 14 kg see *BNF for Children*

Combivir® (ViiV) PoM

Tablets, f/c, scored, zidovudine 300 mg, lamivudine 150 mg, net price 60-tab pack = £255.10

Dose 1 tablet twice daily; CHILD body-weight over 14 kg see *BNF for Children*

Note Tablets may be crushed and mixed with semi-solid food or liquid just before administration

With abacavir and lamivudine

See under Abacavir

Protease inhibitors

Cautions Protease inhibitors are associated with hyperglycaemia and should be used with caution in diabetes (see Lipodystrophy Syndrome, p. 412). Caution is also needed in patients with haemophilia who may be at increased risk of bleeding.

Contra-indications Protease inhibitors should not be given to patients with acute porphyria (but see section 9.8.2).

Hepatic impairment Protease inhibitors should be used with caution in patients with chronic hepatitis B or C (increased risk of hepatic side-effects)

Pregnancy See p. 411

Breast-feeding See p. 411

Side-effects Side-effects of the protease inhibitors include gastro-intestinal disturbances (including diarrhoea, nausea, vomiting, abdominal pain, flatulence), anorexia, hepatic dysfunction, pancreatitis; blood disorders including anaemia, neutropenia, and thrombocytopenia; sleep disturbances, fatigue, headache, dizziness, paraesthesia, myalgia, myositis, rhabdomyolysis; taste disturbances; rash, pruritus, Stevens-Johnson syndrome, hypersensitivity reactions including anaphylaxis; see also notes above for lipodystrophy and metabolic effects (Lipodystrophy Syndrome), and Osteonecrosis.

ATAZANAVIR

Indications HIV infection in combination with other antiretroviral drugs

Cautions see notes above; also concomitant use with drugs that prolong PR interval; cardiac conduction disorders; predisposition to QT interval prolongation (including electrolyte disturbances, concomitant use of drugs that prolong QT interval); **interactions:** Appendix 1 (atazanavir)

Rash Mild to moderate rash occurs commonly, usually within the first 3 weeks of therapy. Severe rash occurs less frequently and may be accompanied by systemic symptoms. Discontinue if severe rash develops

Contra-indications see notes above

Hepatic impairment see notes above; also manufacturer advises caution in mild impairment; avoid in moderate to severe impairment

Pregnancy see p. 411; monitor viral load and plasma-atazanavir concentration during third trimester; theoretical risk of hyperbilirubinaemia in neonate if used at term

Breast-feeding see p. 411

Side-effects see notes above; also AV block (in children); *less commonly* mouth ulcers, dry mouth, cholelithiasis, hypertension, syncope, chest pain, torsade de pointes, dyspnoea, peripheral neuropathy, abnormal dreams, amnesia, disorientation, depression, anxiety, weight changes, increased appetite, gynaecomastia, nephrolithiasis, urinary frequency, haematuria, proteinuria, arthralgia, and alopecia; *rarely* cholecystitis, hepatosplenomegaly, oedema, palpitation, abnormal gait

Dose

- With low-dose ritonavir, 300 mg once daily; CHILD 6–18 years see *BNF for Children*

Reyataz® (Bristol-Myers Squibb) ▼ PoM

Capsules, atazanavir (as sulfate) 150 mg (dark blue/light blue), net price 60-cap pack = £303.38; 200 mg (dark blue), 60-cap pack = £303.38; 300 mg (red/blue), 30-cap pack = £303.38. Label: 5, 21

DARUNAVIR

Indications HIV infection in combination with other antiretroviral drugs

Cautions see notes above; also sulfonamide sensitivity; monitor liver function before and during treatment; **interactions:** Appendix 1 (darunavir)

Rash Mild to moderate rash occurs commonly, usually within the first 4 weeks of therapy and resolves without stopping treatment. Severe skin rash (including Stevens-Johnson syndrome and toxic epidermal necrolysis) occurs less frequently and may be accompanied by fever, malaise, arthralgia, myalgia, oral lesions, conjunctivitis, hepatitis, or eosinophilia; treatment should be stopped if severe rash develops

Contra-indications see notes above

Hepatic impairment see notes above; also manufacturer advises caution in mild to moderate impairment; avoid in severe impairment—no information available

Pregnancy manufacturer advises use only if potential benefit outweighs risk; if required, use the twice daily dose regimen; see also p. 411

Breast-feeding see p. 411

Side-effects see notes above; also peripheral neuropathy; *less commonly* myocardial infarction, angina, QT interval prolongation, tachycardia, hypertension, flushing, peripheral oedema, dyspnoea, cough, anxiety, memory impairment, depression, abnormal dreams, increased appetite, weight changes, pyrexia, hypothyroidism, osteoporosis, gynaecomastia, erectile dysfunction, reduced libido, dysuria, polyuria, nephrolithiasis, renal failure, arthralgia, dry eyes, conjunctival hyperaemia, throat irritation, dry mouth, stomatitis, nail discoloration, acne, eczema, increased sweating, alopecia; *rarely* haematemesis, syncope, bradycardia, palpitation, confusion, convulsions, visual disturbances, rhinorrheoa, seborrhoeic dermatits

Dose

- With low-dose ritonavir, ADULT over 18 years previously treated with antiretroviral therapy, 600 mg twice daily *or* (if no resistance to darunavir, if plasma HIV-RNA concentration less than 100 000 copies/mL, and if CD4 cell count greater than 100 cells $\times 10^6$/litre) 800 mg once daily; CHILD 3–18 years see *BNF for Children*
- With low-dose ritonavir, ADULT over 18 years not previously treated with antiretroviral therapy, 800 mg once daily; CHILD 12–18 years see *BNF for Children*

Missed dose If a dose is more than 6 hours late on the twice daily regimen (or more than 12 hours late on the once daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time

Prezista® (Janssen) PoM

Tablets, f/c, darunavir (as ethanolate) 75 mg (white), net price 480-tab pack = £446.70; 150 mg (white), 240-tab pack = £446.70; 400 mg (light orange), 60-tab pack = £297.80; 600 mg (orange), 60-tab pack = £446.70; 800 mg (red), 30-tab pack = £297.80. Label: 21

Oral suspension, sugar-free, strawberry-flavoured, darunavir (as ethanolate) 100 mg/mL, net price 200-mL = £248.17. Label: 21

FOSAMPRENAVIR

Note Fosamprenavir is a pro-drug of amprenavir

Indications HIV infection in combination with other antiretroviral drugs

Cautions see notes above; **interactions:** Appendix 1 (fosamprenavir)

Rash Rash may occur, usually in the second week of therapy; discontinue permanently if severe rash with systemic or allergic symptoms or, mucosal involvement; if rash mild or moderate, may continue without interruption—usually resolves within 2 weeks and may respond to antihistamines

Contra-indications see notes above

Hepatic impairment see notes above; also manufacturer advises caution in mild impairment; reduce dose to 450 mg twice daily in moderate impairment; reduce dose to 300 mg twice daily in severe impairment

Pregnancy toxicity in *animal* studies; manufacturer advises use only if potential benefit outweighs risk

Breast-feeding see p. 411

Side-effects see notes above; also reported, rash including rarely Stevens-Johnson syndrome (see also Rash above)

Dose

- With low-dose ritonavir, 700 mg twice daily; CHILD 6–18 years see *BNF for Children*

Note 700 mg fosamprenavir is equivalent to approx. 600 mg amprenavir

Telzir® (ViiV) PoM

Tablets, f/c, pink, fosamprenavir (as calcium) 700 mg, net price 60-tab pack = £220.13

Oral suspension, fosamprenavir (as calcium) 50 mg/mL, net price 225-mL pack (grape-bubblegum-and peppermint-flavoured) (with 10-mL oral syringe) = £58.70. Counselling, administration

Counselling In adults, oral suspension should be taken on an empty stomach

INDINAVIR

Indications HIV infection in combination with nucleoside reverse transcriptase inhibitors

Cautions see notes above; also ensure adequate hydration (risk of nephrolithiasis); patients at risk of nephrolithiasis (monitor for nephrolithiasis); patients at high risk of cardiovascular disease (especially if 10-year cardiovascular risk greater than 20%); **interactions:** Appendix 1 (indinavir)

Contra-indications see notes above

Hepatic impairment see notes above; also increased risk of nephrolithiasis; reduce dose in mild to moderate impairment; not studied in severe impairment

Renal impairment use with caution; monitor for nephrolithiasis

Pregnancy toxicity in *animal* studies; manufacturer advises use only if potential benefit outweighs risk; theoretical risk of hyperbilirubinaemia and renal stones in neonate if used at term

Breast-feeding see p. 411

Side-effects see notes above; also reported, dry mouth, hypoaesthesia, dry skin, hyperpigmentation, alopecia, paronychia, interstitial nephritis (with medullary calcification and cortical atrophy in asymptomatic severe leucocyturia), nephrolithiasis (may require interruption or discontinuation), dysuria, haematuria, crystalluria, proteinuria, pyelonephritis; haemolytic anaemia

Dose

- ADULT over 18 years, seek specialist advice

Crixivan® (MSD) PoM

Capsules, indinavir (as sulfate), 200 mg, net price 360-cap pack = £181.02; 400 mg, 180-cap pack = £181.02. Label: 27, counselling, administration

Counselling Administer 1 hour before or 2 hours after a meal; may be administered with a low-fat light meal; in combination with didanosine tablets, allow 1 hour between each drug (antacids in didanosine tablets reduce absorption of indinavir); in combination with low-dose ritonavir, give with food

Note Dispense in original container (contains desiccant)

LOPINAVIR WITH RITONAVIR

Indications HIV infection in combination with other antiretroviral drugs

Cautions see notes above; concomitant use with drugs that prolong QT or PR interval; cardiac conduction disorders, structural heart disease; patients at high risk of cardiovascular disease (especially if 10-year cardiovascular risk greater than 20%); pancreatitis (see below); monitor liver function before and during treatment; **interactions:** Appendix 1 (lopinavir, ritonavir)

Pancreatitis Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed

Contra-indications see notes above

Hepatic impairment see notes above; also avoid oral solution due to propylene glycol content; manufacturer advises avoid capsules and tablets in severe impairment

Renal impairment avoid oral solution due to propylene glycol content; use tablets with caution in severe impairment

Pregnancy avoid oral solution due to high propylene glycol content; use tablets only if potential benefit outweighs risk (toxicity in *animal* studies); for tablets see also p. 411

Breast-feeding see p. 411

Side-effects see notes above; also colitis, weight changes, hypertension, anxiety, neuropathy, sexual dysfunction, amenorrhoea, menorrhagia, arthralgia, night sweats; *less commonly* gastro-intestinal ulcer, rectal bleeding, dry mouth, stomatitis, myocardial infarction, AV block, cerebrovascular accident, deep vein thrombosis, abnormal dreams, convulsions, tremor, nephritis, haematuria, visual disturbances, tinnitus, alopecia

Dose

- See preparations below

Kaletra® (AbbVie) PoM

Tablets, pale yellow, f/c, lopinavir 100 mg, ritonavir 25 mg, net price 60-tab pack = £76.85. Label: 25

Dose CHILD 2–18 years see *BNF for Children*

Tablets, yellow, f/c, lopinavir 200 mg, ritonavir 50 mg, net price 120-tab pack = £285.41. Label: 25

Dose 2 tablets twice daily; alternatively, in adults with a HIV strain that has less than 3 mutations to protease inhibitors, 4 tablets may be taken once daily; CHILD 2–18 years see *BNF for Children*

Oral solution, lopinavir 400 mg, ritonavir 100 mg/5 mL, net price 5 × 60-mL packs = £307.39. Label: 21

Excipients include propylene glycol 153 mg/mL (see Excipients, p. 2), alcohol 42%

Dose 5 mL twice daily with food; CHILD 2–18 years see *BNF for Children*

RITONAVIR

Indications HIV infection in combination with other antiretroviral drugs; low doses used to increase effect of some protease inhibitors

Cautions see notes above; concomitant use with drugs that prolong PR interval; cardiac conduction disorders, structural heart disease; pancreatitis (see below); **interactions:** Appendix 1 (ritonavir)

Pancreatitis Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed

Contra-indications see notes above

Hepatic impairment see notes above; also avoid in decompensated liver disease; in severe impairment without decompensation, use 'booster' doses with caution (avoid treatment doses)

Pregnancy only use low-dose booster to increase the effect of other protease inhibitors; see also p. 411

Breast-feeding see p. 411

Side-effects see notes and Cautions above; also gastro-intestinal haemorrhage, blood pressure changes, oedema, syncope, flushing, cough, pharyngitis, anxiety, confusion, seizures, peripheral neuropathy, fever, decreased blood thyroxine concentration, menorrhagia, renal impairment, arthralgia, blurred vision, mouth ulcers, acne; *less commonly*

myocardial infarction, electrolyte disturbances; *rarely* toxic epidermal necrolysis

Dose

- Initially 300 mg every 12 hours for 3 days, increased in steps of 100 mg every 12 hours over not longer than 14 days to 600 mg every 12 hours; CHILD 2–18 years see *BNF for Children*
- Low-dose booster to increase effect of other protease inhibitors, 100–200 mg once or twice daily; CHILD 2–18 years see *BNF for Children*

Norvir® (AbbVie) PoM

Tablets, f/c, ritonavir 100 mg, net price 30-tab pack = £19.44. Label: 21, 25

Oral solution, sugar-free, ritonavir 400 mg/5 mL, net price 5 × 90-mL packs (with measuring cup) = £403.20. Label: 21, counselling, administration

Excipients include propylene glycol 26% (see Excipients, p. 2), alcohol 43%

Counselling Bitter taste of oral solution can be masked by mixing with chocolate milk; do not mix with water, measuring cup must be dry

With lopinavir

See under Lopinavir with Ritonavir

SAQUINAVIR

Indications HIV infection in combination with other antiretroviral drugs

Cautions see notes above; monitor ECG before starting treatment and then on day 3 or 4 of treatment—discontinue if QT interval over 480 milliseconds, if QT interval more than 20 milliseconds above baseline, or if prolongation of PR interval; concomitant use of garlic (avoid garlic capsules—reduces plasma-saquinavir concentration); **interactions:** Appendix 1 (saquinavir)

Counselling Patients should be told how to recognise signs of arrhythmia and advised to seek medical attention if symptoms such as palpitation or syncope develop

Contra-indications see notes above; predisposition to cardiac arrhythmias (including congenital QT prolongation, bradycardia, history of symptomatic arrhythmias, heart failure with reduced left ventricular ejection fraction, electrolyte disturbances, concomitant use of drugs that prolong QT or PR interval); concomitant use of drugs that increase plasma-saquinavir concentration (avoid unless no alternative treatment available)

Hepatic impairment see notes above; also manufacturer advises caution in moderate impairment; avoid in decompensated liver disease

Renal impairment use with caution if eGFR less than 30 mL/minute/1.73 m^2

Pregnancy see p. 411

Breast-feeding see p. 411

Side-effects see notes above; also dyspnoea, increased appetite, peripheral neuropathy, changes in libido, dry mouth, alopecia; *less commonly* mucosal ulceration, convulsions, renal impairment, visual impairment

Dose

- With low-dose ritonavir, ADULT over 18 years previously treated with antiretroviral therapy, 1 g every 12 hours
- With low-dose ritonavir, ADULT over 18 years not previously treated with antiretroviral therapy, 500 mg every 12 hours for 7 days then 1 g every 12 hours

Invirase® (Roche) PoM

Tablets, orange, f/c, saquinavir (as mesilate) 500 mg, net price 120-tab pack = £251.26. Label: 21, counselling, arrhythmias

TIPRANAVIR

Indications HIV infection resistant to other protease inhibitors, in combination with other antiretroviral drugs in patients previously treated with antiretrovirals

Cautions see notes above; also patients at risk of increased bleeding from trauma, surgery or other pathological conditions; concomitant use of drugs that increase risk of bleeding; **interactions:** Appendix 1 (tipranavir)

Hepatotoxicity Potentially life-threatening hepatotoxicity reported; monitor liver function before treatment then every 2 weeks for 1 month, then every 3 months. Discontinue if signs or symptoms of hepatitis develop or if liver-function abnormality develops (consult product literature)

Contra-indications see notes above

Hepatic impairment see notes above; also manufacturer advises caution in mild impairment; avoid in moderate or severe impairment—no information available

Pregnancy manufacturer advises use only if potential benefit outweighs risk—toxicity in *animal* studies

Breast-feeding see p. 411

Side-effects see notes above; also dyspnoea, anorexia, peripheral neuropathy, influenza-like symptoms, renal impairment and photosensitivity; *rarely* dehydration

Dose

- See preparations

Aptivus® (Boehringer Ingelheim) PoM

Capsules, pink, tipranavir 250 mg, net price 120–cap pack = £441.00. Label: 5, 21

Excipients include ethanol 100 mg per capsule

Dose with low-dose ritonavir, 500 mg twice daily; CHILD 12–18 years see *BNF for Children*

Oral Solution, toffee-and mint-flavoured, tipranavir 100 mg/mL, net price 95–mL pack = £129.65. Label: 5, 21, counselling, crystallisation

Excipients include vitamin E 78 mg/mL

Dose with low-dose ritonavir, CHILD 2–12 years see *BNF for Children*

Note The bioavailability of *Aptivus®* oral solution is higher than that of the capsules; the oral solution is **not** interchangeable with the capsules on a milligram-for-milligram basis

Counselling Patients should be told to observe the oral solution for crystallisation; the bottle should be replaced if more than a thin layer of crystals form (doses should continue to be taken at the normal time until the bottle is replaced)

Non-nucleoside reverse transcriptase inhibitors

EFAVIRENZ

Indications HIV infection in combination with other antiretroviral drugs

Cautions elderly; history of mental illness or seizures; monitor liver function if receiving other hepatotoxic drugs; **interactions:** Appendix 1 (efavirenz)

Rash Rash, usually in the first 2 weeks, is the most common side-effect; discontinue if severe rash with blistering,

desquamation, mucosal involvement or fever; if rash mild or moderate, may continue without interruption—usually resolves within 1 month

Psychiatric disorders Patients or their carers should be advised to seek immediate medical attention if symptoms such as severe depression, psychosis or suicidal ideation occur

Contra-indications acute porphyria (but see section 9.8.2)

Hepatic impairment in mild liver disease, monitor for dose related side-effects (e.g. CNS effects) and monitor liver function; avoid in moderate to severe impairment; greater risk of hepatic side-effects in chronic hepatitis B or C

Renal impairment manufacturer advises caution in severe renal failure—no information available

Pregnancy see p. 411; reports of neural tube defects when used in first trimester

Breast-feeding see p. 411

Side-effects rash including Stevens-Johnson syndrome (see Rash above); abdominal pain, diarrhoea, nausea, vomiting; anxiety, depression, sleep disturbances, abnormal dreams, dizziness, headache, fatigue, impaired concentration (administration at bedtime especially in first 2–4 weeks reduces CNS effects); pruritus; *less commonly* pancreatitis, hepatitis, flushing, psychosis, mania, suicidal ideation, amnesia, ataxia, tremor, convulsions, gynaecomastia, blurred vision, tinnitus; *rarely* hepatic failure, photosensitivity; also reported raised serum cholesterol (see Lipodystrophy Syndrome, p. 412); see also Osteonecrosis, p. 412

Dose

- See preparations below

Sustiva® (Bristol-Myers Squibb) PoM

Capsules, efavirenz 50 mg (yellow/white), net price 30-cap pack = £16.73; 100 mg (white), 30-cap pack = £33.41; 200 mg (yellow), 90-cap pack = £200.27. Label: 23

Dose 600 mg once daily; CHILD 3–18 years see *BNF for Children*

Tablets, f/c, yellow, efavirenz 600 mg, net price 30-tab pack = £200.27. Label: 23

Dose 600 mg once daily; CHILD body-weight over 40 kg see *BNF for Children*

Oral solution, sugar-free, strawberry and mint flavour, efavirenz 30 mg/mL, net price 180-mL pack = £53.84

Dose 720 mg once daily; CHILD 3–18 years see *BNF for Children*

Note The bioavailability of *Sustiva®* oral solution is lower than that of the capsules and tablets; the oral solution is **not** interchangeable with either capsules or tablets on a milligram-for-milligram basis

With emtricitabine and tenofovir

See under Tenofovir

ETRAVIRINE

Indications in combination with other antiretroviral drugs (including a boosted protease inhibitor) for HIV infection resistant to other non-nucleoside reverse transcriptase inhibitors and protease inhibitors

Cautions **interactions:** Appendix 1 (etravirine)

Hypersensitivity reactions Rash, usually in the second week, is the most common side-effect and appears more frequently in women. Life-threatening hypersensitivity reactions reported usually during week 3–6 of treatment and characterised by rash, eosinophilia, and systemic symptoms (including fever, general malaise, myalgia, arthralgia, blistering, oral lesions, conjunctivitis, and hepatitis). Discontinue permanently if hypersensitivity reaction or severe rash develop. If rash mild or moderate (without signs of hypersensitivity reaction), may continue without interruption—usually resolves within 2 weeks

Counselling Patients should be told how to recognise hypersensitivity reactions and advised to seek immediate medical attention if hypersensitivity reaction or severe rash develop

Contra-indications acute porphyria (but see section 9.8.2)

Hepatic impairment manufacturer advises caution in moderate impairment; avoid in severe impairment—no information available; greater risk of hepatic side-effects in chronic hepatitis B or C

Pregnancy see p. 411

Breast-feeding see p. 411

Side-effects rash (including Stevens-Johnson syndrome rarely and toxic epidermal necrolysis very rarely; see also Hypersensitivity Reactions above); gastro-oesophageal reflux, nausea, abdominal pain, flatulence, gastritis; myocardial infarction, hypertension; peripheral neuropathy; diabetes, hyperlipidaemia (see also Lipodystrophy Syndrome, p. 412); renal failure; anaemia; *less commonly* pancreatitis, haematemesis, hepatitis, angina, bronchospasm, drowsiness, malaise, gynaecomastia, blurred vision, dry mouth, and sweating; also reported, haemorrhagic stroke and hypersensitivity reactions; see also Osteonecrosis, p. 412

Dose

- 200 mg twice daily after food; CHILD 6–18 years see *BNF for Children*

Missed dose If a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time

Intelence® (Janssen) ▼ PoM

Tablets, etravirine 100 mg, net price 120-tab pack = £301.27; 200 mg, 60-tab pack = £301.27. Label: 21, counselling, rash and hypersensitivity reactions

Note Dispense in original container (contains desiccant). Patients with swallowing difficulties may disperse tablets in a glass of water just before administration

NEVIRAPINE

Indications HIV infection in combination with other antiretroviral drugs

Cautions chronic hepatitis B or C, high CD4 cell count, and women (all at greater risk of hepatic side-effects—if plasma HIV-1 RNA detectable, manufacturer advises avoid in women with CD4 cell count greater than 250 cells/mm^3 or in men with CD4 cell count greater than 400 cells/mm^3 unless potential benefit outweighs risk); **interactions:** Appendix 1 (nevirapine)

Hepatic disease Potentially life-threatening hepatotoxicity including fatal fulminant hepatitis reported usually in first 6 weeks; close monitoring required during first 18 weeks; monitor liver function before treatment then every 2 weeks for 2 months then after 1 month and then regularly; discontinue permanently if abnormalities in liver function tests accompanied by hypersensitivity reaction (rash, fever, arthralgia, myalgia, lymphadenopathy, hepatitis, renal impairment, eosinophilia, granulocytopenia); suspend if severe abnormalities in liver function tests but no hypersensitivity reaction—discontinue permanently if

significant liver function abnormalities recur; monitor patient closely if mild to moderate abnormalities in liver function tests with no hypersensitivity reaction

Rash Rash, usually in first 6 weeks, is most common side-effect; incidence reduced if introduced at low dose and dose increased after 14 days; monitor closely for skin reactions during first 18 weeks; discontinue permanently if severe rash or if rash accompanied by blistering, oral lesions, conjunctivitis, facial oedema, general malaise or hypersensitivity reactions; if rash mild or moderate may continue without interruption but dose should not be increased until rash resolves

Counselling Patients should be told how to recognise hypersensitivity reactions and advised to discontinue treatment and seek immediate medical attention if severe skin reaction, hypersensitivity reactions, or symptoms of hepatitis develop

Contra-indications acute porphyria (but see section 9.8.2); post-exposure prophylaxis

Hepatic impairment manufacturer advises avoid modified-release preparation—no information available; use 'immediate-release' preparation with caution in moderate impairment and avoid in severe impairment; see also Hepatic Disease, above

Renal impairment manufacturer advises avoid modified-release preparation—no information available

Pregnancy see p. 411

Breast-feeding see p. 411

Side-effects rash including Stevens-Johnson syndrome and toxic epidermal necrolysis (see also Cautions above), nausea, vomiting, abdominal pain, diarrhoea, hepatitis (see also Hepatic Disease above), hypersensitivity reactions (may involve hepatic reactions and rash, see also Hepatic Disease above), headache, fatigue, fever, granulocytopenia; *less commonly* anaemia, myalgia, arthralgia; see also Osteonecrosis, p. 412

Dose

- 200 mg once daily of 'immediate-release' preparation for first 14 days then (if no rash present) 200 mg twice daily of 'immediate-release' preparation or 400 mg once daily of modified-release preparation; CHILD under 18 years see *BNF for children*

Note Duration of once daily dose regimen of 'immediate-release' preparation should not exceed 28 days; if rash not resolved within 28 days, alternative treatment should be sought. If treatment interrupted for more than 7 days, restart using the once daily dose regimen of the 'immediate-release' preparation for the first 14 days as for new treatment

Missed dose If a dose is more than 8 hours late with the 'immediate-release' preparation (or more than 12 hours late with the modified-release preparation), the missed dose should not be taken and the next dose should be taken at the usual time

Nevirapine (Non-proprietary) PoM

Tablets, nevirapine 200 mg, net price 60 = £122.00. Counselling, hypersensitivity reactions

Viramune® (Boehringer Ingelheim) PoM

Tablets, nevirapine 200 mg, net price 14-tab pack = £39.67, 60-tab pack = £170.00. Counselling, hypersensitivity reactions

Suspension, nevirapine 50 mg/5 mL, net price 240-mL pack = £50.40. Counselling, hypersensitivity reactions

Prolonged-release tablets, m/r, yellow, nevirapine 400 mg, net price 30-tab pack = £170.00. Label: 25, counselling, hypersensitivity reactions

RILPIVIRINE

Indications see preparations below

Cautions concomitant use with drugs that prolong QT interval; **interactions**: Appendix 1 (rilpivirine)

Hepatic impairment manufacturer advises caution in moderate impairment; avoid in severe impairment—no information available; greater risk of hepatic side-effects in chronic hepatitis B or C

Renal impairment manufacturer advises caution in severe impairment

Pregnancy manufacturer advises avoid unless essential—no information available

Breast-feeding see p. 411

Side-effects nausea, vomiting, abdominal pain, anorexia, dry mouth, raised serum amylase and lipase, hyperlipidaemia (see also Lipodystrophy Syndrome, p. 412), depression, abnormal dreams, sleep disturbances, headache, dizziness, malaise, rash; see also Osteonecrosis, p. 412

Dose

- See preparations below

Edurant® (Janssen) ▼ PoM

Tablets, f/c, rilpivirine (as hydrochloride) 25 mg, net price 30-tab pack = £200.27. Label: 21, 25, counselling, antacids

Counselling Avoid antacids 2 hours before or 4 hours after taking rilpivirine

Dose HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy and if plasma HIV-1 RNA concentration less than 100 000 copies/mL, ADULT over 18 years, 25 mg once daily

Missed dose If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time

With emtricitabine and tenofovir

See under Tenofovir

Other antiretrovirals

DOLUTEGRAVIR

Indications HIV infection in combination with other antiretroviral drugs

Cautions avoid concomitant use with etravirine, unless used in combination with atazanavir, darunavir, or lopinavir; **interactions**: Appendix 1 (dolutegravir)

Hypersensitivity reactions Hypersensitivity reactions (including severe rash, or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, oral lesions, conjunctivitis, angioedema, eosinophilia, or raised liver enzymes) reported uncommonly. Discontinue immediately if any sign or symptoms of hypersensitivity reactions develop

Hepatic impairment manufacturer advises caution in severe impairment—no information available

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Breast-feeding see p. 411

Side-effects diarrhoea, nausea, vomiting, abdominal pain, flatulence, headache, dizziness, insomnia, abnormal dreams, fatigue, rash, pruritus, raised creatine kinase; *less commonly* hepatitis, hypersensitivity reactions (see Cautions); see also Osteonecrosis, p. 412

Dose

- 50 mg once daily; if resistance to other inhibitors of HIV integrase suspected, 50 mg twice daily with food; CHILD 12–18 years see *BNF for Children*

Note 50 mg twice daily with concomitant efavirenz, nevirapine, tipranavir, or rifampicin, however, avoid concomitant use with these drugs if resistance to other inhibitors of HIV integrase suspected

Missed dose If a dose is more than 20 hours late on the once daily regimen (or more than 8 hours late on the twice daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time

Tivicay® (GSK) ▼ PoM

Tablets, yellow, f/c, dolutegravir (as sodium salt) 50 mg, net price 30-tab pack = £498.75. Counselling, antacids

Counselling Avoid antacids 6 hours before or 2 hours after taking dolutegravir

ENFUVIRTIDE

Indications HIV infection in combination with other antiretroviral drugs for resistant infection or for patients intolerant to other antiretroviral regimens

Cautions **interactions:** Appendix 1 (enfuvirtide)

Hypersensitivity reactions Hypersensitivity reactions including rash, fever, nausea, vomiting, chills, rigors, low blood pressure, respiratory distress, glomerulonephritis, and raised liver enzymes reported; discontinue immediately if any signs or symptoms of systemic hypersensitivity develop and do not rechallenge

Counselling Patients should be told how to recognise signs of hypersensitivity, and advised to discontinue treatment and seek immediate medical attention if symptoms develop

Hepatic impairment manufacturer advises caution—no information available; chronic hepatitis B or C (possibly greater risk of hepatic side-effects)

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Breast-feeding see p. 411

Side-effects injection-site reactions; pancreatitis, gastro-oesophageal reflux disease, anorexia, weight loss; hypertriglyceridaemia; peripheral neuropathy, asthenia, tremor, anxiety, nightmares, irritability, impaired concentration, vertigo; pneumonia, sinusitis, influenza-like illness; diabetes mellitus; haematuria; renal calculi, lymphadenopathy; myalgia; conjunctivitis; dry skin, acne, erythema, skin papilloma; *less commonly* hypersensitivity reactions (see Cautions); see also Osteonecrosis, p. 412

Dose

- By subcutaneous injection, 90 mg twice daily; CHILD 6–18 years see *BNF for Children*

Fuzeon® (Roche) PoM

Injection, powder for reconstitution, enfuvirtide 108 mg (= enfuvirtide 90 mg/mL when reconstituted with 1.1 mL Water for Injections), net price 108-mg vial = £18.03 (with solvent, syringe, and alcohol swabs). Counselling, hypersensitivity reactions

Electrolytes $Na^+ < 1$ mmol/mL

MARAVIROC

Indications CCR5-tropic HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretrovirals

Cautions cardiovascular disease; chronic hepatitis B or C; **interactions:** Appendix 1 (maraviroc)

Hepatic impairment manufacturer advises caution

Renal impairment if eGFR less than 80 mL/minute/1.73 m^2, consult product literature

Pregnancy manufacturer advises use only if potential benefit outweighs risk—toxicity in *animal* studies

Breast-feeding see p. 411

Side-effects nausea, diarrhoea, abdominal pain, flatulence, anorexia, depression, insomnia, malaise, headache, anaemia, rash; *less commonly* seizures, renal failure, proteinuria, myositis; *rarely* hepatitis, angina, pancytopenia, granulocytopenia, Stevens-Johnson syndrome, toxic epidermal necrolysis; also reported hypersensitivity reactions (including rash, fever, eosinophilia, and hepatic reactions); see also Osteonecrosis, p. 412

Dose

- ADULT over 18 years, 300 mg twice daily

Celsentri® (ViiV) PoM

Tablets, blue, f/c, maraviroc, 150 mg, net price 60-tab pack = £441.27; 300 mg, 60-tab pack = £441.27

RALTEGRAVIR

Indications HIV infection in combination with other antiretroviral drugs

Cautions risk factors for myopathy or rhabdomyolysis; chronic hepatitis B or C (greater risk of hepatic side-effects); psychiatric illness (may exacerbate underlying illness including depression); **interactions**: Appendix 1 (raltegravir)

Rash Rash occurs commonly. Discontinue if severe rash or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, mouth ulceration, conjunctivitis, angioedema, hepatitis, or eosinophilia

Hepatic impairment manufacturer advises caution in severe impairment—no information available

Pregnancy manufacturer advises avoid—toxicity in *animal* studies

Breast-feeding see p. 411

Side-effects diarrhoea, nausea, vomiting, dyspepsia, abdominal pain, flatulence, hypertriglyceridaemia, dizziness, headache, depression, insomnia, abnormal dreams, hyperactivity, asthenia, rash (including less commonly Stevens-Johnson syndrome, rash with eosinophilia and systemic symptoms; see also Rash above); *less commonly* gastritis, hepatitis, pancreatitis, dry mouth, taste disturbances, pain on swallowing, peptic ulcer, constipation, rectal bleeding, lipodystrophy (see Lipodystrophy Syndrome, p. 412), palpitation, ventricular extrasystoles, bradycardia, hypertension, flushing, chest pain, oedema, dysphonia, epistaxis, nasal congestion, drowsiness, anxiety, appetite changes, confusion, impaired memory and attention, suicidal ideation, pyrexia, chills, carpal tunnel syndrome, tremor, peripheral neuropathy, erectile dysfunction, gynaecomastia, menopausal symptoms, osteopenia, renal failure, nocturia, polydipsia, anaemia, thrombocytopenia, neutropenia, arthralgia, myalgia, rhabdomyolysis, visual disturbances, tinnitus, gingivitis, glossitis, acne, pruritus, hyperhidrosis, dry skin, skin papilloma, alopecia; see also Osteonecrosis, p. 412

Dose

- 400 mg twice daily; CHILD 2–18 years see *BNF for Children*

Isentress® (MSD) PoM

Tablets, pink, f/c, raltegravir (as potassium salt) 400 mg, net price 60-tab pack = £523.79. Label: 25

5.3.2 Herpesvirus infections

5.3.2.1 Herpes simplex and varicella–zoster infection

The two most important herpesvirus pathogens are herpes simplex virus (herpesvirus hominis) and varicella–zoster virus.

Herpes simplex infections Herpes infection of the mouth and lips and in the eye is generally associated with herpes simplex virus serotype 1 (HSV-1); other areas of the skin may also be infected, especially in immunodeficiency. Genital infection is most often associated with HSV-2 and also HSV-1. Treatment of herpes simplex infection should start as early as possible and usually within 5 days of the appearance of the infection.

In individuals with good immune function, mild infection of the eye (ocular herpes, section 11.3.3) and of the lips (herpes labialis or cold sores, section 13.10.3) is treated with a topical antiviral drug. Primary herpetic gingivostomatitis is managed by changes to diet and with analgesics (section 12.3.2). Severe infection, neonatal herpes infection or infection in immunocompromised individuals requires treatment with a systemic antiviral drug. Primary or recurrent genital herpes simplex infection is treated with an antiviral drug given by mouth. Persistence of a lesion or recurrence in an immunocompromised patient may signal the development of resistance.

Specialist advice should be sought for systemic treatment of herpes simplex infection in pregnancy.

Varicella-zoster infections Regardless of immune function and the use of any immunoglobulins, neonates with *chickenpox* should be treated with a parenteral antiviral to reduce the risk of severe disease. Chickenpox in otherwise healthy children between 1 month and 12 years is usually mild and antiviral treatment is not usually required.

Chickenpox is more severe in adolescents and adults than in children; antiviral treatment started within 24 hours of the onset of rash may reduce the duration and severity of symptoms in otherwise healthy adults and adolescents. Antiviral treatment is generally recommended in immunocompromised patients and those at special risk (e.g. because of severe cardiovascular or respiratory disease or chronic skin disorder); in such cases, an antiviral is given for 10 days with at least 7 days of parenteral treatment.

Pregnant women who develop severe chickenpox may be at risk of complications, especially varicella pneumonia. Specialist advice should be sought for the treatment of chickenpox during pregnancy.

Those who have been exposed to chickenpox and are at special risk of complications may require prophylaxis with varicella-zoster immunoglobulin (see under Disease Specific Immunoglobulins, section 14.5.2).

In *herpes zoster* (shingles) systemic antiviral treatment can reduce the severity and duration of pain, reduce complications, and reduce viral shedding. Treatment with the antiviral should be started within 72 hours of the onset of rash and is usually continued for 7–10 days. Immunocompromised patients at high risk of disseminated or severe infection should be treated with a parenteral antiviral drug.

Chronic pain which persists after the rash has healed (postherpetic neuralgia) requires specific management (section 4.7.3).

Choice **Aciclovir** is active against herpesviruses but does not eradicate them. Uses of aciclovir include systemic treatment of varicella–zoster and the systemic and topical treatment of herpes simplex infections of the skin (section 13.10.3) and mucous membranes (section 7.2.2). It is used by mouth for severe herpetic stomatitis (see also p. 776). Aciclovir eye ointment (section 11.3.3) is used for herpes simplex infections of the eye; it is combined with systemic treatment for ophthalmic zoster.

Famciclovir, a prodrug of penciclovir, is similar to aciclovir and is licensed for use in herpes zoster and genital herpes. Penciclovir itself is used as a cream for herpes simplex labialis (section 13.10.3).

Valaciclovir is an ester of aciclovir, licensed for herpes zoster and herpes simplex infections of the skin and mucous membranes (including genital herpes); it is also licensed for preventing cytomegalovirus disease following solid organ transplantation. Famciclovir or valaciclovir are suitable alternatives to aciclovir for oral lesions associated with herpes zoster. Valaciclovir once daily may reduce the risk of transmitting genital herpes to heterosexual partners—specialist advice should be sought.

Foscarnet (section 5.3.2.2) is used for mucocutaneous herpes simplex virus infection unresponsive to aciclovir in immunocompromised patients; it is toxic and can cause renal impairment.

Inosine pranobex has been used by mouth for herpes simplex infections; its effectiveness remains unproven.

ACICLOVIR
(Acyclovir)

Indications herpes simplex and varicella–zoster (see also under Dose)

Cautions maintain adequate hydration (especially with infusion or high doses, or during renal impairment); elderly (risk of neurological reactions); **interactions:** Appendix 1 (aciclovir)

Renal impairment see Cautions above; also risk of neurological reactions increased; use normal intravenous dose every 12 hours if eGFR 25–50 mL/minute/1.73 m^2 (every 24 hours if eGFR 10–25 mL/minute/1.73 m^2); consult product literature for intravenous dose if eGFR less than 10 mL/minute/1.73 m^2; for *herpes zoster*, use normal oral dose every 8 hours if eGFR 10–25 mL/minute/1.73 m^2 (every 12 hours if eGFR less than 10 mL/minute/1.73 m^2); for *herpes simplex*, use normal oral dose every 12 hours if eGFR less than 10 mL/minute/1.73 m^2

Pregnancy not known to be harmful—manufacturers advise use only when potential benefit outweighs risk

Breast-feeding significant amount in milk after systemic administration—not known to be harmful but manufacturer advises caution

Side-effects nausea, vomiting, abdominal pain, diarrhoea, headache, fatigue, rash, urticaria, pruritus, photosensitivity; *very rarely* hepatitis, jaundice, dyspnoea, neurological reactions (including dizziness, confusion, hallucinations, convulsions, ataxia, dysar-

thria, and drowsiness), acute renal failure, anaemia, thrombocytopenia and leucopenia; on *intravenous infusion*, severe local inflammation (sometimes leading to ulceration), and *very rarely* agitation, tremors, psychosis and fever

Dose

- By mouth, non-genital herpes simplex, treatment, 200 mg (400 mg in the immunocompromised or if absorption impaired) 5 times daily, usually for 5 days (longer if new lesions appear during treatment or if healing incomplete); CHILD 1 month–2 years, half adult dose, over 2 years, adult dose

  Genital herpes simplex, treatment of *first episode*, 200 mg 5 times daily *or* 400 mg 3 times daily usually for 5 days, longer if new lesions appear during treatment or if healing is incomplete (400 mg 5 times daily for 7–10 days in immunocompromised or HIV-positive patients); treatment of *recurrent infection*, 800 mg 3 times daily for 2 days *or* 200 mg 5 times daily for 5 days *or* 400 mg 3 times daily for 3–5 days (400 mg 3 times daily for 5–10 days in immunocompromised or HIV-positive patients)

  Herpes simplex, suppression, 400 mg twice daily *or* 200 mg 4 times daily; increased to 400 mg 3 times daily if recurrences occur on standard suppressive therapy or for suppression of genital herpes during late pregnancy (from 36 weeks gestation); therapy interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

  Herpes simplex, prophylaxis in the immunocompromised, 200–400 mg 4 times daily; CHILD 1 month–2 years, half adult dose, over 2 years, adult dose

  Varicella and herpes zoster, treatment, 800 mg 5 times daily for 7 days (for herpes zoster in immunocompromised continue for 2 days after crusting of lesions); CHILD 1 month–2 years 200 mg 4 times daily for 5 days (for herpes zoster in immunocompromised continue for 2 days after crusting of lesions); 2–6 years 400 mg 4 times daily for 5 days (for herpes zoster in immunocompromised continue for 2 days after crusting of lesions); 6–12 years 800 mg 4 times daily for 5 days (for herpes zoster in immunocompromised continue for 2 days after crusting of lesions)

  Attenuation of chickenpox (if varicella–zoster immunoglobulin not indicated) [unlicensed use], ADULT and CHILD 40 mg/kg daily in 4 divided doses for 7 days starting 1 week after exposure
- By intravenous infusion, treatment of herpes simplex in the immunocompromised, severe initial genital herpes, 5 mg/kg every 8 hours usually for 5 days, doubled to 10 mg/kg every 8 hours if resistant organisms suspected or in simplex encephalitis (given for at least 14 days in encephalitis (at least 21 days if also immunocompromised)—confirm cerebrospinal fluid negative for herpes simplex virus before stopping treatment)

  Treatment of varicella-zoster 5 mg/kg every 8 hours usually for 5 days, doubled to 10 mg/kg every 8 hours in the immunocompromised or in encephalitis (given for 10–14 days in encephalitis, possibly longer if also immunocompromised or if severe infection)

  Prophylaxis of herpes simplex in the immunocompromised, 5 mg/kg every 8 hours

  Note To avoid excessive dosage in obese patients, parenteral dose should be calculated on the basis of ideal weight for height

  CHILD under 18 years, see *BNF for Children*
- By topical application, see section 13.10.3 (skin) and section 11.3.3 (eye)

Note Aciclovir doses in BNF may differ from those in product literature

Aciclovir (Non-proprietary) PoM

Tablets, aciclovir 200 mg, net price 25-tab pack = £1.66; 400 mg, 56-tab pack = £4.30; 800 mg, 35-tab pack = £4.30. Label: 9

Dental prescribing on NHS Aciclovir Tablets 200 mg or 800 mg may be prescribed

Dispersible tablets, aciclovir 200 mg, net price 25-tab pack = £2.17; 400 mg, 56-tab pack = £9.91; 800 mg, 35-tab pack = £9.29. Label: 9

Suspension, aciclovir 200 mg/5 mL, net price 125 mL = £35.82; 400 mg/5 mL, 100 mL = £39.54. Label: 9

Note Sugar-free versions are available and can be ordered by specifying 'sugar-free' on the prescription

Dental prescribing on NHS Aciclovir Oral Suspension 200 mg/5 mL may be prescribed

Intravenous infusion, powder for reconstitution, aciclovir (as sodium salt), net price 250-mg vial = £9.13; 500-mg vial = £20.22

Electrolytes Na^+ 1.1 mmol/250-mg vial

Intravenous infusion, aciclovir (as sodium salt), 25 mg/mL, net price 10-mL (250-mg) vial = £10.18; 20-mL (500-mg) vial = £19.61; 40-mL (1-g) vial = £40.44

Electrolytes Na^+ 1.16 mmol/250-mg vial

Zovirax® (GSK) PoM

Tablets, all dispersible, f/c, aciclovir 200 mg, net price 25-tab pack = £2.85; 800 mg (scored, *Shingles Treatment Pack*), 35-tab pack = £10.50. Label: 9

Suspension, both off-white, sugar-free, aciclovir 200 mg/5 mL (banana-flavoured), net price 125 mL = £29.56; 400 mg/5 mL (*Double Strength Suspension*, orange-flavoured) 100 mL = £33.02. Label: 9

Intravenous infusion, powder for reconstitution, aciclovir (as sodium salt), net price 250-mg vial = £3.34; 500-mg vial = £3.40

Electrolytes Na^+ 1.1 mmol/250-mg vial

FAMCICLOVIR

Note Famciclovir is a pro-drug of penciclovir

Indications see under Dose

Cautions **interactions:** Appendix 1 (famciclovir)

Hepatic impairment usual dose in well compensated liver disease (information not available on decompensated)

Renal impairment reduce dose; consult product literature

Pregnancy manufacturers advise avoid unless potential benefit outweighs risk

Breast-feeding no information available—present in milk in *animal* studies

Side-effects nausea, vomiting, abdominal pain, diarrhoea; headache, fatigue; sweating, pruritus; *rarely* confusion; *very rarely* jaundice, dizziness, drowsiness, hallucinations, thrombocytopenia, rash (including Stevens-Johnson syndrome); also reported, constipation and fever

Dose

- Herpes zoster, treatment, 500 mg 3 times daily for 7 days *or* 750 mg 1–2 times daily for 7 days (in immunocompromised, 500 mg 3 times daily for 10 days, continue for 2 days after crusting of lesions)

- Genital herpes, treatment of *first episode*, 250 mg 3 times daily for 5 days, longer if new lesions appear during treatment or if healing incomplete (500 mg twice daily for 10 days in immunocompromised or HIV-positive patients); treatment of *recurrent infection*, 125 mg twice daily for 5 days *or* 1 g twice daily for 1 day (500 mg twice daily for 5–10 days in immunocompromised or HIV-positive patients)
- Genital herpes, suppression, 250 mg twice daily (500 mg twice daily in immunocompromised or HIV-positive patients); therapy interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences
- Non-genital herpes simplex, treatment in the immunocompromised, 500 mg twice daily for 7 days
- CHILD not recommended

Note Famciclovir doses in BNF may differ from those in product literature

Famciclovir (Non-proprietary) PoM

Tablets, famciclovir 125 mg, net price 10-tab pack = £31.60; 250 mg, 15-tab pack = £103.75, 21-tab pack = £145.25, 56-tab pack = £387.33; 500 mg, 14-tab pack = £179.00, 30-tab pack = £399.34, 56-tab pack = £831.46; 750 mg, 7-tab pack = £134.88. Label: 9

Famvir® (Novartis) PoM

Tablets, all f/c, famciclovir 125 mg, net price 10-tab pack = £44.54; 250 mg, 15-tab pack = £133.62, 21-tab pack = £187.04; 56-tab pack = £498.80; 500 mg, 14-tab pack = £249.43, 30-tab pack = £534.34, 56-tab pack = £997.75. Label: 9

INOSINE PRANOBEX

(Inosine acedoben dimepranol)

Indications see under Dose

Cautions history of gout or hyperuricaemia

Renal impairment manufacturer advises caution; metabolised to uric acid

Pregnancy manufacturer advises avoid

Side-effects reversible increase in serum and urinary uric acid; *less commonly* nausea, vomiting, epigastric discomfort, headache, vertigo, fatigue, arthralgia, rashes and itching; *rarely* diarrhoea, constipation, anxiety, sleep disturbances, and polyuria

Dose

- Mucocutaneous herpes simplex, 1 g 4 times daily for 7–14 days
- Adjunctive treatment of genital warts, 1 g 3 times daily for 14–28 days
- Subacute sclerosing panencephalitis, 50–100 mg/kg daily in 6 divided doses

Imunovir® (Newport) PoM

Tablets, scored, inosine pranobex 500 mg, net price 100-tab pack = £39.50. Label: 9

VALACICLOVIR

Note Valaciclovir is a pro-drug of aciclovir

Indications treatment of herpes zoster; treatment of initial and suppression of recurrent herpes simplex infections of skin and mucous membranes including initial and recurrent genital herpes; reduction of transmission of genital herpes; prevention of cytomegalovirus disease following solid organ transplantation when valganciclovir or ganciclovir cannot be used

Cautions see under Aciclovir

Hepatic impairment manufacturer advises caution with high doses used for herpes labialis and prevention of cytomegalovirus disease—no information available

Renal impairment maintain adequate hydration; for *herpes zoster*, 1 g every 12 hours if eGFR 30–50 mL/minute/1.73 m^2 (1 g every 24 hours if eGFR 10–30 mL/minute/1.73 m^2; 500 mg every 24 hours if eGFR less than 10 mL/minute/1.73 m^2); for *treatment of herpes simplex*, 500 mg (1 g in immunocompromised or HIV-positive patients) every 24 hours if eGFR less than 30 mL/minute/1.73 m^2; for *treatment of herpes labialis*, if eGFR 30–50 mL/minute/1.73 m^2, initially 1 g, then 1 g 12 hours after initial dose (if eGFR 10–30 mL/minute/1.73 m^2, initally 500 mg, then 500 mg 12 hours after initial dose; if eGFR less than 10 mL/minute/1.73 m^2, 500 mg as a single dose); for *suppression of herpes simplex*, 250 mg (500 mg in immunocompromised or HIV-positive patients) every 24 hours if eGFR less than 30 mL/minute/1.73 m^2; for *reduction of genital herpes transmission*, 250 mg every 24 hours if eGFR less than 15 mL/minute/1.73 m^2; reduce dose according to eGFR for *cytomegalovirus prophylaxis* following solid organ transplantation (consult product literature)

Pregnancy see under Aciclovir

Breast-feeding see under Aciclovir

Side-effects see under Aciclovir but neurological reactions more frequent with high doses

Dose

- Herpes zoster, 1 g 3 times daily for 7 days (in immunocompromised continue for 2 days after crusting of lesions); CHILD 12–18 years see *BNF for Children*
- Herpes simplex, treatment of *first episode*, 500 mg twice daily for 5 days, longer if new lesions appear during treatment or if healing incomplete (1 g twice daily for 10 days in immunocompromised or HIV-positive patients); treatment of *recurrent infection*, 500 mg twice daily for 3–5 days (1 g twice daily for 5–10 days in immunocompromised or HIV-positive patients); CHILD 12–18 years see *BNF for Children*
- Herpes labialis, treatment, ADULT and CHILD over 12 years, initially 2 g, then 2 g 12 hours after initial dose
- Herpes simplex, suppression, 500 mg daily in 1–2 divided doses (in immunocompromised or HIV positive patients, 500 mg twice daily); therapy interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences; CHILD 12–18 years see *BNF for Children*
- Reduction of transmission of genital herpes, seek specialist advice, 500 mg once daily to be taken by the infected partner
- Prevention of cytomegalovirus disease following solid organ transplantation (preferably starting within 72 hours of transplantation), 2 g 4 times daily usually for 90 days; CHILD 12–18 years see *BNF for Children*

Valaciclovir (Non-proprietary) PoM

Tablets, valaciclovir 500 mg, net price 10-tab pack = £3.83, 42 tab-pack = £8.50. Label: 9

Valtrex® (GSK) PoM

Tablets, f/c, valaciclovir (as hydrochloride) 250 mg, net price 60-tab pack = £123.28; 500 mg, 10-tab pack = £20.59, 42-tab pack = £86.30. Label: 9

5.3.2.2 Cytomegalovirus infection

Ganciclovir is related to aciclovir but it is more active against cytomegalovirus (CMV); it is also much more toxic than aciclovir and should therefore be prescribed only when the potential benefit outweighs the risks. Ganciclovir is administered by intravenous infusion for the *initial treatment* of CMV infection. Ganciclovir causes profound myelosuppression when given with zidovudine; the two should not normally be given together particularly during initial ganciclovir therapy. The likelihood of ganciclovir resistance increases in patients with a high viral load or in those who receive the drug over a long duration; cross-resistance to cidofovir is common.

Valaciclovir (see p. 425) is licensed for prevention of cytomegalovirus disease following renal transplantation.

Valganciclovir is an ester of ganciclovir which is licensed for the *initial treatment* and *maintenance treatment* of CMV retinitis in AIDS patients. Valganciclovir is also licensed for preventing CMV disease following solid organ transplantation from a cytomegalovirus-positive donor.

Foscarnet is also active against cytomegalovirus; it is toxic and can cause renal impairment.

Cidofovir is given in combination with probenecid for CMV retinitis in AIDS patients when ganciclovir and foscarnet are contra-indicated. Cidofovir is nephrotoxic.

For local treatment of CMV retinitis, see section 11.3.3.

CIDOFOVIR

Indications cytomegalovirus retinitis in AIDS patients for whom other drugs are inappropriate

Cautions monitor renal function (serum creatinine and urinary protein) and neutrophil count within 24 hours before each dose; co-treatment with probenecid and prior hydration with intravenous fluids necessary to minimise potential nephrotoxicity (see below); diabetes mellitus (increased risk of ocular hypotony); **interactions:** Appendix 1 (cidofovir)

Nephrotoxicity Do not initiate treatment in renal impairment (assess creatinine clearance and proteinuria—consult product literature); discontinue treatment and give intravenous fluids if renal function deteriorates—consult product literature

Ocular disorders Regular ophthalmological examinations recommended; iritis and uveitis have been reported which may respond to a topical corticosteroid with or without a cycloplegic drug—discontinue cidofovir if no response to topical corticosteroid or if condition worsens, or if iritis or uveitis recurs after successful treatment

Contra-indications concomitant administration of potentially nephrotoxic drugs (discontinue potentially nephrotoxic drugs at least 7 days before starting cidofovir)

Renal impairment avoid if creatinine clearance less than 55 mL/minute; nephrotoxic

Pregnancy avoid (toxicity in *animal* studies); effective contraception required during and for 1 month after treatment; also men should avoid fathering a child during and for 3 months after treatment

Breast-feeding manufacturer advises avoid

Side-effects nephrotoxicity (see Cautions above); nausea, vomiting, diarrhoea; dyspnoea; headache, fever, asthenia; neutropenia; decreased intra-ocular pressure, iritis, uveitis (see Cautions above); alopecia, rash; *less commonly* Fanconi syndrome; also reported, hearing impairment and pancreatitis

Dose

- Initial (induction) treatment, ADULT over 18 years, by intravenous infusion over 1 hour, 5 mg/kg once weekly for 2 weeks (give probenecid and intravenous fluids with each dose, see below)
- Maintenance treatment, beginning 2 weeks after completion of induction, ADULT over 18 years, by intravenous infusion over 1 hour, 5 mg/kg once every 2 weeks (give probenecid and intravenous fluids with each dose, see below)

Probenecid co-treatment By mouth (preferably after food), probenecid 2 g 3 hours before cidofovir infusion followed by probenecid 1 g at 2 hours and 1 g at 8 hours after the end of cidofovir infusion (total probenecid 4 g); for cautions, contra-indications and side-effects of probenecid see section 10.1.4

Prior hydration Sodium chloride 0.9%, by intravenous infusion, 1 litre over 1 hour immediately before cidofovir infusion (if tolerated an additional 1 litre may be given over 1–3 hours, starting at the same time as the cidofovir infusion or immediately afterwards)

Vistide® (Gilead) PoM

Intravenous infusion, cidofovir 75 mg/mL, net price 5-mL vial = £653.22

Caution in handling Cidofovir is toxic and personnel should be adequately protected during handling and administration; if solution comes into contact with skin or mucosa, wash off immediately with water

GANCICLOVIR

Indications life-threatening or sight-threatening cytomegalovirus infections in immunocompromised patients only; prevention of cytomegalovirus disease during immunosuppressive therapy following organ transplantation; local treatment of CMV retinitis (section 11.3.3)

Cautions close monitoring of full blood count (severe deterioration may require correction and possibly treatment interruption); history of cytopenia; potential carcinogen and teratogen; radiotherapy; ensure adequate hydration during intravenous administration; vesicant—infuse into vein with adequate flow preferably using plastic cannula; children (possible risk of long-term carcinogenic or reproductive toxicity); **interactions:** Appendix 1 (ganciclovir)

Contra-indications hypersensitivity to valganciclovir, ganciclovir, aciclovir, or valaciclovir; abnormally low haemoglobin, neutrophil, or platelet counts (consult product literature)

Renal impairment reduce dose if eGFR less than 70 mL/minute/1.73 m^2; consult product literature

Pregnancy avoid—teratogenic risk; ensure effective contraception during treatment and barrier contraception for men during and for at least 90 days after treatment

Breast-feeding avoid—no information available

Side-effects diarrhoea, nausea, vomiting, dyspepsia, abdominal pain, constipation, flatulence, dysphagia, taste disturbance, hepatic dysfunction; dyspnoea, chest pain, cough; headache, insomnia, convulsions, dizziness, peripheral neuropathy, depression, anxiety, confusion, abnormal thinking, fatigue, weight loss, anorexia; infection, pyrexia, night sweats; anaemia, leucopenia, thrombocytopenia, pancytopenia, renal impairment; myalgia, arthralgia; macular oedema, retinal detachment, vitreous floaters, eye pain; ear pain; dermatitis, pruritus; injection-site reactions; *less commonly* mouth ulcers, pancreatitis, arrhythmias,

hypotension, anaphylactic reactions, psychosis, tremor, male infertility, haematuria, disturbances in hearing and vision, and alopecia

Dose

- By intravenous infusion, initially (induction) 5 mg/kg every 12 hours for 14–21 days for treatment or for 7–14 days for prevention; maintenance (for patients at risk of relapse of retinitis) 6 mg/kg daily on 5 days per week *or* 5 mg/kg daily until adequate recovery of immunity; if retinitis progresses initial induction treatment may be repeated; CHILD under 18 years, see *BNF for Children*

Cymevene® (Roche) PoM

Intravenous infusion, powder for reconstitution, ganciclovir (as sodium salt). Net price 500-mg vial = £29.77

Electrolytes Na^+ 2 mmol/500-mg vial

Caution in handling Ganciclovir is toxic and personnel should be adequately protected during handling and administration; if solution comes into contact with skin or mucosa, wash off immediately with soap and water

FOSCARNET SODIUM

Indications cytomegalovirus disease [licensed for cytomegalovirus retinitis in AIDS patients only]; mucocutaneous herpes simplex virus infections unresponsive to aciclovir in immunocompromised patients

Cautions monitor electrolytes, particularly calcium and magnesium; monitor serum creatinine every second day during induction and every week during maintenance; ensure adequate hydration; avoid rapid infusion; men should avoid fathering a child during and for 6 months after treatment; **interactions**: Appendix 1 (foscarnet)

Renal impairment reduce dose; consult product literature

Pregnancy manufacturer advises avoid

Breast-feeding avoid—present in milk in *animal* studies

Side-effects nausea (reduce infusion rate), vomiting, diarrhoea, abdominal pain, constipation, dyspepsia, anorexia, hepatic dysfunction, pancreatitis, changes in blood pressure and ECG, palpitation, oedema, dizziness, headache, malaise, aggression, agitation, anxiety, confusion, depression, paraesthesia (reduce infusion rate), convulsions, tremor, and other neurological disorders, anaemia, granulocytopenia, leucopenia, thrombocytopenia, dysuria, polyuria, renal impairment (including acute renal failure), electrolyte disturbances (including hypokalaemia, hypomagnesaemia, and hypocalcaemia), myalgia, rash, pruritus, thrombophlebitis if given undiluted by peripheral vein, genital irritation and ulceration (due to high concentrations excreted in urine); *less commonly* acidosis; also reported oesophageal ulceration, ventricular arrhythmias, diabetes insipidus, myasthenia, myositis, rhabdomyolysis

Dose

- CMV disease [licensed for CMV retinitis only], by intravenous infusion, initially (induction) 60 mg/kg every 8 hours *or* 90 mg/kg every 12 hours, for 2–3 weeks; maintenance 60 mg/kg daily, increased to 90–120 mg/kg if tolerated; if disease progresses on maintenance dose, repeat induction regimen
- Mucocutaneous herpes simplex infection, by intravenous infusion, 40 mg/kg every 8 hours for 2–3 weeks or until lesions heal

Note Foscarnet doses in BNF may differ from those in product literature

Foscavir® (Clinigen) PoM

Intravenous infusion, foscarnet sodium hexahydrate 24 mg/mL, net price 250-mL bottle = £119.85

Electrolytes Na^+ 0.24 mmol/mL

VALGANCICLOVIR

Note Valganciclovir is a pro-drug of ganciclovir

Indications induction and maintenance treatment of cytomegalovirus retinitis in AIDS patients; prevention of cytomegalovirus disease following solid organ transplantation from a cytomegalovirus-positive donor.

Cautions see under Ganciclovir

Contra-indications see under Ganciclovir

Renal impairment reduce dose; consult product literature

Pregnancy see under Ganciclovir

Breast-feeding see under Ganciclovir

Side-effects see under Ganciclovir

Dose

- CMV retinitis, induction, ADULT over 18 years, 900 mg twice daily for 21 days then 900 mg once daily; induction regimen may be repeated if retinitis progresses
- Prevention of cytomegalovirus disease following solid organ transplantation (starting within 10 days of transplantation), ADULT over 18 years, 900 mg once daily for 100 days (for 100–200 days following kidney transplantation)

Note Oral valganciclovir 900 mg twice daily is equivalent to intravenous ganciclovir 5 mg/kg twice daily

Valcyte® (Roche) PoM

Tablets, pink, f/c, valganciclovir (as hydrochloride) 450 mg, net price 60-tab pack = £1081.46. Label: 21

Oral solution, tutti-frutti flavoured, valganciclovir (as hydrochloride) 250 mg/5 mL when reconstituted with water, net price 100 mL = £230.32. Label: 21

Caution in handling Valganciclovir is a potential teratogen and carcinogen and caution is advised when handling the powder, reconstituted solution, or broken tablets; if these come into contact with skin or mucosa, wash off immediately with water; avoid inhalation of powder

5.3.3 Viral hepatitis

Treatment for viral hepatitis should be initiated by a specialist. The management of uncomplicated acute viral hepatitis is largely symptomatic. Early treatment of acute hepatitis C with interferon alfa [unlicensed indication] may reduce the risk of chronic infection. Hepatitis B and hepatitis C viruses are major causes of chronic hepatitis. For details on immunisation against hepatitis A and B infections, see section 14.4 (active immunisation), section 14.5.1 (passive immunisation against hepatitis A), and section 14.5.2 (passive immunisation against hepatitis B).

5.3.3.1 Chronic hepatitis B

Peginterferon alfa (section 8.2.4) is an option for the initial treatment of chronic hepatitis B and may be preferable to **interferon alfa**. The use of peginterferon alfa and interferon alfa is limited by a response rate of 30–40% and relapse is frequent. Treatment should be discontinued if no improvement occurs after 4 months. The manufacturers of peginterferon alfa-2a and interferon alfa contraindicate use in decompensated liver disease, but low doses can be used with great caution in these patients. Although interferon alfa is contra-indicated in patients receiving immunosuppressant treatment (or who have received it recently), cautious use of peginterferon alfa-2a may be justified in some cases.

Entecavir or **tenofovir disoproxil** (see p. 415) are options for the initial treatment of chronic hepatitis B. If the response is inadequate after 6–9 months of treatment, a change in treatment should be considered. Other drugs that are licensed for the treatment of chronic hepatitis B include **adefovir dipivoxil**, **lamivudine** (see p. 414), or **telbivudine** (but see NICE guidance below).

Entecavir alone, tenofovir disoproxil alone, or a combination of lamivudine with either adefovir dipivoxil or tenofovir disoproxil can be used in patients with decompensated liver disease.

If drug-resistant hepatitis B virus emerges during treatment, another antiviral drug to which the virus is sensitive should be added. Hepatitis B viruses with reduced susceptibility to lamivudine have emerged following extended therapy. Adefovir or tenofovir can be given with lamivudine in lamivudine-resistant chronic hepatitis B; telbivudine or entecavir should not be used because cross-resistance can occur.

If there is no toxicity or loss in efficacy, treatment with adefovir, entecavir, lamivudine, telbivudine, or tenofovir is usually continued until 6 months after adequate seroconversion has occurred. Treatment is usually continued long-term in patients with decompensated liver disease.

Tenofovir, or a combination of tenofovir with either emtricitabine or lamivudine may be used with other antiretrovirals, as part of 'highly active antiretroviral therapy' (section 5.3.1) in patients who require treatment for both HIV and chronic hepatitis B. If patients infected with both HIV and chronic hepatitis B only require treatment for chronic hepatitis B, they should receive antivirals that are not active against HIV, such as peginterferon alfa or adefovir. Treatment may be continued long-term, even if adequate seroconversion occurs. Management of these patients should be coordinated between HIV and hepatology specialists.

NICE guidance
Entecavir for chronic hepatitis B (August 2008)
Entecavir is an option for the treatment of chronic hepatitis B.
www.nice.org.uk/TA153

NICE guidance
Telbivudine for chronic hepatitis B (August 2008)
Telbivudine is not recommended for the treatment of chronic hepatitis B. Patients currently receiving telbivudine can continue treatment until they and their clinician consider it appropriate to stop.
www.nice.org.uk/TA154

NICE guidance
Tenofovir disoproxil for the treatment of chronic hepatitis B (July 2009)
Tenofovir is an option for the treatment of chronic hepatitis B.
www.nice.org.uk/TA173

ADEFOVIR DIPIVOXIL

Indications chronic hepatitis B infection with *either* compensated liver disease with evidence of viral replication, and histologically documented active liver inflammation and fibrosis, when other treatment not appropriate *or* decompensated liver disease in combination with another antiviral for chronic hepatitis B that has no cross-resistance to adefovir

Cautions monitor liver function tests every 3 months, and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation); monitor renal function before treatment then every 3 months, more frequently in renal impairment or in patients receiving nephrotoxic drugs; elderly; discontinue if deterioration in liver function, hepatic steatosis, progressive hepatomegaly or unexplained lactic acidosis

Renal impairment 10 mg every 48 hours if eGFR 30–50 mL/minute/1.73 m^2; 10 mg every 72 hours if eGFR 10–30 mL/minute/1.73 m^2; no information available if eGFR less than 10 mL/minute/1.73 m^2; see also Cautions above

Pregnancy toxicity in *animal* studies—manufacturer advises use only if potential benefit outweighs risk; effective contraception required during treatment

Breast-feeding manufacturer advises avoid—no information available

Side-effects nausea, vomiting, dyspepsia, abdominal pain, flatulence, diarrhoea; asthenia, headache; renal failure; hypophosphataemia; rash and pruritus; also reported pancreatitis

Dose

- ADULT over 18 years, 10 mg once daily

Hepsera® (Gilead) PoM
Tablets, adefovir dipivoxil 10 mg, net price 30-tab pack = £296.73

ENTECAVIR

Indications chronic hepatitis B infection *either* with compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis) *or* decompensated liver disease

Cautions monitor liver function tests every 3 months, and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1

year after discontinuation—recurrent hepatitis may occur on discontinuation); HIV infection—risk of HIV resistance in patients not receiving 'highly active antiretroviral therapy'; lamivudine-resistant chronic hepatitis B—risk of entecavir resistance; discontinue if deterioration in liver function, hepatic steatosis, progressive hepatomegaly or unexplained lactic acidosis

Renal impairment reduce dose if eGFR less than 50 mL/minute/1.73 m^2; consult product literature

Pregnancy toxicity in *animal* studies—manufacturer advises use only if potential benefit outweighs risk; effective contraception required during treatment

Breast-feeding manufacturer advises avoid—present in milk in *animal* studies

Side-effects nausea, vomiting, dyspepsia, diarrhoea, raised serum amylase and lipase, headache, fatigue, dizziness, sleep disturbances; *less commonly* thrombocytopenia, rash, alopecia

Dose

- Compensated liver disease not previously treated with nucleoside analogues, ADULT over 18 years, 500 micrograms once daily
- Compensated liver disease with lamivudine-resistant chronic hepatitis B (but see notes above), ADULT over 18 years, 1 mg once daily; consider other treatment if inadequate response after 6 months
  Counselling To be taken at least 2 hours before or 2 hours after food
- Decompensated liver disease, ADULT over 18 years, 1 mg once daily
  Counselling To be taken at least 2 hours before or 2 hours after food

Baraclude® (Bristol-Myers Squibb) PoM

Tablets, f/c, entecavir (as monohydrate) 500 micrograms (white), net price 30-tab pack = £363.26; 1 mg (pink), 30-tab pack = £363.26. Counselling, administration

Oral solution, entecavir (as monohydrate) 50 micrograms/mL, net price 210-mL pack (orange-flavoured) = £423.80. Counselling, administration

TELBIVUDINE

Indications chronic hepatitis B infection with compensated liver disease, evidence of viral replication, and histologically documented active liver inflammation or fibrosis, when other treatment is not appropriate

Cautions monitor liver function tests every 3 months and viral markers of hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation); lamivudine-resistant chronic hepatitis B—risk of telbivudine resistance; discontinue if deterioration in liver function, hepatic steatosis, progressive hepatomegaly or unexplained lactic acidosis; **interactions:** Appendix 1 (telbivudine)
Counselling Patients should be advised to promptly report unexplained muscle pain, tenderness, or weakness, or numbness, tingling or burning sensations

Renal impairment 600 mg every 48 hours if eGFR 30–49 mL/minute/1.73 m^2; 600 mg every 72 hours if eGFR less than 30 mL/minute/1.73 m^2

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Breast-feeding manufacturer advises avoid—present in milk in *animal* studies

Side-effects nausea, diarrhoea, abdominal pain, raised serum amylase and lipase; cough; dizziness, headache, fatigue; rash; *less commonly* taste disturbance, arthralgia, myalgia, myopathy (discontinue treatment), and peripheral neuropathy; *rarely* lactic acidosis, rhabdomyolysis

Dose

- ADULT over 18 years, 600 mg once daily

Sebivo® (Novartis) PoM

Tablets, f/c, telbivudine 600 mg, net price 28-tab pack = £290.33. Counselling, muscle effects, peripheral neuropathy

5.3.3.2 Chronic hepatitis C

Before starting treatment, the genotype of the infecting hepatitis C virus should be determined and the viral load measured as this may affect the choice and duration of treatment. A combination of **ribavirin** (see p. 433) and **peginterferon alfa** (section 8.2.4) is used for the treatment of chronic hepatitis C (see NICE guidance, below). The combination of ribavirin and interferon alfa is less effective than the combination of peginterferon alfa and ribavirin. Peginterferon alfa alone should be used if ribavirin is contra-indicated or not tolerated. Ribavirin monotherapy is ineffective.

NICE guidance
Peginterferon alfa and ribavirin for mild chronic hepatitis C (August 2006 and September 2010)

The combination of peginterferon alfa and ribavirin can be used for treating mild chronic hepatitis C in patients over 18 years. Alternatively, treatment can be delayed until the disease has reached a moderate stage ('watchful waiting'). Peginterferon alfa alone can be used if ribavirin is contra-indicated or not tolerated.

www.nice.org.uk/TA200

NICE guidance
Peginterferon alfa, interferon alfa, and ribavirin for moderate to severe chronic hepatitis C (January 2004 and September 2010)

The combination of peginterferon alfa and ribavirin should be used for treating moderate to severe chronic hepatitis C in patients aged over 18 years:

- not previously treated with interferon alfa or peginterferon alfa;
- treated previously with interferon alfa alone or in combination with ribavirin;
- whose condition did not respond to peginterferon alfa alone or to a combination of peginterferon alfa and ribavirin, or responded but subsequently relapsed;
- co-infected with HIV.

Peginterferon alfa alone should be used if ribavirin is contra-indicated or not tolerated. Interferon alfa for either monotherapy or combined therapy should be used only if neutropenia and thrombocytopenia are a particular risk. Patients receiving interferon alfa may be switched to peginterferon alfa.

www.nice.org.uk/TA200

Boceprevir and **telaprevir** are protease inhibitors that inhibit the replication of hepatitis C virus genotype 1, but they are less effective against other genotypes of the virus. Monotherapy is not recommended because there is a high likelihood of resistance developing. Either boceprevir or telaprevir is licensed for use in combination with ribavirin and peginterferon alfa for the treatment of chronic hepatitis C infection of genotype 1 in patients with compensated liver disease; these combinations are more effective than dual therapy with ribavirin and peginterferon alfa. However, triple therapy is associated with a higher incidence and greater severity of anaemia than dual therapy. Neutropenia seems to be more frequent during treatment with regimens containing boceprevir than with those containing telaprevir. Rash is a particular concern with telaprevir, and to a lesser extent with boceprevir.

NICE guidance
Boceprevir for chronic hepatitis C infection of genotype 1 (April 2012)

Boceprevir in combination with ribavirin and peginterferon alfa is an option for the treatment of chronic hepatitis C infection of genotype 1 in adults with compensated liver disease:

- who have not been treated previously;
- in whom previous treatment (e.g. with peginterferon alfa in combination with ribavirin) has failed.

www.nice.org.uk/TA253

NICE guidance
Telaprevir for chronic hepatitis C infection of genotype 1 (April 2012)

Telaprevir in combination with ribavirin and peginterferon alfa is an option for the treatment of chronic hepatitis C infection of genotype 1 in adults with compensated liver disease:

- who have not been treated previously;
- in whom previous treatment (e.g. with peginterferon alfa in combination with ribavirin) has failed.

www.nice.org.uk/TA252

Sofosbuvir is a pro-drug of a nucleoside inhibitor that is effective against hepatitis C virus polymerase NS5B. It is licensed for use in combination with ribavirin, with or without peginterferon alfa, for the treatment of chronic hepatitis C infection of genotypes 1, 2, 3, 4, 5, or 6 in patients with compensated liver disease. Sofosbuvir monotherapy is not recommended because it is less effective than combination therapy.

BOCEPREVIR

Indications in combination with ribavirin and peginterferon alfa for chronic hepatitis C infection of genotype 1 in patients with compensated liver disease

Cautions monitor full blood count before starting treatment and then on weeks 2, 4, 8, and 12 of treatment, then as indicated clinically; predisposition to QT interval prolongation (including concomitant use with other drugs known to prolong QT interval); **interactions:** Appendix 1 (boceprevir)

Contra-indications autoimmune hepatitis

Pregnancy manufacturer advises avoid; see also under Ribavirin

Breast-feeding manufacturer advises avoid; present in milk in *animal* studies

Side-effects in combination with ribavirin and peginterferon alfa, anaemia, nausea, vomiting, abdominal pain, gastro-oesophageal reflux, flatulence, diarrhoea, constipation, haemorrhoids, dry mouth, disturbances in taste and smell, mouth ulcers, stomatitis, tooth disorder, palpitation, blood pressure changes, syncope, peripheral oedema, hypertriglyceridaemia, cough, dyspnoea, dizziness, headache, decreased appetite, weight loss, anxiety, depression, insomnia, agitation, amnesia, asthenia, hypoaesthesia, paraesthesia, tremor, influenza-like symptoms, hyperglycaemia, hypothyroidism, changes in libido, erectile dysfunction, polyuria, leucopenia, thrombocytopenia, pancytopenia, arthralgia, myalgia, muscle spasms, hyperuricaemia, visual disturbances, dry eyes, tinnitus, alopecia, rash (also reported Stevens-Johnson syndrome, rash with eosinophilia and systemic symptoms), pruritus, hyperhidrosis, psoriasis; *less commonly* gingivitis, tongue discoloration, hypersalivation, dysphagia, pancreatitis, colitis, hyperbilirubinaemia, arrhythmias, venous thromboembolism, flushing, pallor, dysphonia, hyperaesthesia, homicidal and suicidal ideation, hyperthyroidism, amenorrhoea, menorrhagia, dysuria, hypokalaemia, hypercalcaemia, gout, retinal ischaemia, retinopathy, conjunctival haemorrhage, eye pain, increased lacrimation, photophobia, hearing impairment, photosensitivity, skin ulceration; *rarely* cholecystitis, acute myocardial infarction, coronary artery disease, pericarditis, pleural fibrosis, respiratory failure, bipolar disorder, hallucinations, encephalopathy, thyroid neoplasms, aspermia, sarcoidosis

Dose

- In combination with ribavirin and peginterferon alfa, ADULT over 18 years, 800 mg 3 times daily (for duration of treatment consult product literature)
  Missed dose If a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time

Victrelis® (MSD) ▼ PoM

Capsules, brown-yellow/white, boceprevir 200 mg, net price 336-cap pack = £2800.00. Label: 21

SOFOSBUVIR

Indications in combination with ribavirin, with or without peginterferon alfa, for chronic hepatitis C infection of genotypes 1, 2, 3, 4, 5, or 6 in patients with compensated liver disease

Cautions in chronic hepatitis C of genotype 1, 4, 5, or 6, only use sofosbuvir with ribavirin in those with intolerance or contra-indications to peginterferon alfa who require urgent treatment; **Interactions:** Appendix 1 (sofosbuvir)

Renal impairment safety and efficacy not established if eGFR less than 30 mL/minute/1.73m^2—accumulation may occur

Pregnancy manufacturer advises avoid; see also under Ribavirin

Breast-feeding manufacturer advises avoid—metabolites present in milk in *animal* studies

Side-effects *in combination with ribavirin (with or without peginterferon alfa)*, anaemia, nausea, constipation, abdominal discomfort, gastro-oesophageal

reflux, dyspnoea, cough, insomnia, depression, headache, disturbance in attention, irritability, asthenia, influenza-like symptoms, myalgia, arthralgia, alopecia, rash; *in combination with ribavirin and peginterferon alfa*, also vomiting, diarrhoea, dry mouth, chest pain, decreased appetite, weight loss, anxiety, agitation, dizziness, migraine, memory impairment, neutropenia, blurred vision

Dose

- In combination with *Copegus*®, with or without peginterferon alfa, ADULT over 18 years, 400 mg once daily (for duration of treatment consult product literature)

  Missed dose If a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time

Sovaldi® (Gilead) ▼ PoM

Tablets, yellow, f/c, sofosbuvir 400 mg, net price 28-tab pack = £11660.98 Label: 21, 25

Note Dispense in original container (contains desiccant)

TELAPREVIR

Indications in combination with ribavirin and peginterferon alfa for chronic hepatitis C infection of genotype 1 in patients with compensated liver disease

Cautions monitor full blood count, platelets, electrolytes, serum creatinine, uric acid, and liver and thyroid function tests before starting treatment and then on weeks 2, 4, 8, and 12 of treatment, then as indicated clinically; electrolyte disturbances; prolongation of QT interval, bradycardia, heart failure with reduced left ventricular ejection fraction, concomitant use with other drugs known to prolong QT interval; congenital or family history of QT interval prolongation, family history of sudden death; effectiveness of hormonal contraceptives reduced during treatment and for 2 months after stopping telaprevir—effective non-hormonal methods of contraception necessary during this time (see also Cautions under Ribavirin); **interactions:** Appendix 1 (telaprevir)

Rash Rash occurs very commonly. If rash mild or moderate, may continue without interruption, but monitor for deterioration. If moderate rash deteriorates, consider permanent discontinuation of telaprevir; if rash does not improve within 7 days of discontinuation, suspend ribavirin. If severe rash or if rash accompanied by blistering or mucosal ulceration, discontinue telaprevir permanently; if rash does not improve within 7 days of discontinuation, consider discontinuation of ribavirin and peginterferon alfa. If serious rash, or if severe rash deteriorates, or if rash accompanied by systemic symptoms, discontinue telaprevir, ribavirin, and peginterferon alfa permanently

Counselling Patients should be told to seek immediate medical attention if a rash develops or if an existing rash worsens

Hepatic impairment manufacturer advises avoid in moderate to severe impairment

Pregnancy manufacturer advises avoid; see Cautions above and also see under Ribavirin

Breast-feeding manufacturer advises avoid—present in milk in *animal* studies

Side-effects in combination with ribavirin and peginterferon alfa, rash (including eczema and rarely Stevens-Johnson syndrome and toxic epidermal necrolysis; see also Rash above), pruritus, anaemia, nausea, vomiting, diarrhoea, haemorrhoids, anal fissure, hyperbilirubinaemia, taste disturbances, syncope, peripheral oedema, hypothyroidism, hypokalaemia, thrombocytopenia, lymphopenia, hyperuricaemia; *less commonly* proctitis, gout, retinopathy, urticaria

Dose

- In combination with ribavirin and peginterferon alfa, ADULT over 18 years, 1.125 g every 12 hours *or* 750 mg every 8 hours (for duration of treatment consult product literature)

  Missed dose If a dose is more than 6 hours late with the 12 hourly regimen (or more than 4 hours late with the 8 hourly regimen), the missed dose should not be taken and the next dose should be taken at the normal time

Incivo® (Janssen) ▼ PoM

Tablets, yellow, f/c, telaprevir 375 mg, net price 42-tab pack = £1866.50. Label: 21, counselling, rash

Note Dispense in original container (contains desiccant)

5.3.4 Influenza

For advice on immunisation against influenza, see section 14.4.

Oseltamivir and **zanamivir** reduce replication of influenza A and B viruses by inhibiting viral neuraminidase. They are most effective for the treatment of influenza if started within a few hours of the onset of symptoms; they are licensed for use within 48 hours (within 36 hours for zanamivir in children) of the first symptoms. In otherwise healthy individuals they reduce the duration of symptoms by about 1–1.5 days. Oseltamivir or zanamivir can reduce the risk of complications from influenza in the elderly and in patients with chronic disease (see also NICE guidance, p. 432).

Oseltamivir and zanamivir are licensed for post-exposure prophylaxis of influenza when influenza is circulating in the community. Oseltamivir should be given within 48 hours of exposure to influenza while zanamivir should be given within 36 hours of exposure to influenza (see also NICE guidance, p. 432). However, in patients with severe influenza or in those who are immunocompromised, antivirals may still be effective after this time if viral shedding continues [unlicensed use]. Oseltamivir and zanamivir are also licensed for use in exceptional circumstances (e.g. when vaccination does not cover the infecting strain) to prevent influenza in an epidemic.

There is evidence that some strains of influenza A virus have reduced susceptibility to oseltamivir, but may retain susceptibility to zanamivir. Resistance to oseltamivir may be greater in severely immunocompromised patients.

Zanamivir should be reserved for patients who are severely immunocompromised, or when oseltamivir cannot be used, or when resistance to oseltamivir is suspected. For those unable to use the dry powder for inhalation, zanamivir is available as a solution that can be administered by nebuliser or intravenously [unlicensed].

Amantadine is licensed for prophylaxis and treatment of influenza A but it is no longer recommended (see NICE guidance).

Information on pandemic influenza, avian influenza, and swine influenza may be found at www.hpa.org.uk

Oseltamivir in children under 1 year of age

Data on the use of oseltamivir in children under 1 year of age is limited. Furthermore, oseltamivir may be ineffective in neonates because they may not be able to metabolise oseltamivir to its active form. However, oseltamivir can be used (under specialist supervision) for the treatment or post-exposure prophylaxis of influenza in children under 1 year of age. The Department of Health has advised (May 2009) that during a pandemic, treatment with oseltamivir can be overseen by healthcare professionals experienced in assessing children.

Pregnancy and breast-feeding Although safety data are limited, either oseltamivir or zanamivir can be used in women who are pregnant or breast-feeding when the potential benefit outweighs the risk (e.g. during a pandemic). Oseltamivir is the preferred drug in women who are breast-feeding.

NICE guidance

Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008)

The drugs described here are not a substitute for vaccination, which remains the most effective way of preventing illness from influenza.

- Amantadine is **not** recommended for prophylaxis of influenza.
- Oseltamivir *or* zanamivir are **not** recommended for seasonal prophylaxis against influenza.
- When influenza is circulating in the community[1], either oseltamivir or zanamivir is recommended (in accordance with UK licensing) for post-exposure prophylaxis in at-risk patients who are not effectively protected by influenza vaccine, and who have been in close contact with someone suffering from influenza-like illness in the same household or residential setting. Oseltamivir should be given within 48 hours of exposure to influenza while zanamivir should be given within 36 hours of exposure to influenza.
- During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, either oseltamivir or zanamivir may be used for post-exposure prophylaxis in at-risk patients (regardless of influenza vaccination) living in long-term residential or nursing homes.

At risk[2] patients include those aged over 65 years *or* those who have one or more of the following conditions:

- chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- chronic neurological disease;
- immunosuppression;
- diabetes mellitus.

This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community.

www.nice.org.uk/TA158

NICE guidance

Oseltamivir, zanamivir, and amantadine for treatment of influenza (February 2009)

The drugs described here are not a substitute for vaccination, which remains the most effective way of preventing illness from influenza.

- Amantadine is **not** recommended for treatment of influenza.
- When influenza is circulating in the community[1], either oseltamivir or zanamivir is recommended (in accordance with UK licensing) for the treatment of influenza in at-risk patients who can start treatment within 48 hours (within 36 hours for zanamivir in children) of the onset of symtoms.
- During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, either oseltamivir or zanamivir may be used for treatment in at-risk patients living in long-term residential or nursing homes.

At risk[2] patients include those aged over 65 years *or* those who have one or more of the following conditions:

- chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- chronic neurological disease;
- immunosuppression;
- diabetes mellitus.

This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community.

www.nice.org.uk/TA168

AMANTADINE HYDROCHLORIDE

Indications see under Dose; parkinsonism (section 4.9.1)

Cautions section 4.9.1

Contra-indications section 4.9.1

Renal impairment section 4.9.1

Pregnancy section 4.9.1

Breast-feeding section 4.9.1

Side-effects section 4.9.1

Dose

- Influenza A (see also notes above), ADULT and CHILD over 10 years, treatment, 100 mg daily for 4–5 days; prophylaxis, 100 mg daily usually for 6 weeks *or* with influenza vaccination for 2–3 weeks after vaccination

Lysovir® (Alliance) PoM

Capsules, red-brown, amantadine hydrochloride 100 mg, net price 5-cap pack = £2.40, 14-cap pack = £3.00. Counselling, driving

Symmetrel® (Alliance) PoM

Section 4.9.1

OSELTAMIVIR

Indications see notes above

Renal impairment for *treatment*, use 30 mg twice daily if eGFR 30–60 mL/minute/1.73 m^2 (30 mg once daily if eGFR 10–30 mL/minute/1.73 m^2); for *prevention*, use 30 mg once daily if eGFR 30–60 mL/minute/1.73 m^2 (30 mg every 48 hours if eGFR 10–30 mL/minute/1.73 m^2); avoid for *treatment* and *prevention* if eGFR less than 10 mL/minute/1.73 m^2

1. National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community.
2. The Department of Health in England has advised (November 2010 and April 2011) that 'at risk patients' also includes patients under 65 years of age who are at risk of developing medical complications from influenza (treatment only) or women who are pregnant.

Pregnancy use only if potential benefit outweighs risk (e.g. during a pandemic); see also p. 432

Breast-feeding amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic); see also p. 432

Side-effects nausea, vomiting, abdominal pain, dyspepsia, headache; *less commonly* arrhythmias, convulsions and altered consciousness (usually in children and adolescents), eczema, rash; *rarely* hepatitis, gastro-intestinal bleeding, neuropsychiatric disorders (usually in children and adolescents), thrombocytopenia, visual disturbances, Stevens-Johnson syndrome, toxic epidermal necrolysis

Dose

- Prevention of influenza, ADULT and CHILD over 13 years, 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic; NEONATE (see notes above), 2 mg/kg once daily for 10 days for post-exposure prophylaxis; CHILD 1–3 months (see notes above), 2.5 mg/kg once daily for 10 days for post–exposure prophylaxis; 3 months–1 year (see notes above), 3 mg/kg once daily for 10 days for post-exposure prophylaxis; 1–13 years, body-weight 10–15 kg, 30 mg once daily for 10 days for post-exposure prophylaxis (for up to 6 weeks during an epidemic); body-weight 15–23 kg, 45 mg once daily for 10 days for post-exposure prophylaxis (for up to 6 weeks during an epidemic); body-weight 23–40 kg, 60 mg once daily for 10 days for post-exposure prophylaxis (for up to 6 weeks during an epidemic); body-weight over 40 kg, adult dose
- Treatment of influenza, ADULT and CHILD over 13 years, 75 mg every 12 hours for 5 days; NEONATE (see notes above), 2 mg/kg every 12 hours for 5 days; CHILD 1–3 months (see notes above), 2.5 mg/kg every 12 hours for 5 days; 3 months–1 year (see notes above), 3 mg/kg every 12 hours for 5 days; 1–13 years, body-weight 10–15 kg, 30 mg every 12 hours for 5 days, body-weight 15–23 kg, 45 mg every 12 hours for 5 days, body-weight 23–40 kg, 60 mg every 12 hours for 5 days, body-weight over 40 kg, adult dose

Note Not licensed for use in children under 1 year of age unless there is a pandemic

[1] **Tamiflu®** (Roche) PoM

Capsules, oseltamivir (as phosphate) 30 mg (yellow), net price 10-cap pack = £7.71; 45 mg (grey), 10-cap pack = £15.41; 75 mg (grey-yellow), 10-cap pack = £15.41. Label: 9

Note If suspension not available, capsules can be opened and the contents mixed with a small amount of sweetened food, such as sugar water or chocolate syrup, just before administration

Oral suspension, sugar-free, tutti-frutti-flavoured, oseltamivir (as phosphate) for reconstitution with water, 30 mg/5 mL, net price 65 mL = £10.27. Label: 9

Excipients include sorbitol 900 mg/5 mL

Note Solutions prepared by 'special order' manufacturers may be a different concentration

ZANAMIVIR

Indications see notes above

Cautions asthma and chronic pulmonary disease (risk of bronchospasm—short-acting bronchodilator should be available; avoid in severe asthma unless close monitoring possible and appropriate facilities available to treat bronchospasm); uncontrolled chronic illness; other inhaled drugs should be administered before zanamivir)

Pregnancy use only if potential benefit outweighs risk (e.g. during a pandemic); see also p. 432

Breast-feeding amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic); see also p. 432

Side-effects rash; *less commonly* bronchospasm, dyspnoea, angioedema, urticaria; *rarely* Stevens-Johnson syndrome, toxic epidermal necrolysis; also reported neuropsychiatric disorders (especially in children and adolescents)

Dose

- By inhalation of powder, post-exposure prophylaxis of influenza, ADULT and CHILD over 5 years, 10 mg once daily for 10 days

  Prevention of influenza during an epidemic, ADULT and CHILD over 5 years, 10 mg once daily for up to 28 days

  Treatment of influenza, ADULT and CHILD over 5 years, 10 mg twice daily for 5 days (for up to 10 days if resistance to oseltamivir suspected [unlicensed duration])

[1] **Relenza®** (GSK) PoM

Dry powder for inhalation disks containing 4 blisters of zanamivir 5 mg/blister, net price 5 disks with *Diskhaler®* device = £16.36

5.3.5 Respiratory syncytial virus

Ribavirin inhibits a wide range of DNA and RNA viruses. It is licensed for administration by inhalation for the treatment of severe bronchiolitis caused by the respiratory syncytial virus (RSV) in infants, especially when they have other serious diseases. However, there is no evidence that ribavirin produces clinically relevant benefit in RSV bronchiolitis. Ribavirin is given by mouth with peginterferon alfa or interferon alfa for the treatment of chronic hepatitis C infection (see section 5.3.3.2, p. 429). Ribavirin is also effective in Lassa fever [unlicensed indication].

Palivizumab is a monoclonal antibody licensed for preventing serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease; it should be prescribed under specialist supervision and on the basis of the likelihood of hospitalisation.

Palivizumab is recommended for:

- children under 9 months of age with chronic lung disease (defined as requiring oxygen for at least 28 days from birth) and who were born preterm[2];
- children under 6 months of age with haemodynamically significant, acyanotic congenital heart disease who were born preterm[2].

Palivizumab should be considered for:

- children under 2 years of age with severe combined immunodeficiency syndrome;
- children under 1 year of age who require long-term ventilation;

1. NHS except for the treatment and prophylaxis of influenza as indicated in the notes above and NICE guidance; endorse prescription 'SLS'

2. For details of the preterm age groups included in the recommendations, see *Immunisation against Infectious Disease* (2006), available at www.gov.uk/dh

- children 1–2 years of age who require long-term ventilation and have an additional co-morbidity (including cardiac disease or pulmonary hypertension).

PALIVIZUMAB

Indications see notes above

Cautions moderate to severe acute infection or febrile illness; thrombocytopenia; serum-palivizumab concentration may be reduced after cardiac surgery; hypersensitivity to humanised monoclonal antibodies

Side-effects fever, injection-site reactions, nervousness; *less commonly* diarrhoea, vomiting, constipation, haemorrhage, rhinitis, cough, wheeze, pain, drowsiness, asthenia, hyperkinesia, leucopenia, and rash; also reported, apnoea, hypersensitivity reactions (including anaphylaxis), convulsions and thombocytopenia

Dose

- By intramuscular injection (preferably in anterolateral thigh), 15 mg/kg once a month during season of RSV risk (child undergoing cardiac bypass surgery, 15 mg/kg as soon as stable after surgery, then once a month during season of risk); injection volume over 1 mL should be divided between more than one site

Synagis® (AbbVie) PoM

Injection, powder for reconstitution, palivizumab, net price 50-mg vial = £306.34; 100-mg vial = £563.64

RIBAVIRIN

(Tribavirin)

Indications severe respiratory syncytial virus bronchiolitis in infants and children; in combination with peginterferon alfa or interferon alfa for chronic hepatitis C in patients without liver decompensation (see also section 5.3.3.2)

Cautions

Specific cautions for inhaled treatment Maintain standard supportive respiratory and fluid management therapy; monitor electrolytes closely; monitor equipment for precipitation; pregnant women (and those planning pregnancy) should avoid exposure to aerosol

Specific cautions for oral treatment Exclude pregnancy before treatment; effective contraception essential during treatment and for 4 months after treatment in women and for 7 months after treatment in men; routine monthly pregnancy tests recommended; condoms must be used if partner of male patient is pregnant (ribavirin excreted in semen); cardiac disease (assessment including ECG recommended before and during treatment—discontinue if deterioration); gout; determine full blood count, platelets, electrolytes, serum creatinine, liver function tests and uric acid before starting treatment and then on weeks 2 and 4 of treatment, then as indicated clinically—adjust dose if adverse reactions or laboratory abnormalities develop (consult product literature); eye examination recommended before treatment; eye examination also recommended during treatment if pre-existing ophthalmological disorder or if decrease in vision reported—discontinue treatment if ophthalmological disorder deteriorates or if new ophthalmological disorder develops; patients with a transplant—risk of rejection; test thyroid function before treatment and then every 3 months in children; risk of growth retardation in children, the reversibility of which is uncertain—if possible, consider starting treatment after pubertal growth spurt

Interactions: Appendix 1 (ribavirin)

Contra-indications

Specific contra-indications for oral treatment Severe cardiac disease, including unstable or uncontrolled cardiac disease in previous 6 months; haemoglobinopathies; severe debilitating medical conditions; autoimmune disease (including autoimmune hepatitis); uncontrolled severe psychiatric condition; history of severe psychiatric condition in children

Hepatic impairment no dosage adjustment required; use oral ribavirin with caution in severe hepatic dysfunction or decompensated cirrhosis

Renal impairment plasma-ribavirin concentration increased; avoid oral ribavirin unless essential if eGFR less than 50 mL/minute/1.73 m^2—monitor haemoglobin concentration closely

Pregnancy avoid; teratogenicity in *animal* studies; see also Cautions above

Breast-feeding avoid—no information available

Side-effects

Specific side-effects for inhaled treatment Worsening respiration, bacterial pneumonia, and pneumothorax reported; rarely non-specific anaemia and haemolysis

Specific side-effects for oral treatment Haemolytic anaemia (anaemia may be improved by epoetin); also (in combination with peginterferon alfa or interferon alfa) nausea, vomiting, dyspepsia, abdominal pain, flatulence, constipation, diarrhoea, colitis, chest pain, palpitation, tachycardia, peripheral oedema, changes in blood pressure, syncope, flushing, cough, dyspnoea, headache, dizziness, asthenia, impaired concentration and memory, sleep disturbances, abnormal dreams, anxiety, depression, suicidal ideation (more frequent in children), psychoses, dysphagia, weight loss, dysphonia, paraesthesia, hypoaesthesia, ataxia, hypertonia, influenza-like symptoms, thyroid disorders, hyperglycaemia, menstrual disturbances, breast pain, prostatitis, sexual dysfunction, micturition disorders, leucopenia, thrombocytopenia, lymphadenopathy, dehydration, hypocalcaemia, myalgia, arthralgia, hyperuricaemia, visual disturbances, eye pain, dry eyes, hearing impairment, tinnitus, earache, dry mouth, taste disturbances, mouth ulcers, stomatitis, glossitis, tooth disorder, gingivitis, alopecia, pruritus, dry skin, rash (including very rarely Stevens-Johnson syndrome and toxic epidermal necrolysis), increased sweating, psoriasis, photosensitivity, and acne; *less commonly* pancreatitis, gastro-intestinal bleeding, and hypertriglyceridaemia; *rarely* peptic ulcer, arrhythmias, cardiomyopathy, myocardial infarction, pericarditis, stroke, interstitial pneumonitis, pulmonary embolism, seizures, renal failure, vasculitis, rheumatoid arthritis, systemic lupus erythematosus, sarcoidosis, optic neuropathy, and retinal haemorrhage; *very rarely* aplastic anaemia and peripheral ischaemia; *in children* also growth retardation (including decrease in height and weight), pallor, tachypnoea, hyperkinesia, virilism, and skin discoloration

Dose

- See preparations below

Copegus® (Roche) PoM

Tablets, f/c, ribavirin 200 mg (pink), net price 42-tab pack = £92.50, 112-tab pack = £246.65, 168-tab pack = £369.98; 400 mg (red-brown), 56-tab pack = £246.65. Label: 21

Dose chronic hepatitis C (in combination with interferon alfa or peginterferon alfa), ADULT over 18 years, body-weight under 75 kg, 400 mg in the morning and 600 mg in the evening; body-weight 75 kg and over, 600 mg twice daily

Note Patients with chronic hepatitis C genotype 2 or 3 (not previously treated), or patients infected with HIV and hepatitis C require a lower dose of *Copegus®* (in combination with peginterferon alfa), usual dose 400 mg twice daily

Rebetol® (MSD) PoM

Capsules, ribavirin 200 mg, net price 84-cap pack = £160.69, 140-cap pack = £267.81, 168-cap pack = £321.38. Label: 21

Oral solution, ribavirin 200 mg/5 mL, net price 100 mL (bubble-gum-flavoured) = £67.08. Label: 21

Dose chronic hepatitis C (in combination with interferon alfa or peginterferon alfa), ADULT over 18 years, body-weight under 65 kg, 400 mg twice daily; body-weight 65–

81 kg, 400 mg in the morning and 600 mg in the evening; body-weight 81–105 kg, 600 mg twice daily; body-weight over 105 kg, 600 mg in the morning and 800 mg in the evening; CHILD 3–18 years see *BNF for Children*

Virazole® (Meda) PoM

Inhalation, ribavirin 6 g for reconstitution with 300 mL water for injections. Net price 3 × 6-g vials = £349.00

Dose bronchiolitis, by aerosol inhalation *or* nebulisation (via small particle aerosol generator) of solution containing 20 mg/mL for 12–18 hours for at least 3 days; max. 7 days

5.4 Antiprotozoal drugs

5.4.1 Antimalarials

Recommendations on the prophylaxis and treatment of malaria reflect guidelines agreed by UK malaria specialists.

The centres listed above should be consulted for advice on special problems.

Treatment of malaria

If the infective species is **not known**, or if the infection is **mixed**, initial treatment should be as for *falciparum malaria* with quinine, *Malarone®* (proguanil with atovaquone), or *Riamet®* (artemether with lumefantrine). Falciparum malaria can progress rapidly in unprotected individuals and antimalarial treatment should be considered in those with features of severe malaria and possible exposure, even if the initial blood tests for the organism are negative.

Falciparum malaria (treatment)

Falciparum malaria (malignant malaria) is caused by *Plasmodium falciparum*. In most parts of the world *P. falciparum* is now resistant to chloroquine which should not therefore be given for treatment.

Quinine, ***Malarone®*** (proguanil with atovaquone), or ***Riamet®*** (artemether with lumefantrine) can be given *by mouth* if the patient can swallow and retain tablets and there are no serious manifestations (e.g. impaired consciousness); quinine should be given *by intravenous infusion* (see below) if the patient is seriously ill or unable to take tablets. Mefloquine is now rarely used for treatment because of concerns about resistance.

Oral. The adult dosage regimen for **quinine** *by mouth* is:
600 mg (of quinine salt[1]) every 8 hours for 5–7 days *together with or followed by*
either **doxycycline** 200 mg once daily for 7 days
or **clindamycin** 450 mg every 8 hours for 7 days [unlicensed indication].
If the parasite is likely to be sensitive, **pyrimethamine** 75 mg with **sulfadoxine** 1.5 g as a single dose [unlicensed] may be given (instead of either clindamycin or doxycycline) together with, or after, a course of quinine.

Alternatively, ***Malarone®*** or ***Riamet®*** may be given instead of quinine. It is not necessary to give doxycycline, clindamycin or pyrimethamine with sulfadoxine after *Malarone®* or *Riamet®* treatment.

The adult dose of ***Malarone®*** *by mouth* is:
4 ('standard') tablets once daily for 3 days.

The dose of ***Riamet®*** *by mouth* for adult with body-weight over 35 kg is:
4 tablets initially, followed by 5 further doses of 4 tablets each given at 8, 24, 36, 48, and 60 hours (total 24 tablets over 60 hours).

Parenteral. If the patient is seriously ill or unable to take tablets, or if more than 2% of red blood cell are parasitized, **quinine** should be given *by intravenous infusion* [unlicensed]. The adult dosage regimen for quinine *by infusion* is:
loading dose[2] of 20 mg/kg[3] (up to maximum 1.4 g) of quinine salt[1] infused over 4 hours *then 8 hours after the start of the loading dose,* maintenance dose of 10 mg/kg[4] (up to maximum 700 mg) of quinine salt[1] infused over 4 hours every 8 hours (until patient can swallow tablets to complete the 7-day

1. Valid for quinine hydrochloride, dihydrochloride, and sulfate; not valid for quinine bisulfate which contains a correspondingly smaller amount of quinine.
2. In intensive care units the loading dose can alternatively be given as quinine salt[1] 7 mg/kg infused over 30 minutes followed immediately by 10 mg/kg over 4 hours then (after 8 hours) maintenance dose as described.
3. **Important:** the loading dose of 20 mg/kg should **not** be used if the patient has received quinine or mefloquine during the previous 12 hours.
4. Maintenance dose should be reduced to 5–7 mg/kg of quinine salt[1] in patients with severe renal impairment, severe hepatic impairment, or if parenteral treatment is required for more than 48 hours.

course *together with or followed by either* doxycycline or clindamycin as above).

Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired in quinine-resistant areas of south east Asia) because intravenous **artesunate** may be available for 'named-patient' use.

Children

Oral. **Quinine** is well tolerated by children although the salts are bitter. The dosage regimen for quinine *by mouth* for children is:

10 mg/kg (of quinine salt[1]; max. 600 mg) every 8 hours for 7 days *together with or followed by*
Clindamycin 7–13 mg/kg (max. 450 mg) every 8 hours for 7 days [unlicensed indication]
or in children over 12 years, **doxycycline** 200 mg once daily for 7 days
or if the parasite is likely to be sensitive, **pyrimethamine** with **sulfadoxine** as a single dose [unlicensed]: up to 4 years and body-weight over 5 kg, pyrimethamine 12.5 mg with sulfadoxine 250 mg; 5–6 years, pyrimethamine 25 mg with sulfadoxine 500 mg; 7–9 years, pyrimethamine 37.5 mg with sulfadoxine 750 mg; 10–14 years, pyrimethamine 50 mg with sulfadoxine 1 g; 14–18 years, pyrimethamine 75 mg with sulfadoxine 1.5 g

Alternatively, ***Malarone***® or ***Riamet***® may be given instead of quinine; it is not necessary to give clindamycin, doxycycline, or pyrimethamine with sulfadoxine after *Malarone*® or *Riamet*® treatment. The dose regimen for *Malarone*® *by mouth* for children over 40 kg is the same as for adults (see above); the dose regimen for *Malarone*® for smaller children is reduced as follows:

body-weight 5–9 kg, 2 'paediatric' tablets once daily for 3 days; body-weight 9–11 kg, 3 'paediatric' tablets once daily for 3 days; body-weight 11–21 kg, 1 'standard' tablet once daily for 3 days; body-weight 21–31 kg, 2 'standard' tablets once daily for 3 days; body-weight 31–40 kg, 3 'standard' tablets once daily for 3 days.

The dose regimen of *Riamet*® *by mouth* for children over 12 years and body-weight over 35 kg is the same as for adults (see above). The dose regimen for *Riamet*® for children under 12 years is as follows:

body-weight 5–15 kg 1 tablet initially, followed by 5 further doses of 1 tablet each given at 8, 24, 36, 48, and 60 hours (total 6 tablets over 60 hours); body-weight 15–25 kg 2 tablets initially, followed by 5 further doses of 2 tablets each given at 8, 24, 36, 48, and 60 hours (total 12 tablets over 60 hours); body-weight 25–35 kg 3 tablets initially, followed by 5 further doses of 3 tablets each given at 8, 24, 36, 48, and 60 hours (total 18 tablets over 60 hours)

Parenteral. The dose regimen for quinine *by intravenous infusion* for children is calculated on a mg/kg basis as for adults (see above).

Pregnancy Falciparum malaria is particularly dangerous in pregnancy, especially in the last trimester. The adult treatment doses of oral and intravenous quinine given above (including the loading dose) can safely be given to pregnant women. Clindamycin 450 mg every 8 hours for 7 days [unlicensed indication] should be given with or after quinine. Doxycycline should be avoided in pregnancy (affects teeth and skeletal development); pyrimethamine with sulfadoxine, *Malarone*®, and *Riamet*® are also best avoided until more information is available. Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired in quinine-resistant areas of south east Asia) because intravenous artesunate may be available for 'named patient' use.

1. Valid for quinine hydrochloride, dihydrochloride, and sulfate; not valid for quinine bisulfate which contains a correspondingly smaller amount of quinine.

Non-falciparum malaria (treatment)

Non-falciparum malaria is usually caused by *Plasmodium vivax* and less commonly by *P. ovale* and *P. malariae*. *P. knowlesi* is also present in the Asia-Pacific region. **Chloroquine**[2] is the drug of choice for the treatment of non-falciparum malaria (but chloroquine-resistant *P. vivax* has been reported in the Indonesian archipelago, the Malay Peninsula, including Myanmar, and eastward to Southern Vietnam).

The adult dosage regimen for **chloroquine** *by mouth* is:

initial dose of 620 mg of base *then*

a single dose of 310 mg of base after 6 to 8 hours *then*

a single dose of 310 mg of base daily for 2 days

(approximate total cumulative dose of 25 mg/kg of base)

Chloroquine alone is adequate for *P. malariae* and *P. knowlesi* infections but in the case of *P. vivax* and *P. ovale*, a *radical cure* (to destroy parasites in the liver and thus prevent relapses) is required. This is achieved with **primaquine**[3] [unlicensed] given after chloroquine; in *P. vivax* infection primaquine is given in an adult dosage of 30 mg daily for 14 days and for *P. ovale* infection it is given in an adult dosage of 15 mg daily for 14 days.

Children The dosage regimen of chloroquine for non-falciparum malaria in children is:

initial dose of 10 mg/kg of base (max. 620 mg) *then*

a single dose of 5 mg/kg of base (max. 310 mg) after 6–8 hours *then*

a single dose of 5 mg/kg of base (max. 310 mg) daily for 2 days

For a *radical cure*, primaquine[3] [unlicensed] is then given to children over 6 months of age; specialist advice should be sought for children under 6 months of age. In *P. vivax* infection primaquine is given in a dose of 500 micrograms/kg (max. 30 mg) daily for 14 days, and for *P. ovale* infection it is given in a dose of 250 micrograms/kg (max. 15 mg) daily for 14 days.

Parenteral If the patient is unable to take oral therapy, **quinine** can be given by *intravenous infusion* [unli-

2. For the treatment of chloroquine-resistant non-falciparum malaria, *Malarone*® [unlicensed indication], quinine, or *Riamet*® [unlicensed indication] can be used; as with chloroquine, primaquine should be given for radical cure.
3. Before starting primaquine, blood should be tested for glucose-6-phosphate dehydrogenase (G6PD) activity since the drug can cause haemolysis in G6PD-deficient patients. Specialist advice should be obtained in G6PD deficiency; in mild G6PD deficiency primaquine in a dose for adults of 45 mg once a week (children 750 micrograms/kg once a week; max. 45 mg once a week) for 8 weeks, has been found useful and without undue harmful effects.

censed]. The dose (for adults and children) is 10 mg/kg[1] (max. 700 mg) of quinine salt[2] infused over 4 hours every 8 hours, changed to oral chloroquine as soon as the patient's condition permits.

Pregnancy The adult treatment doses of chloroquine can be given for non-falciparum malaria. In the case of *P. vivax* or *P. ovale*, however, the radical cure with primaquine should be **postponed** until the pregnancy is over; instead chloroquine should be continued at a dose of 310 mg each week during the pregnancy.

Prophylaxis against malaria

The recommendations on prophylaxis reflect guidelines agreed by UK malaria specialists; the advice is aimed at residents of the UK who travel to endemic areas. The choice of drug for a particular individual should take into account:

- risk of exposure to malaria;
- extent of drug resistance;
- efficacy of the recommended drugs;
- side-effects of the drugs;
- patient-related factors (e.g. age, pregnancy, renal or hepatic impairment, compliance with prophylactic regimen).

Protection against bites **Prophylaxis is not absolute**, and breakthrough infection can occur with any of the drugs recommended. Personal protection against being bitten is very important. Mosquito nets impregnated with permethrin provide the most effective barrier protection against insects; mats and vaporised insecticides are also useful. Diethyltoluamide (DEET) 20–50% in lotions, sprays, or roll-on formulations is safe and effective when applied to the skin of adults and children over 2 months of age. It can also be used during pregnancy and breast-feeding. The duration of protection varies according to the concentration of DEET and is longest for DEET 50%. When sunscreen is also required, DEET should be applied after the sunscreen. Long sleeves and trousers worn after dusk also provide protection against bites.

Length of prophylaxis In order to determine tolerance and to establish habit, prophylaxis should generally be started one week (2–3 weeks in the case of mefloquine) before travel into an endemic area; *Malarone*® or doxycycline prophylaxis should be started 1–2 days before travel. Prophylaxis should be continued for **4 weeks after leaving** (except for *Malarone*® prophylaxis which should be stopped 1 week after leaving).

In those requiring long-term prophylaxis, chloroquine and proguanil may be used for periods of over 5 years. Mefloquine is licensed for up to 1 year (although, if it is tolerated in the short term, there is no evidence of harm when it is used for up to 3 years). Doxycycline can be used for up to 2 years. *Malarone*® can be used for up to 1 year. Prophylaxis with mefloquine, doxycycline, or *Malarone*® may be considered for longer durations if it is justified by the risk of exposure to malaria. Specialist advice should be sought for long-term prophylaxis.

1. Maintenance dose should be reduced to 5–7 mg/kg of quinine salt[2] in patients with severe renal impairment, severe hepatic impairment, or if parenteral treatment is required for more than 48 hours.
2. Valid for quinine hydrochloride, dihydrochloride, and sulfate; not valid for quinine bisulfate which contains a correspondingly smaller amount of quinine.

Return from malarial region It is important to be aware that **any illness** that occurs within 1 year and **especially within 3 months of return might be malaria** even if all recommended precautions against malaria were taken. Travellers should be **warned** of this and told that if they develop any illness **particularly within 3 months** of their return they should go **immediately** to a doctor and specifically mention their exposure to malaria.

Children Prophylactic doses are based on guidelines agreed by UK malaria experts and may differ from advice in product literature. Weight is a better guide than age. If in doubt telephone centres listed on p. 435.

Epilepsy Both chloroquine and mefloquine are unsuitable for malaria prophylaxis in individuals with a history of epilepsy. In areas *without chloroquine resistance* proguanil 200 mg daily alone is recommended; in areas *with chloroquine resistance*, doxycycline or *Malarone*® may be considered; the metabolism of doxycycline may be influenced by antiepileptics (see **interactions**: Appendix 1 (tetracyclines)).

Asplenia Asplenic individuals (or those with severe splenic dysfunction) are at particular risk of severe malaria. If travel to malarious areas is unavoidable, rigorous precautions are required against contracting the disease.

Renal impairment Avoidance (or dosage reduction) of proguanil is recommended since it is excreted by the kidneys. *Malarone*® should not be used for prophylaxis in patients with estimated glomerular filtration rate less than 30 mL/minute/1.73 m^2. Chloroquine is only partially excreted by the kidneys and reduction of the dose for prophylaxis is not required except in severe impairment. Mefloquine is considered to be appropriate to use in renal impairment and does not require dosage reduction. Doxycycline is also considered to be appropriate.

Pregnancy Travel to malarious areas should be avoided during pregnancy; if travel is unavoidable, effective prophylaxis must be used. Chloroquine and proguanil can be given in the usual doses during pregnancy, but these drugs are not appropriate for most areas because their effectiveness has declined, particularly in Sub-Saharan Africa; in the case of proguanil, folic acid 5 mg daily should be given for at least the first trimester. The centres listed on p. 435 should be consulted for advice on prophylaxis in chloroquine-resistant areas. Although the manufacturer advises that mefloquine should not be used during pregnancy, particularly in the first trimester, unless the potential benefit outweighs the risk, studies of mefloquine in pregnancy (including use in the first trimester) indicate that it can be considered for travel to chloroquine-resistant areas. Doxycycline is contra-indicated during pregnancy (see section 5.1.3); however, it can be used for malaria prophylaxis if other regimens are unsuitable, and if the entire course of doxycycline can be completed before 15 weeks' gestation [unlicensed]. *Malarone*® should be avoided during pregnancy, however, it can be considered during the second and third trimesters if there is no suitable alternative.

Breast-feeding Prophylaxis is required in **breast-fed infants**; although antimalarials are present in milk, the amounts are too variable to give reliable protection.

Anticoagulants Travellers taking warfarin should begin chemoprophylaxis 2–3 weeks before departure. The INR should be stable before departure. It should be

measured before starting chemoprophylaxis, 7 days after starting, and after completing the course. For prolonged stays, the INR should be checked at regular intervals.

Specific recommendations

Where a journey requires two regimens, the regimen for the higher risk area should be used for the whole journey. Those travelling to remote or little-visited areas may require expert advice.

Important

Settled immigrants (or long-term visitors) to the UK may be unaware that **any immunity they may have acquired while living in malarious areas is lost rapidly** after migration to the UK, or that any non-malarious areas where they lived previously **may now be malarious**

Key to recommended regimens for prophylaxis against malaria

Codes for regimens	Details of regimens for prophylaxis against malaria
1	Chemoprophylaxis not recommended, but avoid mosquito bites and consider malaria if fever presents
2	Chloroquine only
3	Chloroquine + proguanil hydrochloride
4	*Malarone®* *or* doxycycline *or* mefloquine
5	*Malarone®* *or* doxycycline

Specific recommendations: Afghanistan–Burundi

Country	Comments on risk of malaria and regional or seasonal variation	Codes for regimens
Afghanistan	Risk below 2000 m from May–November	3
	Low to no risk above 2000 m	1
Algeria	Very low risk in Illizi department only	1
Andaman and Nicobar Islands (India)	Risk present	3
Angola	High risk	4
Argentina	Low risk in low altitude areas of Salta provinces bordering Bolivia and in Chaco, Corrientes, and Misiones provinces close to border with Paraguay and Brazil	2
	No risk in areas other than those above and Iguaçu Falls	1
Azerbaijan	Low to no risk	1
Bahamas	Sporadic local transmission on Great Exuma Island only	1
Bangladesh	High risk in Chittagong Hill Tract districts (but not Chittagong city)	4
	Low to no risk in Chittagong city and other areas, except Chittagong Hill Tract districts	1
Belize	Low risk in rural areas	2
Benin	High risk	4
Bhutan	Risk in southern belt districts, along border with India: Chukha, Geyleg-phug, Samchi, Samdrup Jonkhar, and Shemgang	3
	Low to no risk in areas other than those above	1
Bolivia	High risk in Amazon basin	4
	Risk in rural areas below 2500 m (other than above)	2
	No risk above 2500 m	1
Botswana	High risk from November–June in northern half, including Okavango Delta area	4
	Low to no risk in southern half	1
Brazil	Risk in Amazon basin, including city of Manaus	4
	Very low risk in areas other than those above, and no risk in Iguaçu Falls	1
Brunei Darussalam	Very low risk	1
Burkina Faso	High risk	4
Burundi	High risk	4

Specific recommendations: Cambodia–Ethiopia

Country	Comments on risk of malaria and regional or seasonal variation	Codes for regimens
Cambodia	High risk, with widespread chloroquine and mefloquine resistance, in western provinces bordering Thailand	5
	High risk in areas other than those above and below	4
	Very low risk in Angkor Wat and Lake Tonle Sap; no risk in Phnom Penh	1
Cameroon	High risk	4
Cape Verde	Very low risk on island of Santiago (Sao Tiago) and Boa Vista	1
Central African Republic	High risk	4
Chad	High risk	4
China	High risk in Yunnan and Hainan provinces	4
	Very low risk in areas other than those above and below	1
	No risk in Hong Kong	–
Colombia	High risk in rural areas below 1600 m	4
	Low to no risk above 1600 m and in Cartagena	1
Comoros	High risk	4
Congo	High risk	4
Costa Rica	Risk in Limon province (but not city of Limon)	2
	Very low risk in other areas than those above	1
Cote d'Ivoire (Ivory Coast)	High risk	4
Democratic Republic of the Congo	High risk	4
Djibouti	High risk	4
Dominican Republic	Risk in all areas except cities of Santiago and Santo Domingo	2
	Cities of Santiago and Santo Domingo	1
East Timor (Timor-Leste)	High risk	4
Ecuador	Risk in areas below 1500 m including coastal provinces and Amazon basin (no risk in Galapagos islands or city of Guayaquil)	4
El Salvador	Low risk in rural areas of Santa Ana, Ahuachapán, and La Unión provinces in western part of country; low to no risk in other areas	1
Equatorial Guinea	High risk	4
Eritrea	High risk below 2200 m	4
Ethiopia	High risk below 2000 m	4

Specific recommendations: French Guiana–Jamaica

Country	Comments on risk of malaria and regional or seasonal variation	Codes for regimens
French Guiana	High risk, particularly in border areas (no risk in city of Cayenne or Devil's Island (Ile du Diable))	4
Gabon	High risk	4
Gambia	High risk	4
Georgia	Very low risk in rural south east from June–October	1
Ghana	High risk	4
Guatemala	Low risk below 1500 m	2
	No risk in Guatemala City, Antigua, or Lake Atitlan	–
Guinea	High risk	4
Guinea-Bissau	High risk	4
Guyana	High risk in all interior regions	4
	Very low risk in Georgetown and coastal region	1
Haiti	Risk present	2

Specific recommendations: French Guiana–Jamaica (*continued*)

Country	Comments on risk of malaria and regional or seasonal variation	Codes for regimens
Honduras	Risk below 1000 m and in Roatán and other Bay Islands (no risk in San Pedro Sula or Tegucigalpa)	2
India	High risk in Assam	4
	Risk in Goa, Andaman and Nicobar islands, and areas other than those above or below	3
	Very low risk in southern states of Kerala, Tamil Nadu, and Karnataka, southern Andhra Pradesh (including city of Hyderabad), Rajasthan (including city of Jaipur), Uttar Pradesh (including city of Agra), Punjab, the cities of Delhi, Kolkata, Mumbai (Bombay), Nagpur, Nasik, and Pune	1
	No risk in Lakshadweep islands	–
Indonesia	High risk in Lombok and Irian Jaya (Papua)	4
	Risk in areas other than those above or below	3
	Very low risk in Bali, and cities on islands of Java and Sumatra	1
	No risk in city of Jakarta	–
Indonesia (Borneo)	High risk	4
Iran	Risk from March–November in rural south eastern provinces and in north, along Azerbaijan border in Ardabil, and near Turkmenistan border in North Khorasan	3
	Low to no risk in areas other than those above	–
Iraq	Very low risk from May–November in rural northern area below 1500 m	1
Jamaica	Sporadic local transmission reported in Kingston; no risk in other areas	1

Key to recommended regimens for prophylaxis against malaria

Codes for regimens	Details of regimens for prophylaxis against malaria
1	Chemoprophylaxis not recommended, but avoid mosquito bites and consider malaria if fever presents
2	Chloroquine only
3	Chloroquine + proguanil hydrochloride
4	*Malarone*® *or* doxycycline *or* mefloquine
5	*Malarone*® *or* doxycycline

Specific recommendations: Kenya–Myanmar

Country	Comments on risk of malaria and regional or seasonal variation	Codes for regimens
Kenya	High risk below 2500 m (except city of Nairobi)	4
	Very low risk above 2500 m and in city of Nairobi	1
Kyrgyzstan	Very low risk from June–October in southwest areas bordering Tajikistan and Uzbekistan	1
Laos	High risk along the border with Myanmar in the provinces of Bokeo and Louang Namtha, and along the border with Thailand in the province of Champasak and Saravan	5
	High risk in areas other than those above or below	4
	Low to no risk in city of Vientiane	1
Liberia	High risk	4
Madagascar	High risk	4
Malawi	High risk	4
Malaysia	Risk in inland forested areas of peninsular Malaysia	4
	Very low risk in rest of peninsular Malaysia, including Cameron Highlands and city of Kuala Lumpur	1

Specific recommendations: Kenya–Myanmar (*continued*)

Country	Comments on risk of malaria and regional or seasonal variation	Codes for regimens
Malaysia (Borneo)	High risk in inland areas of eastern Sabah and in inland, forested areas of Sarawak	4
	Very low risk in areas other than those above, including coastal areas of Sabah and Sarawak	1
Mali	High risk	4
Mauritania	High risk all year in southern provinces, and from July–October in the north	4
	Low to no risk in areas other than those above	1
Mayotte	Risk present	4
Mexico	Low risk in Oaxaca and Chiapas	2
	Very low risk in areas other than those above	1
Mozambique	High risk	4
Myanmar	High risk (but not in cities of Mandalay and Yangon)	5
	No risk in cities of Mandalay and Yangon	1

Specific recommendations: Namibia–Rwanda

Country	Comments on risk of malaria and regional or seasonal variation	Codes for regimens
Namibia	High risk all year in regions of Caprivi Strip, Kavango, and Kunene river, and from November–June in northern third of country	4
	Low to no risk in areas other than those above	1
Nepal	Risk below 1500 m, particularly in Terai district	3
	No risk in city of Kathmandu and on typical Himalayan treks	1
Nicaragua	Low risk (except Managua)	2
	Very low risk in Managua	1
Niger	High risk	4
Nigeria	High risk	4
North Korea	Very low risk in some southern areas	1
Oman	Sporadic local transmission reported subsequent to international importation	1
Pakistan	Risk below 2000 m	3
	Low to no risk above 2000 m	1
Panama	Risk east of Canal Zone	3
	Low risk west of Canal Zone	2
	No risk in Panama City or Canal Zone itself	1
Papua New Guinea	High risk below 1800 m	4
	Low to no risk above 1800 m	1
Paraguay	Low risk in departments of Alto Paraná and Caaguazú	2
	Very low risk in areas other than those above	1
Peru	High risk in Amazon basin along border with Brazil, particularly in Loreto province	4
	Risk in rural areas below 2000 m (other than those above and below) and in part of the Amazon basin that borders Bolivia	2
	No risk in city of Lima and coastal region south of Chiclayo	–
Philippines	Risk in rural areas below 600 m and on islands of Luzon, Mindanao, Mindoro, and Palawan	3
	No risk in cities or on islands of Boracay, Bohol, Catanduanes, Cebu, or Leyte	1
Rwanda	High risk	4

Key to recommended regimens for prophylaxis against malaria

Codes for regimens	Details of regimens for prophylaxis against malaria
1	Chemoprophylaxis not recommended, but avoid mosquito bites and consider malaria if fever presents
2	Chloroquine only
3	Chloroquine + proguanil hydrochloride
4	*Malarone*® *or* doxycycline *or* mefloquine
5	*Malarone*® *or* doxycycline

Specific recommendations: São Tomé and Principe–Syria

Country	Comments on risk of malaria and regional or seasonal variation	Codes for regimens
São Tomé and Principe	High risk	4
Saudi Arabia	Risk in south-western provinces along border with Yemen, including below 2000 m in Asir province	3
	No risk in cities of Jeddah, Makkah (Mecca), Medina, Riyadh, or Ta'if, or above 2000 m in Asir province	1
Senegal	High risk	4
Sierra Leone	High risk	4
Solomon Islands	High risk	4
Somalia	High risk	4
South Africa	High risk in north-east KwaZulu-Natal, as far south as Tugela river, and in low altitude areas of Mpumalanga and Limpopo, which border Mozambique and Zimbabwe (including Kruger National Park)	4
	Low risk in areas bordering those above	1
South Korea	Very low risk in northern areas, in Gangwon-do and Gyeonggi-do provinces, and Incheon city (towards Demilitarized Zone)	1
South Sudan	High risk	4
Sri Lanka	Risk north of Vavuniya	3
	Low to no risk in areas other than those above and below	1
	No risk in Colombo or Kandy	–
Sudan	High risk in central and southern areas; risk also present in rest of country (except Khartoum)	4
	Very low risk in Khartoum	1
Suriname	High risk (except coastal districts or city of Paramaribo)	4
	Very low risk in coastal districts; no risk in city of Paramaribo	1
Swaziland	High risk in northern and eastern regions bordering Mozambique and South Africa, including all of Lubombo district and Big Bend, Mhlume, Simunye, and Tshaneni regions	4
	Very low risk in the west	1
Syria	Very low risk in small remote foci of Al Hasakah	1

Specific recommendations: Tajikistan–Zimbabwe

Country	Comments on risk of malaria and regional or seasonal variation	Codes for regimens
Tajikistan	Risk below 2000 m from June–October	3
Tanzania	High risk below 1800 m; risk also in Zanzibar	4
Thailand	High risk, with chloroquine and mefloquine resistance, in rural forested borders with Cambodia, Laos, and Myanmar	5
	Very low risk in areas other than those above, including Kanchanaburi (Kwai Bridge); no risk in cities of Bangkok, Chiang Mai, Chiang Rai, Koh Phangan, Koh Samui, and Pattaya	1

Specific recommendations: Tajikistan–Zimbabwe (*continued*)

Country	Comments on risk of malaria and regional or seasonal variation	Codes for regimens
Togo	High risk	4
Turkey	Low risk from May–October along the border plain with Syria, around Adana and east of Adana	2
	Very low risk in areas other than those above	1
Uganda	High risk	4
Uzbekistan	Very low risk in extreme south-east	1
Vanuatu	Risk present	4
Venezuela	High risk in all areas south of, and including, the Orinoco river and Angel Falls	4
	Risk in rural areas of Apure, Monagas, Sucre, and Zulia states	3
	No risk in city of Caracas or on Margarita Island	1
Vietnam	Risk in rural areas, and in southern provinces of Tay Ninh, Lam Dong, Dac Lac, Gia Lai, and Kon Tum	5
	Very low risk in Mekong river delta until border area with Cambodia; no risk in large cities (including Ho Chi Minh (Saigon) and Hanoi), Red river delta, and coastal areas north of Nha Trang	1
Yemen	Risk below 2000 m	3
	Very low risk on Socrota Island; no risk above 2000 m, including Sana'a city	1
Zambia	High risk	4
Zimbabwe	High risk all year in Zambezi valley, and from November–June in areas below 1200 m	4
	Very low risk in Harare and Bulawayo	1

Standby treatment

Travellers visiting remote, malarious areas for prolonged periods should carry standby treatment if they are likely to be more than 24 hours away from medical care. Self-medication should be **avoided** if medical help is accessible.

In order to avoid excessive self-medication, the traveller should be provided with **written instructions** that urgent medical attention should be sought if fever (38°C or more) develops 7 days (or more) after arriving in a malarious area and that self-treatment is indicated if medical help is not available within 24 hours of fever onset.

In view of the continuing emergence of resistant strains and of the different regimens required for different areas expert advice should be sought on the best treatment course for an individual traveller. A drug used for chemoprophylaxis should not be considered for standby treatment for the same traveller.

Artemether with lumefantrine

Artemether with lumefantrine is licensed for the *treatment of acute uncomplicated falciparum malaria.*

ARTEMETHER WITH LUMEFANTRINE

Indications treatment of acute uncomplicated falciparum malaria; treatment of non-falciparum malaria [unlicensed indication]

Cautions electrolyte disturbances, concomitant use with other drugs known to cause QT-interval prolongation; monitor patients unable to take food (greater risk of recrudescence); avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (artemether with lumefantrine)

Driving Dizziness may affect performance of skilled tasks (e.g. driving)

Contra-indications history of arrhythmias, of clinically relevant bradycardia, and of congestive heart failure accompanied by reduced left ventricular ejection fraction; family history of sudden death or of congenital QT interval prolongation

Hepatic impairment manufacturer advises caution in severe impairment

Renal impairment manufacturer advises caution in severe impairment—monitor ECG and plasma potassium concentration

Pregnancy toxicity in *animal* studies with artemether; manufacturer advises use only if potential benefit outweighs risk

Breast-feeding manufacturer advises avoid breast-feeding for at least 1 week after last dose; present in milk in *animal* studies

Side-effects abdominal pain, anorexia, diarrhoea, vomiting, nausea; palpitation, prolonged QT interval; cough; headache, dizziness, sleep disturbances, asthenia, paraesthesia; arthralgia, myalgia; pruritus, rash; *less commonly* ataxia, hypoaesthesia, and clonus

Dose

- Treatment of malaria, see p. 435

Riamet® (Novartis) PoM

Tablets, yellow, artemether 20 mg, lumefantrine 120 mg, net price 24-tab pack = £22.50. Label: 21, counselling, driving

Note Tablets may be crushed just before administration

Chloroquine

Chloroquine is used for the *prophylaxis of malaria* in areas of the world where the *risk of chloroquine-resistant*

falciparum malaria is still low. It is also used with proguanil when chloroquine-resistant falciparum malaria is present but this regimen may not give optimal protection (see specific recommendations by country, p. 438).

Chloroquine is **no longer recommended** for the *treatment of falciparum malaria* owing to widespread resistance, nor is it recommended if the infective species is *not known* or if the infection is *mixed*; in these cases treatment should be with quinine, *Malarone*®, or *Riamet*® (for details, see p. 435). It is still recommended for the *treatment of non-falciparum malaria* (for details, see p. 436).

CHLOROQUINE

Indications chemoprophylaxis and treatment of malaria; rheumatoid arthritis and lupus erythematosus (section 10.1.3)

Cautions may exacerbate psoriasis; neurological disorders (avoid for prophylaxis if history of epilepsy, see notes above); may aggravate myasthenia gravis; severe gastro-intestinal disorders; G6PD deficiency (see section 9.1.5); ophthalmic examination and long-term therapy, see under Chloroquine, section 10.1.3; avoid concurrent therapy with hepatotoxic drugs—other **interactions:** Appendix 1 (chloroquine and hydroxychloroquine)

Hepatic impairment use with caution in moderate to severe impairment

Renal impairment manufacturers advise caution; see also Prophylaxis Against Malaria, p. 437

Pregnancy benefit of prophylaxis and treatment in malaria outweighs risk; see also Non-falciparum Malaria (treatment), p. 437 and Prophylaxis Against Malaria, p. 437

Breast-feeding amount in milk probably too small to be harmful; see also Prophylaxis Against Malaria, p. 437

Side-effects gastro-intestinal disturbances, headache, skin reactions (rashes, pruritus); also hypotension, convulsions, extrapyramidal symptoms, visual disturbances, depigmentation or loss of hair; rarely bone-marrow suppression, hypersensitivity reactions such as urticaria and angioedema; other side-effects (not usually associated with malaria prophylaxis or treatment), see under Chloroquine, section 10.1.3; very toxic in **overdosage**—immediate advice from poisons centres essential (see also p. 39)

Dose

Note Doses expressed as chloroquine base

- Prophylaxis of malaria, started 1 week before entering endemic area and continued for 4 weeks after leaving (see notes above), 310 mg once weekly; CHILD up to 6 weeks body-weight under 4.5 kg, 25 mg once weekly; 6 weeks–6 months body-weight 4.5–8 kg, 50 mg once weekly; 6 months–1 year body-weight 8–11 kg, 75 mg once weekly; 1–3 years body-weight 11–15 kg, 100 mg once weekly; 3–4 years body-weight 15–16.5 kg, 125 mg once weekly; 4–8 years body-weight 16.5–25 kg, 150 mg once weekly (or 155 mg once weekly if tablets used); 8–13 years body-weight 25–45 kg, 225 mg once weekly (or 232.5 mg once weekly if tablets used); over 13 years body-weight over 45 kg, adult dose

  Counselling Warn travellers about **importance** of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and **especially** within 3 months of return. For details, see notes above

- Treatment of non-falciparum malaria, see p. 436

Note Chloroquine doses in BNF may differ from those in product literature

[1] **Avloclor**® (Alliance) PoM

Tablets, scored, chloroquine phosphate 250 mg (≡ chloroquine base 155 mg). Net price 20-tab pack = £3.13. Label: 5, counselling, prophylaxis, see above

[1] **Malarivon**® (Wallace Mfg) PoM

Syrup, chloroquine phosphate 80 mg/5 mL (≡ chloroquine base 50 mg/5 mL), net price 75 mL = £10.85. Label: 5, counselling, prophylaxis, see above

[1] **Nivaquine**® (Sanofi-Aventis) PoM

Syrup, golden, chloroquine sulfate 68 mg/5 mL (≡ chloroquine base 50 mg/5 mL), net price 100 mL = £4.60. Label: 5, counselling, prophylaxis, see above

With proguanil

For cautions and side-effects of proguanil see Proguanil; for dose see Chloroquine and Proguanil

[1] **Paludrine/Avloclor**® (Alliance)

Tablets, travel pack of 14 tablets of chloroquine phosphate 250 mg (≡ chloroquine base 155 mg) and 98 tablets of proguanil hydrochloride 100 mg, net price 112-tab pack = £9.95. Label: 5, 21, counselling, prophylaxis, see above

Mefloquine

Mefloquine is used for the *prophylaxis of malaria* in areas of the world where there is a *high risk of chloroquine-resistant falciparum malaria* (for details, see specific recommendations by country, p. 438).

Mefloquine is now rarely used for the *treatment of falciparum malaria* because of increased resistance. It is rarely used for the *treatment of non-falciparum malaria* because better tolerated alternatives are available. Mefloquine should not be used for treatment if it has been used for prophylaxis.

MEFLOQUINE

Indications chemoprophylaxis of malaria, treatment of malaria, see notes above

Cautions cardiac conduction disorders; epilepsy (avoid for prophylaxis); traumatic brain injury; not recommended in infants under 3 months (5 kg); **interactions:** Appendix 1 (mefloquine)

Neuropsychiatric reactions Mefloquine is associated with potentially serious neuropsychiatric reactions. Abnormal dreams, insomnia, anxiety, and depression occur commonly. Psychosis, suicidal ideation, and suicide have also been reported. Psychiatric symptoms such as nightmares, acute anxiety, depression, restlessness, or confusion should be regarded as potentially prodromal for a more serious event. If neuropsychiatric symptoms occur, patients should be advised to discontinue mefloquine and to seek immediate medical attention so that mefloquine can be replaced with an alternative antimalarial. Adverse reactions may occur and persist up to several months after discontinuation because mefloquine has a long half-life. Mefloquine is contra-indicated for malaria prophylaxis in those with a history of psychiatric disorders or convulsions

Driving Dizziness or a disturbed sense of balance may affect performance of skilled tasks (e.g. driving); effects may occur and persist up to several months after stopping mefloquine

Contra-indications hypersensitivity to quinine; history of blackwater fever; avoid for standby treatment if history of convulsions; avoid for prophylaxis if

1. Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria. Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials are prescribed

history of psychiatric disorders (including depression) or convulsions

Hepatic impairment elimination may be prolonged; avoid in severe impairment

Renal impairment manufacturer advises caution

Pregnancy manufacturer advises adequate contraception during prophylaxis and for 3 months after stopping (teratogenicity in *animal* studies), but see also p. 437

Breast-feeding present in milk but risk to infant minimal; see also p. 437

Side-effects nausea, vomiting, abdominal pain, diarrhoea, headache, dizziness, visual disturbances, pruritus; see also Neuropsychiatric Reactions above; *also reported* anorexia, dyspepsia, hepatic failure, hypotension, hypertension, flushing, chest pain, bradycardia, tachycardia, palpitation, arrhythmias, syncope, oedema, dyspnoea, pneumonitis, drowsiness, sensory and motor neuropathies, tremor, ataxia, panic attacks, confusion, amnesia, seizures, encephalopathy, speech disturbances, malaise, fever, blood disorders (including leucopenia, leucocytosis, thrombocytopenia), muscle weakness, myalgia, arthralgia, cataract, optic neuropathy, vestibular disorders, rash (including Stevens-Johnson syndrome), alopecia, hyperhidrosis

Dose

- Prophylaxis of malaria, started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving (see notes above), ADULT and CHILD bodyweight over 45 kg, 250 mg once weekly; body-weight 5–16 kg, 62.5 mg once weekly; body-weight 16–25 kg, 125 mg once weekly; body-weight 25–45 kg, 187.5 mg once weekly
- Treatment of malaria, see notes above

Counselling Inform travellers about adverse reactions of mefloquine and, if they occur, to seek medical advice on alternative antimalarials before the next dose is due (see also Neuropsychiatric Reactions and Driving above). Also warn travellers about **importance** of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and **especially** within 3 months of return. For details, see notes above

Note Mefloquine doses in BNF may differ from those in product literature

[1]**Lariam®** (Roche) PoM

Tablets, scored, mefloquine (as hydrochloride) 250 mg. Net price 8-tab pack = £14.53. Label: 21, 27, counselling, driving, prophylaxis, see above

Note Tablet may be crushed and mixed with food such as jam or honey just before administration

Piperaquine with artenimol

Piperaquine with artenimol is not recommended for the first-line treatment of acute uncomplicated falciparum malaria because there is limited experience of its use in travellers who usually reside in areas where malaria is not endemic. Piperaquine has a long half-life.

PIPERAQUINE PHOSPHATE WITH ARTENIMOL

(Piperaquine tetraphosphate with dihydroartemisinin)

Indications see notes above

Cautions obtain ECG as soon as possible after starting treatment then continue monitoring in those taking medicines that increase plasma-piperaquine concentration, in children who are vomiting, in females, or in the elderly; consider obtaining ECG in all patients before third dose and 4–6 hours after third dose; if QT_C interval more than 500 milliseconds, discontinue treatment and monitor ECG for a further 24–48 hours; **interactions**: Appendix 1 (piperaquine with artenimol)

Contra-indications risk factors for QT interval prolongation (e.g. electrolyte disturbances, acute myocardial infarction, severe hypertension, left ventricular hypertrophy, heart failure with reduced left ventricular ejection fraction, bradycardia, congenital long QT syndrome, family history of sudden death, concomitant use with other drugs known to prolong the QT interval, history of symptomatic arrhythmias)

Hepatic impairment no information available in moderate to severe impairment—manufacturer advises monitor ECG and plasma-potassium concentration

Renal impairment no information available in moderate to severe impairment—manufacturer advises monitor ECG and plasma-potassium concentration

Pregnancy teratogenic in *animal* studies—manufacturer advises use only if other antimalarials cannot be used

Breast-feeding manufacturer advises avoid—present in milk in *animal* studies

Side-effects QT interval prolonged, tachycardia, headache, malaise, anaemia; *less commonly* nausea, vomiting, abdominal pain, diarrhoea, anorexia, hepatitis, hepatomegaly, arrhythmias, bradycardia, cough, dizziness, convulsions, influenza-like symptoms, arthralgia, myalgia, pruritus; also reported in children stomatitis, jaundice, heart murmur, blood disorders (including leucopenia and thrombocytopenia), conjunctivitis, rash, acanthosis

Dose

- See preparations

Eurartesim® (Sigma-Tau) ▼ PoM

Tablets, f/c, scored, piperaquine phosphate 320 mg, artenimol 40 mg, net price 12-tab pack = £40.00. Counselling, administration

Counselling Tablets to be taken at least 3 hours before and at least 3 hours after food. Tablets may be crushed and mixed with water immediately before administration

Dose Treatment of uncomplicated falciparum malaria, ADULT and CHILD over 6 months, body-weight 7–13 kg, ½ tablet once daily for 3 days; body-weight 13–24 kg, 1 tablet once daily for 3 days; body-weight 24–36 kg, 2 tablets once daily for 3 days; body-weight 36–75 kg, 3 tablets once daily for 3 days; body-weight 75–100 kg, 4 tablets once daily for 3 days

Note Max. 2 courses in 12 months; second course given at least 2 months after first course

Primaquine

Primaquine is used to eliminate the liver stages of *P. vivax or P. ovale following chloroquine treatment* (for details, see p. 436).

PRIMAQUINE

Indications adjunct in the treatment of *Plasmodium vivax* and *P. ovale* malaria (eradication of liver stages)

Cautions G6PD deficiency (test blood, see under Non-falciparum Malaria (treatment), p. 436); systemic diseases associated with granulocytopenia (e.g.

1. Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials prescribed

rheumatoid arthritis, lupus erythematosus); **interactions:** Appendix 1 (primaquine)

Pregnancy risk of neonatal haemolysis and methaemoglobinaemia in third trimester; see also p. 437

Breast-feeding no information available; theoretical risk of haemolysis in G6PD-deficient infants

Side-effects nausea, vomiting, anorexia, abdominal pain; less commonly methaemoglobinaemia, haemolytic anaemia especially in G6PD deficiency, leucopenia

Dose

- Treatment of non-falciparum malaria, see p. 436

Primaquine (Non-proprietary)

Tablets, primaquine (as phosphate) 7.5 mg or 15 mg

Available from 'special-order' manufacturers or specialist-importing companies, see p. 1104

Proguanil

Proguanil is used (usually *with chloroquine*, but occasionally *alone*) for the *prophylaxis of malaria*, (for details, see specific recommendations by country, p. 438).

Proguanil used alone is not suitable for the *treatment of malaria*; however, *Malarone*® (a combination of atovaquone with proguanil) is licensed for the treatment of acute uncomplicated falciparum malaria. *Malarone*® is also used for the *prophylaxis of falciparum malaria* in areas of *widespread mefloquine or chloroquine resistance. Malarone*® is also used as an alternative to mefloquine or doxycycline. *Malarone*® is particularly suitable for short trips to highly chloroquine-resistant areas because it needs to be taken only for 7 days after leaving an endemic area.

PROGUANIL HYDROCHLORIDE

Indications chemoprophylaxis of malaria

Cautions **interactions:** Appendix 1 (proguanil)

Renal impairment 100 mg once daily if eGFR 20–60 mL/minute/1.73 m^2; 50 mg on alternate days if eGFR 10–20 mL/minute/1.73 m^2; 50 mg once weekly if eGFR less than 10 mL/minute/1.73 m^2 (increased risk of haematological toxicity)

Pregnancy benefit of prophylaxis in malaria outweighs risk; adequate folate supplements should be given to mother; see also p. 437

Breast-feeding amount in milk probably too small to be harmful when used for malaria prophylaxis; see also p. 437

Side-effects mild gastric intolerance, diarrhoea, and constipation; occasionally mouth ulcers and stomatitis; *very rarely* cholestasis, vasculitis, skin reactions, and hair loss

Dose

- Prophylaxis of malaria, started 1 week before entering endemic area and continued for 4 weeks after leaving (see notes above), 200 mg once daily; INFANT up to 12 weeks body-weight under 6 kg, 25 mg once daily; 12 weeks–1 year body-weight 6–10 kg, 50 mg once daily; CHILD 1–4 years body-weight 10–16 kg, 75 mg once daily; 4–8 years body-weight 16–25 kg, 100 mg once daily; 8–13 years, body-weight 25–45 kg, 150 mg once daily; over 13 years body-weight over 45 kg, adult dose

  Counselling Warn travellers about **importance** of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and **especially** within 3 months of return. For details, see notes above

  Note Proguanil doses in BNF may differ from those in product literature.

[1]**Paludrine**® (Alliance)

Tablets, scored, proguanil hydrochloride 100 mg. Net price 98-tab pack = £8.65. Label: 21, counselling, prophylaxis, see above

Note Tablet may be crushed and mixed with food such as milk, jam, or honey just before administration

With chloroquine

See under Chloroquine

PROGUANIL HYDROCHLORIDE WITH ATOVAQUONE

Indications treatment of acute uncomplicated falciparum malaria and prophylaxis of falciparum malaria, particularly where resistance to other antimalarial drugs suspected; treatment of non-falciparum malaria [unlicensed indication]

Cautions diarrhoea or vomiting (reduced absorption of atovaquone); efficacy not evaluated in cerebral or complicated malaria (including hyperparasitaemia, pulmonary oedema or renal failure); **interactions:** see Appendix 1 (proguanil, atovaquone)

Renal impairment avoid for malaria prophylaxis (and if possible for malaria treatment) if eGFR less than 30 mL/minute/1.73 m^2

Pregnancy manufacturer advises avoid unless essential; see also p. 437

Breast-feeding use only if no suitable alternative available; see also p. 437

Side-effects abdominal pain, nausea, vomiting, diarrhoea; cough; headache, dizziness, insomnia, abnormal dreams, depression, anorexia, fever; rash, pruritus; *less frequently* stomatitis, palpitation, anxiety, blood disorders, hyponatraemia, and hair loss; also reported, hepatitis, cholestasis, tachycardia, hallucinations, seizures, vasculitis, mouth ulcers, photosensitivity, and Stevens-Johnson syndrome

Dose

- See preparations

  Counselling Warn travellers about **importance** of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and **especially** within 3 months of return. For details, see notes above

[2]**Malarone**® (GSK) PoM

Tablets ('standard'), pink, f/c, proguanil hydrochloride 100 mg, atovaquone 250 mg. Net price 12-tab pack = £25.21. Label: 21, counselling, prophylaxis, see above

Dose prophylaxis of malaria, started 1–2 days before entering endemic area and continued for 1 week after leaving, ADULT and CHILD over 40 kg, 1 tablet daily

Treatment of malaria, ADULT and CHILD body-weight over 40 kg, 4 tablets once daily for 3 days; CHILD body-weight 11–21 kg 1 tablet daily for 3 days; body-weight 21–31 kg 2 tablets once daily for 3 days; body-weight 31–40 kg 3 tablets once daily for 3 days

1. Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria. Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials are prescribed
2. Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials prescribed

[1]**Malarone® Paediatric** (GSK) PoM

Paediatric tablets, pink, f/c proguanil hydrochloride 25 mg, atovaquone 62.5 mg, net price 12-tab pack = £6.26. Label: 21, counselling, prophylaxis, see above

Dose prophylaxis of malaria, started 1–2 days before entering endemic area and continued for 1 week after leaving, CHILD body-weight 5–10 kg, see *BNF for Children*; body-weight 10–20 kg, 1 tablet once daily; body-weight 20–30 kg, 2 tablets once daily; body-weight 30–40 kg, 3 tablets once daily; body-weight over 40 kg use *Malarone*® ('standard') tablets

Treatment of malaria, CHILD body-weight 5–9 kg, 2 tablets once daily for 3 days; body-weight 9–11 kg, 3 tablets once daily for 3 days; body-weight 11 kg and over use *Malarone*® ('standard') tablets

Note *Malarone*® *Paediatric* doses in BNF may differ from those in product literature. Tablets may be crushed and mixed with food or milky drink just before administration

Pyrimethamine

Pyrimethamine should not be used alone, but is used with sulfadoxine.

Pyrimethamine with sulfadoxine is not recommended for the *prophylaxis of malaria*, but it can be used in the treatment of *falciparum malaria with (or following) quinine*.

PYRIMETHAMINE

Indications malaria (but used only in combined preparations incorporating sulfadoxine); toxoplasmosis—section 5.4.7

Cautions blood counts required with prolonged treatment; predisposition to folate deficiency; history of seizures—avoid large loading doses; **interactions:** Appendix 1 (pyrimethamine)

Hepatic impairment manufacturer advises caution

Renal impairment manufacturer advises caution

Pregnancy theoretical teratogenic risk in *first trimester* (folate antagonist); adequate folate supplements should be given to mother

Breast-feeding significant amount in milk—avoid administration of other folate antagonists to infant; avoid breast-feeding during toxoplasmosis treatment

Side-effects nausea, vomiting, diarrhoea, headache, dizziness, blood disorders with high doses (including anaemia, leucopenia, thrombocytopenia), rash; *less commonly* fever, abnormal skin pigmentation; *very rarely* colic, buccal ulceration, convulsions

Dose

- Malaria, no dose stated because not recommended alone, see Pyrimethamine with Sulfadoxine below
- Toxoplasmosis, section 5.4.7

Daraprim® (GSK) PoM

Tablets, scored, pyrimethamine 25 mg. Net price 30-tab pack = £13.00

PYRIMETHAMINE WITH SULFADOXINE

Indications adjunct to quinine in treatment of *Plasmodium falciparum* malaria; **not** recommended for prophylaxis

Cautions see under Pyrimethamine and under Co-trimoxazole (section 5.1.8); not recommended for prophylaxis (severe side-effects on long-term use); **interactions:** Appendix 1 (pyrimethamine, sulfonamides)

Contra-indications see under Pyrimethamine and under Co-trimoxazole (section 5.1.8); sulfonamide allergy

Pregnancy possible teratogenic risk in *first trimester* (pyrimethamine a folate antagonist); in *third trimester*—risk of neonatal haemolysis and methaemoglobinaemia; fear of increased risk of kernicterus in neonates appears to be unfounded; see also p. 436

Breast-feeding small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants (due to sulfadoxine)

Side-effects see under Pyrimethamine and under Co-trimoxazole (section 5.1.8); pulmonary infiltrates (e.g. eosinophilic or allergic alveolitis) reported—discontinue if cough or shortness of breath

Dose

- Treatment of falciparum malaria, see p. 435
- Prophylaxis, not recommended by UK malaria experts

Pyrimethamine with sulfadoxine (Non-proprietary) PoM

Tablets, scored, pyrimethamine 25 mg, sulfadoxine 500 mg, net price 3-tab pack = 74p

Note Also known as *Fansidar*®

Available from 'special-order' manufacturers or specialist importing companies, see p. 1104

Quinine

Quinine is not suitable for the *prophylaxis of malaria*.

Quinine is used for the *treatment of falciparum malaria* or if the infective species is *not known* or if the infection is *mixed* (for details see p. 435).

QUININE

Indications falciparum malaria; nocturnal leg cramps, see section 10.2.2

Cautions cardiac disease (including atrial fibrillation, conduction defects, heart block), elderly—monitor ECG during parenteral treatment; monitor blood glucose and electrolyte concentration during parenteral treatment; G6PD deficiency (see section 9.1.5); **interactions:** Appendix 1 (quinine)

Contra-indications haemoglobinuria, myasthenia gravis, optic neuritis, tinnitus

Hepatic impairment for treatment of malaria in severe impairment, reduce parenteral maintenance dose to 5–7 mg/kg of quinine salt

Renal impairment for treatment of malaria in severe impairment, reduce parenteral maintenance dose to 5–7 mg/kg of quinine salt

Pregnancy high doses are teratogenic in *first trimester*, but in malaria benefit of treatment outweighs risk; see also p. 436

Breast-feeding present in milk but not known to be harmful

Side-effects cinchonism, including tinnitus, hearing impairment, vertigo, headache, nausea, vomiting, abdominal pain, diarrhoea, visual disturbances (including temporary blindness); agitation, confusion; cardiovascular effects (see Cautions); dyspnoea; hypersensitivity reactions including angioedema, rashes, hot and flushed skin; hypoglycaemia (espe-

1. Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials prescribed

cially after parenteral administration); blood disorders (including thrombocytopenia and intravascular coagulation); acute renal failure; muscle weakness; photosensitivity; very toxic in **overdosage**—immediate advice from poisons centres essential (see also p. 39)

Dose

- Treatment of malaria, see p. 435

  Note Quinine (anhydrous base) 100 mg ≡ quinine bisulfate 169 mg ≡ quinine dihydrochloride 122 mg ≡ quinine hydrochloride 122 mg ≡ quinine sulfate 121 mg. Quinine bisulfate 300-mg tablets are available but provide less quinine than 300 mg of the dihydrochloride, hydrochloride, or sulfate

Quinine Sulfate (Non-proprietary) PoM

Tablets, coated, quinine sulfate 200 mg, net price 28-tab pack = £1.68; 300 mg, 28-tab pack = £1.80

Quinine Dihydrochloride (Non-proprietary) PoM

Injection, quinine dihydrochloride 300 mg/mL. For dilution and use as an infusion. 1- and 2-mL amps

Available from 'special-order' manufacturers or specialist importing companies, see p. 1104

Note Intravenous injection of quinine is so hazardous that it has been superseded by infusion

Tetracyclines

Doxycycline (section 5.1.3) is used for the *prophylaxis of malaria* in areas of *widespread mefloquine or chloroquine resistance*. Doxycycline is also used as an alternative to mefloquine or *Malarone*® (for details, see specific recommendations by country, p. 438).

Doxycycline is also used as an *adjunct to quinine in the treatment of falciparum malaria* (for details see p. 435).

DOXYCYCLINE

Indications prophylaxis of malaria; adjunct to quinine in treatment of *Plasmodium falciparum* malaria; see also section 5.1.3

Cautions section 5.1.3

Contra-indications section 5.1.3

Hepatic impairment section 5.1.3

Renal impairment section 5.1.3

Pregnancy section 5.1.3

Breast-feeding section 5.1.3

Side-effects section 5.1.3

Dose

- Prophylaxis of malaria, started 1–2 days before entering endemic area and continued for 4 weeks after leaving (see notes above), ADULT and CHILD over 12 years, 100 mg once daily
- Treatment of falciparum malaria, see p. 435

Preparations

Section 5.1.3

5.4.2 Amoebicides

Metronidazole is the drug of choice for *acute invasive amoebic dysentery* since it is very effective against vegetative forms of *Entamoeba histolytica* in ulcers; it is given in an adult dose of 800 mg three times daily for 5 days. **Tinidazole** is also effective. Metronidazole and tinidazole are also active against amoebae which may have migrated to the liver. Treatment with metronidazole (or tinidazole) is followed by a 10-day course of diloxanide furoate.

Diloxanide furoate is the drug of choice for asymptomatic patients with *E. histolytica* cysts in the faeces; metronidazole and tinidazole are relatively ineffective. Diloxanide furoate is relatively free from toxic effects and the usual course is of 10 days, given alone for chronic infections or following metronidazole or tinidazole treatment.

For *amoebic abscesses* of the liver **metronidazole** is effective; tinidazole is an alternative. Aspiration of the abscess is indicated where it is suspected that it may rupture or where there is no improvement after 72 hours of metronidazole; the aspiration may need to be repeated. Aspiration aids penetration of metronidazole and, for abscesses with more than 100 mL of pus, if carried out in conjunction with drug therapy, may reduce the period of disability.

Diloxanide furoate is not effective against hepatic amoebiasis, but a 10-day course should be given at the completion of metronidazole or tinidazole treatment to destroy any amoebae in the gut.

DILOXANIDE FUROATE

Indications see notes above; chronic amoebiasis and as adjunct to metronidazole or tinidazole in acute amoebiasis

Pregnancy manufacturer advises avoid—no information available

Breast-feeding manufacturer advises avoid

Side-effects flatulence, vomiting, urticaria, pruritus

Dose

- 500 mg every 8 hours for 10 days; CHILD body-weight over 25 kg, 20 mg/kg daily in 3 divided doses for 10 days; body-weight under 25 kg, see *BNF for Children*

  See also notes above

Diloxanide (Non-proprietary) PoM

Tablets, diloxanide furoate 500 mg, net price 30-tab pack = £93.50. Label: 9

METRONIDAZOLE

Indications see under Dose below; anaerobic infections, section 5.1.11

Cautions section 5.1.11

Hepatic impairment section 5.1.11

Pregnancy section 5.1.11

Breast-feeding section 5.1.11

Side-effects section 5.1.11

Dose

- By mouth, invasive intestinal amoebiasis, extra-intestinal amoebiasis (including liver abscess), 800 mg every 8 hours for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection); CHILD 1–3 years 200 mg every 8 hours; 3–7 years 200 mg every 6 hours; 7–10 years 400 mg every 8 hours

  Urogenital trichomoniasis, 200 mg every 8 hours for 7 days *or* 400–500 mg every 12 hours for 5–7 days, *or* 2 g as a single dose; CHILD 1–3 years 50 mg every 8 hours for 7 days; 3–7 years 100 mg every 12 hours; 7–10 years 100 mg every 8 hours

  Giardiasis, 2 g daily for 3 days *or* 400 mg 3 times daily for 5 days *or* 500 mg twice daily for 7–10 days; CHILD 1–3 years 500 mg daily for 3 days; 3–7 years 600–800 mg daily; 7–10 years 1 g daily

Preparations

Section 5.1.11

TINIDAZOLE

Indications see under Dose below; anaerobic infections, section 5.1.11

Cautions section 5.1.11

Pregnancy section 5.1.11

Breast-feeding section 5.1.11

Side-effects section 5.1.11

Dose

- Intestinal amoebiasis, 2 g daily for 2–3 days; CHILD 50–60 mg/kg daily for 3 days
- Amoebic involvement of liver, 1.5–2 g daily for 3–6 days; CHILD 50–60 mg/kg daily for 5 days
- Urogenital trichomoniasis and giardiasis, single 2 g dose; CHILD single dose of 50–75 mg/kg (repeated once if necessary)

Preparations

Section 5.1.11

5.4.3 Trichomonacides

Metronidazole (section 5.4.2) is the treatment of choice for *Trichomonas vaginalis* infection. Contact tracing is recommended and sexual contacts should be treated simultaneously. If metronidazole is ineffective, **tinidazole** (section 5.4.2) may be tried.

5.4.4 Antigiardial drugs

Metronidazole (section 5.4.2) is the treatment of choice for *Giardia lamblia* infections. Alternative treatments are **tinidazole** (section 5.4.2) or **mepacrine hydrochloride**.

MEPACRINE HYDROCHLORIDE

Indications giardiasis; discoid lupus erythematosus (Antimalarials, section 10.1.3)

Cautions hepatic impairment, elderly, history of psychosis; avoid in psoriasis; **interactions:** Appendix 1 (mepacrine)

Side-effects gastro-intestinal disturbances; dizziness, headache; with large doses nausea, vomiting and occasionally transient acute toxic psychosis and CNS stimulation; on prolonged treatment yellow discoloration of skin and urine, chronic dermatoses (including severe exfoliative dermatitis), hepatitis, aplastic anaemia; also reported blue/black discoloration of palate and nails and corneal deposits with visual disturbances

Dose

- Giardiasis [unlicensed], 100 mg every 8 hours for 5–7 days

Mepacrine Hydrochloride

Tablets, mepacrine hydrochloride 100 mg. Label: 4, 9, 14, 21

Available from 'special-order' manufacturers or specialist importing companies, see p. 1104

5.4.5 Leishmaniacides

Cutaneous leishmaniasis frequently heals spontaneously but if skin lesions are extensive or unsightly, treatment is indicated, as it is in visceral leishmaniasis (kala-azar). Leishmaniasis should be treated under specialist supervision.

Sodium stibogluconate, an organic pentavalent antimony compound, is used for visceral leishmaniasis. The dose is 20 mg/kg daily by intramuscular or intravenous injection for 28 days in visceral leishmaniasis and for 20 days in cutaneous infection; the dosage varies with different geographical regions and expert advice should be obtained. Some early non-inflamed lesions of cutaneous leishmaniasis can be treated with intralesional injections of sodium stibogluconate under specialist supervision.

Amphotericin is used with or after an antimony compound for visceral leishmaniasis unresponsive to the antimonial alone; side-effects may be reduced by using liposomal amphotericin (*AmBisome*®—section 5.2.3) at a dose of 1–3 mg/kg daily for 10–21 days to a cumulative dose of 21–30 mg/kg *or* at a dose of 3 mg/kg for 5 consecutive days followed by a single dose of 3 mg/kg 6 days later. *Abelcet*®, a lipid formulation of amphotericin is also likely to be effective but less information is available.

Pentamidine isetionate (pentamidine isethionate) (section 5.4.8) has been used in antimony-resistant visceral leishmaniasis, but although the initial response is often good, the relapse rate is high; it is associated with serious side-effects. Other treatments include paromomycin [unlicensed] (available from 'special-order' manufacturers or specialist importing companies, see p. 1104).

SODIUM STIBOGLUCONATE

Indications leishmaniasis

Cautions intravenous injections must be given slowly over 5 minutes (to reduce risk of local thrombosis) and stopped if coughing or substernal pain; mucocutaneous disease (see below); treat intercurrent infection (e.g. pneumonia); monitor ECG before and during treatment; heart disease (withdraw if conduction disturbances occur); predisposition to QT interval prolongation (including concomitant use with drugs that prolong QT interval); **interactions:** Appendix 1 (sodium stibogluconate)

Mucocutaneous disease Successful treatment of mucocutaneous leishmaniasis may induce severe inflammation around the lesions (may be life-threatening if pharyngeal or tracheal involvement)—may require corticosteroid

Hepatic impairment use with caution

Renal impairment avoid in significant impairment

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Breast-feeding amount probably too small to be harmful

Side-effects anorexia, nausea, vomiting, abdominal pain, diarrhoea; ECG changes; coughing (see Cautions); headache, lethargy; arthralgia, myalgia; *rarely* jaundice, flushing, bleeding from nose or gum, substernal pain (see Cautions), vertigo, fever, sweating, and rash; also reported pancreatitis and anaphylaxis; pain and thrombosis on intravenous administration, intramuscular injection also painful

Dose

- See notes above

Pentostam® (GSK) PoM

Injection, sodium stibogluconate equivalent to pentavalent antimony 100 mg/mL. Net price 100-mL bottle = £66.43

Note Injection should be filtered immediately before administration using a filter of 5 microns or less

5.4.6 Trypanocides

The prophylaxis and treatment of trypanosomiasis is difficult and differs according to the strain of organism. Expert advice should therefore be obtained.

5.4.7 Drugs for toxoplasmosis

Most infections caused by *Toxoplasma gondii* are self-limiting, and treatment is not necessary. Exceptions are patients with eye involvement (toxoplasma choroidoretinitis), and those who are immunosuppressed. Toxoplasmic encephalitis is a common complication of AIDS. The treatment of choice is a combination of pyrimethamine and sulfadiazine, given for several weeks (expert advice **essential**). Pyrimethamine is a folate antagonist, and adverse reactions to this combination are relatively common (folinic acid supplements and weekly blood counts needed). Alternative regimens use combinations of pyrimethamine with clindamycin or clarithromycin or azithromycin. Long-term secondary prophylaxis is required after treatment of toxoplasmosis in immunocompromised patients; prophylaxis should continue until immunity recovers.

If toxoplasmosis is acquired in pregnancy, transplacental infection may lead to severe disease in the fetus. Spiramycin [unlicensed] (available from 'special-order' manufacturers or specialist importing companies, see p. 1104) may reduce the risk of transmission of maternal infection to the fetus.

5.4.8 Drugs for pneumocystis pneumonia

Pneumonia caused by *Pneumocystis jirovecii (Pneumocystis carinii)* occurs in immunosuppressed patients; it is a common cause of pneumonia in AIDS. Pneumocystis pneumonia should generally be treated by those experienced in its management. Blood gas measurement is used to assess disease severity.

Treatment

Mild to moderate disease **Co-trimoxazole** (section 5.1.8) in high dosage is the drug of choice for the treatment of mild to moderate pneumocystis pneumonia.

Atovaquone is licensed for the treatment of mild to moderate pneumocystis infection in patients who cannot tolerate co-trimoxazole. A combination of **dapsone** 100 mg daily (section 5.1.10) with **trimethoprim** 5 mg/kg every 6–8 hours (section 5.1.8) is given by mouth for the treatment of mild to moderate disease [unlicensed indication].

A combination of **clindamycin** 600 mg by mouth every 8 hours (section 5.1.6) and **primaquine** 30 mg daily by mouth (section 5.4.1) is used in the treatment of mild to moderate disease [unlicensed indication]; this combination is associated with considerable toxicity.

Severe disease **Co-trimoxazole** (section 5.1.8) in high dosage, given by mouth or by intravenous infusion, is the drug of choice for the treatment of severe pneumocystis pneumonia. **Pentamidine isetionate** given by intravenous infusion is an alternative for patients who cannot tolerate co-trimoxazole, or who have not responded to it. Pentamidine isetionate is a potentially toxic drug that can cause severe hypotension during or immediately after infusion.

Corticosteroid treatment can be lifesaving in those with severe pneumocystis pneumonia (see Adjunctive Therapy below).

Adjunctive therapy In moderate to severe infections associated with HIV infection, prednisolone 50–80 mg daily is given by mouth for 5 days (alternatively, hydrocortisone may be given parenterally); the dose is then reduced to complete 21 days of treatment. Corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards. The corticosteroid should be withdrawn before anti-pneumocystis treatment is complete.

Prophylaxis

Prophylaxis against pneumocystis pneumonia should be given to all patients with a history of the infection. Prophylaxis against pneumocystis pneumonia should also be considered for severely immunocompromised patients. Prophylaxis should continue until immunity recovers sufficiently. It should not be discontinued if the patient has oral candidiasis, continues to lose weight, or is receiving cytotoxic therapy or long-term immunosuppressant therapy.

Co-trimoxazole by mouth is the drug of choice for prophylaxis against pneumocystis pneumonia. It is given in a dose of 960 mg daily or 960 mg on alternate days (3 times a week); the dose may be reduced to co-trimoxazole 480 mg daily to improve tolerance.

Inhaled **pentamidine isetionate** is better tolerated than parenteral pentamidine. Intermittent inhalation of pentamidine isetionate is used for prophylaxis against pneumocystis pneumonia in patients unable to tolerate co-trimoxazole. It is effective but patients may be prone to extrapulmonary infection. Alternatively, **dapsone** 100 mg daily (section 5.1.10) can be used. **Atovaquone** 750 mg twice daily has also been used for prophylaxis [unlicensed indication].

ATOVAQUONE

Indications treatment of mild to moderate *Pneumocystis jirovecii (Pneumocystis carinii)* pneumonia in patients intolerant of co-trimoxazole

Cautions initial diarrhoea and difficulty in taking with food may reduce absorption (and require alternative therapy); other causes of pulmonary disease should be sought and treated; elderly; **interactions:** Appendix 1 (atovaquone)

Hepatic impairment manufacturer advises caution—monitor more closely

Renal impairment manufacturer advises caution—monitor more closely

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk—no information available

Breast-feeding manufacturer advises avoid

Side-effects nausea, diarrhoea, vomiting; headache, insomnia; fever; anaemia, neutropenia, hyponatraemia; rash, pruritus; also reported, Stevens-Johnson syndrome

Dose

- 750 mg twice daily with food (particularly high fat) for 21 days; CHILD not recommended

Wellvone® (GSK) PoM

Suspension, sugar-free, atovaquone 750 mg/5 mL, net price 226 mL (tutti-frutti-flavoured) = £405.31. Label: 21

With proguanil hydrochloride

See section 5.4.1

PENTAMIDINE ISETIONATE

Indications see under Dose (should only be given by specialists)

Cautions risk of severe hypotension following administration (monitor blood pressure before starting treatment, during administration, and at regular intervals, until treatment concluded; patient should be lying down when receiving drug parenterally); hypokalaemia, hypomagnesaemia, coronary heart disease, bradycardia, history of ventricular arrhythmias, concomitant use with other drugs which prolong QT-interval; hypertension or hypotension; hyperglycaemia or hypoglycaemia; leucopenia, thrombocytopenia, or anaemia; carry out laboratory monitoring according to product literature; care required to protect personnel during handling and administration; **interactions:** Appendix 1 (pentamidine isetionate)

Hepatic impairment manufacturer advises caution

Renal impairment reduce intravenous dose for pneumocystis pneumonia if creatinine clearance less than 10 mL/minute: in *life-threatening infection*, use 4 mg/kg once daily for 7–10 days, then 4 mg/kg on alternate days to complete course of at least 14 doses; in *less severe infection*, use 4 mg/kg on alternate days for at least 14 doses

Pregnancy manufacturer advises avoid unless essential

Breast-feeding manufacturer advises avoid unless essential—no information available

Side-effects severe reactions, sometimes fatal, due to hypotension, hypoglycaemia, pancreatitis, and arrhythmias; also leucopenia, thrombocytopenia, acute renal failure, hypocalcaemia; also reported: azotaemia, abnormal liver-function tests, anaemia, hyperkalaemia, nausea and vomiting, dizziness, syncope, flushing, hyperglycaemia, rash, and taste disturbances; Stevens-Johnson syndrome reported; on inhalation, bronchoconstriction (may be prevented by prior use of bronchodilators), cough, and shortness of breath; discomfort, pain, induration, abscess formation, and muscle necrosis at injection site

Dose

- Treatment of *Pneumocystis jirovecii (Pneumocystis carinii)* pneumonia, by intravenous infusion, 4 mg/kg once daily for at least 14 days
- Prophylaxis of *Pneumocystis jirovecii (Pneumocystis carinii)* pneumonia, by inhalation of nebulised solution (using suitable equipment—consult product literature), 300 mg every 4 weeks *or* 150 mg every 2 weeks [unlicensed for primary prevention]
- Visceral leishmaniasis (kala-azar, section 5.4.5), by deep intramuscular injection, 3–4 mg/kg on alternate days to max. total of 10 injections; course may be repeated if necessary
- Cutaneous leishmaniasis, by deep intramuscular injection, 3–4 mg/kg once or twice weekly until condition resolves (but see also section 5.4.5)
- Trypanosomiasis, by deep intramuscular injection *or* intravenous infusion, 4 mg/kg daily or on alternate days to total of 7–10 injections

  Note Direct intravenous injection should be avoided whenever possible and **never** given rapidly; intramuscular injections should be deep and preferably given into the buttock

Pentacarinat® (Sanofi-Aventis) PoM

Injection, powder for reconstitution, pentamidine isetionate, net price 300-mg vial = £31.77

Caution in handling Pentamidine isetionate is toxic and personnel should be adequately protected during handling and administration—consult product literature

Note *Pentacarinat®* Injection (dissolved in water for injection) may be used for nebulisation

5.5 Anthelmintics

Advice on prophylaxis and treatment of helminth infections is available from:

Birmingham	(0121) 424 0357
Scottish Centre for Infection and Environmental Health (registered users of Travax only)	(0141) 300 1100 (weekdays 12–5 p.m. only)
Liverpool	(0151) 705 3100
London	0845 155 5000 (treatment)

5.5.1 Drugs for threadworms (pinworms, *Enterobius vermicularis*)

Anthelmintics are effective in threadworm infections, but their use needs to be combined with hygienic measures to break the cycle of auto-infection. All members of the family require treatment.

Adult threadworms do not live for longer than 6 weeks and for development of fresh worms, ova must be swallowed and exposed to the action of digestive juices in the upper intestinal tract. Direct multiplication of worms does not take place in the large bowel. Adult female worms lay ova on the perianal skin which causes pruritus; scratching the area then leads to ova being transmitted on fingers to the mouth, often via food eaten with unwashed hands. Washing hands and scrubbing nails before each meal and after each visit to the toilet is essential. A bath taken immediately after rising will remove ova laid during the night.

Mebendazole is the drug of choice for treating threadworm infection in patients of all ages over 2 years. It is given as a single dose; as reinfection is very common, a second dose may be given after 2 weeks.

MEBENDAZOLE

Indications threadworm, roundworm, whipworm, and hookworm infections

Cautions **interactions:** Appendix 1 (mebendazole)

Note The package insert in the *Vermox*® pack includes the statement that it is not suitable for women known to be pregnant or children under 2 years

Pregnancy manufacturer advises toxicity in *animal* studies

Breast-feeding amount too small to be harmful but manufacturer advises avoid

Side-effects abdominal pain; *less commonly* diarrhoea, flatulence; *rarely* hepatitis, convulsions, dizziness, neutropenia, urticaria, alopecia, rash (including Stevens-Johnson syndrome and toxic epidermal necrolysis)

Dose

- Threadworms, ADULT and CHILD over 2 years, 100 mg as a single dose; if reinfection occurs second dose may be needed after 2 weeks; CHILD under 2 years, see *BNF for Children*
- Whipworms, ADULT and CHILD over 2 years, 100 mg twice daily for 3 days; CHILD under 2 years, see *BNF for Children*
- Roundworms—section 5.5.2
- Hookworms—section 5.5.4

[1]**Mebendazole** (Non-proprietary) PoM
Tablets, chewable, mebendazole 100 mg

Vermox® (Janssen) PoM
Tablets, orange, scored, chewable, mebendazole 100 mg. Net price 6-tab pack = £1.36
Oral suspension, mebendazole 100 mg/5 mL (banana-flavoured). Net price 30 mL = £1.59

5.5.2 Ascaricides
(common roundworm infections)

Mebendazole (section 5.5.1) is effective against *Ascaris lumbricoides* and is generally considered to be the drug of choice; the usual dose is 100 mg twice daily for 3 days *or* 500 mg as a single dose [unlicensed single dose].

Levamisole [unlicensed] (available from 'special-order' manufacturers or specialist importing companies, see p. 1104) is an alternative when mebendazole cannot be used. It is very well tolerated; mild nausea or vomiting has been reported in about 1% of treated patients; it is given as a single dose of 120–150 mg in adults.

5.5.3 Drugs for tapeworm infections

Taenicides

Niclosamide [unlicensed] (available from 'special-order' manufacturers or specialist importing companies, see p. 1104) is the most widely used drug for tapeworm infections and side-effects are limited to occasional gastro-intestinal upset, lightheadedness, and pruritus; it is not effective against larval worms. Fears of developing cysticercosis in *Taenia solium* infections have proved unfounded. All the same, an antiemetic can be given before treatment and a laxative can be given 2 hours after niclosamide.

Praziquantel [unlicensed] (available from 'special-order' manufacturers or specialist importing companies, see p. 1104) is as effective as niclosamide and is given as a single dose of 5–10 mg/kg after a light breakfast (a single dose of 25 mg/kg for *Hymenolepis nana*).

Hydatid disease

Cysts caused by *Echinococcus granulosus* grow slowly and asymptomatic patients do not always require treatment. Surgical treatment remains the method of choice in many situations. **Albendazole** [unlicensed] (available from 'special-order' manufacturers or specialist importing companies, see p. 1104) is used in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases. Alveolar echinococcosis due to *E. multilocularis* is usually fatal if untreated. Surgical removal with albendazole cover is the treatment of choice, but where effective surgery is impossible, repeated cycles of albendazole (for a year or more) may help. Careful monitoring of liver function is particularly important during drug treatment.

5.5.4 Drugs for hookworms
(ancylostomiasis, necatoriasis)

Hookworms live in the upper small intestine and draw blood from the point of their attachment to their host. An iron-deficiency anaemia may occur and, if present, effective treatment of the infection requires not only expulsion of the worms but treatment of the anaemia.

Mebendazole (section 5.5.1) has a useful broad-spectrum activity, and is effective against hookworms; the usual dose is 100 mg twice daily for 3 days. **Albendazole** [unlicensed] (available from 'special-order' manufacturers or specialist importing companies, see p. 1104) given as a single dose of 400 mg, is an alternative.

5.5.5 Schistosomicides
(bilharziasis)

Adult *Schistosoma haematobium* worms live in the genito-urinary veins and adult *S. mansoni* in those of the colon and mesentery. *S. japonicum* is more widely distributed in veins of the alimentary tract and portal system.

Praziquantel [unlicensed] is available from Merck Serono (*Cysticide*®) and is effective against all human schistosomes. The dose is 20 mg/kg followed after 4–6 hours by one further dose of 20 mg/kg (20 mg/kg given 3 times on one day for *S. japonicum* infections). No serious adverse effects have been reported. Of all the available schistosomicides, it has the most attractive combination of effectiveness, broad-spectrum activity, and low toxicity.

Hycanthone, lucanthone, niridazole, oxamniquine, and sodium stibocaptate have now been superseded.

5.5.6 Filaricides

Diethylcarbamazine [unlicensed] (available from 'special-order' manufacturers or specialist importing com-

1. Mebendazole tablets can be sold to the public if supplied for oral use in the treatment of enterobiasis in adults and children over 2 years provided its container or package is labelled to show a max. single dose of 100 mg and it is supplied in a container or package containing not more than 800 mg

panies, see p. 1104) is effective against microfilariae and adults of *Loa loa*, *Wuchereria bancrofti*, and *Brugia malayi*. To minimise reactions treatment is commenced with a dose of diethylcarbamazine citrate 1 mg/kg on the first day and increased gradually over 3 days to 6 mg/kg daily in divided doses (up to 9 mg/kg daily in divided doses for *Loa loa*); this dosage is maintained for a further period. Close medical supervision is necessary particularly in the early phase of treatment.

In heavy infections there may be a febrile reaction, and in heavy *Loa loa* infection there is a small risk of encephalopathy. In such cases specialist advice should be sought, and treatment must be given under careful in-patient supervision and stopped at the first sign of cerebral involvement.

Ivermectin [unlicensed] (available from 'special-order' manufacturers or specialist importing companies, see p. 1104) is very effective in *onchocerciasis* and it is now the drug of choice. A single dose of 150 micrograms/kg by mouth produces a prolonged reduction in microfilarial levels. Retreatment at intervals of 6 to 12 months depending on symptoms must be given until the adult worms die out. Reactions are usually slight and most commonly take the form of temporary aggravation of itching and rash. Diethylcarbamazine or suramin should no longer be used for onchocerciasis because of their toxicity.

5.5.7 Drugs for cutaneous larva migrans
(creeping eruption)

Dog and cat hookworm larvae may enter human skin where they produce slowly extending itching tracks usually on the foot. Single tracks can be treated with topical tiabendazole (no commercial preparation available). Multiple infections respond to **ivermectin**, **albendazole** or **tiabendazole** (thiabendazole) by mouth [all unlicensed] and available from 'special-order' manufacturers or specialist importing companies, see p. 1104).

5.5.8 Drugs for strongyloidiasis

Adult *Strongyloides stercoralis* live in the gut and produce larvae which penetrate the gut wall and invade the tissues, setting up a cycle of auto-infection. **Ivermectin** [unlicensed] (available from 'special-order' manufacturers or specialist importing companies, see p. 1104) in a dose of 200 micrograms/kg daily for 2 days is the treatment of choice for chronic *Strongyloides* infection. **Albendazole** [unlicensed] (available from 'special-order' manufacturers or specialist importing companies, see p. 1104) is an alternative given in a dose of 400 mg twice daily for 3 days, repeated after 3 weeks if necessary.

6 Endocrine system

This chapter also includes advice on the drug management of the following:

- Adrenal suppression during illness, trauma or surgery, p. 484
- Serious infections in patients taking corticosteroids, p. 485
- Osteoporosis, p. 510
- Breast pain (mastalgia), p. 524

For hormonal contraception, see section 7.3.

6.1 Drugs used in diabetes

Diabetes mellitus occurs because of a lack of insulin or resistance to its action. It is diagnosed by measuring fasting or random blood-glucose concentration (and occasionally by oral glucose tolerance test). Although there are many subtypes, the two principal classes of diabetes are type 1 diabetes and type 2 diabetes.

Type 1 diabetes, (formerly referred to as insulin-dependent diabetes mellitus (IDDM)), occurs as a result of a deficiency of insulin following autoimmune destruction of pancreatic beta cells. Patients with type 1 diabetes require administration of insulin.

Type 2 diabetes, (formerly referred to as non-insulin-dependent diabetes (NIDDM)), is due to reduced secretion of insulin or to peripheral resistance to the action of insulin or to a combination of both. Although patients may be controlled on diet alone, many also require oral antidiabetic drugs or insulin (or both) to maintain satisfactory control. In overweight individuals, type 2 diabetes may be prevented by losing weight and increasing physical activity; use of the anti-obesity drug orlistat (section 4.5.1) may be considered in obese patients.

Treatment of diabetes Treatment of all forms of diabetes should be aimed at alleviating symptoms and minimising the risk of long-term complications (see below); tight control of diabetes is essential.

Diabetes is a strong risk factor for cardiovascular disease (section 2.12). Other risk factors for cardiovascular

disease such as smoking (section 4.10.2), hypertension (section 2.5), obesity (section 4.5), and hyperlipidaemia (section 2.12) should be addressed. Cardiovascular risk in patients with diabetes can be further reduced by the use of an ACE inhibitor (section 2.5.5.1), low-dose aspirin (section 2.9) and a lipid-regulating drug (section 2.12).

Prevention of diabetic complications Optimal glycaemic control in both type 1 diabetes and type 2 diabetes reduces, in the long term, the risk of microvascular complications including retinopathy, development of proteinuria and to some extent neuropathy. However, a temporary deterioration in established diabetic retinopathy may occur when normalising blood-glucose concentration. For reference to the use of an ACE inhibitor or an angiotensin-II receptor antagonist in the management of diabetic nephropathy, see section 6.1.5.

A measure of the total glycosylated (or glycated) haemoglobin (HbA_1) or a specific fraction (HbA_{1c}) provides a good indication of glycaemic control over the previous 2–3 months. Overall it is ideal to aim for an HbA_{1c} (glycosylated haemoglobin) concentration of 48–59 mmol/mol or less (reference range 20–42 mmol/mol) but this cannot always be achieved and for those using insulin there is a significantly increased risk of disabling hypoglycaemia; in those at risk of arterial disease, the aim should be to maintain the HbA_{1c} concentration at 48 mmol/mol or less. HbA_{1c} should be measured every 3–6 months.

Measurement of HbA_{1c}

HbA_{1c} values are expressed in *mmol of glycosylated haemoglobin per mol of haemoglobin (mmol/mol)*, a standardised unit specific for HbA_{1c} created by the International Federation of Clinical Chemistry and Laboratory Medicine (IFCC). HbA_{1c} values were previously aligned to the assay used in the Diabetes Control and Complications Trial (DCCT) and expressed as a percentage.

Equivalent values

IFCC-HbA_{1c} (mmol/mol)	DCCT-HbA_{1c} (%)
42	6.0
48	6.5
53	7.0
59	7.5
64	8.0
75	9.0

Laboratory measurement of serum-fructosamine concentration is technically simpler and cheaper than the measurement of HbA_{1c} and can be used to assess control over short periods of time, particularly when HbA_{1c} monitoring is invalid (e.g. disturbed erythrocyte turnover or abnormal haemoglobin type).

Tight control of blood pressure in hypertensive patients with type 2 diabetes reduces mortality and protects visual acuity (by reducing considerably the risks of maculopathy and retinal photocoagulation) (see also section 2.5).

Driving Drivers with diabetes may be required to notify the Driver and Vehicle Licensing Agency (DVLA) of their condition depending on their treatment, the type of licence, and whether they have diabetic complications. Detailed guidance on eligibility to drive, and precautions required, is available from the DVLA (www.gov.uk/government/publications/at-a-glance).

Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems. Drivers treated with insulin should normally check their blood-glucose concentration before driving and, on long journeys, at 2-hour intervals as specified by DVLA guidance; depending on the type of licence, monitoring may also be necessary for drivers taking oral antidiabetic drugs which carry a risk of hypoglycaemia (e.g. sulfonylureas, nateglinide, repaglinide). Drivers treated with insulin should ensure that a supply of sugar is always available in the vehicle and they should avoid driving if their meal is delayed. If hypoglycaemia occurs, or warning signs develop, the driver should:

- stop the vehicle in a safe place;
- switch off the ignition and move from the driver's seat;
- eat or drink a suitable source of sugar;
- wait until 45 minutes after blood glucose has returned to normal, before continuing journey.

6.1.1 Insulins

Insulin plays a key role in the regulation of carbohydrate, fat, and protein metabolism. It is a polypeptide hormone of complex structure. There are differences in the amino-acid sequence of animal insulins, human insulins and the human insulin analogues. Insulin may be extracted from pork pancreas and purified by crystallisation; it may also be extracted from beef pancreas, but beef insulins are now rarely used. Human sequence insulin may be produced semisynthetically by enzymatic modification of porcine insulin (emp) or biosynthetically by recombinant DNA technology using bacteria (crb, prb) or yeast (pyr).

All insulin preparations are to a greater or lesser extent immunogenic in man but immunological resistance to insulin action is uncommon. Preparations of human sequence insulin should theoretically be less immunogenic, but no real advantage has been shown in trials.

Insulin is inactivated by gastro-intestinal enzymes, and must therefore be given by injection; the subcutaneous route is ideal in most circumstances. Insulin is usually injected into the upper arms, thighs, buttocks, or abdomen; absorption from a limb site may be increased if the limb is used in strenuous exercise after the injection. Generally subcutaneous insulin injections cause few problems; lipodystrophy may occur but can be minimised by using different injection sites in rotation. Local allergic reactions are rare.

Insulin is needed by all patients with ketoacidosis, and it is likely to be needed by most patients with:

- rapid onset of symptoms;
- substantial loss of weight;
- weakness;
- ketonuria;
- a first-degree relative who has type 1 diabetes.

Insulin is required by almost all children with diabetes. It is also needed for type 2 diabetes when other methods have failed to achieve good control, and temporarily in the presence of intercurrent illness or peri-operatively. Pregnant women with type 2 diabetes may be treated with insulin when diet alone fails. For advice on use of oral antidiabetic drugs in the management of diabetes in pregnancy, see section 6.1.2.

NHS Diabetes guidance
Safe and Effective Use of Insulin in Hospitalised Patients (March 2010)
Available at www.diabetes.nhs.uk

Management of diabetes with insulin The aim of treatment is to achieve the best possible control of blood-glucose concentration without making the patient obsessional and to avoid disabling hypoglycaemia; close co-operation is needed between the patient and the medical team because good control reduces the risk of complications.

Insulin preparations can be divided into 3 types:

- those of **short** duration which have a relatively rapid onset of action, namely soluble insulin and the rapid-acting insulin analogues, insulin aspart, insulin glulisine, and insulin lispro (section 6.1.1.1);
- those with an **intermediate** action, e.g. isophane insulin (section 6.1.1.2); and
- those whose action is slower in onset and lasts for **long** periods, e.g. protamine zinc insulin, insulin detemir, and insulin glargine (section 6.1.1.2).

The duration of action of a particular type of insulin varies considerably from one patient to another, and needs to be assessed individually.

Mixtures of insulin preparations may be required and appropriate combinations have to be determined for the individual patient. Treatment should be started with a short-acting insulin (e.g. soluble insulin) or a rapid-acting insulin analogue (e.g. insulin aspart) given before meals with intermediate-acting or long-acting insulin once or twice daily. Alternatively, for those who have difficulty with, or prefer not to use, multiple injection regimens, a mixture of premixed short-acting insulin or rapid acting insulin analogue with an intermediate-acting or long-acting insulin (most commonly in a proportion of 30% soluble insulin and 70% isophane insulin) can be given once or twice daily. The dose of short-acting or rapid-acting insulin (or the proportion of the short-acting soluble insulin component in premixed insulin) can be increased in those with excessive post-prandial hyperglycaemia. The dose of insulin is increased gradually according to the patient's individual requirements, taking care to avoid troublesome hypoglycaemic reactions.

Insulin requirements may be increased by infection, stress, accidental or surgical trauma, and during puberty. Requirements may be decreased in those with certain endocrine disorders (e.g. Addison's disease, hypopituitarism), or in coeliac disease.

Examples of recommended insulin regimens

- Multiple injection regimen: short-acting insulin or rapid-acting insulin analogue, before meals
  With intermediate-acting or long-acting insulin, once or twice daily;
- Short-acting insulin or rapid-acting insulin analogue mixed with intermediate-acting or long-acting insulin, once or twice daily (before meals);
- Intermediate-acting or long-acting insulin, once or twice daily
  With or without short-acting insulin or rapid-acting insulin before meals;
- Continuous subcutaneous insulin infusion (see below).

Hepatic impairment Insulin requirements may be decreased in patients with hepatic impairment.

Renal impairment Insulin requirements may decrease in patients with renal impairment and therefore dose reduction may be necessary. The compensatory response to hypoglycaemia is impaired in renal impairment.

Pregnancy and breast-feeding During pregnancy and breast-feeding, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician. The dose of insulin generally needs to be increased in the second and third trimesters of pregnancy. The short-acting insulin analogues, insulin aspart and insulin lispro, are not known to be harmful, and may be used during pregnancy and lactation. Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin is recommended where longer-acting insulins are needed; insulin detemir may also be considered.

Insulin administration Insulin is generally given by *subcutaneous injection*; the injection site should be rotated to prevent lipodystrophy. Injection devices ('pens') (section 6.1.1.3), which hold the insulin in a cartridge and meter the required dose, are convenient to use. Insulin syringes (for use with needles) are required for insulins not available in cartridge form.

For intensive insulin regimens multiple subcutaneous injections (3 or more times daily) are usually recommended.

Short-acting injectable insulins (soluble insulin, insulin aspart, insulin glulisine, and insulin lispro) can also be given by *continuous subcutaneous infusion* using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens (see also NICE guidance, below). Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team.

NICE guidance

Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008)

Continuous subcutaneous insulin infusion is recommended as an option in adults and children over 12 years with type 1 diabetes:

- who suffer repeated or unpredictable hypoglycaemia, whilst attempting to achieve optimal glycaemic control with multiple-injection regimens, **or**
- whose glycaemic control remains inadequate (HbA_{1c} over 8.5% [69 mmol/mol]) despite optimised multiple-injection regimens (including the use of long-acting insulin analogues where appropriate).

Continuous subcutaneous insulin infusion is also recommended as an option for children under 12 years with type 1 diabetes for whom multiple-injection regimens are considered impractical or inappropriate. Children on insulin pumps should undergo a trial of multiple-injection therapy between the ages of 12 and 18 years.

www.nice.org.uk/TA151

Soluble insulin by the *intravenous route* is reserved for urgent treatment, e.g. in diabetic ketoacidosis, and for fine control in serious illness and in the peri-operative period (see under Diabetes and Surgery, below).

Units The word 'unit' should **not** be abbreviated.

Monitoring Many patients now monitor their own blood-glucose concentrations (section 6.1.6). Since blood-glucose concentration varies substantially throughout the day, 'normoglycaemia' cannot always be achieved throughout a 24-hour period without causing damaging hypoglycaemia. It is therefore best to recommend that patients should maintain a blood-glucose concentration of between 4 and 9 mmol/litre for most of the time (4–7 mmol/litre before meals and less than 9 mmol/litre after meals), while accepting that on occasions, for brief periods, it will be above these values; strenuous efforts should be made to prevent the blood-glucose concentration from falling below 4 mmol/litre. Patients using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen. The intake of energy and of simple and complex carbohydrates should be adequate to allow normal growth and development but obesity must be avoided.

Hypoglycaemia Hypoglycaemia is a potential problem with insulin therapy. All patients must be carefully instructed on how to avoid it.

Loss of warning of hypoglycaemia among insulin-treated patients can be a serious hazard, especially for drivers and those in dangerous occupations. Very tight control of diabetes lowers the blood-glucose concentration needed to trigger hypoglycaemic symptoms; an increase in the frequency of hypoglycaemic episodes may reduce the warning symptoms experienced by the patient. Beta-blockers can also blunt hypoglycaemic awareness (and also delay recovery).

To restore the warning signs, episodes of hypoglycaemia must be minimised; this involves appropriate adjustment of insulin type, dose and frequency together with suitable timing and quantity of meals and snacks.

Some patients have reported loss of hypoglycaemia warning after transfer to human insulin. Clinical studies do not confirm that human insulin decreases hypoglycaemia awareness. If a patient believes that human insulin is responsible for the loss of warning it is reasonable to revert to animal insulin and essential to educate the patient about avoiding hypoglycaemia. Great care should be taken to specify whether a human or an animal preparation is required.

Few patients are now treated with beef insulins; when undertaking conversion from beef to human insulin, the total dose should be reduced by about 10% with careful monitoring for the first few days. When changing between pork and human-sequence insulins, a dose change is not usually needed, but careful monitoring is still advised.

Diabetes and surgery Perioperative control of blood-glucose concentrations in patients with type 1 diabetes is achieved via an adjustable, continuous, intravenous infusion of insulin. Detailed local protocols should be available to all healthcare professionals involved in the treatment of these patients; in general, the following steps should be followed:

- Give an injection of the patient's usual insulin on the night before the operation;
- Early on the day of the operation, start an intravenous infusion of glucose containing potassium chloride (provided that the patient is not hyperkalaemic) and infuse at a constant rate appropriate to the patient's fluid requirements (usually 125 mL per hour); make up a solution of soluble insulin in sodium chloride 0.9% and infuse intravenously using a syringe pump piggy-backed to the intravenous infusion. Glucose and potassium infusions, and insulin infusions should be made up according to locally agreed protocols;
- The rate of the insulin infusion should be adjusted according to blood-glucose concentration (frequent monitoring necessary) in line with locally agreed protocols. Other factors affecting the rate of infusion include the patient's volume depletion, cardiac function, and age.

Protocols should include specific instructions on how to manage resistant cases (such as patients who are in shock or severely ill or those receiving corticosteroids or sympathomimetics) and those with hypoglycaemia.

If a syringe pump is not available, soluble insulin should be added to the intravenous infusion of glucose and potassium chloride (provided the patient is not hyperkalaemic), and the infusion run at the rate appropriate to the patient's fluid requirements (usually 125 mL per hour) with the insulin dose adjusted according to blood-glucose concentration in line with locally agreed protocols.

Once the patient starts to eat and drink, give subcutaneous insulin before breakfast and stop intravenous insulin 30 minutes later; the dose may need to be 10–20% more than usual if the patient is still in bed or unwell. If the patient was not previously receiving insulin, an appropriate initial dose is 30–40 units daily in four divided doses using soluble insulin before meals and intermediate-acting insulin at bedtime and the dose adjusted from day to day. Patients with hyperglycaemia often relapse after conversion back to subcutaneous insulin calling for one of the following approaches:

- additional doses of soluble insulin at any of the four injection times (before meals or bedtime) *or*
- temporary addition of intravenous insulin infusion (while continuing the subcutaneous regimen) until blood-glucose concentration is satisfactory *or*
- complete reversion to the intravenous regimen (especially if the patient is unwell).

Insulin Passport Insulin Passports and patient information booklets should be offered to patients receiving insulin. The Insulin Passport provides a record of the patient's current insulin preparations and contains a section for emergency information. The patient information booklet provides advice on the safe use of insulin. They are available for purchase from:

3M Security Print and Systems Limited
Gorse Street, Chadderton
Oldham
OL9 9QH

GP practices can obtain supplies through their Local Area Team stores.

NHS Trusts can order supplies from www.nhsforms.co.uk or by emailing nhsforms@mmm.com.

Further information is available at www.npsa.nhs.uk.

6.1.1.1 Short-acting insulins

Soluble insulin is a short-acting form of insulin. For maintenance regimens it is usual to inject it 15 to 30 minutes before meals.

Soluble insulin is the most appropriate form of insulin for use in diabetic emergencies e.g. diabetic ketoacidosis (section 6.1.3) and at the time of surgery. It can be given intravenously and intramuscularly, as well as subcutaneously.

When injected subcutaneously, soluble insulin has a rapid onset of action (30 to 60 minutes), a peak action between 2 and 4 hours, and a duration of action of up to 8 hours.

When injected intravenously, soluble insulin has a very short half-life of only about 5 minutes and its effect disappears within 30 minutes.

The rapid-acting human insulin analogues, **insulin aspart**, **insulin glulisine**, and **insulin lispro** have a faster onset and shorter duration of action than soluble insulin; as a result, compared to soluble insulin, fasting and preprandial blood-glucose concentrations are a little higher, postprandial blood-glucose concentration is a little lower, and hypoglycaemia occurs slightly less frequently. Subcutaneous injection of insulin analogues may be convenient for those who wish to inject shortly before or, when necessary, shortly after a meal. They can also help those susceptible to hypoglycaemia before lunch and those who eat late in the evening and are prone to nocturnal hypoglycaemia. They can also be administered by subcutaneous infusion (see Insulin Administration, above). Insulin aspart and insulin lispro can be administered intravenously and can be used as alternatives to soluble insulin for diabetic emergencies and at the time of surgery.

INSULIN

(Insulin Injection; Neutral Insulin; Soluble Insulin)

A sterile solution of insulin (i.e. bovine or porcine) or of human insulin; pH 6.6–8.0

Indications diabetes mellitus; diabetic ketoacidosis (section 6.1.3)

Cautions section 6.1.1; **interactions:** Appendix 1 (antidiabetics)

Hepatic impairment section 6.1.1

Renal impairment section 6.1.1

Pregnancy section 6.1.1

Breast-feeding section 6.1.1

Side-effects see notes above; transient oedema; local reactions and fat hypertrophy at injection site; *rarely* hypersensitivity reactions including urticaria, rash; overdose causes hypoglycaemia

Dose

- By subcutaneous, intramuscular *or* intravenous injection *or* intravenous infusion, according to requirements

Highly purified animal

Counselling Show container to patient and confirm that patient is expecting the version dispensed

Hypurin® Bovine Neutral (Wockhardt) PoM
Injection, soluble insulin (bovine, highly purified) 100 units/mL. Net price 10-mL vial = £27.72; cartridges (for *Autopen® Classic*) 5 × 3 mL = £41.58

Hypurin® Porcine Neutral (Wockhardt) PoM
Injection, soluble insulin (porcine, highly purified) 100 units/mL. Net price 10-mL vial = £25.20; cartridges (for *Autopen® Classic*) 5 × 3 mL = £37.80

Human sequence

Counselling Show container to patient and confirm that patient is expecting the version dispensed

Actrapid® (Novo Nordisk) PoM
Injection, soluble insulin (human, pyr) 100 units/mL. Net price 10-mL vial = £7.48
Note Not recommended for use in subcutaneous insulin infusion pumps—may precipitate in catheter or needle

Humulin S® (Lilly) PoM
Injection, soluble insulin (human, prb) 100 units/mL. Net price 10-mL vial = £15.68; 5 × 3-mL cartridge (for most *Autopen® Classic* or *HumaPen®*) = £19.08

Insuman® Rapid (Sanofi-Aventis) PoM
Injection, soluble insulin (human, crb) 100 units/mL, net price 5 × 3-mL cartridge (for *ClikSTAR®* and *Autopen® 24*) = £17.50
Note Not recommended for use in subcutaneous insulin infusion pumps

Mixed preparations

See Biphasic Isophane Insulin (section 6.1.1.2)

INSULIN ASPART

(Recombinant human insulin analogue)

Indications diabetes mellitus

Cautions section 6.1.1; **interactions:** Appendix 1 (antidiabetics)

Hepatic impairment section 6.1.1

Renal impairment section 6.1.1

Pregnancy section 6.1.1

Breast-feeding section 6.1.1

Side-effects see under Insulin

Dose

- By subcutaneous injection, ADULT and CHILD over 2 years, immediately before meals or when necessary shortly after meals, according to requirements
- By subcutaneous infusion, *or* intravenous injection, *or* intravenous infusion, ADULT and CHILD over 2 years, according to requirements

NovoRapid® (Novo Nordisk) PoM

Injection, insulin aspart (recombinant human insulin analogue) 100 units/mL, net price 10-mL vial = £14.08; *Penfill®* cartridge (for *NovoPen®* devices) 5 × 3-mL = £28.31; 5 × 3-mL *FlexPen®* prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £30.60; 5 × 3-mL *FlexTouch®* prefilled disposable injection devices (range 1–80 units, allowing 1-unit dosage adjustment) = £32.13

Counselling Show container to patient and confirm that patient is expecting the version dispensed

INSULIN GLULISINE

(Recombinant human insulin analogue)

Indications diabetes mellitus

Cautions section 6.1.1; **interactions:** Appendix 1 (antidiabetics)

Hepatic impairment section 6.1.1

Renal impairment section 6.1.1

Pregnancy section 6.1.1

Breast-feeding section 6.1.1

Side-effects see under Insulin

Dose

- By subcutaneous injection, ADULT and CHILD over 6 years, immediately before meals or when necessary shortly after meals, according to requirements
- By subcutaneous infusion *or* intravenous infusion ADULT and CHILD over 6 years, according to requirements

Apidra® (Sanofi-Aventis) PoM

Injection, insulin glulisine (recombinant human insulin analogue) 100 units/mL, net price 10-mL vial = £16.00; 5× 3-mL cartridge (for *ClikSTAR®* and *Autopen® 24*) = £28.30; 5 × 3-mL *Apidra® SoloStar®* prefilled disposable injection devices (range 1–80 units, allowing 1-unit dosage adjustment) = £28.30

Counselling Show container to patient and confirm that patient is expecting the version dispensed

Note The *Scottish Medicines Consortium* (p. 4) has advised (October 2008) that *Apidra®* is accepted for restricted use within NHS Scotland for the treatment of adults and children over 6 years with diabetes mellitus in whom the use of a short-acting insulin analogue is appropriate

INSULIN LISPRO

(Recombinant human insulin analogue)

Indications diabetes mellitus

Cautions section 6.1.1; children (use only if benefit likely compared to soluble insulin); **interactions:** Appendix 1 (antidiabetics)

Hepatic impairment section 6.1.1

Renal impairment section 6.1.1

Pregnancy section 6.1.1

Breast-feeding section 6.1.1

Side-effects see under Insulin

Dose

- By subcutaneous injection shortly before meals or when necessary shortly after meals, according to requirements
- By subcutaneous infusion, *or* intravenous injection, *or* intravenous infusion, according to requirements

Humalog® (Lilly) PoM

Injection, insulin lispro (recombinant human insulin analogue) 100 units/mL, net price 10-mL vial = £16.61; 5 × 3-mL cartridge (for *Autopen® Classic* or *HumaPen®*) = £28.31; 5 × 3-mL *Humalog® KwikPen* prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £29.46

Counselling Show container to patient and confirm that patient is expecting the version dispensed

6.1.1.2 Intermediate- and long-acting insulins

When given by subcutaneous injection, intermediate- and long-acting insulins have an onset of action of approximately 1–2 hours, a maximal effect at 4–12 hours, and a duration of 16–42 hours. Some are given twice daily in conjunction with short-acting (soluble) insulin, and others are given once daily, particularly in elderly patients. Soluble insulin can be mixed with intermediate and long-acting insulins (except insulin detemir, insulin glargine, and insulin degludec) in the syringe, essentially retaining the properties of the two components, although there may be some blunting of the initial effect of the soluble insulin component (especially on mixing with protamine zinc insulin, see below).

Isophane insulin is a suspension of insulin with protamine; it is of particular value for initiation of twice-daily insulin regimens. Patients usually mix isophane with soluble insulin but ready-mixed preparations may be appropriate (**biphasic isophane insulin**, **biphasic insulin aspart**, or **biphasic insulin lispro**).

Insulin zinc suspension (30% amorphous, 70% crystalline) has a more prolonged duration of action.

Protamine zinc insulin is usually given once daily with short-acting (soluble) insulin. It has the drawback of binding with the soluble insulin when mixed in the same syringe and is now rarely used.

Insulin glargine and **insulin detemir** are both long-acting human insulin analogues with a prolonged duration of action; insulin glargine is given once daily and insulin detemir is given once or twice daily. NICE (December 2002) has recommended that insulin glargine should be available as an option for patients with type 1 diabetes.

NICE (May 2009) has recommended that, if insulin is required in patients with type 2 diabetes, insulin detemir or insulin glargine may be considered for those:

- who require assistance with injecting insulin *or*
- whose lifestyle is significantly restricted by recurrent symptomatic hypoglycaemia *or*
- who would otherwise need twice-daily basal insulin injections in combination with oral antidiabetic drugs *or*
- who cannot use the device needed to inject isophane insulin.

Insulin detemir is also licensed as add-on therapy in patients receiving treatment with liraglutide.

Insulin degludec is a long-acting human insulin analogue for once daily subcutaneous administration.

INSULIN DEGLUDEC

(Recombinant human insulin analogue—long acting)

Indications diabetes mellitus

Cautions section 6.1.1; **interactions:** Appendix 1 (antidiabetics)

Hepatic impairment section 6.1.1

Renal impairment section 6.1.1

Pregnancy section 6.1.1

Breast-feeding section 6.1.1

Side-effects see under Insulin (section 6.1.1.1)

Dose

> **Important**
> Insulin degludec (*Tresiba*®) is available in strengths of 100 units/mL (allows 1-unit dose adjustment) and 200 units/mL (allows 2-unit dose adjustment)—ensure correct strength prescribed

- By subcutaneous injection, ADULT over 18 years, according to requirements

Tresiba® (Novo Nordisk) ▼ PoM

Injection, insulin degludec (recombinant human insulin analogue) 100 units/mL, net price 5 × 3-mL *Penfill*® cartridges (for *Novo Nordisk*® devices) = £72.00; 100 units/mL, 5 × 3-mL *FlexTouch*® prefilled disposable injection devices (range 1– 80 units, allowing 1-unit dosage adjustment) = £72.00; 200 units/mL, 3 × 3-mL *FlexTouch*® prefilled disposable injection devices (range 2–160 units, allowing 2-unit dosage adjustment) = £86.40

Counselling Show container to patient and confirm that patient is expecting the version dispensed

INSULIN DETEMIR

(Recombinant human insulin analogue—long acting)

Indications diabetes mellitus

Cautions section 6.1.1.1; **interactions:** Appendix 1 (antidiabetics)

Hepatic impairment section 6.1.1

Renal impairment section 6.1.1

Pregnancy section 6.1.1

Breast-feeding section 6.1.1

Side-effects see under Insulin (section 6.1.1.1)

Dose

- By subcutaneous injection, ADULT and CHILD over 2 years, according to requirements

Levemir® (Novo Nordisk) PoM

Injection, insulin detemir (recombinant human insulin analogue) 100 units/mL, net price 5 × 3-mL cartridge (for *NovoPen*® devices) = £42.00; 5 × 3-mL *FlexPen*® prefilled disposable injection device (range 1–60 units, allowing 1-unit dosage adjustment) = £42.00; 5 × 3-mL *Levemir InnoLet*® prefilled disposable injection devices (range 1–50 units, allowing 1-unit dosage adjustment) = £44.85

Counselling Show container to patient and confirm that patient is expecting the version dispensed

INSULIN GLARGINE

(Recombinant human insulin analogue—long acting)

Indications diabetes mellitus

Cautions section 6.1.1.1; **interactions:** Appendix 1 (antidiabetics)

Hepatic impairment section 6.1.1

Renal impairment section 6.1.1

Pregnancy section 6.1.1

Breast-feeding section 6.1.1

Side-effects see under Insulin (section 6.1.1.1)

Dose

- By subcutaneous injection, ADULT and CHILD over 2 years, according to requirements

Lantus® (Sanofi-Aventis) PoM

Injection, insulin glargine (recombinant human insulin analogue) 100 units/mL, net price 10-mL vial = £30.68; 5 × 3-mL cartridge (for *ClikSTAR*® and *Autopen*® *24*) = £41.50; 5 × 3-mL *Lantus*® *SoloStar*® prefilled disposable injection devices (range 1–80 units, allowing 1-unit dosage adjustment) = £41.50

Note The *Scottish Medicines Consortium* (p. 4) has advised (March 2013) that insulin glargine is accepted for restricted use within NHS Scotland for the treatment of type 1 diabetes:

- in those who are at risk of or experience unacceptable frequency or severity of nocturnal hypoglycaemia on attempting to achieve better hypoglycaemic control during treatment with other insulins
- as a once daily insulin therapy for patients who require a carer to administer their insulin.

It is **not** recommended for routine use in patients with type 2 diabetes unless they suffer from recurrent episodes of hypoglycaemia or require assistance with their insulin injections.

Counselling Show container to patient and confirm that patient is expecting the version dispensed

INSULIN ZINC SUSPENSION

(Insulin Zinc Suspension (Mixed)—long acting)

A sterile neutral suspension of bovine and/or porcine insulin or of human insulin in the form of a complex obtained by the addition of a suitable zinc salt; consists of rhombohedral crystals (10–40 microns) and of particles of no uniform shape (not exceeding 2 microns)

Indications diabetes mellitus

Cautions section 6.1.1.1; **interactions:** Appendix 1 (antidiabetics)

Hepatic impairment section 6.1.1

Renal impairment section 6.1.1

Pregnancy section 6.1.1

Breast-feeding section 6.1.1

Side-effects see under Insulin (section 6.1.1.1)

Dose

- By subcutaneous injection, according to requirements

Highly purified animal

Hypurin® **Bovine Lente** (Wockhardt) PoM

Injection, insulin zinc suspension (bovine, highly purified) 100 units/mL. Net price 10-mL vial = £27.72

Counselling Show container to patient and confirm that patient is expecting the version dispensed

ISOPHANE INSULIN

(Isophane Insulin Injection; Isophane Protamine Insulin Injection; Isophane Insulin (NPH)—intermediate acting)

A sterile suspension of bovine or porcine insulin or of human insulin in the form of a complex obtained by the addition of protamine sulfate or another suitable protamine

Indications diabetes mellitus

Cautions section 6.1.1.1; **interactions:** Appendix 1 (antidiabetics)

Hepatic impairment section 6.1.1

Renal impairment section 6.1.1

Pregnancy section 6.1.1

Hypurin® Porcine 30/70 Mix (Wockhardt) PoM

Injection, biphasic isophane insulin (porcine, highly purified), 30% soluble, 70% isophane, 100 units/mL, net price 10-mL vial = £25.20; cartridges (for *Autopen® Classic*) 5 × 3 mL = £37.80

Human sequence

Counselling Show container to patient and confirm that patient is expecting the version dispensed; the proportions of the two components should be checked **carefully** (the order in which the proportions are stated may not be the same in other countries)

Humulin M3® (Lilly) PoM

Injection, biphasic isophane insulin (human, prb), 30% soluble, 70% isophane, 100 units/mL, net price 10-mL vial = £15.68; 5 × 3-mL cartridge (for most *Autopen® Classic* or *HumaPen®*) = £19.08; 5 × 3-mL *Humulin M3 KwikPen®* prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £21.70

Insuman® Comb 15 (Sanofi-Aventis) PoM

Injection, biphasic isophane insulin (human, crb), 15% soluble, 85% isophane, 100 units/mL, net price 5 × 3-mL cartridge (for *ClikSTAR®* and *Autopen® 24*) = £17.50

Insuman® Comb 25 (Sanofi-Aventis) PoM

Injection, biphasic isophane insulin (human, crb), 25% soluble, 75% isophane, 100 units/mL, net price 5-mL vial = £5.61; 5 × 3-mL cartridge (for *ClikSTAR®* and *Autopen® 24*) = £17.50; 5 × 3-mL *Insuman® Comb 25 SoloStar®* prefilled disposable injection devices (range 1–80 units, allowing 1-unit dosage adjustment) = £19.80

Insuman® Comb 50 (Sanofi-Aventis) PoM

Injection, biphasic isophane insulin (human, crb), 50% soluble, 50% isophane, 100 units/mL, net price 5 × 3-mL cartridge (for *ClikSTAR®* and *Autopen® 24*) = £17.50

6.1.1.3 Hypodermic equipment

Patients should be advised on the safe disposal of lancets, single-use syringes, and needles. Suitable arrangements for the safe disposal of contaminated waste must be made before these products are prescribed for patients who are carriers of infectious diseases.

Injection devices

Autopen® (Owen Mumford)

Injection device, *Autopen® 24* (for use with Sanofi-Aventis 3-mL insulin cartridges), allowing 1-unit dosage adjustment, max. 21 units (single-unit version) *or* 2-unit dosage adjustment, max. 42 units (2-unit version), net price (both) = £16.47; *Autopen® Classic* (for use with Lilly and Wockhardt 3-mL insulin cartridges), allowing 1-unit dosage adjustment, max. 21 units (single-unit version) *or* 2-unit dosage adjustment, max. 42 units (2-unit version), net price (all) = £16.72

ClikSTAR® (Sanofi-Aventis)

Injection device, for use with *Lantus®*, *Apidra®*, and *Insuman®* 3-mL insulin cartridges; allowing 1-unit dose adjustment, max. 80 units, net price = £25.00

HumaPen® Luxura (Lilly)

Injection device, for use with *Humulin®* and *Humalog®* 3-mL cartridges; allowing 1-unit dosage adjustment, max. 60 units, net price = £26.82

HumaPen® Luxura HD (Lilly)

Injection device, for use with *Humulin®* and *Humalog®* 3-mL cartridges; allowing 0.5-unit dosage adjustment, max. 30 units, net price = £26.82

HumaPen® Memoir (Lilly)
Injection device, for use with *Humalog®* 3-mL cartridges; allowing 1-unit dosage adjustment, max. 60 units, net price = £26.82

Injex (Injex UK)
Needle-free insulin delivery device, for use with any 10-mL vial of insulin, allowing 1-unit dosage adjustment, max. 30 units, net price *starter set* (*Injex®* device, reset box, transporter, 9 × 10-mL vial adaptors, 165 ampoules) = £149.36; *4-month refill pack* (6 × 10-mL vial adaptors, 100 ampoules) = £24.47; *ampoule pack* (50 ampoules) = £12.28; *vial adaptor pack* (20 × 10-mL vial adaptors) = £12.23

InsuJet (European Pharma)
Needle-free insulin delivery device, for use with any 10-mL vial or 3-mL cartridge of insulin, allowing 1-unit dosage adjustment, max 40 units, net price *starter set* (*InsuJet®* device, nozzle cap, nozzle and piston, 1 × 10-mL adaptor, 1 × 3-mL adaptor, 1 cartridge cap removal key) = £143.60, *nozzle pack* (15 nozzles) = £28.40, *cartridge adaptor pack* (15 adaptors) = £21.70, *vial adaptor pack* (15 adaptors) = £21.70

NovoPen® 4 (Novo Nordisk)
Injection device, for use with *Penfill®* 3-mL insulin cartridges; allowing 1-unit dosage adjustment, max. 60 units, net price = £26.86

Lancets, needles, syringes, and accessories

Lancets, **needles**, **syringes**, and **accessories** are listed under Hypodermic Equipment in Part IXA of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 3 of the Scottish Drug Tariff).

The Drug Tariffs can be accessed online at:
National Health Service Drug Tariff for England and Wales: www.ppa.org.uk/ppa/edt_intro.htm
Health and Personal Social Services for Northern Ireland Drug Tariff: www.dhsspsni.gov.uk/pas-tariff
Scottish Drug Tariff: www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/

6.1.2 Antidiabetic drugs

Oral antidiabetic drugs are used for the treatment of type 2 diabetes mellitus. They should be prescribed only if the patient fails to respond adequately to at least 3 months' restriction of energy and carbohydrate intake and an increase in physical activity. They should be used to augment the effect of diet and exercise, and not to replace them.

For patients not adequately controlled by diet and oral hypoglycaemic drugs, insulin may be added to the treatment regimen or substituted for oral therapy. When insulin is added to oral therapy, it is generally given at bedtime as isophane or long-acting insulin, and when insulin replaces an oral regimen it may be given as twice-daily injections of a biphasic insulin (or isophane insulin mixed with soluble insulin), or a multiple injection regimen. Weight gain and hypoglycaemia may be complications of insulin therapy but weight gain may be reduced if the insulin is given in combination with metformin.

Exenatide, liraglutide, and lixisenatide, given by subcutaneous injection, are also available for the treatment of type 2 diabetes, see section 6.1.2.3.

Pregnancy and breast-feeding During pregnancy, women with *pre-existing diabetes* can be treated with metformin [unlicensed use], either alone or in combination with insulin (section 6.1.1). Metformin can be continued, or glibenclamide resumed, during breast-feeding for those with pre-existing diabetes. Women with *gestational diabetes* may be treated, with or without concomitant insulin (section 6.1.1), with glibenclamide from 11 weeks gestation (after organogenesis) [unlicensed use] or with metformin [unlicensed use]. Women with gestational diabetes should discontinue hypoglycaemic treatment after giving birth.

Other oral hypoglycaemic drugs, exenatide, liraglutide, and lixisenatide are contra-indicated in pregnancy.

6.1.2.1 Sulfonylureas

The sulfonylureas act mainly by augmenting insulin secretion and consequently are effective only when some residual pancreatic beta-cell activity is present; during long-term administration they also have an extrapancreatic action. All may cause hypoglycaemia but this is uncommon and usually indicates excessive dosage. Sulfonylurea-induced hypoglycaemia may persist for many hours and must always be treated in hospital.

Sulfonylureas are considered for patients who are not overweight, or in whom metformin is contra-indicated or not tolerated. Several sulfonylureas are available and choice is determined by side-effects and the duration of action as well as the patient's age and renal function. **Glibenclamide**, a long-acting sulfonylurea, is associated with a greater risk of hypoglycaemia; for this reason it should be avoided in the elderly, and shorter-acting alternatives, such as **gliclazide** or **tolbutamide**, should be used instead.

When the combination of strict diet and sulfonylurea treatment fails, other options include:

- combining with metformin (section 6.1.2.2);
- combining with pioglitazone, but see section 6.1.2.3;
- combining with alogliptin, linagliptin, saxagliptin, sitagliptin, or vildagliptin (section 6.1.2.3);
- combining with canagliflozin or dapagliflozin (section 6.1.2.3);
- combining with exenatide, liraglutide, or lixisenatide (section 6.1.2.3);
- combining with acarbose (section 6.1.2.3), which may have a small beneficial effect, but flatulence can be a problem;
- combining with bedtime isophane insulin (section 6.1.1) but weight gain and hypoglycaemia can occur.

The risk of hypoglycaemia associated with sulfonylureas (see notes above) should be discussed with the patient, especially when concomitant glucose-lowering drugs are prescribed.

Insulin therapy should be instituted temporarily during intercurrent illness (such as myocardial infarction, coma, infection, and trauma). Sulfonylureas should be

omitted on the morning of surgery; insulin is required because of the ensuing hyperglycaemia in these circumstances.

Cautions Sulfonylureas can encourage weight gain and should be prescribed only if poor control and symptoms persist despite adequate attempts at dieting; metformin (section 6.1.2.2) is considered the drug of choice in obese patients. Caution is needed in the elderly and in patients with G6PD deficiency (section 9.1.5).

Contra-indications Sulfonylureas should be avoided where possible in acute porphyria (section 9.8.2) but glipizide and glimepiride are thought to be safe. Sulfonylureas are contra-indicated in the presence of ketoacidosis.

Hepatic impairment Sulfonylureas should be avoided or a reduced dose should be used in severe hepatic impairment, because there is an increased risk of hypoglycaemia. Jaundice may occur.

Renal impairment Sulfonylureas should be used with care in those with mild to moderate renal impairment, because of the hazard of hypoglycaemia; they should be avoided where possible in severe renal impairment. Glipizide should also be avoided if the patient has both renal and hepatic impairment. If necessary, the short-acting drug tolbutamide can be used in renal impairment, as can gliclazide which is principally metabolised in the liver, but careful monitoring of blood-glucose concentration is essential; care is required to use the lowest dose that adequately controls blood glucose.

Pregnancy The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia; however, glibenclamide can be used during the second and third trimesters of pregnancy in women with gestational diabetes, see section 6.1.2.

Breast-feeding The use of sulfonylureas (except glibenclamide [unlicensed use], see section 6.1.2) in breast-feeding should be avoided because there is a theoretical possibility of hypoglycaemia in the infant.

Side-effects Side-effects of sulfonylureas are generally mild and infrequent and include gastro-intestinal disturbances such as nausea, vomiting, diarrhoea, and constipation. Hyponatraemia has been reported with glimepiride and glipizide.

Sulfonylureas can occasionally cause a disturbance in liver function, which may rarely lead to cholestatic jaundice, hepatitis, and hepatic failure. Hypersensitivity reactions can occur, usually in the first 6–8 weeks of therapy. They consist mainly of allergic skin reactions which progress rarely to erythema multiforme and exfoliative dermatitis, fever, and jaundice; photosensitivity has rarely been reported with glipizide. Blood disorders are also rare but may include leucopenia, thrombocytopenia, agranulocytosis, pancytopenia, haemolytic anaemia, and aplastic anaemia.

GLIBENCLAMIDE

Indications type 2 diabetes mellitus

Cautions see notes above; **interactions:** Appendix 1 (antidiabetics)

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment see notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above

Dose

- Initially 5 mg daily with or immediately after breakfast, dose adjusted according to response (ELDERLY avoid, see notes above); max. 15 mg daily

Glibenclamide (Non-proprietary) PoM

Tablets, glibenclamide 2.5 mg, net price 28-tab pack = £18.50; 5 mg, 28-tab pack = 97p

GLICLAZIDE

Indications type 2 diabetes mellitus

Cautions see notes above; **interactions:** Appendix 1 (antidiabetics)

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment see notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above

Dose

- Initially, 40–80 mg daily, adjusted according to response; up to 160 mg as a single dose, with breakfast; higher doses divided; max. 320 mg daily

Gliclazide (Non-proprietary) PoM

Tablets, gliclazide 40 mg, net price 28-tab pack = £3.36; 80 mg, 28-tab pack = £1.04, 60-tab pack = £2.23

Brands include *Zicron*®

Diamicron® (Servier) PoM

Tablets, scored, gliclazide 80 mg, net price 60-tab pack = £4.38

Modified release

Gliclazide (Non-proprietary) PoM

Tablets, m/r, gliclazide 30 mg, net price 28-tab pack = £2.06, 56-tab pack = £4.10. Label: 25

Brands include *Dacadis*® *MR*, *Vitile*® *XL*

Dose ADULT over 18 years, initially 30 mg daily with breakfast, adjusted according to response every 4 weeks (after 2 weeks if no decrease in blood glucose); max. 120 mg daily

Note Gliclazide modified release 30 mg may be considered to be approximately equivalent in therapeutic effect to standard formulation gliclazide 80 mg

Diamicron® MR (Servier) PoM

Tablets, m/r, gliclazide 30 mg, net price 28-tab pack = £2.81, 56-tab pack = £5.62. Label: 25

Dose ADULT initially 30 mg daily with breakfast, adjusted according to response every 4 weeks (after 2 weeks if no decrease in blood glucose); max. 120 mg daily

Note *Diamicron*® *MR* 30 mg may be considered to be approximately equivalent in therapeutic effect to standard formulation *Diamicron*® 80 mg

GLIMEPIRIDE

Indications type 2 diabetes mellitus

Cautions see notes above; manufacturer recommends regular hepatic and haematological monitoring but limited evidence of clinical value; **interactions**: Appendix 1 (antidiabetics)

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment see notes above

Pregnancy see notes above
Breast-feeding see notes above
Side-effects see notes above
Dose
- Initially 1 mg daily, adjusted according to response in 1-mg steps at 1–2 week intervals; usual max. 4 mg daily (exceptionally, up to 6 mg daily may be used); taken shortly before or with first main meal

Glimepiride (Non-proprietary) PoM
Tablets, glimepiride 1 mg, net price 30-tab pack = £1.20; 2 mg, 30-tab pack = £1.12; 3 mg, 30-tab pack = £7.25; 4 mg, 30-tab pack = £1.33

Amaryl® (Sanofi-Aventis) PoM
Tablets, all scored, glimepiride 1 mg (pink), net price 30-tab pack = £4.33; 2 mg (green), 30-tab pack = £7.13; 3 mg (yellow), 30-tab pack = £10.75; 4 mg (blue), 30-tab pack = £14.24

GLIPIZIDE

Indications type 2 diabetes mellitus
Cautions see notes above; **interactions:** Appendix 1 (antidiabetics)
Contra-indications see notes above
Hepatic impairment see notes above
Renal impairment see notes above
Pregnancy see notes above
Breast-feeding see notes above
Side-effects see notes above; also dizziness, drowsiness
Dose
- Initially 2.5–5 mg daily shortly before breakfast or lunch, adjusted according to response; max. 20 mg daily; up to 15 mg may be given as a single dose; higher doses divided

Glipizide (Non-proprietary) PoM
Tablets, glipizide 5 mg, net price 56-tab pack = £5.36

Minodiab® (Pharmacia) PoM
Tablets, scored, glipizide 5 mg, net price 28-tab pack = £1.26

TOLBUTAMIDE

Indications type 2 diabetes mellitus
Cautions see notes above; **interactions:** Appendix 1 (antidiabetics)
Contra-indications see notes above
Hepatic impairment see notes above
Renal impairment see notes above
Pregnancy see notes above
Breast-feeding see notes above
Side-effects see notes above; also headache, tinnitus
Dose
- 0.5–1.5 g (max. 2 g) daily in divided doses with or immediately after meals *or* as a single dose with or immediately after breakfast

Tolbutamide (Non-proprietary) PoM
Tablets, tolbutamide 500 mg, net price 28-tab pack = £22.64

6.1.2.2 Biguanides

Metformin, the only available biguanide, has a different mode of action from the sulfonylureas, and is not interchangeable with them. It exerts its effect mainly by decreasing gluconeogenesis and by increasing peripheral utilisation of glucose; since it acts only in the presence of endogenous insulin it is effective only if there are some residual functioning pancreatic islet cells.

Metformin is the drug of first choice in overweight patients in whom strict dieting has failed to control diabetes, if appropriate it may also be considered as an option in patients who are not overweight. It is also used when diabetes is inadequately controlled with sulfonylurea treatment. When the combination of strict diet and metformin treatment fails, other options include:

- combining with a sulfonylurea (section 6.1.2.1);
- combining with pioglitazone (section 6.1.2.3);
- combining with repaglinide or nateglinide (section 6.1.2.3);
- combining with alogliptin, linagliptin, saxagliptin, sitagliptin, or vildagliptin (section 6.1.2.3);
- combining with canagliflozin or dapagliflozin (section 6.1.2.3);
- combining with exenatide, liraglutide, or lixisenatide (section 6.1.2.3);
- combining with acarbose (section 6.1.2.3), which may have a small beneficial effect, but flatulence can be a problem;
- combining with insulin (section 6.1.1) but weight gain and hypoglycaemia can be problems (weight gain minimised if insulin given at night).

Insulin treatment is almost always required in medical and surgical emergencies; insulin should also be substituted before elective surgery (omit metformin on the morning of surgery and give insulin if required).

Hypoglycaemia does not usually occur with metformin; other advantages are the lower incidence of weight gain and lower plasma-insulin concentration. It does not exert a hypoglycaemic action in non-diabetic subjects unless given in overdose.

Gastro-intestinal side-effects are initially common with metformin, and may persist in some patients, particularly when very high doses such as 3 g daily are given.

Very rarely, metformin can provoke lactic acidosis. It is most likely to occur in patients with renal impairment, see Lactic Acidosis below.

Metformin is used for the symptomatic management of polycystic ovary syndrome [unlicensed indication]; however, treatment should be initiated by a specialist. Metformin improves insulin sensitivity, may aid weight reduction, helps to normalise menstrual cycle (increasing the rate of spontaneous ovulation), and may improve hirsutism.

METFORMIN HYDROCHLORIDE

Indications diabetes mellitus (see notes above); polycystic ovary syndrome [unlicensed indication]
Cautions see notes above; determine renal function before treatment and at least annually (at least twice a

year in patients with additional risk factors for renal impairment, or if deterioration suspected); **interactions:** Appendix 1 (antidiabetics)

Lactic acidosis Use with caution in renal impairment—increased risk of lactic acidosis; avoid in significant renal impairment. NICE[1] recommends that the dose should be reviewed if eGFR less than 45 mL/minute/1.73 m^2 and to avoid if eGFR less than 30 mL/minute/1.73 m^2. Withdraw or interrupt treatment in those at risk of tissue hypoxia or sudden deterioration in renal function, such as those with dehydration, severe infection, shock, sepsis, acute heart failure, respiratory failure or hepatic impairment, or those who have recently had a myocardial infarction

Contra-indications ketoacidosis, see also Lactic Acidosis above; use of general anaesthesia (suspend metformin on the morning of surgery and restart when renal function returns to baseline)

Iodine-containing X-ray contrast media Intravascular administration of iodinated contrast agents can cause renal failure, which can increase the risk of lactic acidosis with metformin—see Lactic Acidosis above. Suspend metformin prior to the test; restart no earlier than 48 hours after the test if renal function has returned to baseline

Hepatic impairment withdraw if tissue hypoxia likely

Renal impairment see under Cautions

Pregnancy used in pregnancy for both pre-existing and gestational diabetes—see also p. 463

Breast-feeding may be used during breast-feeding—see p. 463

Side-effects anorexia, nausea, vomiting, diarrhoea (usually transient), abdominal pain, taste disturbance, *rarely* lactic acidosis (withdraw treatment), decreased vitamin-B_{12} absorption, erythema, pruritus and urticaria; hepatitis also reported

Dose

- Diabetes mellitus, ADULT and CHILD over 10 years initially 500 mg with breakfast for at least 1 week then 500 mg with breakfast and evening meal for at least 1 week then 500 mg with breakfast, lunch and evening meal; usual max. 2 g daily in divided doses
- Polycystic ovary syndrome [unlicensed], initially 500 mg with breakfast for 1 week, then 500 mg with breakfast and evening meal for 1 week, then 1.5–1.7 g daily in 2–3 divided doses

Note Metformin doses in the BNF may differ from those in the product literature

Metformin (Non-proprietary) PoM

Tablets, coated, metformin hydrochloride 500 mg, net price 28-tab pack = 87p, 84-tab pack = £1.00; 850 mg, 56-tab pack = £1.36. Label: 21

Oral solution, sugar-free, metformin hydrochloride 500 mg/5 mL, net price 100 mL = £40.50. Label: 21

Glucophage® (Merck Serono) PoM

Tablets, f/c, metformin hydrochloride 500 mg, net price 84-tab pack = £2.88; 850 mg, 56-tab pack = £3.20. Label: 21

Oral powder, sugar-free, metformin hydrochloride 500 mg/sachet, net price 30-sachet pack = £3.29, 60-sachet pack = £6.58; 1 g/sachet, 30-sachet pack = £6.58, 60-sachet pack = £13.16. Label: 13, 21, counselling, administration

Excipients include aspartame (section 9.4.1)

Counselling The contents of each sachet should be mixed with 150 mL of water and taken immediately

The *Scottish Medicines Consortium* (p. 4) has advised (March 2010) that *Glucophage®* oral powder is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in patients who are unable to swallow the solid dosage form.

1. NICE clinical guideline 87 (May 2009): Type 2 diabetes: The management of type 2 diabetes

Modified release

Metformin (Non-proprietary) PoM

Tablets, m/r, metformin hydrochloride 500 mg, net price 28 tab-pack = £2.66, 56 tab-pack = £5.32. Label: 21, 25

Brands include *Bolamyn® SR, Glucient® SR, Metabet® SR*

Dose initially 500 mg once daily, increased every 10–15 days, max. 2 g once daily with evening meal; if control not achieved, use 1 g twice daily with meals, and if control still not achieved change to standard-release tablets

Note Patients taking up to 2 g daily of the standard-release metformin may start with the same daily dose of metformin modified release; not suitable if dose of standard-release tablets more than 2 g daily

Glucophage® SR (Merck Serono) PoM

Tablets, m/r, metformin hydrochloride 500 mg, net price 28-tab pack = £2.66, 56-tab pack = £5.32; 750 mg, 28-tab pack = £3.20, 56-tab pack = £6.40; 1 g, 28-tab pack = £4.26, 56-tab pack = £8.52. Label: 21, 25

Dose initially 500 mg once daily, increased every 10–15 days, max. 2 g once daily with evening meal; if control not achieved, use 1 g twice daily with meals, and if control still not achieved change to standard-release tablets

Note Patients taking up to 2 g daily of the standard-release metformin may start with the same daily dose of *Glucophage® SR*; not suitable if dose of standard-release tablets more than 2 g daily

The *Scottish Medicines Consortium* (p. 4) has advised (September 2009) that *Glucophage® SR* is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in adult patients who are intolerant of standard-release metformin, and in whom the prolonged-release tablet allows the use of a dose of metformin not previously tolerated, or in patients for whom a once daily preparation offers a clinically significant benefit.

With alogliptin

Section 6.1.2.3

With dapagliflozin

Section 6.1.2.3

With linagliptin

Section 6.1.2.3

With pioglitazone

Section 6.1.2.3

With saxagliptin

Section 6.1.2.3

With sitagliptin

Section 6.1.2.3

With vildagliptin

Section 6.1.2.3

6.1.2.3 Other antidiabetic drugs

Acarbose, an inhibitor of intestinal alpha glucosidases, delays the digestion and absorption of starch and sucrose; it has a small but significant effect in lowering blood glucose. Use of acarbose is usually reserved for when other oral hypoglycaemics are not tolerated or are contra-indicated. Postprandial hyperglycaemia in type 1 diabetes can be reduced by acarbose, but it has been little used for this purpose. Flatulence deters some from using acarbose although this side-effect tends to decrease with time.

Nateglinide and **repaglinide** stimulate insulin secretion. Both drugs have a rapid onset of action and

short duration of activity, and should be administered shortly before each main meal. Repaglinide may be given as monotherapy for patients who are not overweight or for those in whom metformin is contra-indicated or not tolerated, or it may be given in combination with metformin. Nateglinide is licensed only for use with metformin.

The thiazolidinedione, **pioglitazone**, reduces peripheral insulin resistance, leading to a reduction of blood-glucose concentration. Pioglitazone can be used alone or in combination with metformin or with a sulfonylurea (if metformin inappropriate), or with both; the combination of pioglitazone plus metformin is preferred to pioglitazone plus sulfonylurea, particularly for obese patients. Inadequate response to a combination of metformin and sulfonylurea may indicate failing insulin release; the introduction of pioglitazone has a limited role in these circumstances and the initiation of insulin is often more appropriate. Pioglitazone is also licensed in combination with insulin, in patients who have not achieved adequate glycaemic control with insulin alone, when metformin is inappropriate. Blood-glucose control may deteriorate temporarily when pioglitazone is substituted for an oral antidiabetic drug that is being used in combination with another. Long-term benefits of pioglitazone have not yet been demonstrated. NICE (May 2009) has recommended that, when glycaemic control is inadequate with existing treatment, pioglitazone can be added to:

- a sulfonylurea, if metformin is contra-indicated or not tolerated;
- metformin, if risks of hypoglycaemia with sulfonylurea are unacceptable or a sulfonylurea is contra-indicated or not tolerated;
- a combination of metformin and a sulfonylurea, if insulin is unacceptable because of lifestyle or other personal issues, or because the patient is obese.

NICE has recommended that treatment with pioglitazone is continued only if HbA_{1c} concentration is reduced by at least 0.5 percentage points within 6 months of starting treatment.

The *Scottish Medicines Consortium* (p. 4) accepts use of pioglitazone (February 2007) with metformin and a sulfonylurea, for patients (especially if overweight) whose glycaemic control is inadequate despite the use of 2 oral hypoglycaemic drugs and who are unable or unwilling to take insulin; treatment should be initiated and monitored by an experienced diabetes physician.

MHRA/CHM advice

Pioglitazone cardiovascular safety (December 2007 and January 2011)

Incidence of heart failure is increased when pioglitazone is combined with insulin especially in patients with predisposing factors e.g. previous myocardial infarction. Patients who take pioglitazone should be closely monitored for signs of heart failure; treatment should be discontinued if any deterioration in cardiac status occurs.

Pioglitazone should not be used in patients with heart failure or a history of heart failure.

Pioglitazone: risk of bladder cancer (July 2011)

The European Medicines Agency has advised that there is a small increased risk of bladder cancer associated with pioglitazone use. However, in patients who respond adequately to treatment, the benefits of pioglitazone continue to outweigh the risks.

Pioglitazone should not be used in patients with active bladder cancer or a past history of bladder cancer, or in those who have uninvestigated macroscopic haematuria. Pioglitazone should be used with caution in elderly patients as the risk of bladder cancer increases with age.

Before initiating treatment with pioglitazone, patients should be assessed for risk factors of bladder cancer (including age, smoking status, exposure to certain occupational or chemotherapy agents, or previous radiation therapy to the pelvic region) and any macroscopic haematuria should be investigated.

The safety and efficacy of pioglitazone should be reviewed after 3–6 months and pioglitazone should be stopped in patients who do not respond adequately to treatment.

Patients already receiving treatment with pioglitazone should be assessed for risk factors of bladder cancer and treatment should be reviewed after 3–6 months, as above.

Patients should be advised to report promptly any haematuria, dysuria, or urinary urgency during treatment.

Alogliptin, **linagliptin**, **saxagliptin**, **sitagliptin**, and **vildagliptin** inhibit dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion. Linagliptin is licensed for use in type 2 diabetes as monotherapy (if metformin inappropriate), or in combination with metformin (when treatment with metformin alone fails to achieve adequate glycaemic control), or both metformin and a sulfonylurea (when dual therapy with these drugs fails to achieve adequate glycaemic control). Linagliptin may also be used in combination with insulin (with or without metformin) when a stable dose of insulin has not provided adequate glycaemic control. Saxagliptin and vildagliptin are licensed for use in type 2 diabetes as monotherapy (if metformin inappropriate), or in combination with metformin or a sulfonylurea (if metformin inappropriate), or pioglitazone (when treatment with either metformin or a sulfonylurea or pioglitazone fails to achieve adequate glycaemic control), and also in combination with both metformin and a sulfonylurea (when dual therapy with these drugs fails to achieve adequate glycaemic control). The combination of either saxagliptin or vildagliptin, and insulin (with or without metformin) is also licensed for use when a stable dose of insulin has not provided adequate glycaemic control. Sitagliptin is licensed for use in type 2 diabetes as monotherapy (if metformin inappropriate), or in combination with metformin or a sulfonylurea (if metformin inappropriate), or pioglitazone (when treatment with either metformin or a sulfonylurea or pioglitazone fails to achieve adequate glycaemic control), and also in combination with both metformin and a sulfonylurea (when dual therapy with these drugs fails to achieve adequate glycaemic control). Sitagliptin is also licensed for use in combination with both metformin and pioglitazone when dual therapy with these drugs

fails to achieve adequate glycaemic control, and may also be used in combination with insulin (with or without metformin) when a stable dose of insulin has not provided adequate glycaemic control. Alogliptin is licensed for use in type 2 diabetes as dual therapy in combination with either metformin, pioglitazone, a sulfonylurea, or insulin (when treatment with these drugs alone fails to achieve adequate glycaemic control); it is also licensed for use as triple therapy in combination with metformin and either pioglitazone or insulin.

NICE (May 2009) has recommended that, when glycaemic control is inadequate with existing treatment:

- sitagliptin or vildagliptin (instead of a sulfonylurea) can be added to metformin, if there is a significant risk of hypoglycaemia *or* if a sulfonylurea is contra-indicated or not tolerated;
- sitagliptin or vildagliptin can be added to a sulfonylurea, if metformin is contra-indicated or not tolerated;
- sitagliptin can be added to both metformin and a sulfonylurea, if insulin is unacceptable because of lifestyle or other personal issues, or because the patient is obese.

NICE has recommended that treatment with sitagliptin or vildagliptin is continued only if HbA_{1c} concentration is reduced by at least 0.5 percentage points within 6 months of starting treatment.

The *Scottish Medicines Consortium* (p. 4) has advised that vildagliptin (*Galvus*®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus as monotherapy when treatment with metformin or a sulfonylurea is inappropriate (December 2012), and in combination with metformin when addition of a sulfonylurea is inappropriate (March 2008), and in combination with a sulfonylurea if metformin is inappropriate (September 2009), and also as triple therapy in combination with metformin and a sulfonylurea, as an alternative to existing dipeptidyl peptidase-4 inhibitors, when treatment with metformin and a sulfonylurea is inadequate (November 2013).

The *Scottish Medicines Consortium* (p. 4) has advised that linagliptin (*Trajenta*®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus as monotherapy when both metformin and a sulfonylurea are inappropriate (January 2013), and in combination with metformin when addition of a sulfonylurea is inappropriate (December 2011), and also in combination with both a sulfonylurea and metformin when dual therapy is ineffective (January 2013).

The *Scottish Medicines Consortium* (p. 4) has advised that saxagliptin (*Onglyza*®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus as triple therapy in combination with metformin and a sulfonylurea, as an alternative to existing dipeptidyl peptidase-4 inhibitors, when treatment with metformin and a sulfonylurea is inadequate (November 2013).

Exenatide, **liraglutide**, and **lixisenatide** bind to, and activate, the GLP-1 (glucagon-like peptide-1) receptor to increase insulin secretion, suppress glucagon secretion, and slow gastric emptying. Treatment with exenatide, liraglutide, and lixisenatide is associated with the prevention of weight gain and possible promotion of weight loss which can be beneficial in overweight patients. They are given by subcutaneous injection for the treatment of type 2 diabetes mellitus.

Exenatide is licensed in combination with metformin or a sulfonylurea, or both, or with pioglitazone, or with both metformin and pioglitazone, in patients who have not achieved adequate glycaemic control with these drugs alone or in combination; standard-release exenatide is also licensed in combination with basal insulin alone or with metformin or pioglitazone (or both).

NICE (May 2009) has recommended that, when glycaemic control is inadequate with metformin and sulfonylurea treatment, the addition of standard-release exenatide may be considered if the patient has:

- a body mass index of 35 kg/m^2 or over and is of European descent (with appropriate adjustment for other ethnic groups) and weight-related psychological or medical problems *or*
- a body mass index less than 35 kg/m^2, and insulin would be unacceptable for occupational reasons *or* weight loss would benefit other significant obesity-related comorbidities.

NICE has recommended that treatment with standard-release exenatide is continued only if HbA_{1c} concentration is reduced by at least 1 percentage point and a weight loss of at least 3% is achieved within 6 months of starting treatment.

The *Scottish Medicines Consortium* (p. 4) has advised (June 2007) that standard-release exenatide (*Byetta*®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with metformin or sulfonylurea (or both), as an alternative to treatment with insulin in patients where treatment with metformin or sulfonylurea (or both) at maximally tolerated doses has been inadequate, and treatment with insulin would be the next option.

The *Scottish Medicines Consortium* (p. 4) has also advised (February 2011) that standard-release exenatide (*Byetta*®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with metformin and pioglitazone as a third-line pre-insulin treatment option.

NICE guidance

Exenatide modified-release for the treatment of type 2 diabetes mellitus (February 2012)

Modified-release exenatide in triple therapy regimens (in combination with metformin and a sulphonylurea, or metformin and a thiazolidinedione) is recommended for the treatment of type 2 diabetes, only when glycaemic control is inadequate and the patient has:

- a body mass index (BMI) $\geq 35\,kg/m^2$ (in those of European descent, with appropriate adjustment for other ethnic groups) and weight-related psychological or medical problems, *or*
- a BMI $< 35\,kg/m^2$, and insulin would be unacceptable for occupational reasons, or weight loss would benefit other significant obesity-related comorbidities.

Treatment with modified-release exenatide in a triple therapy regimen should be continued only if HbA_{1c} concentration is reduced by at least 1 percentage point and a weight loss of at least 3% is achieved within 6 months of starting treatment.

Modified-release exenatide in dual therapy regimens (in combination with metformin or a sulphonylurea) is recommended only if:

- treatment with metformin or a sulphonylurea is contra-indicated or not tolerated, *and*
- treatment with thiazolidinediones and dipeptidylpeptidase-4 inhibitors is contra-indicated or not tolerated.

Modified-release exenatide in a dual therapy regimen should be continued only if HbA_{1c} concentration is reduced by at least 1 percentage point within 6 months of starting treatment.

www.nice.org.uk/TA248

NICE guidance

Liraglutide for the treatment of type 2 diabetes mellitus (October 2010)

Liraglutide in triple therapy regimens (in combination with metformin and a sulfonylurea, or metformin and a thiazolidinedione) is recommended for the treatment of type 2 diabetes, only when glycaemic control is inadequate, and the patient has:

- a body mass index of $35\,kg/m^2$ or over and is of European descent (with appropriate adjustment for other ethnic groups) and weight-related psychological or medical problems, *or*
- a body mass index of less than $35\,kg/m^2$, and insulin would be unacceptable for occupational reasons *or* weight loss would benefit other significant obesity-related comorbidities.

Treatment with liraglutide in a triple therapy regimen should be continued only if HbA_{1c} concentration is reduced by at least 1 percentage point and a weight loss of at least 3% is achieved within 6 months of starting treatment.

Liraglutide in dual therapy regimens (in combination with metformin or a sulfonylurea) is recommended only if:

- treatment with metformin or a sulfonylurea is contra-indicated or not tolerated, *and*
- treatment with thiazolidinediones and dipeptidylpeptidase-4 inhibitors is contra-indicated or not tolerated.

Liraglutide, in combination with metformin or a sulfonylurea should be continued only if HbA_{1c} concentration is reduced by at least 1 percentage point within 6 months of starting treatment.

Liraglutide 1.8 mg daily is not recommended.

www.nice.org.uk/TA203

The *Scottish Medicines Consortium* (p. 4) has advised (December 2011) that modified-release exenatide (*Bydureon*®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes as a third-line treatment option.

Liraglutide is licensed for the treatment of type 2 diabetes mellitus in combination with metformin or a sulfonylurea, or both, in patients who have not achieved adequate glycaemic control with these drugs alone or in combination. Liraglutide is also licensed for use in combination with both metformin and pioglitazone when dual therapy with these drugs fails to achieve adequate glycaemic control.

Lixisenatide is licensed for the treatment of type 2 diabetes mellitus in combination with oral antidiabetic drugs (e.g. metformin, pioglitazone, or a sulfonylurea) or basal insulin, or both, when adequate glycaemic control has not been achieved with these drugs; lixisenatide should not be used in combination with both basal insulin and a sulfonylurea because of an increased risk of hypoglycaemia.

The *Scottish Medicines Consortium* (p. 4) has advised (August 2013) that lixisenatide (*Lyxumia*®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with oral antidiabetic drugs or basal insulin (or both), when adequate glycaemic control has not been achieved with these drugs; use is restricted to patients in whom a GLP-1 agonist is appropriate, as an alternative to an existing GLP-1 agonist (exenatide or liraglutide).

Canagliflozin and **dapagliflozin** reversibly inhibit sodium-glucose co-transporter 2 (SGLT2) in the renal proximal convoluted tubule to reduce glucose reabsorption and increase urinary glucose excretion. Canagliflozin and dapagliflozin are licensed for use in type 2 diabetes as monotherapy (if metformin inappropriate), or in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control). Dapagliflozin is not recommended in combination with pioglitazone.

NICE guidance

Dapagliflozin in combination therapy for treating type 2 diabetes (June 2013)

Dapagliflozin in a dual therapy regimen in combination with metformin is recommended for the treatment of type 2 diabetes, only if glycaemic control is inadequate, and the patient has a significant risk of hypoglycaemia *or* if a sulfonylurea is contra-indicated or not tolerated.

Dapagliflozin in combination with insulin (alone or with other antidiabetic drugs) is an option for the treatment of type 2 diabetes.

Dapagliflozin in combination with metformin and a sulfonylurea as triple therapy is not recommended for the treatment of type 2 diabetes except as part of a clinical trial.

Patients currently receiving dapagliflozin in a dual or triple therapy regimen that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA288

The *Scottish Medicines Consortium* (p. 4) has advised that dapagliflozin (*Forxiga*®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with metformin, when treatment with metformin alone is inadequate and a sulfonylurea is inappropriate (December 2012), or in combination with insulin when treatment with insulin alone is inadequate (February 2014).

ACARBOSE

Indications diabetes mellitus inadequately controlled by diet or by diet with oral antidiabetic drugs

Cautions monitor liver function; may enhance hypoglycaemic effects of insulin and sulfonylureas (hypoglycaemic episodes may be treated with oral glucose but not with sucrose); **interactions:** Appendix 1 (antidiabetics)

Contra-indications inflammatory bowel disease, predisposition to partial intestinal obstruction; hernia, previous abdominal surgery

Hepatic impairment avoid

Renal impairment avoid if eGFR less than 25 mL/minute/1.73 m^2

Pregnancy avoid

Breast-feeding avoid

Side-effects flatulence, soft stools, diarrhoea (may need to reduce dose or withdraw), abdominal distention and pain; *rarely*, nausea, abnormal liver function tests and skin reactions; *very rarely* ileus, oedema, jaundice, and hepatitis

Note Antacids unlikely to be beneficial for treating side-effects

Dose

- ADULT over 18 years, initially 50 mg daily increased to 50 mg 3 times daily, then increased if necessary after 6–8 weeks to 100 mg 3 times daily; max. 200 mg 3 times daily

Counselling Tablets should be chewed with first mouthful of food or swallowed whole with a little liquid immediately before food. To counteract possible hypoglycaemia, patients receiving insulin or a sulfonylurea as well as acarbose need to carry glucose (not sucrose—acarbose interferes with sucrose absorption)

Glucobay® (Bayer) PoM

Tablets, acarbose 50 mg, net price 90-tab pack = £7.35; 100 mg (scored), 90-tab pack = £13.50. Counselling, administration

ALOGLIPTIN

Indications see notes above

Cautions determine renal function before treatment and periodically thereafter; history of pancreatitis; discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain); not recommended in moderate to severe heart failure (limited experience); **interactions:** Appendix 1 (antidiabetics)

Contra-indications history of serious hypersensitivity to dipeptidylpeptidase-4 inhibitors; ketoacidosis

Hepatic impairment manufacturer advises avoid in severe impairment—no information available

Renal impairment reduce dose to 12.5 mg once daily if eGFR 30–50 mL/minute/1.73 m^2; reduce dose to 6.25 mg once daily if eGFR less than 30 mL/minute/1.73 m^2 and use with caution

Pregnancy manufacturer advises avoid—no information available

Breast-feeding avoid—present in milk in *animal* studies

Side-effects abdominal pain, gastro-oesophageal reflux, nasopharyngitis, upper respiratory-tract infection, headache, pruritus, rash; *also reported* pancreatitis, hepatic impairment, angioedema, urticaria, Stevens-Johnson syndrome

Dose

- ADULT over 18 years, 25 mg once daily

Note Dose of concomitant sulfonylurea or insulin may need to be reduced; caution with use in combination with both metformin and pioglitazone—risk of hypoglycaemia (dose of metformin or pioglitazone may need to be reduced)

Vipidia® (Takeda) ▼ PoM

Tablets, f/c, alogliptin (as benzoate) 6.25 mg (pink), net price 28-tab pack = £26.60; 12.5 mg (yellow), 28-tab pack = £26.60; 25 mg (red), 28-tab pack = £26.60

With metformin

For prescribing information on metformin, see section 6.1.2.2

Vipdomet® (Takeda) ▼ PoM

Tablets, f/c, yellow, alogliptin (as benzoate) 12.5 mg, metformin hydrochloride 1 g, net price 56-tab pack = £26.60. Label: 21

Dose type 2 diabetes mellitus not controlled by metformin alone *or* by metformin in combination with either pioglitazone or insulin, ADULT over 18 years, 1 tablet twice daily (based on patient's current metformin dose)

Note Dose of concomitant insulin may need to be reduced; caution with use in combination with pioglitazone—risk of hypoglycaemia (dose of pioglitazone may need to be reduced)

CANAGLIFLOZIN

Indications see notes above

Cautions determine renal function before treatment and at least annually thereafter, and before initiation of concomitant drugs that reduce renal function and periodically thereafter; elderly or cardiovascular disease (risk of hypotension); history of hypotension;

elevated haematocrit; **interactions**: Appendix 1 (antidiabetics)

Volume depletion Correct hypovolaemia before starting treatment. Patients should be advised to report symptoms of volume depletion including postural hypotension and dizziness—consider interrupting treatment if volume depletion occurs

Contra-indications ketoacidosis

Hepatic impairment manufacturer advises avoid in severe impairment—no information available

Renal impairment monitor renal function at least twice a year in moderate impairment; avoid initiation if eGFR less than 60 mL/minute/1.73 m^2; reduce dose to 100 mg once daily if eGFR falls persistently below 60 mL/minute/1.73m^2 and existing canagliflozin treatment tolerated; avoid if eGFR less than 45 mL/minute/1.73m^2

Pregnancy avoid—toxicity in *animal* studies

Breast-feeding avoid—present in milk in *animal* studies

Side-effects constipation, thirst, nausea, dyslipidaemia, urinary-tract infection, hypoglycaemia (in combination with insulin or sulfonylurea), genital infection, polyuria, urinary frequency, raised haematocrit; *less commonly* postural hypotension, dizziness, syncope, dehydration, hypovolaemia, rash, raised serum creatinine and urea

Dose

- ADULT over 18 years, 100 mg once daily preferably before breakfast; if necessary and if tolerated, increase to 300 mg once daily

  Note Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced

Invokana® (Janssen) ▼ PoM

Tablets, f/c, canagliflozin 100 mg (yellow), net price 30-tab pack = £39.20; 300 mg (white), 30-tab pack = £49.99. Counselling, volume depletion, see above

DAPAGLIFLOZIN

Indications see notes above

Cautions determine renal function before treatment and at least annually thereafter; hypotension; electrolyte disturbances; cardiovascular disease or elderly (risk of hypotension); raised haematocrit; **interactions**: Appendix 1 (antidiabetics)

Volume depletion Correct hypovolaemia before starting treatment. Consider interrupting treatment if volume depletion occurs

Contra-indications ketoacidosis

Hepatic impairment initial dose 5 mg daily in severe impairment, increased according to response; in combination with metformin (*Xigduo®*), avoid

Renal impairment avoid if eGFR less than 60 mL/minute/1.73 m^2 (ineffective)

Pregnancy avoid—toxicity in *animal* studies

Breast-feeding avoid—present in milk in *animal* studies

Side-effects hypoglycaemia (in combination with insulin or sulphonylurea), constipation, dyslipidaemia, back pain, genital infection, urinary-tract infection, dysuria, polyuria, thirst, sweating; *less commonly* nausea, hypotension, dizziness, rash, nocturia, dehydration, hypovolaemia, raised serum creatinine and urea

Dose

- ADULT over 18 years, 10 mg once daily; ELDERLY over 75 years, initiation not recommended

  Note Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced

Forxiga® (Bristol-Myers Squibb, AstraZeneca) ▼ PoM

Tablets, yellow, f/c, dapagliflozin (as propanediol monohydrate) 5 mg, net price 28-tab pack = £36.59; 10 mg, 28-tab pack = £36.59

With metformin

For prescribing information on metformin, see section 6.1.2.2

Xigduo® (Bristol-Myers Squibb, AstraZeneca) ▼ PoM

Xigduo® 5 mg/850 mg tablets, f/c, brown, dapagliflozin (as propanediol monohydrate) 5 mg, metformin hydrochloride 850 mg, net price 56 tab-pack = £36.59. Label: 21

Xigduo® 5 mg/1 g tablets, f/c, yellow, dapagliflozin (as propanediol monohydrate) 5 mg, metformin hydrochloride 1 g, net price 56 tab-pack = £36.59. Label: 21

Dose type 2 diabetes mellitus not controlled by metformin alone *or* by metformin in combination with insulin or other antidiabetic drugs, ADULT over 18 years, 1 tablet twice daily (based on patient's current metformin dose); ELDERLY over 75 years, initiation not recommended

Note Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced

EXENATIDE

Indications see notes above

Cautions elderly; pancreatitis (see below); may cause weight loss greater than 1.5 kg weekly; **interactions**: Appendix 1 (antidiabetics)

Pancreatitis Severe pancreatitis (sometimes fatal), including haemorrhagic or necrotising pancreatitis, has been reported rarely. Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek prompt medical attention if symptoms such as abdominal pain, nausea, and vomiting develop; discontinue permanently if pancreatitis is diagnosed

Contra-indications ketoacidosis; severe gastro-intestinal disease

Renal impairment

- for *standard-release* injection, use with caution if eGFR 30–50 mL/minute/1.73 m^2; avoid if eGFR less than 30 mL/minute/1.73m^2
- for *modified-release* injection, avoid if eGFR less than 50 mL/minute/1.73 m^2

Pregnancy avoid—toxicity in *animal* studies. Women of child-bearing age should use effective contraception during treatment with modified-release exenatide and for 12 weeks after discontinuation

Breast-feeding avoid—no information available

Side-effects gastro-intestinal disturbances including nausea, vomiting, diarrhoea, dyspepsia, abdominal pain and distension, gastro-oesophageal reflux disease, decreased appetite, weight loss, headache, dizziness, agitation, asthenia, hypoglycaemia, increased sweating, injection-site reactions, antibody formation; *less commonly* pancreatitis (see Cautions above); *rarely* alopecia; *very rarely* anaphylactic reactions; also reported constipation, flatulence, eructation, dehydration, taste disturbance, renal impairment, drowsiness, rash, pruritus, urticaria, and angioedema

Dose

- By subcutaneous injection, ADULT over 18 years, initially 5 micrograms twice daily within 1 hour before 2 main meals (at least 6 hours apart), increased if necessary after at least 1 month to max. 10 micrograms twice daily

  Counselling If a dose is missed, continue with the next scheduled dose—do not administer **after** a meal. Some oral

medications should be taken at least 1 hour before or 4 hours after exenatide injection—consult product literature for details

Note Dose of concomitant sulfonylurea may need to be reduced

Byetta® (Bristol-Myers Squibb) ▼ PoM

Injection, exenatide 250 micrograms/mL, net price 5 microgram/dose prefilled pen (60 doses) = £68.24, 10 microgram/dose prefilled pen (60 doses) = £68.24. Label: 10, counselling, administration

Modified release

Bydureon® (Bristol-Myers Squibb) ▼ PoM

Injection, m/r, powder for reconstitution, exenatide, net price 2-mg vial (with solvent) = £18.34. Label: 10, counselling, administration

Dose by subcutaneous injection, ADULT over 18 years, 2 mg once weekly

Counselling Patients changing from standard-release exenatide formulation may experience initial transient increase in blood glucose. Some oral medications should be taken at least 1 hour before or 4 hours after exenatide injection—consult product literature for details

Note Dose of concomitant sulfonylurea may need to be reduced

Important Effect of *Bydureon®* may persist for 10 weeks after discontinuation

LINAGLIPTIN

Indications see notes above

Cautions discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain); **interactions**: Appendix 1 (antidiabetics)

Pregnancy avoid—no information available

Breast-feeding avoid—present in milk in *animal* studies

Side-effects *less commonly* cough, nasopharyngitis; *also reported* pancreatitis

Dose

- ADULT over 18 years, 5 mg once daily

Note Dose of concomitant sulfonylurea or insulin may need to be reduced

Trajenta® (Boehringer Ingelheim) ▼ PoM

Tablets, light red, f/c, linagliptin 5 mg, net price 28-tab pack = £33.26

With metformin

For prescribing information on metformin, see section 6.1.2.2

Jentadueto® (Boehringer Ingelheim) ▼ PoM

Jentadueto® 2.5 mg/850 mg tablets, f/c, light orange, linagliptin 2.5 mg, metformin hydrochloride 850 mg, net price 56-tab pack = £33.26. Label: 21

Jentadueto® 2.5 mg/1 g tablets, f/c, light pink, linagliptin 2.5 mg, metformin hydrochloride 1 g, net price 56-tab pack = £33.26. Label: 21

Dose type 2 diabetes mellitus not controlled by metformin alone *or* by metformin in combination with either a sulfonylurea *or* insulin, ADULT over 18 years, 1 *Jentadueto®* tablet twice daily (based on patient's current metformin dose)

Note Dose of concomitant sulfonyurea or insulin may need to be reduced

LIRAGLUTIDE

Indications see notes above

Cautions discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain); **interactions**: Appendix 1 (antidiabetics)

Contra-indications ketoacidosis; inflammatory bowel disease; diabetic gastroparesis

Hepatic impairment avoid—limited experience

Renal impairment avoid if eGFR less than 60 mL/minute/1.73 m^2—limited experience

Pregnancy avoid—toxicity in *animal* studies

Breast-feeding avoid—no information available

Side-effects gastro-intestinal disturbances including nausea, vomiting, constipation, diarrhoea, dyspepsia, abdominal pain and distension, flatulence, gastritis, gastro-oesophageal reflux disease, decreased appetite; headache, dizziness, fatigue; fever, bronchitis, nasopharyngitis; hypoglycaemia; injection site reactions; *also reported* acute pancreatitis, thyroid neoplasm, goitre, increased blood calcitonin, angioedema

Dose

- By subcutaneous injection, ADULT over 18 years, initially 0.6 mg once daily, increased after at least 1 week to 1.2 mg once daily, further increased if necessary after an interval of at least 1 week to max. 1.8 mg once daily

Note Dose of concomitant sulfonylurea may need to be reduced

Victoza® (Novo Nordisk) PoM

Injection, liraglutide 6 mg/mL, net price 2 × 3-mL prefilled pens = £78.48, 3 × 3-mL prefilled pens = £117.72. Counselling, administration

LIXISENATIDE

Indications see notes above

Cautions discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain); **interactions**: Appendix 1 (antidiabetics)

Contra-indications ketoacidosis; severe gastro-intestinal disease

Renal impairment use with caution if eGFR 30–50 mL/minute/1.73 m^2; avoid if eGFR less than 30 mL/minute/1.73 m^2—no information available

Pregnancy avoid—toxicity in *animal* studies; women of child-bearing age should use effective contraception

Breast-feeding avoid—no information available

Side-effects nausea, vomiting, diarrhoea, dyspepsia, palpitation, headache, dizziness, drowsiness, hypoglycaemia, injection-site reactions; *less commonly* tachycardia, urticaria

Dose

- By subcutaneous injection, ADULT over 18 years, initially 10 micrograms once daily within 1 hour before the first meal of the day or the evening meal for 14 days, increased to 20 micrograms once daily thereafter

Counselling If a dose is missed, inject within 1 hour before the next meal—do not administer **after** a meal. Some oral medications should be taken at least 1 hour before or 4 hours after lixisenatide injection—consult product literature for details

Note Dose of concomitant sulfonylurea or insulin may need to be reduced

Lyxumia® (Sanofi-Aventis) ▼ PoM

Injection, 50 micrograms/mL, net price 10 micrograms/dose prefilled pen (14 doses) = £27.07; 100 micrograms/mL, 20 micrograms/dose prefilled pen (14 doses) × 2 = £54.14; treatment initiation pack, 10 micrograms/dose prefilled pen and 20 micrograms/dose prefilled pen = £54.14. Label: 10, counselling, administration

NATEGLINIDE

Indications type 2 diabetes mellitus in combination with metformin (section 6.1.2.2) when metformin alone inadequate

Cautions substitute insulin during intercurrent illness (such as myocardial infarction, coma, infection, and trauma) and during surgery (omit nateglinide on morning of surgery and recommence when eating and drinking normally); elderly, debilitated and malnourished patients; **interactions:** Appendix 1 (antidiabetics)

Contra-indications ketoacidosis

Hepatic impairment caution in moderate hepatic impairment; avoid in severe impairment—no information available

Pregnancy avoid—toxicity in *animal* studies

Breast-feeding avoid—present in milk in *animal* studies

Side-effects hypoglycaemia; hypersensitivity reactions including pruritus, rashes and urticaria

Dose

- ADULT over 18 years, initially 60 mg 3 times daily within 30 minutes before main meals, adjusted according to response up to max. 180 mg 3 times daily

Starlix® (Novartis) PoM

Tablets, f/c, nateglinide 60 mg (pink), net price 84-tab pack = £22.71; 120 mg (yellow), 84-tab pack = £25.88; 180 mg (red), 84-tab pack = £25.88

PIOGLITAZONE

Indications type 2 diabetes mellitus (alone or combined with metformin or a sulfonylurea, or with both, or with insulin—see also notes above)

Cautions monitor liver function (see below); cardiovascular disease or in combination with insulin (risk of heart failure—see MHRA/CHM advice p. 467); substitute insulin during peri-operative period (omit pioglitazone on morning of surgery and recommence when eating and drinking normally); increased risk of bone fractures, particularly in women; avoid in acute porphyria (but see section 9.8.2); risk factors for bladder cancer (see Risk of Bladder Cancer, p. 467); elderly (increased risk of heart failure, fractures, and bladder cancer); **interactions:** Appendix 1 (antidiabetics)

Liver toxicity Rare reports of liver dysfunction; monitor liver function before treatment, and periodically thereafter; advise patients to seek immediate medical attention if symptoms such as nausea, vomiting, abdominal pain, fatigue and dark urine develop; discontinue if jaundice occurs

Contra-indications history of heart failure; uninvestigated macroscopic haematuria, previous or active bladder cancer

Hepatic impairment avoid; see also Cautions above

Pregnancy avoid—toxicity in *animal* studies

Breast-feeding avoid—present in milk in *animal* studies

Side-effects gastro-intestinal disturbances, weight gain, oedema, anaemia, headache, visual disturbances, dizziness, arthralgia, hypoaesthesia, haematuria, impotence; *less commonly* hypoglycaemia, fatigue, insomnia, vertigo, sweating, altered blood lipids, proteinuria, bladder cancer; see also Liver Toxicity above

Dose

- ADULT over 18 years, initially 15–30 mg once daily increased to 45 mg once daily according to response, (ELDERLY, initiate with lowest possible dose and increase gradually); review treatment after 3–6 months and regularly thereafter

Note Dose of concomitant sulfonylurea or insulin may need to be reduced

Pioglitazone (Non-proprietary) PoM

Tablets, pioglitazone (as hydrochloride) 15 mg, net price 28-tab pack = £1.29; 30 mg, 28-tab pack = £1.57; 45 mg, 28-tab pack = £1.79

Actos® (Takeda) PoM

Tablets, pioglitazone (as hydrochloride) 15 mg, net price 28-tab pack = £25.83; 30 mg, 28-tab pack = £35.89; 45 mg, 28-tab pack = £39.55

With metformin

For prescribing information on metformin, see section 6.1.2.2

Competact® (Takeda) PoM

Tablets, f/c, pioglitazone (as hydrochloride) 15 mg, metformin hydrochloride 850 mg, net price 56-tab pack = £35.89. Label: 21

Dose ADULT over 18 years, type 2 diabetes not controlled by metformin alone, 1 tablet twice daily

Note Titration with the individual components (pioglitazone and metformin) desirable before initiating *Competact®*

REPAGLINIDE

Indications type 2 diabetes mellitus (as monotherapy or in combination with metformin when metformin alone inadequate)

Cautions substitute insulin during intercurrent illness (such as myocardial infarction, coma, infection, and trauma) and during surgery (omit repaglinide on morning of surgery and recommence when eating and drinking normally); debilitated and malnourished patients; **interactions:** Appendix 1 (antidiabetics)

Contra-indications ketoacidosis

Hepatic impairment avoid in severe liver disease

Renal impairment use with caution

Pregnancy avoid

Breast-feeding avoid—present in milk in *animal* studies

Side-effects abdominal pain, diarrhoea, constipation, nausea, vomiting; *rarely* hypoglycaemia, hypersensitivity reactions including pruritus, rashes, vasculitis, urticaria, and visual disturbances

Dose

- ADULT over 18 years, initially 500 micrograms within 30 minutes before main meals (1 mg if transferring from another oral hypoglycaemic), adjusted according to response at intervals of 1–2 weeks; up to 4 mg may be given as a single dose, max. 16 mg daily; ELDERLY over 75 years, not recommended

Repaglinide (Non-proprietary) PoM

Tablets, repaglinide 500 micrograms, net price 30-tab pack = £2.67, 90-tab pack = £8.70; 1 mg, 30-tab pack = £2.82, 90-tab pack = £9.08; 2 mg, 90-tab pack = £5.74

Prandin® (Daiichi Sankyo) PoM

Tablets, repaglinide 500 micrograms, net price 30-tab pack = £3.92, 90-tab pack = £11.76; 1 mg (yellow), 30-tab pack = £3.92, 90-tab pack = £11.76; 2 mg (peach), 90-tab pack = £11.76

Formerly marketed as *NovoNorm®*

SAXAGLIPTIN

Indications see notes above

Cautions elderly; determine renal function before treatment and periodically thereafter; discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain); **interactions:** Appendix 1 (antidiabetics)

Contra-indications history of serious hypersensitivity to dipeptidylpeptidase-4 inhibitors

Hepatic impairment use with caution in moderate impairment; avoid in severe impairment

Renal impairment reduce dose to 2.5 mg once daily in moderate to severe impairment; use with caution in severe impairment

Pregnancy avoid unless essential—toxicity in *animal* studies

Breast-feeding avoid—present in milk in *animal* studies

Side-effects vomiting, dyspepsia, gastritis; peripheral oedema; headache, dizziness, fatigue; upper respiratory tract infection, urinary tract infection, gastroenteritis, sinusitis, nasopharyngitis; hypoglycaemia, myalgia; *less commonly* dyslipidaemia, hypertriglyceridaemia, pancreatitis, erectile dysfunction, arthralgia, hypersensitivity reactions (including anaphylaxis); *also reported* rash

Dose

- ADULT over 18 years, 5 mg once daily

Note Dose of concomitant sulfonylurea or insulin may need to be reduced

Onglyza® (Bristol-Myers Squibb) PoM

Tablets, f/c, saxagliptin (as hydrochloride) 2.5 mg (yellow), net price 28-tab pack = £31.60; 5 mg (pink), net price 28-tab pack = £31.60

With metformin

For prescribing information on metformin, see section 6.1.2.2

Komboglyze® (Bristol-Myers Squibb, AstraZeneca) PoM

Komboglyze® 2.5 mg/850 mg tablets, f/c, brown, saxagliptin (as hydrochloride) 2.5 mg, metformin hydrochloride 850 mg, net price 56-tab pack = £31.60. Label: 21

Komboglyze® 2.5 mg/1 g tablets, f/c, yellow, saxagliptin (as hydrochloride) 2.5 mg, metformin hydrochloride 1 g, net price 56-tab pack = £31.60. Label: 21

Dose type 2 diabetes mellitus not controlled by metformin alone *or* by metformin in combination with either a sulfonylurea *or* insulin, ADULT over 18 years, 1 tablet twice daily (based on patient's current metformin dose)

Note Dose of concomitant sulfonylurea or insulin may need to be reduced

The *Scottish Medicines Consortium* (p. 4) has advised (May 2013) that *Komboglyze®* is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in patients unable to achieve adequate glycaemic control with metformin alone and when the addition of a sulfonylurea is inappropriate

SITAGLIPTIN

Indications see notes above

Cautions discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain); **interactions:** Appendix 1 (antidiabetics)

Contra-indications ketoacidosis

Renal impairment reduce dose to 50 mg once daily if eGFR 30–50 mL/minute/1.73 m^2; reduce dose to 25 mg once daily if eGFR less than 30 mL/minute/1.73 m^2

Pregnancy avoid—toxicity in *animal* studies

Breast-feeding avoid—present in milk in *animal* studies

Side-effects gastro-intestinal disturbances; peripheral oedema; upper respiratory tract infection, nasopharyngitis; pain; *less commonly* dry mouth, anorexia, headache, drowsiness, dizziness, hypoglycaemia, osteoarthritis; *also reported* pancreatitis, rash, cutaneous vasculitis, and Stevens-Johnson syndrome

Dose

- ADULT over 18 years, 100 mg once daily

Note Dose of concomitant sulfonylurea or insulin may need to be reduced

Januvia® (MSD) PoM

Tablets, f/c, sitagliptin (as phosphate monohydrate) 25 mg (pink), net price 28-tab pack =£33.26; 50 mg (light beige), 28-tab pack =£33.26; 100 mg (beige), 28-tab pack = £33.26

The *Scottish Medicines Consortium* (p. 4) has advised (June 2010) that *Januvia®* is accepted for restricted use within NHS Scotland as monotherapy, to improve glycaemic control in patients with type 2 diabetes mellitus, for whom both metformin and sulfonylureas are not appropriate

With metformin

For prescribing information on metformin, see section 6.1.2.2

Janumet® (MSD) PoM

Tablets, f/c, red, sitagliptin 50 mg, metformin hydrochloride 1 g, net price 56-tab pack = £33.26. Label: 21

Dose type 2 diabetes mellitus not controlled by metformin alone *or* by metformin in combination with either a sulfonylurea *or* pioglitazone *or* insulin, ADULT over 18 years, 1 tablet twice daily

Note Dose of concomitant sulfonylurea or insulin may need to be reduced

The *Scottish Medicines Consortium* (p. 4) has advised (July 2008) that *Janumet®* is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus when the addition of a sulfonylurea to metformin is not appropriate; it is also accepted for use in NHS Scotland in combination with a sulfonylurea in patients inadequately controlled on maximum tolerated doses of metformin and a sulfonylurea.

VILDAGLIPTIN

Indications see notes above

Cautions monitor liver function (see below); manufacturer advises avoid in severe heart failure—no information available; discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain); **interactions:** Appendix 1 (antidiabetics)

Liver toxicity Rare reports of liver dysfunction; monitor liver function before treatment and every 3 months for first year and periodically thereafter; advise patients to seek prompt medical attention if symptoms such as nausea, vomiting, abdominal pain, fatigue, and dark urine develop; discontinue if jaundice or other signs of liver dysfunction occur

Contra-indications ketoacidosis

Hepatic impairment avoid; see also Cautions above

Renal impairment reduce dose to 50 mg once daily if eGFR less than 50 mL/minute/1.73 m^2

Pregnancy avoid—toxicity in *animal* studies

Breast-feeding avoid—present in milk in *animal* studies

Side-effects nausea, peripheral oedema, headache, tremor, asthenia, dizziness; *less commonly* constipation, hypoglycaemia, arthralgia; *rarely* hepatic dysfunction (see also Liver Toxicity above); *very rarely* nasopharyngitis, upper respiratory tract infection; *also reported* pancreatitis, exfoliative and bullous skin reactions

Dose

- ADULT over 18 years, monotherapy, 50 mg twice daily
- ADULT over 18 years, dual therapy in combination with metformin or pioglitazone, 50 mg twice daily; dual therapy in combination with a sulfonylurea, 50 mg daily in the morning
- ADULT over 18 years, triple therapy in combination with metformin and a sulfonylurea, 50 mg twice daily
- ADULT over 18 years, in combination with insulin (with or without metformin), 50 mg twice daily

Note Dose of concomitant sulfonylurea or insulin may need to be reduced

Galvus® (Novartis) PoM

Tablets, pale yellow, vildagliptin 50 mg, net price 56-tab pack = £31.76

With metformin

For prescribing information on metformin, see section 6.1.2.2

Eucreas® (Novartis) PoM

Eucreas® 50 mg/850 mg tablets, f/c, yellow, vildagliptin 50 mg, metformin hydrochloride 850 mg, net price 60-tab pack = £33.98. Label: 21

Eucreas® 50 mg/1 g tablets, f/c, dark yellow, vildagliptin 50 mg, metformin hydrochloride 1 g, net price 60-tab pack = £33.98. Label: 21

Dose type 2 diabetes mellitus not controlled by metformin alone *or* by metformin in combination with either a sulfonylurea *or* insulin, ADULT over 18 years, 1 *Eucreas®* tablet twice daily (based on patient's current metformin dose)

Note Dose of concomitant sulfonylurea or insulin may need to be reduced

The *Scottish Medicines Consortium* (p. 4) has advised (June 2008) that *Eucreas®* is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in patients unable to achieve adequate glycaemic control with metformin alone or those already treated with vildagliptin and metformin as separate tablets

6.1.3 Diabetic ketoacidosis

The management of diabetic ketoacidosis involves the replacement of fluid and electrolytes and the administration of insulin. Guidelines for the Management of Diabetic Ketoacidosis in Adults, published by the Joint British Diabetes Societies Inpatient Care Group[1], should be followed.

- To restore circulating volume if systolic blood pressure is below 90 mmHg (adjusted for age, sex, and medication as appropriate), give 500 mL **sodium chloride 0.9%** by intravenous infusion over 10–15 minutes; repeat if blood pressure remains below 90 mmHg and seek senior medical advice.
- When blood pressure is over 90 mmHg, **sodium chloride 0.9%** should be given by intravenous infusion at a rate that replaces deficit and provides maintenance; see guideline for suggested regimen.
- Include **potassium chloride** in the fluids unless anuria is suspected; adjust according to plasma-potassium concentration (measure at 60 minutes, 2 hours, and 2 hourly thereafter; measure hourly if outside the normal range).
- Start an intravenous insulin infusion: **soluble insulin** should be diluted (and **mixed thoroughly**) with **sodium chloride 0.9%** intravenous infusion to a concentration of 1 unit/mL; infuse at a fixed rate of 0.1 units/kg/hour.
- Established subcutaneous therapy with long-acting insulin analogues (insulin detemir or insulin glargine) should be continued during treatment of diabetic ketoacidosis.
- Monitor blood-ketone and blood-glucose concentrations hourly and adjust the insulin infusion rate accordingly. Blood-ketone concentration should fall by at least 0.5 mmol/litre/hour and blood-glucose concentration should fall by at least 3 mmol/litre/hour.
- Once blood-glucose concentration falls below 14 mmol/litre, **glucose 10%** should be given by intravenous infusion (into a large vein through a large-gauge needle) at a rate of 125 mL/hour, in addition to the **sodium chloride 0.9%** infusion.
- Continue insulin infusion until blood-ketone concentration is below 0.3 mmol/litre, blood pH is above 7.3 *and* the patient is able to eat and drink; ideally give subcutaneous fast-acting insulin and a meal, and stop the insulin infusion 1 hour later.

For the management of diabetic ketoacidosis in children under 18 years, see *BNF for Children*.

The management of hyperosmolar hyperglycaemic state or hyperosmolar hyperglycaemic nonketotic coma is similar to that of diabetic ketoacidosis, although lower rates of insulin infusion are usually necessary and slower rehydration may be required.

6.1.4 Treatment of hypoglycaemia

Initially glucose 10–20 g is given by mouth either in liquid form or as granulated sugar or sugar lumps. Approximately 10 g of glucose is available from non-diet versions of *Lucozade® Energy Original* 55 mL, *Coca-Cola®* 100 mL, *Ribena® Blackcurrant* 19 mL (to be diluted), 2 teaspoons of sugar, and also from 3 sugar lumps[2]. If necessary this may be repeated in 10–15 minutes. After initial treatment, a snack providing sustained availability of carbohydrate (e.g. a sandwich, fruit, milk, or biscuits) or the next meal, if it is due, can prevent blood-glucose concentration from falling again.

Hypoglycaemia which causes unconsciousness is an emergency. **Glucagon**, a polypeptide hormone produced by the alpha cells of the islets of Langerhans, increases plasma-glucose concentration by mobilising glycogen stored in the liver. In hypoglycaemia, if sugar cannot be given by mouth, glucagon can be given by injection. Carbohydrates should be given as soon as possible to restore liver glycogen; glucagon is not appropriate for chronic hypoglycaemia. Glucagon may

1. Available at www.diabetes.org.uk/About_us/What-we-say/Improving-diabetes-healthcare/The-Management-of-Diabetic-Ketoacidosis-in-Adults

2. Proprietary products of quick-acting carbohydrate (e.g. *GlucoGel®*, *Dextrogel®*, *GSF-Syrup®*, *Rapilose®* gel) are available on prescription for the patient to keep to hand in case of hypoglycaemia.

be issued to close relatives of insulin-treated patients for emergency use in hypoglycaemic attacks. It is often advisable to prescribe on an 'if necessary' basis to hospitalised insulin-treated patients, so that it may be given rapidly by the nurses during an hypoglycaemic emergency. If not effective in 10 minutes intravenous glucose should be given.

Alternatively, 50 mL of **glucose intravenous infusion 20%** (section 9.2.2) may be given intravenously into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs. Glucose intravenous infusion 10% may also be used but larger volumes are needed. Glucose intravenous infusion 50% is not recommended because of the higher risk of extravasation injury and because administration is difficult. Close monitoring is necessary in the case of an overdose with a long-acting insulin because further administration of glucose may be required. Patients whose hypoglycaemia is caused by an oral antidiabetic drug should be transferred to hospital because the hypoglycaemic effects of these drugs may persist for many hours.

For advice on the emergency management of hypoglycaemia in dental practice, see p. 29.

GLUCAGON

Indications see notes above and under Dose

Cautions see notes above, insulinoma, glucagonoma; ineffective in chronic hypoglycaemia, starvation, and adrenal insufficiency

Contra-indications phaeochromocytoma

Side-effects nausea, vomiting, abdominal pain, hypokalaemia, hypotension, rarely hypersensitivity reactions

Dose

- Insulin-induced hypoglycaemia, by subcutaneous *or* intramuscular injection, ADULT and CHILD over 8 years (or body-weight over 25 kg), 1 mg; CHILD under 8 years (or body-weight under 25 kg), 500 micrograms; if no response within 10 minutes intravenous glucose must be given
- Diagnostic aid, consult product literature
- Beta-blocker poisoning, see p. 39

  Note 1 unit of glucagon = 1 mg of glucagon

[1]**GlucaGen® HypoKit** (Novo Nordisk) PoM

Injection, powder for reconstitution, glucagon (rys) as hydrochloride with lactose, net price 1-mg vial with prefilled syringe containing water for injection = £11.52

Chronic hypoglycaemia

Diazoxide, administered by mouth, is useful in the management of patients with chronic hypoglycaemia from excess endogenous insulin secretion, either from an islet cell tumour or islet cell hyperplasia. It has no place in the management of acute hypoglycaemia.

DIAZOXIDE

Indications chronic intractable hypoglycaemia

Cautions impaired cardiac or cerebral circulation; heart failure; aortic coarctation; aortic stenosis; arteriovenous shunt; monitor blood pressure; hyperuricaemia; during prolonged use monitor white cell and platelet count; **interactions:** Appendix 1 (diazoxide)

Renal impairment dose reduction may be required

Pregnancy use only if essential; alopecia and hypertrichosis reported in neonates with prolonged use; may inhibit uterine activity during labour

Breast-feeding manufacturer advises avoid—no information available

Side-effects nausea, vomiting, abdominal pain, diarrhoea, constipation, ileus, pancreatitis, anorexia (prolonged use), taste disturbance, bleeding, heart failure, hypotension, pulmonary hypertension, dyspnoea, extrapyramidal effects, headache, dizziness, galactorrhoea, hyperglycaemia, decreased libido, leucopenia, thrombocytopenia, anaemia, eosinophilia, hyperosmolar non-ketotic coma, raised serum creatinine and urea, reversible nephritic syndrome, sodium and fluid retention, hyperuricaemia (prolonged use), musculoskeletal pain, visual disturbances, transient cataracts, lacrimation, tinnitus, hypertrichosis, pruritus, dermatitis, lichenoid eruption

Dose

- By mouth, ADULT, initially 5 mg/kg daily in 2–3 divided doses, then adjusted according to response; usual maintenance dose 3–8 mg/kg daily in 2–3 divided doses; CHILD 1 month–18 years see *BNF for Children*

Eudemine® (PharSafer) PoM

Tablets, diazoxide 50 mg. Net price 100 = £46.45

1. PoM restriction does not apply where administration is for saving life in emergency

6.1.5 Treatment of diabetic nephropathy and neuropathy

Diabetic nephropathy

Regular review of diabetic patients should include an annual test for urinary protein (using *Albustix®*) and serum creatinine measurement. If the urinary protein test is negative, the urine should be tested for microalbuminuria (the earliest sign of nephropathy). If reagent strip tests (*Micral-Test II®* NHS or *Microbumintest®* NHS) are used and prove positive, the result should be confirmed by laboratory analysis of a urine sample. Provided there are no contra-indications, all diabetic patients with nephropathy causing proteinuria or with established microalbuminuria (at least 3 positive tests) should be treated with an ACE inhibitor (section 2.5.5.1) or an angiotensin-II receptor antagonist (section 2.5.5.2) even if the blood pressure is normal; in any case, to minimise the risk of renal deterioration, blood pressure should be carefully controlled (section 2.5).

ACE inhibitors can potentiate the hypoglycaemic effect of insulin and oral antidiabetic drugs; this effect is more likely during the first weeks of combined treatment and in patients with renal impairment.

For the treatment of hypertension in diabetes, see section 2.5.

Diabetic neuropathy

Optimal diabetic control is beneficial for the management of *painful neuropathy* in patients with type 1 diabetes (see also section 4.7.3). **Paracetamol** (p. 276) or a non-steroidal anti-inflammatory drug such as **ibuprofen** (p. 708) may relieve *mild to moderate pain*.

Duloxetine (p. 259) is effective for the treatment of painful diabetic neuropathy; **amitriptyline** (p. 250) [unlicensed use] can be used if duloxetine is ineffective or unsuitable. **Nortriptyline** (p. 252) [unlicensed] may be better tolerated than amitriptyline. If treatment with amitriptyline or duloxetine is inadequate, treatment with **pregabalin** (p. 304) should be tried. Combination therapy of duloxetine or amitriptyline with pregabalin can be used if monotherapy at the maximum tolerated dose does not control symptoms.

Neuropathic pain may respond to opioid analgesics. There is evidence of efficacy for **tramadol** (p. 290), **morphine** (p. 286), and **oxycodone** (p. 287); however, treatment with morphine or oxycodone should be initiated only under specialist supervision. Tramadol can be prescribed while the patient is waiting for assessment by a specialist if other treatments have been unsuccessful.

Gabapentin (p. 303) and **carbamazepine** (p. 300) are sometimes used for the treatment of neuropathic pain. **Capsaicin** cream 0.075% (p. 738) is licensed for painful diabetic neuropathy and may have some effect, but it produces an intense burning sensation during the initial treatment period.

In *autonomic neuropathy* diabetic diarrhoea can often be managed by 2 or 3 doses of **tetracycline** 250 mg [unlicensed use] (p. 375). Otherwise **codeine** (p. 59) is the best drug, but other antidiarrhoeal preparations can be tried. Erythromycin (especially when given intravenously) may be beneficial for gastroparesis [unlicensed use] but this needs confirmation.

In *neuropathic postural hypotension* increased salt intake and the use of the mineralocorticoid **fludrocortisone** 100–400 micrograms daily [unlicensed use] (p. 483) may help by increasing plasma volume, but uncomfortable oedema is a common side-effect. Fludrocortisone can also be combined with **flurbiprofen** (p. 708) and **ephedrine hydrochloride** (p. 189) [both unlicensed]. **Midodrine** [unlicensed], an alpha agonist, may also be useful in postural hypotension.

Gustatory sweating can be treated with an antimuscarinic such as **propantheline bromide** (p. 49); side-effects are common. For the management of hyperhidrosis, see section 13.12.

In some patients with *neuropathic oedema*, ephedrine hydrochloride [unlicensed use] 30–60 mg 3 times daily offers effective relief.

For the management of erectile dysfunction, see section 7.4.5.

6.1.6 Diagnostic and monitoring devices for diabetes mellitus

Blood monitoring

Blood **glucose** monitoring using a meter gives a direct measure of the glucose concentration at the time of the test and can detect hypoglycaemia as well as hyperglycaemia. Patients should be properly trained in the use of blood glucose monitoring systems and to take appropriate action on the results obtained. Inadequate understanding of the normal fluctuations in blood glucose can lead to confusion and inappropriate action.

Meters and test strips

Meter (all NHS)	Type of monitoring	Compatible test strips	Test strip net price	Sensitivity range (mmol/litre)	Manufacturer
Accu-Chek® Active[1]	Blood glucose	**Active®**	50-strip pack = £9.95	0.6–33.3	Roche Diagnostics

1. Free of charge from diabetes healthcare professionals
2. Meter no longer available

Patients using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen.

Self-monitoring of blood-glucose concentration is appropriate for patients with type 2 diabetes:

- who are treated with insulin;
- who are treated with oral hypoglycaemic drugs e.g. sulfonylureas, to provide information on hypoglycaemia;
- to monitor changes in blood-glucose concentration resulting from changes in lifestyle or medication, and during intercurrent illness;
- to ensure safe blood-glucose concentration during activities, including driving.

Note In the UK blood-glucose concentration is expressed in mmol/litre and Diabetes UK advises that these units should be used for self-monitoring of blood glucose. In other European countries units of mg/100 mL (or mg/dL) are commonly used.
It is advisable to check that the meter is pre-set in the correct units.

If the patient is unwell and diabetic ketoacidosis is suspected, blood **ketones** should be measured according to local guidelines (section 6.1.3). Patients and their carers should be trained in the use of blood ketone monitoring systems and to take appropriate action on the results obtained, including when to seek medical attention.

Urinalysis

Reagent strips are available for measuring for glucose in the urine. Tests for ketones by patients are rarely

required unless they become unwell—see also Blood Monitoring, p. 477.

Microalbuminuria can be detected with *Micral-Test II*® but this should be followed by confirmation in the laboratory, since false positive results are common.

Glucose

Diabur-Test 5000® (Roche Diagnostics)
Reagent strips, for detection of glucose in urine. Net price 50-strip pack = £2.87

Diastix® (Bayer Diabetes Care)
Reagent strips, for detection of glucose in urine. Net price 50-strip pack = £2.78

Medi-Test® Glucose (BHR)
Reagent strips, for detection of glucose in urine. Net price 50-strip pack = £2.33

Mission® Glucose (Spirit)
Reagent strips, for detection of glucose in urine. Net price 50-strip pack = £2.29

Ketones

Ketostix® (Bayer Diabetes Care)
Reagent strips, for detection of ketones in urine. Net price 50-strip pack = £3.03

Mission® Ketone (Spirit)
Reagent strips, for detection of ketones in urine. Net price 50-strip pack = £2.50

Protein

Albustix® (Siemens)
Reagent strips, for detection of protein in urine. Net price 50-strip pack = £4.10

Medi-Test® Protein 2 (BHR)
Reagent strips, for detection of protein in urine. Net price 50-strip pack = £3.27

Other reagent strips available for urinalysis include:

Combur-3 Test® (glucose and protein—Roche Diagnostics)

Clinitek Microalbumin® (albumin and creatinine—Siemens)

Ketodiastix® (glucose and ketones—Bayer Diagnostics)

Medi-Test Combi 2® (glucose and protein—BHR)

Micral-Test II® (albumin—Roche Diagnostics)

Microalbustix® (albumin and creatinine—Siemens)

Uristix® (glucose and protein—Siemens)

Oral glucose tolerance test

The oral glucose tolerance test is used mainly for diagnosis of impaired glucose tolerance; it is not recommended or necessary for routine diagnostic use when severe symptoms of hyperglycaemia are present. In patients who have less severe symptoms and blood glucose levels that do not establish or exclude diabetes (e.g. impaired fasting glycaemia), an oral glucose tolerance test may be required. It is also used to establish the presence of gestational diabetes. The oral glucose tolerance test generally involves giving anhydrous glucose 75 g (equivalent to Glucose BP 82.5 g) by mouth to the fasting patient, and measuring blood-glucose concentrations at intervals.

The appropriate amount of glucose should be given with 200–300 mL fluid. Anhydrous glucose 75 g may alternatively be given as 113 mL *Polycal*® with extra fluid to administer a total volume of 200–300 mL, or as *Rapilose*® *OGTT* oral solution.

6.2 Thyroid and antithyroid drugs

6.2.1 Thyroid hormones

Thyroid hormones are used in hypothyroidism (myxoedema), and also in diffuse non-toxic goitre, Hashimoto's thyroiditis (lymphadenoid goitre), and thyroid carcinoma. Neonatal hypothyroidism requires prompt treatment for normal development. **Levothyroxine sodium** (thyroxine sodium) is the treatment of choice for *maintenance* therapy.

In infants and children with congenital hypothyroidism and juvenile myxoedema, the dose of levothyroxine should be titrated according to clinical response, growth assessment, and measurements of plasma thyroxine and thyroid-stimulating hormone. See *BNF for Children* (section 6.2.1) for suitable dosage regimens.

Liothyronine sodium has a similar action to levothyroxine but is more rapidly metabolised and has a more rapid effect; 20–25 micrograms is equivalent to 100 micrograms of levothyroxine. Its effects develop after a few hours and disappear within 24 to 48 hours of discontinuing treatment. It may be used in *severe hypothyroid states* when a rapid response is desired.

Liothyronine by intravenous injection is the treatment of choice in *hypothyroid coma*. Adjunctive therapy includes intravenous fluids, hydrocortisone, and treatment of infection; assisted ventilation is often required.

LEVOTHYROXINE SODIUM
(Thyroxine sodium)

Indications hypothyroidism; see also notes above

Cautions panhypopituitarism or predisposition to adrenal insufficiency (initiate corticosteroid therapy before starting levothyroxine), elderly, cardiovascular disorders (including hypertension, myocardial insufficiency or myocardial infarction, see Initial Dosage below), long-standing hypothyroidism, diabetes insipidus, diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased); **interactions:** Appendix 1 (thyroid hormones)

Initial dosage Baseline ECG is valuable because changes induced by hypothyroidism can be confused with ischaemia. If metabolism increases too rapidly (causing diarrhoea, nervousness, rapid pulse, insomnia, tremors and sometimes anginal pain where there is latent myocardial ischaemia), reduce dose or withhold for 1–2 days and start again at a lower dose

Contra-indications thyrotoxicosis

Pregnancy levothyroxine may cross the placenta; excessive or insufficient maternal thyroid hormones can be detrimental to fetus; levothyroxine require-

ment may increase during pregnancy; assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of levothyroxine)

Breast-feeding amount too small to affect tests for neonatal hypothyroidism

Side-effects usually at excessive dosage (see Initial Dosage above) include diarrhoea, vomiting, anginal pain, arrhythmias, palpitation, tachycardia, tremor, restlessness, excitability, insomnia; headache, flushing, sweating, fever, heat intolerance, weight-loss, muscle cramp, and muscular weakness; transient hair loss in children; hypersensitivity reactions including rash, pruritus and oedema also reported

Dose

- ADULT over 18 years, initially 50–100 micrograms once daily, preferably taken at least 30 minutes before breakfast, caffeine-containing liquids (e.g. coffee, tea), or other medication, adjusted in steps of 25–50 micrograms every 3–4 weeks according to response (usual maintenance dose 100–200 micrograms once daily); in cardiac disease, severe hypothyroidism, and patients over 50 years, initially 25 micrograms once daily, adjusted in steps of 25 micrograms every 4 weeks according to response (usual maintenance dose 50–200 micrograms once daily); CHILD under 18 years see *BNF for Children* (section 6.2.1)
- Congenital hypothyroidism and juvenile myxoedema, see *BNF for Children* (section 6.2.1)

Levothyroxine (Non-proprietary) (PoM)

Tablets, levothyroxine sodium 25 micrograms, net price 28-tab pack = £2.58; 50 micrograms, 28-tab pack = £1.76; 100 micrograms, 28-tab pack = £1.76
Brands include *Eltroxin*®

Oral solution, levothyroxine sodium 25 micrograms/5 mL, net price 100 mL = £52.83; 50 micrograms/5 mL, 100 mL = £58.80; 100 micrograms/5 mL, 100 mL = £84.72

LIOTHYRONINE SODIUM

(L-Tri-iodothyronine sodium)

Indications see notes above

Cautions see under Levothyroxine Sodium; **interactions:** Appendix 1 (thyroid hormones)

Contra-indications see under Levothyroxine Sodium

Pregnancy does not cross the placenta in significant amounts; excessive or insufficient maternal thyroid hormones can be detrimental to fetus; liothyronine requirement may increase during pregnancy; assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of liothyronine)

Breast-feeding amount too small to affect tests for neonatal hypothyroidism

Side-effects see under Levothyroxine Sodium

Dose

- By mouth, initially 10–20 micrograms daily gradually increased to 60 micrograms daily in 2–3 divided doses; ELDERLY smaller initial doses; CHILD, adult dose reduced in proportion to body-weight
- By slow intravenous injection, hypothyroid coma, 5–20 micrograms repeated every 12 hours or as often as every 4 hours if necessary; *alternatively* initially 50 micrograms then 25 micrograms every 8 hours reducing to 25 micrograms twice daily

Liothyronine sodium (Non-proprietary) (PoM)

Tablets, scored, liothyronine sodium 20 micrograms, net price 28-tab pack = £102.30

Important Patients switched to a different brand should be monitored (particularly if pregnant or if heart disease present) as brands without a UK licence may not be bioequivalent and dose adjustment may be necessary; pregnant women or those with heart disease should undergo an early review of thyroid status, and other patients should have thyroid function assessed if experiencing a significant change in symptoms. If liothyronine is continued long-term, thyroid function tests should be repeated 1–2 months after any change in brand.

Injection, powder for reconstitution, liothyronine sodium, net price 20-microgram vial = £22.50

6.2.2 Antithyroid drugs

Antithyroid drugs are used for hyperthyroidism either to prepare patients for thyroidectomy or for long-term management. In the UK **carbimazole** is the most commonly used drug. **Propylthiouracil** should be reserved for patients who are intolerant of carbimazole or for those who experience sensitivity reactions to carbimazole (sensitivity is not necessarily displayed to both drugs), and for whom other treatments are inappropriate. Both drugs act primarily by interfering with the synthesis of thyroid hormones.

Neutropenia and agranulocytosis

Doctors are reminded of the importance of recognising bone marrow suppression induced by carbimazole and the need to stop treatment promptly.

1. Patient should be asked to report symptoms and signs suggestive of infection, especially sore throat.
2. A white blood cell count should be performed if there is any clinical evidence of infection.
3. Carbimazole should be stopped promptly if there is clinical or laboratory evidence of neutropenia.

Carbimazole is given in a dose of 15 to 40 mg daily; higher doses should be prescribed under specialist supervision only. This dose is continued until the patient becomes euthyroid, usually after 4 to 8 weeks and the dose is then gradually reduced to a maintenance dose of 5 to 15 mg. Therapy is usually given for 12 to 18 months. Treatment in children should be undertaken by a specialist, see *BNF for Children*. Rashes and pruritus are common but they can be treated with antihistamines without discontinuing therapy; alternatively propylthiouracil can be substituted. All patients should be advised to report any sore throat immediately because of the rare complication of agranulocytosis (see Neutropenia and Agranulocytosis, above).

Propylthiouracil is given in a dose of 200 to 400 mg daily in divided doses in adults and this dose is maintained until the patient becomes euthyroid; the dose may then be gradually reduced to a maintenance dose of 50 to 150 mg daily in divided doses.

Over-treatment with antithyroid drugs can result in the rapid development of hypothyroidism and should be avoided particularly during pregnancy because it can cause fetal goitre.

A combination of carbimazole, 40 to 60 mg daily with levothyroxine, 50 to 150 micrograms daily, may be used in a *blocking-replacement regimen*; therapy is usually given for 18 months. The blocking-replacement regimen is **not** suitable during pregnancy.

Iodine has been used as an adjunct to antithyroid drugs for 10 to 14 days before partial thyroidectomy; however, there is little evidence of a beneficial effect. Iodine should not be used for long-term treatment because its antithyroid action tends to diminish.

Radioactive sodium iodide (^{131}I) solution is used increasingly for the treatment of thyrotoxicosis at all ages, particularly where medical therapy or compliance is a problem, in patients with cardiac disease, and in patients who relapse after thyroidectomy.

Propranolol is useful for rapid relief of thyrotoxic symptoms and may be used in conjunction with antithyroid drugs or as an adjunct to radioactive iodine. Beta-blockers are also useful in neonatal thyrotoxicosis and in supraventricular arrhythmias due to hyperthyroidism. Propranolol has been used in conjunction with iodine to prepare mildly thyrotoxic patients for surgery but it is preferable to make the patient euthyroid with carbimazole. Laboratory tests of thyroid function are not altered by beta-blockers. Most experience in treating thyrotoxicosis has been gained with propranolol but **nadolol** is also used. For doses and preparations of beta-blockers see section 2.4.

Thyrotoxic crisis ('thyroid storm') requires emergency treatment with intravenous administration of fluids, propranolol (5 mg) and hydrocortisone (100 mg every 6 hours, as sodium succinate), as well as oral iodine solution and carbimazole or propylthiouracil which may need to be administered by nasogastric tube.

Pregnancy Radioactive iodine therapy is contra-indicated during pregnancy. Propylthiouracil and carbimazole can be given but the blocking-replacement regimen (see above) is **not** suitable. Rarely, carbimazole has been associated with congenital defects, including aplasia cutis of the neonate, therefore propylthiouracil remains the drug of choice during the first trimester of pregnancy. In the second trimester, consider switching to carbimazole because of the potential risk of hepatotoxicity with propylthiouracil. Both propylthiouracil and carbimazole cross the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves' disease tend to fall during pregnancy).

Breast-feeding Carbimazole and propylthiouracil are present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used.

CARBIMAZOLE

Indications hyperthyroidism

Contra-indications severe blood disorders

Hepatic impairment use with caution in mild to moderate impairment; avoid in severe impairment

Pregnancy neonatal goitre and hypothyroidism; has been associated with congenital defects including aplasia cutis of the neonate; see also notes above

Breast-feeding amount in milk may be sufficient to affect neonatal thyroid function therefore lowest effective dose should be used; see also notes above

Side-effects nausea, mild gastro-intestinal disturbances, taste disturbance, headache, fever, malaise, rash, pruritus, arthralgia; *rarely* myopathy, alopecia, bone marrow suppression (including pancytopenia and agranulocytosis, see Neutropenia and Agranulocytosis above), and jaundice

Counselling Warn patient to tell doctor **immediately** if sore throat, mouth ulcers, bruising, fever, malaise, or non-specific illness develops

Dose

- See notes above

Carbimazole (Non-proprietary) PoM

Tablets, carbimazole 5 mg, net price 100-tab pack = £45.67; 20 mg, 100-tab pack = £112.86. Counselling, blood disorder symptoms

IODINE AND IODIDE

Indications thyrotoxicosis (pre-operative)

Cautions children; not for long-term treatment

Pregnancy neonatal goitre and hypothyroidism; see also notes above

Breast-feeding stop breast-feeding; danger of neonatal hypothyroidism or goitre; appears to be concentrated in milk; see also notes above

Side-effects hypersensitivity reactions including coryza-like symptoms, headache, lacrimation, conjunctivitis, pain in salivary glands, laryngitis, bronchitis, rashes; on prolonged treatment depression, insomnia, impotence; goitre in infants of mothers taking iodides

Dose

- See under preparation

Aqueous Iodine Oral Solution

Oral solution, iodine 5%, potassium iodide 10% in purified water, freshly boiled and cooled, total iodine 130 mg/mL, net price 500 mL = £9.40. Label: 27

Dose 0.1–0.3 mL 3 times daily well diluted with milk or water

PROPYLTHIOURACIL

Indications hyperthyroidism

Cautions monitor for hepatotoxicity

Hepatotoxicity Severe hepatic reactions have been reported, including fatal cases and cases requiring liver transplant—discontinue if significant liver-enzyme abnormalities develop

Counselling Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, jaundice, dark urine, or pruritus develop

Hepatic impairment reduce dose (see also Hepatotoxicity above)

Renal impairment use three-quarters normal dose if eGFR 10–50 mL/minute/1.73 m^2; use half normal dose if eGFR less than 10 mL/minute/1.73 m^2

Pregnancy neonatal goitre and hypothyroidism; see also notes above

Breast-feeding monitor infant's thyroid status but amount in milk probably too small to affect infant; high doses may affect neonatal thyroid function; see also notes above

Side-effects see under Carbimazole; leucopenia; rarely cutaneous vasculitis, thrombocytopenia, aplastic anaemia, hypoprothrombinaemia, hepatic disorders (including hepatitis, hepatic failure, encephalopathy, hepatic necrosis; see also Hepato-

toxicity above), nephritis, lupus erythematous-like syndromes

Dose

- See notes above

Propylthiouracil (Non-proprietary) PoM

Tablets, propylthiouracil 50 mg, net price 56-tab pack = £58.93, 100-tab pack = £96.32

6.3 Corticosteroids

6.3.1 Replacement therapy

The adrenal cortex normally secretes hydrocortisone (cortisol) which has glucocorticoid activity and weak mineralocorticoid activity. It also secretes the mineralocorticoid aldosterone.

In deficiency states, physiological replacement is best achieved with a combination of **hydrocortisone** (section 6.3.2) and the mineralocorticoid **fludrocortisone**; hydrocortisone alone does not usually provide sufficient mineralocorticoid activity for complete replacement.

In *Addison's disease* or following adrenalectomy, **hydrocortisone** 20 to 30 mg daily by mouth is usually required. This is given in 2 doses, the larger in the morning and the smaller in the evening, mimicking the normal diurnal rhythm of cortisol secretion. The optimum daily dose is determined on the basis of clinical response. Glucocorticoid therapy is supplemented by fludrocortisone 50 to 300 micrograms daily.

In *acute adrenocortical insufficiency*, **hydrocortisone** is given intravenously (preferably as sodium succinate) in doses of 100 mg every 6 to 8 hours in sodium chloride intravenous infusion 0.9%.

In *hypopituitarism* glucocorticoids should be given as in adrenocortical insufficiency, but since production of aldosterone is also regulated by the renin-angiotensin system a mineralocorticoid is not usually required. Additional replacement therapy with levothyroxine (section 6.2.1) and sex hormones (section 6.4) should be given as indicated by the pattern of hormone deficiency.

FLUDROCORTISONE ACETATE

Indications mineralocorticoid replacement in adrenocortical insufficiency

Cautions section 6.3.2; **interactions:** Appendix 1 (corticosteroids)

Contra-indications section 6.3.2

Hepatic impairment section 6.3.2

Renal impairment section 6.3.2

Pregnancy section 6.3.2

Breast-feeding section 6.3.2

Side-effects section 6.3.2

Dose

- 50–300 micrograms daily; CHILD 1 month–18 years see *BNF for Children*

Florinef® (Squibb) PoM

Tablets, scored, fludrocortisone acetate 100 micrograms. Net price 100-tab pack = £5.05. Label: 10, steroid card

6.3.2 Glucocorticoid therapy

In comparing the relative potencies of corticosteroids in terms of their anti-inflammatory (glucocorticoid) effects it should be borne in mind that high glucocorticoid activity in itself is of no advantage unless it is accompanied by relatively low mineralocorticoid activity (see Disadvantages of Corticosteroids below). The mineralocorticoid activity of **fludrocortisone** (section 6.3.1) is so high that its anti-inflammatory activity is of no clinical relevance. The table below shows equivalent anti-inflammatory doses.

Equivalent anti-inflammatory doses of corticosteroids

This table takes no account of mineralocorticoid effects, nor does it take account of variations in duration of action

Prednisolone 5 mg	
≡	Betamethasone 750 micrograms
≡	Deflazacort 6 mg
≡	Dexamethasone 750 micrograms
≡	Hydrocortisone 20 mg
≡	Methylprednisolone 4 mg
≡	Prednisone 5 mg
≡	Triamcinolone 4 mg

The relatively high mineralocorticoid activity of **hydrocortisone**, and the resulting fluid retention, makes it unsuitable for disease suppression on a long-term basis. However, hydrocortisone can be used for adrenal replacement therapy (section 6.3.1). Hydrocortisone is used on a short-term basis by intravenous injection for the emergency management of some conditions. The relatively moderate anti-inflammatory potency of hydrocortisone also makes it a useful topical corticosteroid for the management of inflammatory skin conditions because side-effects (both topical and systemic) are less marked (section 13.4).

Prednisolone and **prednisone** have predominantly glucocorticoid activity. Prednisolone is the corticosteroid most commonly used by mouth for long-term disease suppression.

Betamethasone and **dexamethasone** have very high glucocorticoid activity in conjunction with insignificant mineralocorticoid activity. This makes them particularly suitable for high-dose therapy in conditions where fluid retention would be a disadvantage.

Betamethasone and dexamethasone also have a long duration of action and this, coupled with their lack of mineralocorticoid action makes them particularly suitable for conditions which require suppression of corticotropin (corticotrophin) secretion (e.g. congenital adrenal hyperplasia). Some esters of betamethasone and of **beclometasone** (beclomethasone) exert a considerably more marked topical effect (e.g. on the skin or the lungs) than when given by mouth; use is made of this to obtain topical effects whilst minimising systemic side-effects (e.g. for skin applications and asthma inhalations).

Deflazacort has a high glucocorticoid activity; it is derived from prednisolone.

Use of corticosteroids

Dosages of corticosteroids vary widely in different diseases and in different patients. If the use of a corticosteroid can save or prolong life, as in exfoliative dermatitis, pemphigus, acute leukaemia or acute transplant rejection, high doses may need to be given, because the complications of therapy are likely to be less serious than the effects of the disease itself.

When long-term corticosteroid therapy is used in some chronic diseases, the adverse effects of treatment may become greater than the disabilities caused by the disease. To minimise side-effects the maintenance dose should be kept as low as possible.

When potentially less harmful measures are ineffective corticosteroids are used topically for the treatment of inflammatory conditions of the skin (section 13.4). Corticosteroids should be avoided or used only under specialist supervision in psoriasis (section 13.5).

Corticosteroids are used both topically (by rectum) and systemically (by mouth or intravenously) in the management of ulcerative colitis and Crohn's disease (section 1.5). They are also included in locally applied creams for haemorrhoids (section 1.7.2).

Use can be made of the mineralocorticoid activity of fludrocortisone to treat postural hypotension in autonomic neuropathy (section 6.1.5).

High-dose corticosteroids should be avoided for the management of septic shock. However, there is evidence that administration of lower doses of hydrocortisone (50 mg intravenously every 6 hours) and fludrocortisone (50 micrograms daily by mouth) is of benefit in adrenocortical insufficiency resulting from septic shock.

Dexamethasone and betamethasone have little if any mineralocorticoid action and their long duration of action makes them particularly suitable for suppressing corticotropin secretion in congenital adrenal hyperplasia where the dose should be tailored to clinical response and by measurement of adrenal androgens and 17-hydroxyprogesterone. In common with all glucocorticoids their suppressive action on the hypothalamic-pituitary-adrenal axis is greatest and most prolonged when they are given at night. In most individuals a single dose of 1 mg of dexamethasone at night, is sufficient to inhibit corticotropin secretion for 24 hours. This is the basis of the 'overnight dexamethasone suppression test' for diagnosing Cushing's syndrome.

Betamethasone and dexamethasone are also appropriate for conditions where water retention would be a disadvantage.

A corticosteroid may be used in the management of raised intracranial pressure or cerebral oedema that occurs as a result of malignancy (see also Prescribing in Palliative Care p.); high doses of betamethasone or dexamethasone are generally used. However, a corticosteroid should **not** be used for the management of head injury or stroke because it is unlikely to be of benefit and may even be harmful.

In acute hypersensitivity reactions such as angioedema of the upper respiratory tract and anaphylaxis, corticosteroids are indicated as an adjunct to emergency treatment with adrenaline (epinephrine) (section 3.4.3). In such cases hydrocortisone (as sodium succinate) by intravenous injection in a dose of 100 to 300 mg may be required.

Corticosteroids are preferably used by inhalation in the management of asthma (section 3.2) but systemic therapy in association with bronchodilators is required for the emergency treatment of severe acute asthma (section 3.1.1).

Corticosteroids may also be useful in conditions such as autoimmune hepatitis, rheumatoid arthritis and sarcoidosis; they may also lead to remissions of acquired haemolytic anaemia (section 9.1.3), and some cases of the nephrotic syndrome (particularly in children) and thrombocytopenic purpura (section 9.1.4).

Corticosteroids can improve the prognosis of serious conditions such as systemic lupus erythematosus, temporal arteritis, and polyarteritis nodosa; the effects of the disease process may be suppressed and symptoms relieved, but the underlying condition is not cured, although it may ultimately remit. It is usual to begin therapy in these conditions at fairly high dose, such as 40 to 60 mg prednisolone daily, and then to reduce the dose to the lowest commensurate with disease control.

For other references to the use of corticosteroids see Prescribing in Palliative Care, section 8.2.2 (immunosuppression), section 10.1.2 (rheumatic diseases), section 11.4 (eye), section 12.1.1 (otitis externa), section 12.2.1 (allergic rhinitis), and section 12.3.1 (aphthous ulcers).

Administration

Whenever possible *local treatment* with creams, intra-articular injections, inhalations, eye-drops, or enemas should be used in preference to *systemic treatment.* The suppressive action of a corticosteroid on cortisol secretion is least when it is given as a single dose in the morning. In an attempt to reduce pituitary-adrenal suppression further, the total dose for two days can sometimes be taken as a single dose on alternate days; alternate-day administration has not been very successful in the management of asthma (section 3.2). Pituitary-adrenal suppression can also be reduced by means of intermittent therapy with short courses. In some conditions it may be possible to reduce the dose of corticosteroid by adding a small dose of an immunosuppressive drug (section 8.2.1).

Cautions and contra-indications of corticosteroids

Adrenal suppression

During prolonged therapy with corticosteroids, adrenal atrophy develops and can persist for years after stopping. Abrupt withdrawal after a prolonged period can lead to acute adrenal insufficiency, hypotension or death (see Withdrawal of Corticosteroids, below). Withdrawal can also be associated with fever, myalgia, arthralgia, rhinitis, conjunctivitis, painful itchy skin nodules and weight loss.

To compensate for a diminished adrenocortical response caused by prolonged corticosteroid treatment, any significant intercurrent illness, trauma, or surgical procedure requires a temporary increase in corticosteroid dose, or if already stopped, a temporary re-introduction of corticosteroid treatment. To avoid a precipitous fall in blood pressure during anaesthesia or in the immediate postoperative period, anaesthetists **must** know whether a patient is taking or has been taking a corticosteroid. A suitable regimen for cortico-

steroid replacement, in patients who have taken more than 10 mg prednisolone daily (or equivalent) within 3 months of surgery, is:

- *Minor surgery under general anaesthesia*—usual oral corticosteroid dose on the morning of surgery or hydrocortisone 25–50 mg (usually the sodium succinate) intravenously at induction; the usual oral corticosteroid dose is recommenced after surgery
- *Moderate or major surgery*—usual oral corticosteroid dose on the morning of surgery and hydrocortisone 25–50 mg intravenously at induction, followed by hydrocortisone 25–50 mg 3 times a day by intravenous injection for 24 hours after moderate surgery or for 48–72 hours after major surgery; the usual pre-operative oral corticosteroid dose is recommenced on stopping hydrocortisone injections

Patients on long-term corticosteroid treatment should carry a Steroid Treatment Card (see p. 487) which gives guidance on minimising risk and provides details of prescriber, drug, dosage and duration of treatment.

Infections

Prolonged courses of corticosteroids increase susceptibility to infections and severity of infections; clinical presentation of infections may also be atypical. Serious infections e.g. *septicaemia* and *tuberculosis* may reach an advanced stage before being recognised, and *amoebiasis* or *strongyloidiasis* may be activated or exacerbated (exclude before initiating a corticosteroid in those at risk or with suggestive symptoms). Fungal or viral *ocular infections* may also be exacerbated (see also section 11.4.1).

Chickenpox Unless they have had chickenpox, patients receiving oral or parenteral corticosteroids for purposes other than replacement should be regarded as being *at risk of severe chickenpox* (see Steroid Treatment Card). Manifestations of fulminant illness include pneumonia, hepatitis and disseminated intravascular coagulation; rash is not necessarily a prominent feature.

Passive immunisation with varicella–zoster immunoglobulin (section 14.5.2) is needed for exposed non-immune patients receiving systemic corticosteroids or for those who have used them within the previous 3 months. Confirmed chickenpox warrants specialist care and urgent treatment (section 5.3.2.1). Corticosteroids should not be stopped and dosage may need to be increased.

Topical, inhaled or rectal corticosteroids are less likely to be associated with an increased risk of severe chickenpox.

Measles Patients taking corticosteroids should be advised to take particular care to avoid exposure to measles and to seek immediate medical advice if exposure occurs. Prophylaxis with intramuscular normal immunoglobulin (section 14.5.1) may be needed.

Withdrawal of corticosteroids

The magnitude and speed of dose reduction in corticosteroid withdrawal should be determined on a case-by-case basis, taking into consideration the underlying condition that is being treated, and individual patient factors such as the likelihood of relapse and the duration of corticosteriod treatment. *Gradual* withdrawal of systemic corticosteroids should be considered in those whose disease is unlikely to relapse and have:

- received more than 40 mg prednisolone (or equivalent) daily for more than 1 week;
- been given repeat doses in the evening;
- received more than 3 weeks' treatment;
- recently received repeated courses (particularly if taken for longer than 3 weeks);
- taken a short course within 1 year of stopping long-term therapy;
- other possible causes of adrenal suppression.

Systemic corticosteroids may be stopped abruptly in those whose disease is unlikely to relapse *and* who have received treatment for 3 weeks or less *and* who are not included in the patient groups described above.

During corticosteroid withdrawal the dose may be reduced rapidly down to physiological doses (equivalent to prednisolone 7.5 mg daily) and then reduced more slowly. Assessment of the disease may be needed during withdrawal to ensure that relapse does not occur.

STEROID TREATMENT CARD

I am a patient on STEROID treatment which must not be stopped suddenly

- If you have been taking this medicine for more than three weeks, the dose should be reduced gradually when you stop taking steroids unless your doctor says otherwise.
- Read the patient information leaflet given with the medicine.
- Always carry this card with you and show it to anyone who treats you (for example a doctor, nurse, pharmacist or dentist). For one year after you stop the treatment, you must mention that you have taken steroids.
- If you become ill, or if you come into contact with anyone who has an infectious disease, consult your doctor promptly. If you have never had chickenpox, you should avoid close contact with people who have chickenpox or shingles. If you do come into contact with chickenpox, see your doctor urgently.
- Make sure that the information on the card is kept up to date.

Psychiatric reactions

Systemic corticosteroids, particularly in high doses, are linked to psychiatric reactions including euphoria, nightmares, insomnia, irritability, mood lability, suicidal thoughts, psychotic reactions, and behavioural disturbances. A serious paranoid state or depression with risk of suicide can be induced, particularly in patients with a history of mental disorder. These reactions frequently subside on reducing the dose or discontinuing the corticosteroid but they may also require specific management. Patients should be advised to seek medical advice if psychiatric symptoms (especially depression and suicidal thoughts) occur and they should also be alert to the rare possibility of such reactions during withdrawal of corticosteroid treatment.

Systemic corticosteroids should be prescribed with care in those predisposed to psychiatric reactions, including those who have previously suffered corticosteroid-induced psychosis, or who have a personal or family history of psychiatric disorders.

Advice to patients

A patient information leaflet should be supplied to every patient when a systemic corticosteroid is prescribed. Patients should especially be advised of the following (for details, see Infections, Adrenal Suppression, Psychiatric Reactions, and Withdrawal of Corticosteroids above):

- **Immunosuppression** Prolonged courses of corticosteroids can increase susceptibility to infection and serious infections can go unrecognised. Unless already immune, patients are at risk of severe **chickenpox** and should avoid close contact with people who have chickenpox or shingles. Similarly, precautions should also be taken against contracting **measles**;
- **Adrenal suppression** If the corticosteroid is given for longer than 3 weeks, treatment must not be stopped abruptly. Adrenal suppression can last for a year or more after stopping treatment and the patient must mention the course of corticosteroid when receiving treatment for any illness or injury;
- **Mood and behaviour changes** Corticosteroid treatment, especially with high doses, can alter mood and behaviour early in treatment—the patient can become confused, irritable and suffer from delusion and suicidal thoughts. These effects can also occur when corticosteroid treatment is being withdrawn. Medical advice should be sought if worrying psychological changes occur;
- **Other serious effects** Serious gastro-intestinal, musculoskeletal, and ophthalmic effects which require medical help can also occur; for details see Side-effects of Corticosteroids, p. 487.

Steroid treatment cards

Steroid treatment cards (see p. 487) should be issued where appropriate, and are available for purchase from:

3M Security Print and Systems Limited
Gorse Street, Chadderton
Oldham, OL9 9QH
Tel: 0845 610 1112

GP practices can obtain supplies through their Local Area Team Stores.

NHS Trusts can order supplies from www.nhsforms.co.uk or by emailing nhsforms@mmm.com.

Other cautions and contra-indications

Other cautions include: children and adolescents (growth restriction possibly irreversible), elderly (close supervision required particularly on long-term treatment); frequent monitoring required if history of tuberculosis (or X-ray changes), hypertension, recent myocardial infarction (rupture reported), congestive heart failure, diabetes mellitus including family history, osteoporosis (post-menopausal women at special risk), glaucoma (including family history), ocular herpes simplex—risk of corneal perforation, severe affective disorders (particularly if history of steroid-induced psychosis—see also Psychiatric Reactions, above), epilepsy, peptic ulcer, hypothyroidism, history of steroid myopathy, ulcerative colitis, diverticulitis, recent intestinal anastomoses, thromboembolic disorders; myasthenia gravis; **interactions:** Appendix 1 (corticosteroids).

Other contra-indications include: systemic infection (unless specific therapy given); avoid live virus vaccines in those receiving immunosuppressive doses (serum antibody response diminished).

Hepatic impairment

When corticosteroids are administered orally or parenterally, the plasma-drug concentration may be increased in patients with hepatic impairment. Corticosteroids should be used with caution in hepatic impairment and the patient should be monitored closely.

Renal impairment

Oral and parenteral preparations of corticosteroids should be used with caution in patients with renal impairment.

Pregnancy and breast-feeding

The benefit of treatment with corticosteroids during pregnancy and breast-feeding outweighs the risk; pregnant women with fluid retention should be monitored closely. Corticosteroid cover is required during labour.

Following a review of the data on the safety of systemic corticosteroids used in pregnancy and breast-feeding the CSM (May 1998) has concluded:

- corticosteroids vary in their ability to cross the placenta; betamethasone and dexamethasone cross the placenta readily while 88% of prednisolone is inactivated as it crosses the placenta;
- there is no convincing evidence that systemic corticosteroids increase the incidence of congenital abnormalities such as cleft palate or lip;
- when administration is prolonged or repeated during pregnancy, systemic corticosteroids increase the risk of intra-uterine growth restriction; there is no evidence of intra-uterine growth restriction following short-term treatment (e.g. prophylactic treatment for neonatal respiratory distress syndrome);
- any adrenal suppression in the neonate following prenatal exposure usually resolves spontaneously after birth and is rarely clinically important;
- prednisolone appears in small amounts in breast milk but maternal doses of up to 40 mg daily are unlikely to cause systemic effects in the infant; infants should be monitored for adrenal suppression if the mothers are taking a higher dose.

Side-effects of corticosteroids

Overdosage or prolonged use can exaggerate some of the normal physiological actions of corticosteroids leading to mineralocorticoid and glucocorticoid side-effects.

Mineralocorticoid side-effects include hypertension, sodium and water retention, and potassium and calcium loss. They are most marked with fludrocortisone, but are significant with hydrocortisone, corticotropin, and tetracosactide. Mineralocorticoid actions are negligible with the high potency glucocorticoids, betamethasone and dexamethasone, and occur only slightly with methylprednisolone, prednisolone, and triamcinolone.

Glucocorticoid side-effects include diabetes and osteoporosis (section 6.6), which is a danger, particularly in the elderly, as it can result in osteoporotic fractures for example of the hip or vertebrae; in addition high doses are associated with avascular necrosis of the femoral head. Muscle wasting (proximal myopathy) can also occur. Corticosteroid therapy is also weakly linked with peptic ulceration and perforation; there is no conclusive evidence that the use of enteric-coated preparations of prednisolone reduces the risk of peptic ulceration. See also Psychiatric Reactions, p. 486.

High doses of corticosteroids can cause Cushing's syndrome, with moon face, striae, and acne; it is usually reversible on withdrawal of treatment, but this must always be gradually tapered to avoid symptoms of acute adrenal insufficiency (**important:** see also Adrenal Suppression, p. 484).

In children, administration of corticosteroids may result in suppression of growth. For the effect of corticosteroids given in pregnancy, see Pregnancy and Breast-feeding, p. 486.

Side-effects can be minimised by using lowest effective dose for minimum period possible.

Other side-effects include: *gastro-intestinal effects*: dyspepsia, abdominal distension, acute pancreatitis, oesophageal ulceration and candidiasis; *musculoskeletal effects*: muscle weakness, vertebral and long bone fractures, tendon rupture; *endocrine effects*: menstrual irregularities and amenorrhoea, hirsutism, weight gain, hypercholesterolaemia, hyperlipidaemia, negative nitrogen and calcium balance, increased appetite; increased susceptibility to and severity of infection, reactivation of dormant tuberculosis; *neuropsychiatric effects*: psychological dependence, insomnia, increased intracranial pressure with papilloedema in children (usually after withdrawal), aggravation of schizophrenia, aggravation of epilepsy; *ophthalmic effects*: glaucoma, papilloedema, posterior subcapsular cataracts, corneal or scleral thinning and exacerbation of ophthalmic viral or fungal disease, increased intra-ocular pressure, exophthalmos; *also* impaired healing, petechiae, ecchymoses, facial erythema, suppression of skin test reactions, urticaria, hyperhidrosis, skin atrophy, bruising, telangiectasia, myocardial rupture following recent myocardial infarction, congestive heart failure, leucocytosis, hyperglycaemia, thromboembolism, nausea, malaise, hiccups, headache, vertigo.

For other references to the side-effects of corticosteroids see section 3.2 (asthma), section 11.4 (eye) and section 13.4 (skin).

BETAMETHASONE

Indications suppression of inflammatory and allergic disorders; congenital adrenal hyperplasia; see also notes above; ear (section 12.1.1); eye (section 11.4.1); nose (section 12.2.1); oral ulceration (section 12.3.1)

Cautions see notes above

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment see notes above

Pregnancy see notes above; transient effect on fetal movements and heart rate

Breast-feeding see notes above

Side-effects see notes above

Dose

- By mouth, usual range 0.5–5 mg daily; see also Administration (above)
- By intramuscular injection *or* slow intravenous injection *or* infusion, 4–20 mg, repeated up to 4 times in 24 hours; CHILD, by slow intravenous injection, up to 1 year 1 mg, 1–5 years 2 mg, 6–12 years 4 mg, repeated up to 4 times in 24 hours according to response

Betamethasone (Non-proprietary) PoM

Soluble tablets, betamethasone (as sodium phosphate) 500 micrograms, net price 100-tab pack = £19.52. Label: 10, steroid card, 13, 21

Betnesol® (RPH) PoM

Injection, betamethasone (as sodium phosphate) 4 mg/mL, net price 1-mL amp = £1.22. Label: 10, steroid card

DEFLAZACORT

Indications suppression of inflammatory and allergic disorders

Cautions see notes above

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment see notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above

Dose

- Usual maintenance 3–18 mg daily (acute disorders, initially up to 120 mg daily); see also Administration (above)

  CHILD 0.25–1.5 mg/kg daily (or on alternate days); see also Administration (above)

Calcort® (Sanofi-Aventis) PoM

Tablets, deflazacort 6 mg, net price 60-tab pack = £15.82. Label: 5, 10, steroid card

DEXAMETHASONE

Indications suppression of inflammatory and allergic disorders; diagnosis of Cushing's disease, congenital adrenal hyperplasia; cerebral oedema associated with malignancy; croup (section 3.1); nausea and vomiting with chemotherapy (section 8.1); rheumatic disease (section 10.1.2); eye (section 11.4.1); see also notes above

Cautions see notes above

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment see notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above; also perineal irritation may follow intravenous administration of the phosphate ester

Dose

- By mouth, usual range 0.5–10 mg daily; CHILD 10–100 micrograms/kg daily; see also Administration (above)
- By intramuscular injection *or* slow intravenous injection *or* infusion, see under preparations

Dexamethasone (Non-proprietary) PoM

Tablets, dexamethasone 500 micrograms, net price 28-tab pack = £48.00; 2 mg, 50-tab pack = £21.16, 100-tab pack = £12.05. Label: 10, steroid card, 21

Oral solution, sugar-free, dexamethasone (as sodium phosphate) 2 mg/5 mL, net price 75-mL= £32.50, 150-mL = £42.30. Label: 10, steroid card, 21

Brands include *Dexsol*®, *Martapan*®

Injection, dexamethasone (as sodium phosphate) 4 mg/mL, net price 1-mL amp = 91p. Label: 10, steroid card

Dose By intramuscular injection *or* slow intravenous injection *or* infusion, 0.4–20 mg; CHILD 200–400 micrograms/kg daily

Cerebral oedema, by intravenous injection 8–16 mg initially, then 5 mg by intramuscular injection *or* intravenous injection every 6 hours as required for 2–4 days then gradually reduced and stopped over 5–7 days

Adjunctive treatment of bacterial meningitis, (starting before or with first dose of antibacterial treatment), [unlicensed indication], by intravenous injection 8.3 mg every 6 hours for 4 days; CHILD 3 months–18 years see *BNF for Children*

Injection, dexamethasone (as sodium phosphate) 3.3 mg/mL, net price 1-mL amp = £1.14, 2-mL vial = £4.80. Label: 10, steroid card

Dose by intramuscular injection *or* slow intravenous injection *or* infusion, 0.4–20 mg; CHILD 167–333 micrograms/kg daily

Cerebral oedema associated with malignancy, by intravenous injection 8.3 mg initially, then 3.3 mg by intramuscular injection every 6 hours as required for 2–4 days then gradually reduced and stopped over 5–7 days

Adjunctive treatment of bacterial meningitis, (starting before or with first dose of antibacterial treatment), [unlicensed indication], by intravenous injection 8.3 mg every 6 hours for 4 days; CHILD 3 months–18 years see *BNF for Children*

HYDROCORTISONE

Indications adrenocortical insufficiency (section 6.3.1); shock; see also notes above; hypersensitivity reactions e.g. anaphylaxis and angioedema (section 3.4.3); asthma (section 3.1); severe inflammatory bowel disease (section 1.5); haemorrhoids (section 1.7.2); rheumatic disease (section 10.1.2); skin (section 13.4)

Cautions see notes above

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment see notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above; also phosphate ester associated with paraesthesia and pain (particularly in the perineal region)

Dose

- By mouth, replacement therapy, 20–30 mg daily in divided doses—see section 6.3.1; CHILD 1 month–18 years see *BNF for Children*
- By intramuscular injection *or* slow intravenous injection *or* infusion, 100–500 mg, 3–4 times in 24 hours or as required; CHILD by slow intravenous injection up to 1 year 25 mg, 1–5 years 50 mg, 6–12 years 100 mg

Hydrocortisone (Non-proprietary) PoM

Tablets, scored, hydrocortisone 10 mg, net price 30-tab pack = £58.52; 20 mg, 30-tab pack = £65.03. Label: 10, steroid card, 21

[1]**Efcortesol**® (AMCo) PoM

Injection, hydrocortisone 100 mg (as sodium phosphate)/mL, net price 1-mL amp = £1.08, 5-mL amp = £4.89. Label: 10, steroid card

Note Paraesthesia and pain (particularly in the perineal region) may follow intravenous injection of the phosphate ester

[1]**Solu-Cortef**® (Pharmacia) PoM

Injection, powder for reconstitution, hydrocortisone (as sodium succinate). Net price 100-mg vial = 92p, 100-mg vial with 2-mL amp water for injections = £1.16. Label: 10, steroid card

Modified release

Plenadren® (ViroPharma) ▼ PoM

Tablets, m/r, hydrocortisone 5 mg (pink), net price 50-tab pack = £242.50; 20 mg (white), 50-tab pack = £400.00. Label: 10, steroid card, 22, 25

Dose replacement in adrenocortical insufficiency, ADULT over 18 years, usual dose 20–30 mg once daily in the morning, adjusted according to response

Note When switching from immediate-release hydrocortisone tablets to *Plenadren*® use same total daily dose. Bioavailability of *Plenadren*® lower than immediate-release tablets—monitor clinical response

METHYLPREDNISOLONE

Indications suppression of inflammatory and allergic disorders; severe inflammatory bowel disease (section 1.5); cerebral oedema associated with malignancy; see also notes above; rheumatic disease (section 10.1.2); skin (section 13.4)

Cautions see notes above; also rapid intravenous administration of large doses associated with cardiovascular collapse

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment see notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above

Dose

- By mouth, usual range 2–40 mg daily; see also Administration (above)
- By intramuscular injection *or* slow intravenous injection *or* infusion, initially 10–500 mg; graft rejection, up to 1 g daily by intravenous infusion for up to 3 days

Medrone® (Pfizer) PoM

Tablets, scored, methylprednisolone 2 mg (pink), net price 30-tab pack = £3.88; 4 mg, 30-tab pack = £6.19; 16 mg, 30-tab pack = £17.17; 100 mg (blue), 20-tab pack = £48.32. Label: 10, steroid card, 21

1. PoM restriction does not apply where administration is for saving life in emergency

Solu-Medrone® (Pharmacia) PoM

Injection, powder for reconstitution, methylprednisolone (as sodium succinate) (all with solvent). Net price 40-mg vial = £1.58; 125-mg vial = £4.75; 500-mg vial = £9.60; 1-g vial = £17.30; 2-g vial = £32.86. Label: 10, steroid card

Intramuscular depot

Depo-Medrone® (Pharmacia) PoM

Injection (aqueous suspension), methylprednisolone acetate 40 mg/mL. Net price 1-mL vial = £3.44; 2-mL vial = £6.18; 3-mL vial = £8.96. Label: 10, steroid card

Dose by deep intramuscular injection into gluteal muscle, 40–120 mg, a second injection may be given after 2–3 weeks if required

PREDNISOLONE

Indications suppression of inflammatory and allergic disorders; see also notes above; inflammatory bowel disease (section 1.5); asthma (section 3.1 and section 3.2); croup (section 3.1); immunosuppression (section 8.2.2); rheumatic disease (section 10.1.2); eye (section 11.4.1); ear (section 12.1.1)

Cautions see notes above; also Duchenne's muscular dystrophy (possible transient rhabdomyolysis and myoglobinuria following strenuous physical activity)

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment see notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above

Dose

- By mouth, initially, up to 10–20 mg daily (severe disease, up to 60 mg daily), preferably taken in the morning after breakfast; can often be reduced within a few days but may need to be continued for several weeks or months

  Maintenance, usual range, 2.5–15 mg daily, but higher doses may be needed; cushingoid side-effects increasingly likely with doses above 7.5 mg daily
- By intramuscular injection, prednisolone acetate (section 10.1.2.2), 25–100 mg once or twice weekly

Prednisolone (Non-proprietary) PoM

Tablets, prednisolone 1 mg, net price 28-tab pack = £1.03; 5 mg, 28-tab pack = £1.31; 25 mg, 56-tab pack = £40.00. Label: 10, steroid card, 21

Tablets, e/c, prednisolone 2.5 mg (brown), net price 28-tab pack = £1.86, 100-tab pack = £13.43; 5 mg (red), 28-tab pack = £1.89, 100-tab pack = £13.54. Label: 5, 10, steroid card, 25

Brands include *Deltacortril®*

Soluble tablets, prednisolone 5 mg (as sodium phosphate), net price 30-tab pack = £42.78. Label: 10, steroid card, 13, 21

Injection, see section 10.1.2.2

PREDNISONE

Indications moderate to severe rheumatoid arthritis (section 10.1.2.1)

Cautions see notes above

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment see notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above

Dose

- ADULT over 18 years, initially 10–20 mg at bedtime, adjusted according to response

Lodotra® (Napp) PoM

Tablets, m/r, yellow, prednisone 1 mg, net price 30-tab pack = £26.70; 2 mg, 30-tab pack = £26.70, 100-tab pack = £89.00; 5 mg, 30-tab pack = £26.70, 100-tab pack = £89.00. Label: 10, steroid card, 21, 25

TRIAMCINOLONE

Indications suppression of inflammatory and allergic disorders; see also notes above; rheumatic disease (section 10.1.2); skin (section 13.4)

Cautions see notes above; also high dosage may cause proximal myopathy, avoid in chronic therapy

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment see notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above

Dose

- By deep intramuscular injection, into gluteal muscle, 40 mg of acetonide for depot effect, repeated at intervals according to the patient's response; max. single dose 100 mg

Kenalog® Intra-articular/Intramuscular (Squibb) PoM

Injection (aqueous suspension), triamcinolone acetonide 40 mg/mL, net price 1-mL vial = £1.49. Label: 10, steroid card

6.4 Sex hormones

6.4.1 Female sex hormones and their modulators

6.4.1.1 Oestrogens and HRT

Oestrogens are necessary for the development of female secondary sexual characteristics; they also stimulate myometrial hypertrophy with endometrial hyperplasia.

In terms of oestrogenic activity *natural oestrogens* (estradiol (oestradiol), estrone (oestrone), and estriol (oestriol)) have a more appropriate profile for hormone replacement therapy (HRT) than *synthetic oestrogens* (ethinylestradiol (ethinyloestradiol) and mestranol). Tibolone has oestrogenic, progestogenic and weak androgenic activity.

Oestrogen therapy is given cyclically or continuously for a number of gynaecological conditions. If long-term therapy is required in women with a uterus, a progestogen should normally be added to reduce the risk of cystic hyperplasia of the endometrium (or of endometriotic foci in women who have had a hysterectomy) and possible transformation to cancer.

Oestrogens are no longer used to suppress lactation because of their association with thromboembolism.

Hormone replacement therapy

Hormone replacement therapy (HRT) with small doses of an oestrogen (together with a progestogen in women with a uterus) is appropriate for alleviating menopausal symptoms such as vaginal atrophy or vasomotor instability. Oestrogen given systemically in the perimenopausal and postmenopausal period or tibolone given in the postmenopausal period also diminish postmenopausal osteoporosis (section 6.6.1) but other drugs (section 6.6) are preferred. Menopausal atrophic vaginitis may respond to a short course of a topical vaginal oestrogen preparation (section 7.2.1) used for a few weeks and repeated if necessary.

Systemic therapy with an oestrogen or drugs with oestrogenic properties alleviates the symptoms of oestrogen deficiency such as vasomotor symptoms. Tibolone combines oestrogenic and progestogenic activity with weak androgenic activity; it is given continuously, without cyclical progestogen.

HRT may be used in women with early natural or surgical menopause (before age 45 years), since they are at high risk of osteoporosis. For early menopause, HRT can be given until the approximate age of natural menopause (i.e. until age 50 years). Alternatives to HRT should be considered if osteoporosis is the main concern (section 6.6).

Clonidine (section 2.5.2 and section 4.7.4.2) may be used to reduce vasomotor symptoms in women who cannot take an oestrogen, but clonidine may cause unacceptable side-effects.

HRT increases the risk of venous thromboembolism, stroke, endometrial cancer (reduced by a progestogen), breast cancer, and ovarian cancer; there is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. For details of these risks see HRT Risk table, below.

HRT Risk

Risk	Age range (years)	Background incidence per 1000 women in Europe not using HRT		**Additional** cases per 1000 women using **oestrogen only HRT** (estimated)		**Additional** cases per 1000 women using **combined (oestrogen-progestogen) HRT** (estimated)	
		Over 5 years	Over 10 years	For 5 years' use	For 10 years' use	For 5 years' use	For 10 years' use
Breast cancer[1]	50–59	10	20	2	6	6	24
	60–69	15	30	3	9	9	36
Endometrial cancer[2,3]	50–59	2	4	4	32	NS	NS
	60–69	3	6	6	48	NS	NS
Ovarian cancer	50–59	2	4	<1	1	<1	1
	60–69	3	6	<1	2	<1	2
Venous thromboembolism[4,5]	50–59	5	–	2	–	7	–
	60–69	8	–	2	–	10	–
Stroke[6]	50–59	4	–	1	–	1	–
	60–69	9	–	3	–	3	–
Coronary heart disease[7,8]	70–79	29–44	–	NS	–	15	–

Note Where background incidence or additional cases have not been included in the table, this indicates a lack of available data. NS indicates a non-significant difference
Taken from MHRA/CHM (*Drug Safety Update* 2007; 1 (2): 2–6) available at www.mhra.gov.uk/drugsafetyupdate

1. Tibolone increases the risk of breast cancer but to a lesser extent than with combined HRT.
2. Evidence suggests an increased risk of endometrial cancer with tibolone. After 2.7 years of use (in women of average age 68 years), 1 extra case of endometrial hyperplasia and 4 extra cases of endometrial cancer were diagnosed compared with placebo users.
3. The risk of endometrial cancer cannot be reliably estimated in those using combined HRT because the addition of progestogen for at least 10 days per 28-day cycle greatly reduces the additional risk, and addition of a daily progestogen eliminates the additional risk. The risk of endometrial cancer in women who have not used HRT increases with body mass index (BMI); the increased risk of endometrial cancer in users of oestrogen-only HRT or tibolone is more apparent in women who are not overweight.
4. Limited data does not suggest an increased risk of thromboembolism with tibolone compared with combined HRT or women not taking HRT.
5. Although the level of risk of thromboembolism associated with non-oral routes of administration of HRT has not been established, it may be lower for the transdermal route.
6. Tibolone increases the risk of stroke about 2.2 times from the first year of treatment; risk of stroke is age-dependent and therefore the absolute risk of stroke with tibolone increases with age.
7. Increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause.
8. There is insufficient data to draw a conclusion on the risk of coronary heart disease with tibolone.

The minimum effective dose of HRT should be used for the shortest duration. Treatment should be reviewed at least annually and for osteoporosis alternative treatments considered (section 6.6). HRT does not prevent coronary heart disease or protect against a decline in cognitive function and it should **not** be prescribed for these purposes. Experience of treating women over 65 years with HRT is limited.

For the treatment of menopausal symptoms the benefits of short-term HRT outweigh the risks in the majority of women, especially in those aged under 60 years.

Risk of breast cancer It is estimated that using *all* types of HRT, including tibolone, increases the risk of breast cancer within 1–2 years of initiating treatment, see HRT Risk table, p. 490 for details. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping.

Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use; tibolone has only a limited effect on mammographic density.

Risk of endometrial cancer The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT, see HRT Risk table, p. 490 for details.

In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

Risk of ovarian cancer Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer, see HRT Risk table, p. 490 for details; this excess risk disappears within a few years of stopping.

Risk of venous thromboembolism Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use, see HRT Risk table, p. 490 for details.

In *women who have predisposing factors* (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits. See below for advice on surgery.

Travel involving prolonged immobility further increases the risk of deep vein thrombosis, see under Travel in section 7.3.1.

Risk of stroke Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke. Tibolone increases the risk of stroke about 2.2 times from the first year of treatment, see HRT Risk table, p. 490 for details.

Risk of coronary heart disease HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause, see HRT Risk table, p. 490 for details. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.

Choice The choice of HRT for an individual depends on an overall balance of indication, risk, and convenience. A woman with a uterus normally requires oestrogen with cyclical progestogen for the last 12 to 14 days of the cycle *or* a preparation which involves continuous administration of an oestrogen and a progestogen (*or* one which provides both oestrogenic and progestogenic activity in a single preparation). Continuous combined preparations or tibolone are **not suitable** for use in the perimenopause or within 12 months of the last menstrual period; women who use such preparations may bleed irregularly in the early stages of treatment—if bleeding continues endometrial abnormality should be ruled out and consideration given to changing to cyclical HRT.

An oestrogen alone is suitable for continuous use in women without a uterus. However, in endometriosis, endometrial foci may remain despite hysterectomy and the addition of a progestogen should be considered in these circumstances.

An oestrogen may be given by mouth or by transdermal administration, which avoids first-pass metabolism. For the use of topical HRT preparations see section 7.2.1.

Contraception HRT does **not** provide contraception and a woman is considered potentially fertile for 2 years after her last menstrual period if she is under 50 years, and for 1 year if she is over 50 years. A woman who is under 50 years and free of all risk factors for venous and arterial disease can use a low-oestrogen combined oral contraceptive pill (section 7.3.1) to provide both relief of menopausal symptoms and contraception; it is recommended that the oral contraceptive be stopped at 50 years of age since there are more suitable alternatives. If any potentially fertile woman needs HRT, non-hormonal contraceptive measures (such as condoms) are necessary.

Measurement of follicle-stimulating hormone can help to determine fertility, but high measurements alone (particularly in women aged under 50 years) do not necessarily preclude the possibility of becoming pregnant.

Surgery Major surgery under general anaesthesia, including orthopaedic and vascular leg surgery, is a predisposing factor for venous thromboembolism and it may be prudent to stop HRT 4–6 weeks before surgery (see Risk of Venous Thromboembolism, above); it should be restarted only after full mobilisation. If HRT is continued or if discontinuation is not possible (e.g. in non-elective surgery), prophylaxis with unfractionated or low molecular weight heparin and graduated compression hosiery is advised.

Reasons to stop HRT For circumstances in which HRT should be stopped, see p. 537.

OESTROGENS FOR HRT

Note Relates only to small amounts of oestrogens given for hormone replacement therapy

Indications see notes above and under preparations

Cautions prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer (see notes above); migraine (or migraine-like

headaches); diabetes (increased risk of heart disease); history of breast nodules or fibrocystic disease—closely monitor breast status (risk of breast cancer, see notes above); risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative); uterine fibroids may increase in size, symptoms of endometriosis may be exacerbated; history of endometrial hyperplasia; factors predisposing to thromboembolism (see notes above); presence of antiphospholipid antibodies (increased risk of thrombotic events); increased risk of gall-bladder disease reported; hypophyseal tumours; acute porphyria (see section 9.8.2); **interactions:** Appendix 1 (oestrogens)

Other conditions The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present, see above). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

Contra-indications oestrogen-dependent cancer, history of breast cancer, active thrombophlebitis, active or recent arterial thromboembolic disease (e.g. angina or myocardial infarction), venous thromboembolism, or history of recurrent venous thromboembolism (unless already on anticoagulant treatment), thrombophilic disorder, liver disease (where liver function tests have failed to return to normal), Dubin-Johnson and Rotor syndromes (or monitor closely), untreated endometrial hyperplasia, undiagnosed vaginal bleeding

Hepatic impairment see Combined Hormonal Contraceptives, section 7.3.1

Renal impairment see Other Conditions, above

Pregnancy see Combined Hormonal Contraceptives, section 7.3.1

Breast-feeding see Combined Hormonal Contraceptives, section 7.3.1

Side-effects see notes above for risks of long-term use; nausea and vomiting, abdominal cramps and bloating, weight changes, breast enlargement and tenderness, premenstrual-like syndrome, sodium and fluid retention, cholestatic jaundice, glucose intolerance, altered blood lipids—may lead to pancreatitis, rashes and chloasma, changes in libido, depression, mood changes, headache, migraine, dizziness, leg cramps (rule out venous thrombosis), vaginal candidiasis, contact lenses may irritate; transdermal delivery systems may cause contact sensitisation (possible severe hypersensitivity reaction on continued exposure), and headache has been reported on vigorous exercise

Withdrawal bleeding Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in *regular withdrawal bleeding* towards the end of the progestogen. The aim of continuous combined HRT (where a combination of oestrogen and progestogen is taken, usually in a single tablet, throughout each 28-day treatment cycle) is to avoid bleeding, but *irregular bleeding* may occur during the early treatment stages (if it continues endometrial abnormality should be excluded and consideration given to cyclical HRT instead)

Dose

- See under preparations

Counselling on patches Patch should be removed after 3–4 days (or once a week in case of 7-day patch) and replaced with fresh patch on slightly different site; recommended sites: clean, dry, unbroken areas of skin on trunk below waistline; not to be applied on or near breasts or under waistband. If patch falls off in bath allow skin to cool before applying new patch

Conjugated oestrogens with progestogen

For prescribing information on progestogens, see section 6.4.1.2

Premique® (Pfizer) PoM

Premique® Low Dose tablets, m/r, ivory, s/c, conjugated oestrogen (equine) 300 micrograms and medroxyprogesterone acetate 1.5 mg, net price 3 × 28-tab pack = £6.52

Dose menopausal symptoms in women with a uterus, 1 tablet daily continuously

Premique® tablets, s/c, blue, conjugated oestrogen (equine) 625 micrograms and medroxyprogesterone acetate 5 mg, net price 3 × 28-tab pack = £10.61

Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 tablet daily continuously

Prempak-C® (Pfizer) PoM

Prempak C® 0.625 Calendar pack, s/c, 28 maroon tablets, conjugated oestrogens (equine) 625 micrograms; 12 light brown tablets, norgestrel 150 micrograms (≡ levonorgestrel 75 micrograms), net price 3 × 40-tab pack = £6.25

Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 maroon tablet daily continuously, starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), and 1 brown tablet daily on days 17–28 of each 28-day treatment cycle; subsequent courses are repeated without interval

Prempak C® 1.25 Calendar pack, s/c, 28 yellow tablets, conjugated oestrogens (equine) 1.25 mg; 12 light brown tablets, norgestrel 150 micrograms (≡ levonorgestrel 75 micrograms), net price 3 × 40-tab pack = £7.40

Dose see under 0.625 Calendar pack, but taking 1 yellow tablet daily continuously (instead of 1 maroon tablet) if symptoms not fully controlled with lower strength

Estradiol with progestogen

For prescribing information on progestogens, see section 6.4.1.2

Angeliq® (Bayer) PoM

Tablets, f/c, red, estradiol 1 mg, drospirenone 2 mg, net price 3 × 28-tab pack = £29.00

Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus whose last menstrual period occurred over 12 months previously, 1 tablet daily continuously (if changing from cyclical HRT begin treatment the day after finishing oestrogen plus progestogen phase)

Cautions use with care if an increased concentration of potassium might be hazardous

Renal impairment avoid if eGFR less than 30 mL/minute/1.73 m^2

Climagest® (Novartis) PoM

Climagest® 1-mg tablets, 16 grey-blue, estradiol valerate 1 mg; 12 white, estradiol valerate 1 mg and norethisterone 1 mg, net price 28-tab pack = £5.51; 3 × 28-tab pack = £16.02

Dose menopausal symptoms, 1 grey-blue tablet daily for 16 days, starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent) then 1 white tablet for 12 days; subsequent courses are repeated without interval

Climagest® 2-mg tablets, 16 blue, estradiol valerate 2 mg; 12 yellow, estradiol valerate 2 mg and norethisterone 1 mg, net price 28-tab pack = £5.51; 3 × 28-tab pack = £16.02

Dose see *Climagest® 1-mg*, but starting with 1 blue tablet daily (instead of 1 grey-blue tablet) if symptoms not controlled with lower strength

Climesse® (Novartis) PoM

Tablets, pink, estradiol valerate 2 mg, norethisterone 700 micrograms, net price 1 × 28-tab pack = £9.92; 3 × 28-tab pack = £29.78

Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus whose last menstrual period occurred over 12 months previously, 1 tablet daily continuously

Clinorette® (ReSource Medical) PoM

Tablets, f/c, 16 white, estradiol 2 mg; 12 pink, estradiol 2 mg and norethisterone 1 mg, net price 3 × 28-tab pack = £9.23

Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 white tablet daily for 16 days starting on day 5 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 pink tablet daily for 12 days; subsequent courses repeated without interval

Cyclo-Progynova® (Meda) PoM

Cyclo-Progynova® 2-mg tablets, s/c, 11 white, estradiol valerate 2 mg; 10 brown, estradiol valerate 2 mg and norgestrel 500 micrograms (≡ levonorgestrel 250 micrograms), net price per pack = £3.11

Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus, 1 white tablet daily for 11 days, starting on day 5 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 brown tablet daily for 10 days, followed by a 7-day tablet-free interval

Elleste-Duet® (Meda) PoM

Elleste-Duet® 1-mg tablets, 16 white, estradiol 1 mg; 12 green, estradiol 1 mg and norethisterone acetate 1 mg, net price 3 × 28-tab pack = £9.20

Dose menopausal symptoms, 1 white tablet daily for 16 days starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 green tablet daily for 12 days; subsequent courses are repeated without interval

Elleste-Duet® 2-mg tablets, 16 orange, estradiol 2 mg; 12 grey, estradiol 2 mg, norethisterone acetate 1 mg, net price 3 × 28-tab pack = £9.20

Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 1 orange tablet daily for 16 days, starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent) then 1 grey tablet daily for 12 days; subsequent courses are repeated without interval

Elleste-Duet Conti® tablets, f/c, grey, estradiol 2 mg, norethisterone acetate 1 mg, net price 3 × 28-tab pack = £17.02

Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus whose last menstrual period occurred over 12 months previously, 1 tablet daily on a continuous basis (if changing from cyclical HRT begin treatment at the end of scheduled bleed)

Evorel® (Janssen) PoM

Evorel® Conti patches, self-adhesive, (releasing estradiol approx. 50 micrograms/24 hours and norethisterone acetate approx. 170 micrograms/24 hours), net price 8-patch pack = £13.00, 24-patch pack = £37.22. Counselling, administration

Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 patch to be applied twice weekly continuously

Evorel® Sequi combination pack, 4 self-adhesive patches of *Evorel® 50* (releasing estradiol approx. 50 micrograms/24 hours) and 4 self-adhesive patches of *Evorel® Conti* (releasing estradiol approx. 50 micrograms/24 hours and norethisterone acetate approx. 170 micrograms/24 hours), net price 8-patch pack = £11.09. Counselling, administration

Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 *Evorel® 50* patch to be applied twice weekly for 2 weeks, starting within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), followed by 1 *Evorel® Conti* patch twice weekly for 2 weeks; subsequent courses are repeated without interval

Femoston® (Abbott Healthcare) PoM

Femoston® 1 mg/10 mg tablets, f/c, 14 white, estradiol 1 mg; 14 grey, estradiol 1 mg, dydrogesterone 10 mg, net price 3 × 28-tab pack = £16.16

Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 white tablet daily for 14 days, starting within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent) then 1 grey tablet daily for 14 days; subsequent courses repeated without interval

Femoston® 2 mg/10 mg tablets, f/c, 14 red, estradiol 2 mg; 14 yellow, estradiol 2 mg, dydrogesterone 10 mg, net price 3 × 28-tab pack = £16.16

Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 red tablet daily for 14 days, starting within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent) then 1 yellow tablet daily for 14 days; subsequent courses repeated without interval; where therapy required for menopausal symptoms alone, *Femoston® 1 mg/10* mg given initially and *Femoston® 2 mg/10* mg substituted if symptoms not controlled

Femoston®-conti 0.5 mg/2.5 mg tablets , f/c, yellow, estradiol 0.5 mg, dydrogesterone 2.5 mg, net price 3 × 28-tab pack = £20.36

Dose menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously, 1 tablet daily continuously (if changing from cyclical HRT begin treatment the day after finishing oestrogen plus progestogen phase)

Femoston®-conti 1 mg/5 mg tablets, f/c, salmon, estradiol 1 mg, dydrogesterone 5 mg, net price 3 × 28-tab pack = £24.43

Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus whose last menstrual period occurred over 12 months previously, 1 tablet daily continuously (if changing from cyclical HRT begin treatment the day after finishing oestrogen plus progestogen phase)

FemSeven® Conti (TEVA UK) PoM

Patches, self-adhesive (releasing estradiol approx. 50 micrograms/24 hours and levonorgestrel approx. 7 micrograms/24 hours); net price 4-patch pack = £15.48, 12-patch pack = £ 44.12. Counselling, administration

Dose menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously, 1 patch to be applied once a week continuously

FemSeven® Sequi (TEVA UK) PoM

Combination pack, self-adhesive patches of *FemSeven® Sequi Phase 1* (releasing estradiol approx. 50 micrograms/24 hours) and of *FemSeven® Sequi Phase 2* (releasing estradiol approx. 50 micrograms/24 hours and levonorgestrel approx. 10 micrograms/24 hours); net price 1-month pack (2 of each) = £13.18, 3-month pack (6 of each) = £37.54. Counselling, administration

Dose menopausal symptoms in women with a uterus, 1 *Phase 1* patch applied once a week for 2 weeks followed by 1 *Phase 2* patch once a week for 2 weeks; subsequent courses are repeated without interval

Indivina® (Orion) PoM

Indivina® 1 mg/2.5 mg tablets, estradiol valerate 1 mg, medroxyprogesterone acetate 2.5 mg, net price 3 × 28-tab pack = £20.58

Indivina® 1 mg/5 mg tablets, estradiol valerate 1 mg, medroxyprogesterone acetate 5 mg, net price 3 × 28-tab pack = £20.58

Indivina® 2 mg/5 mg tablets, estradiol valerate 2 mg, medroxyprogesterone acetate 5 mg, net price 3 × 28-tab pack = £20.58

Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus whose last menstrual period occurred over 3 years previously, 1 tablet daily continuously; initiate therapy with *Indivina® 1 mg/2.5 mg* tablets and adjust according to response; start at end of scheduled bleed if changing from cyclical HRT

Kliofem® (Novo Nordisk) PoM

Tablets, f/c yellow, estradiol 2 mg, norethisterone acetate 1 mg, net price 3 × 28-tab pack = £11.43

Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus whose last menstrual period occurred over 12 months previously, 1 tablet daily continuously; start at end of scheduled bleed if changing from cyclical HRT

Kliovance® (Novo Nordisk) PoM

Tablets, f/c, estradiol 1 mg, norethisterone acetate 500 micrograms, net price 3 × 28-tab pack = £13.20

Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus whose last menstrual period occurred over 12 months previously, 1 tablet daily continuously; start at end of scheduled bleed if changing from cyclical HRT

Novofem® (Novo Nordisk) PoM

Tablets, f/c, 16 red, estradiol 1 mg; 12 white, estradiol 1 mg, norethisterone acetate 1 mg, net price 3 × 28-tab pack = £11.43

Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 red tablet daily for 16 days then 1 white tablet daily for 12 days; subsequent courses are repeated without interval; start treatment with red tablet at any time or if changing from cyclical HRT, start treatment the day after finishing oestrogen plus progestogen phase

Nuvelle® Continuous (Bayer) PoM

Tablets, f/c, pink, estradiol 2 mg, norethisterone acetate 1 mg, net price 3 × 28-tab pack = £19.00

Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6) in women with a uterus whose last menstrual period occurred over 12 months previously, 1 tablet daily continuously; if changing from cyclical HRT, start treatment the day after finishing oestrogen plus progestogen phase

Tridestra® (Orion) PoM

Tablets, 70 white, estradiol valerate 2 mg; 14 blue, estradiol valerate 2 mg and medroxyprogesterone acetate 20 mg; 7 yellow, inactive, net price 91-tab pack = £20.49

Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 white tablet daily for 70 days, then 1 blue tablet daily for 14 days, then 1 yellow tablet daily for 7 days; subsequent courses are repeated without interval

Trisequens® (Novo Nordisk) PoM

Tablets, 12 blue, estradiol 2 mg; 10 white, estradiol 2 mg, norethisterone acetate 1 mg; 6 red, estradiol 1 mg, net price 3 × 28-tab pack = £11.10

Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6), in women with a uterus, 1 blue tablet daily for 12 days followed by 1 white tablet for 10 days, then 1 red tablet daily for 6 days; subsequent courses are repeated without interval

Conjugated oestrogens only

Premarin® (Pfizer) PoM

Tablets, all s/c, conjugated oestrogens (equine) 300 micrograms (green) net price 3 × 28-tab pack = £6.07; 625 micrograms (maroon), 3 × 28-tab pack = £4.02; 1.25 mg (yellow), 3 × 28-tab pack = £3.58

Dose menopausal symptoms, 0.3–1.25 mg daily continuously; osteoporosis prophylaxis (see section 6.6), 0.625–1.25 mg daily continuously; with cyclical progestogen for 12–14 days of each cycle in women with a uterus

Estradiol only

Bedol® (ReSource Medical) PoM

Tablets, f/c, estradiol 2 mg, net price 3 × 28-tab pack = £5.07

Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6), with cyclical progestogen for 12–14 days of each cycle in women with a uterus, 2 mg daily starting on day 1–5 of menstruation (or at any time if cycles have ceased or are infrequent)

Climaval® (Novartis) PoM

Tablets, estradiol valerate 1 mg (grey-blue), net price 1 × 28-tab pack = £2.94, 3 × 28-tab pack = £8.82; 2 mg (blue), 1 × 28-tab pack = £2.94, 3 × 28-tab pack = £8.82

Dose menopausal symptoms (if patient has had a hysterectomy), 1–2 mg daily

Elleste-Solo® (Meda) PoM

Elleste-Solo® 1-mg tablets, estradiol 1 mg, net price 3 × 28-tab pack = £5.06

Dose menopausal symptoms, with cyclical progestogen for 12–14 days of each cycle in women with a uterus, 1 mg daily starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent)

Elleste-Solo® 2-mg tablets, orange, estradiol 2 mg, net price 3 × 28-tab pack = £5.06

Dose menopausal symptoms not controlled with lower strength and osteoporosis prophylaxis (see section 6.6), with cyclical progestogen for 12–14 days of each cycle in women with a uterus, 2 mg daily starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent)

Elleste Solo® MX (Meda) PoM

Patches, self-adhesive, estradiol, *MX 40 patch* (releasing approx. 40 micrograms/24 hours), net price 8-patch pack = £5.19; *MX 80 patch* (releasing approx. 80 micrograms/24 hours), 8-patch pack = £5.99. Counselling, administration

Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 1 patch to be applied twice weekly continuously starting within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent); with cyclical progestogen for 12–14 days of each cycle in women with a uterus; for menopausal symptoms initiate therapy with *MX 40*, subsequently adjust according to response; for osteoporosis prophylaxis, initiate therapy with *MX 80*

Estraderm MX® (Novartis) PoM

Patches, self-adhesive, estradiol, *MX 25 patch* (releasing approx. 25 micrograms/24 hours), net price 8-patch pack = £5.50, 24-patch pack = £16.46; *MX 50 patch* (releasing approx. 50 micrograms/24 hours), 8-patch pack = £5.51, 24-patch pack = £16.46, 20-patch pack (hosp. only) = £13.04; *MX 75 patch* (releasing approx. 75 micrograms/24 hours), 8-patch pack = £6.42, 24-patch pack = £19.27; *MX 100 patch* (releasing approx. 100 micrograms/24 hours), 8-patch pack = £6.66, 24-patch pack = £19.99. Counselling, administration

Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 1 patch to be applied twice weekly continuously starting within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), with cyclical progestogen for at least 12 days of each cycle in women with a uterus; for menopausal symptoms, initiate therapy with *MX25* for first 3 months; for osteoporosis prophylaxis, initiate therapy with *MX50*; subsequently adjust according to response

Estradot® (Novartis) PoM

Patches, self-adhesive, estradiol, *'25' patch* (releasing approx. 25 micrograms/24 hours), net price 8-patch pack = £4.99; *'37.5' patch* (releasing approx. 37.5 micrograms/24 hours), 8-patch pack = £5.00;

'50' patch (releasing approx. 50 micrograms/24 hours), 8-patch pack = £5.02; *'75' patch* (releasing approx. 75 micrograms/24 hours), 8-patch pack = £5.83; *'100' patch* (releasing approx. 100 micrograms/24 hours), 8-patch pack = £6.06. Counselling, administration

Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 1 patch to be applied twice weekly continuously, with cyclical progestogen for 12–14 days of each cycle in women with a uterus; for menopausal symptoms, initiate therapy with *25 patch* for 3 months; for osteoporosis prophylaxis initiate therapy with *50 patch*; subsequently adjust according to response

Evorel® (Janssen) PoM

Patches, self-adhesive, estradiol, *'25' patch* (releasing approx. 25 micrograms/24 hours), net price 8-patch pack = £3.42; *'50' patch* (releasing approx. 50 micrograms/24 hours), 8-patch pack = £3.88, 24-patch pack = £11.66; *'75' patch* (releasing approx. 75 micrograms/24 hours), 8-patch pack = £4.12; *'100' patch* (releasing approx. 100 micrograms/24 hours), 8-patch pack = £4.28. Counselling, administration

Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 1 patch to be applied twice weekly continuously starting within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), with cyclical progestogen for 12–14 days of each cycle in women with a uterus; therapy should be initiated with *Evorel 50* patch; subsequently adjust according to response; dose may be reduced to *Evorel 25* patch after first month if necessary for menopausal symptoms **only**

FemSeven® (TEVA UK) PoM

Patches, self-adhesive, estradiol, *'50' patch* (releasing approx. 50 micrograms/24 hours), net price 4-patch pack = £6.04, 12-patch pack = £18.02; *'75' patch* (releasing approx. 75 micrograms/24 hours), net price 4-patch pack = £6.98; *'100' patch* (releasing approx. 100 micrograms/24 hours), net price 4-patch pack = £7.28. Counselling, administration

Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 1 patch to be applied once a week continuously, with cyclical progestogen for 12–14 days of each cycle in women with a uterus; initiate therapy with *FemSeven 50* patches for the first few months, subsequently adjust according to response

Oestrogel® (Besins) PoM

Gel, estradiol 0.06%, net price 64-dose pump pack = £4.80. Counselling, administration

Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 2 measures (estradiol 1.5 mg) to be applied over an area twice that of the template provided once daily continuously, starting within 5 days of menstruation (or anytime if cycles have ceased or are infrequent), with cyclical progestogen for at least 12 days of each cycle in women with a uterus; for menopausal symptoms may be increased if necessary after 1 month to max. 4 measures daily

Counselling Apply gel to clean, dry, intact skin such as arms, shoulders or inner thighs and allow to dry for 5 minutes before covering with clothing. Not to be applied on or near breasts or on vulval region. Avoid skin contact with another person (particularly male) and avoid other skin products or washing the area for at least 1 hour after application

Progynova® (Bayer) PoM

Tablets, s/c, estradiol valerate 1 mg (beige), net price 3 × 28-tab pack = £7.30; 2 mg (blue), 3 × 28-tab pack = £7.30

Dose menopausal symptoms, 1–2 mg daily continuously starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent); osteoporosis prophylaxis (see section 6.6), 2 mg daily continuously; with cyclical progestogen for 12–14 days of each cycle in women with a uterus

Progynova® TS (Bayer) PoM

Patches, self-adhesive, *Progynova® TS 50* (releasing estradiol approx. 50 micrograms/24 hours), net price 12-patch pack = £18.90; *Progynova® TS 100* (releasing estradiol approx. 100 micrograms/24 hours), 12-patch pack = £20.70. Counselling, administration

Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 1 patch to be applied once a week continuously *or* 1 patch per week for 3 weeks followed by a 7-day patch-free interval (cyclical); with cyclical progestogen for 12–14 days of each cycle in women with a uterus; initiate therapy with *Progynova TS 50*, subsequently adjust according to response

Note Women receiving *Progynova TS 100* patches for menopausal symptoms may continue with this strength for osteoporosis prophylaxis (see section 6.6)

Sandrena® (Orion) PoM

Gel, estradiol (0.1%), 500 microgram/500 mg sachet, net price 28-sachet pack = £5.08, 1 mg/1 g sachet, 28-sachet pack = £5.85. Counselling, administration

Excipients include propylene glycol (see section 13.1.3)

Dose menopausal symptoms, estradiol 1 mg (1 g gel) to be applied once daily over area 1–2 times size of hand; with cyclical progestogen for 12–14 days of each cycle in women with a uterus; dose may be adjusted after 2–3 cycles to lowest effective dose (usual dose of estradiol 0.5–1.5 mg (0.5–1.5 g gel) daily)

Counselling Apply gel to intact areas of skin such as lower trunk or thighs, using right and left sides on alternate days. Wash hands after application. Not to be applied on the breasts or face and avoid contact with eyes. Allow area of application to dry for 5 minutes and do not wash area for at least 1 hour

Zumenon® (Abbott Healthcare) PoM

Tablets, f/c, estradiol 1 mg, net price 84-tab pack = £6.89; 2 mg (red), 84-tab pack = £6.89

Dose menopausal symptoms, initially 1 mg daily starting within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent) increased to 2 mg daily if required; osteoporosis prophylaxis (see section 6.6), 2 mg daily; with cyclical progestogen for 12–14 days of each cycle in women with a uterus

Estradiol, estriol and estrone

Hormonin® (AMCo) PoM

Tablets, pink, estradiol 600 micrograms, estriol 270 micrograms, estrone 1.4 mg, net price 84-tab pack = £7.93

Dose menopausal symptoms and osteoporosis prophylaxis (see section 6.6), 1–2 tablets daily starting within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), with cyclical progestogen for 12–14 days of each cycle in women with a uterus

Note *Hormonin®* tablets can be given continuously or cyclically (21 days out of 28)

TIBOLONE

Indications short-term treatment of symptoms of oestrogen deficiency (including women being treated with gonadotrophin releasing hormone analogues); osteoporosis prophylaxis in women at high risk of fractures when other prophylaxis contra-indicated or not tolerated

Cautions see Hormone Replacement Therapy, p. 490 and under Oestrogens for HRT; vaginal bleeding (investigate for endometrial cancer if bleeding continues beyond 6 months or after stopping treatment); history of liver disease, epilepsy, migraine, diabetes mellitus, hypertriglyceridaemia; withdraw if signs of thromboembolic disease, abnormal liver function tests or cholestatic jaundice; see also Note below; **interactions:** Appendix 1 (tibolone)

Contra-indications see notes above and under Oestrogens for HRT; history of cardiovascular or cerebrovascular disease (e.g. thrombophlebitis, thromboembolism), uninvestigated vaginal bleeding

Hepatic impairment avoid in acute liver disease or if history of liver disease and liver function tests not returned to normal

Renal impairment risk of fluid retention—patients with renal impairment should be closely monitored

Pregnancy avoid; toxicity in *animal* studies

Breast-feeding avoid

Side-effects see notes above; also abdominal pain, weight changes, vaginal bleeding, leucorrhoea, facial hair, and *rarely* amnesia; gastro-intestinal disturbances, oedema, dizziness, headache, migraine, depression, breast cancer (see notes above and section 6.4.1.1), arthralgia, myalgia, visual disturbances, seborrhoeic dermatitis, rash and pruritus also reported

Dose

- 2.5 mg daily

Note Unsuitable for use in the premenopause (unless being treated with gonadotrophin-releasing hormone analogue) and as (or with) an oral contraceptive; also unsuitable for use within 12 months of last menstrual period (may cause irregular bleeding). If transferring from cyclical HRT, start at end of regimen; if transferring from continuous-combined HRT, start at any time

Livial® (MSD) PoM

Tablets, tibolone 2.5 mg, net price 28-tab pack = £10.36; 3 × 28-tab pack = £31.08

Ethinylestradiol

Ethinylestradiol (ethinyloestradiol) is licensed for short-term treatment of symptoms of oestrogen deficiency, for osteoporosis prophylaxis if other drugs (section 6.6) cannot be used and for the treatment of female hypogonadism and menstrual disorders.

Ethinylestradiol is occasionally used under **specialist supervision** for the management of *hereditary haemorrhagic telangiectasia* (but evidence of benefit is limited). Side-effects include nausea, fluid retention, and thrombosis. Impotence and gynaecomastia have been reported in men.

For use in prostate cancer, see section 8.3.1.

ETHINYLESTRADIOL

(Ethinyloestradiol)

Indications see notes above

Cautions cardiovascular disease (sodium retention with oedema, thromboembolism); see also under Combined Hormonal Contraceptives (section 7.3.1) and under Oestrogens for HRT (p. 491)

Contra-indications see under Combined Hormonal Contraceptives (section 7.3.1) and under Oestrogens for HRT (p. 491)

Hepatic impairment avoid; see also Combined Hormonal Contraceptives, section 7.3.1

Pregnancy see Combined Hormonal Contraceptives, section 7.3.1

Breast-feeding see Combined Hormonal Contraceptives, section 7.3.1

Side-effects feminising effects in men; see also under Combined Hormonal Contraceptives (section 7.3.1) and under Oestrogens for HRT (p. 492)

Dose

- Menopausal symptoms and osteoporosis prophylaxis, (with progestogen for 12–14 days per cycle in women with intact uterus), 10–50 micrograms daily for 21 days, repeated after 7-day tablet-free period
- Female hypogonadism, 10–50 micrograms daily, usually on cyclical basis; initial oestrogen therapy should be followed by combined oestrogen and progestogen therapy
- Menstrual disorders, 20–50 micrograms daily from day 5 to 25 of each cycle, with progestogen added either throughout the cycle or from day 15 to 25

Ethinylestradiol (Non-proprietary) PoM

Tablets, ethinylestradiol 10 micrograms, net price 21-tab pack = £139.22; 50 micrograms, 21-tab pack = £139.22; 1 mg, 28-tab pack = £139.22

Raloxifene

Raloxifene is licensed for the treatment and prevention of *postmenopausal osteoporosis*; unlike hormone replacement therapy, raloxifene does not reduce menopausal vasomotor symptoms.

Raloxifene may reduce the incidence of oestrogen-receptor-positive breast cancer but its role in established breast cancer is not yet clear. The manufacturer advises avoiding its use during treatment for breast cancer.

RALOXIFENE HYDROCHLORIDE

Indications treatment and prevention of postmenopausal osteoporosis

Cautions risk factors for venous thromboembolism (discontinue if prolonged immobilisation); risk factors for stroke; breast cancer (see notes above); history of oestrogen-induced hypertriglyceridaemia (monitor serum triglycerides); avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (raloxifene)

Contra-indications history of venous thromboembolism, undiagnosed uterine bleeding, endometrial cancer, cholestasis

Hepatic impairment avoid

Renal impairment caution in mild to moderate impairment; avoid in severe impairment

Side-effects hot flushes, leg cramps, peripheral oedema, influenza-like symptoms; *less commonly* venous thromboembolism, thrombophlebitis; *rarely* rashes, gastro-intestinal disturbances, hypertension, arterial thromboembolism, headache (including migraine), breast discomfort, thrombocytopenia

Dose

- 60 mg once daily

Evista® (Daiichi Sankyo) PoM

Tablets, f/c, raloxifene hydrochloride 60 mg, net price 28-tab pack = £17.06; 84-tab pack = £59.59

6.4.1.2 Progestogens and progesterone receptor modulators

There are two main groups of progestogen, progesterone and its analogues (dydrogesterone and medroxyprogesterone) and testosterone analogues (norethisterone and norgestrel). The newer progestogens (desogestrel, norgestimate, and gestodene) are all derivatives of norgestrel; levonorgestrel is the active isomer of norgestrel and has twice its potency. Progesterone

and its analogues are less androgenic than the testosterone derivatives and neither progesterone nor dydrogesterone causes virilisation.

Where endometriosis requires drug treatment, it may respond to a progestogen, e.g. norethisterone, administered on a continuous basis. Danazol and gonadorelin analogues are also available (section 6.7.2).

Although oral progestogens have been used widely for menorrhagia they are relatively ineffective compared with tranexamic acid (section 2.11) or, particularly where dysmenorrhoea is also a factor, mefenamic acid (section 10.1.1); the levonorgestrel-releasing intrauterine system (section 7.3.2.3) may be particularly useful for women also requiring contraception. Oral progestogens have also been used for severe dysmenorrhoea, but where contraception is also required in younger women the best choice is a combined oral contraceptive (section 7.3.1).

Progestogens have also been advocated for the alleviation of premenstrual symptoms, but no convincing physiological basis for such treatment has been shown.

Progestogens have been used for the prevention of miscarriage in women with a history of recurrent miscarriage but there is no evidence of benefit and they are **not** recommended for this purpose. In pregnant women with antiphospholipid antibody syndrome who have suffered recurrent miscarriage, administration of low-dose aspirin (section 2.9) and a prophylactic dose of a low molecular weight heparin (section 2.8.1) may decrease the risk of fetal loss (use under specialist supervision only).

Hormone replacement therapy In women with a uterus a progestogen needs to be added to long-term oestrogen therapy for hormone replacement, to prevent cystic hyperplasia of the endometrium and possible transformation to cancer; it can be added on a cyclical or a continuous basis (see section 6.4.1.1). Combined packs incorporating suitable progestogen tablets are available, see p. 492.

Oral contraception Desogestrel, gestodene, levonorgestrel, norethisterone, and norgestimate are used in combined oral contraceptives and in progestogen-only contraceptives (section 7.3.1 and section 7.3.2).

Cancer Progestogens also have a role in neoplastic disease (section 8.3.2).

Cautions Progestogens should be used with caution in conditions that may worsen with fluid retention e.g. epilepsy, hypertension, migraine, asthma, or cardiac dysfunction, and in those susceptible to thromboembolism (particular caution with high dose). Care is also required in those with a history of depression. Progestogens can decrease glucose tolerance and patients with diabetes should be monitored closely. For **interactions** see Appendix 1 (progestogens).

Contra-indications Progestogens should be avoided in patients with a history of liver tumours. They are also contra-indicated in those with genital or breast cancer (unless progestogens are being used in the management of these conditions), severe arterial disease, undiagnosed vaginal bleeding and acute porphyria (section 9.8.2). Progestogens should not be used if there is a history during pregnancy of idiopathic jaundice, severe pruritus, or pemphigoid gestationis.

Side-effects Side-effects of progestogens include menstrual disturbances, premenstrual-like syndrome (including bloating, fluid retention, breast tenderness), weight change, nausea, headache, dizziness, insomnia, drowsiness, depression, change in libido; also skin reactions (including urticaria, pruritus, rash, and acne), hirsutism and alopecia. Jaundice and anaphylactoid reactions have also been reported.

DYDROGESTERONE

Indications HRT (section 6.4.1.1)
Cautions see notes above
Contra-indications see notes above
Hepatic impairment avoid; see also Combined Hormonal Contraceptives, section 7.3.1
Renal impairment use with caution
Pregnancy not known to be harmful
Breast-feeding present in milk—no adverse effects reported
Side-effects see notes above
Dose

- See under combined preparations (section 6.4.1.1)

MEDROXYPROGESTERONE ACETATE

Indications see under Dose; contraception (section 7.3.2.2); malignant disease (section 8.3.2)
Cautions see notes above
Contra-indications see notes above
Hepatic impairment section 8.3.2
Renal impairment use with caution
Pregnancy section 8.3.2
Breast-feeding section 8.3.2
Side-effects see notes above; indigestion
Dose

- By mouth, 2.5–10 mg daily for 5–10 days beginning on day 16 to 21 of cycle, repeated for 2 cycles in dysfunctional uterine bleeding and 3 cycles in secondary amenorrhoea
- Mild to moderate endometriosis, 10 mg 3 times daily for 90 consecutive days, beginning on day 1 of cycle
- Progestogenic opposition of oestrogen HRT, 10 mg daily for the last 14 days of each 28-day oestrogen HRT cycle

Provera® (Pharmacia) PoM
Tablets, all scored, medroxyprogesterone acetate 2.5 mg (orange), net price 30-tab pack = £1.84; 5 mg (blue), 10-tab pack = £1.23; 10 mg (white), 10-tab pack = £2.47, 90-tab pack = £22.16

Climanor® (ReSource Medical) PoM
Tablets, f/c, medroxyprogesterone acetate 5 mg, net price 28-tab pack = £3.27

Combined preparations

Section 6.4.1.1

NORETHISTERONE

Indications see under Dose; HRT (section 6.4.1.1); contraception (section 7.3.1 and section 7.3.2); malignant disease (section 8.3.2)
Cautions see notes above
Contra-indications see notes above
Hepatic impairment section 8.3.2
Renal impairment use with caution
Pregnancy section 8.3.2

Breast-feeding section 8.3.2

Side-effects see notes above

Dose

- Endometriosis, by mouth, 10–15 mg daily for 4–6 months or longer, starting on day 5 of cycle (if spotting occurs increase dose to 20–25 mg daily, reduced once bleeding has stopped)
- Dysfunctional uterine bleeding, menorrhagia (but see notes above), by mouth, 5 mg 3 times daily for 10 days to arrest bleeding; to prevent bleeding 5 mg twice daily from day 19 to 26
- Dysmenorrhoea (but see notes above), by mouth, 5 mg 3 times daily from day 5 to 24 for 3–4 cycles
- Premenstrual syndrome (but not recommended, see notes above), by mouth, 5 mg 2–3 times daily from day 19 to 26 for several cycles
- Postponement of menstruation, by mouth, 5 mg 3 times daily starting 3 days before expected onset (menstruation occurs 2–3 days after stopping)

Norethisterone (Non-proprietary) PoM

Tablets, norethisterone 5 mg, net price 30-tab pack = £2.04

Primolut N® (Bayer) PoM

Tablets, norethisterone 5 mg, net price 30-tab pack = £2.26

Utovlan® (Pharmacia) PoM

Tablets, norethisterone 5 mg, net price 30-tab pack = £1.40, 90-tab pack = £4.21

Combined preparations

Section 6.4.1.1

PROGESTERONE

Indications see under preparations

Cautions see notes above

Contra-indications see notes above; missed or incomplete miscarriage

Hepatic impairment avoid; see also Combined Hormonal Contraceptives, section 7.3.1

Renal impairment use with caution

Pregnancy not known to be harmful

Breast-feeding avoid—present in milk

Side-effects see notes above; injection-site reactions; *with rectal administration*, pain, diarrhoea and flatulence; *with vaginal administration*, local irritation

Dose

- See under preparations

Crinone® (Merck Serono) PoM

Vaginal gel, progesterone 90 mg/application (8%), net price 15 = £30.83

Dose by vagina, infertility due to inadequate luteal phase, insert 1 applicatorful daily starting either after documented ovulation or on day 18–21 of cycle. *In vitro* fertilisation, daily application continued for 30 days after laboratory evidence of pregnancy

Cyclogest® (Actavis) PoM

Pessaries, progesterone 200 mg, net price 15 = £8.95; 400 mg, 15 = £12.96

Dose by vagina *or* rectum, premenstrual syndrome and post-natal depression, 200 mg daily to 400 mg twice daily; for premenstrual syndrome start on day 12–14 and continue until onset of menstruation (but not recommended, see notes above); rectally if barrier methods of contraception are used, in patients who have recently given birth or in those who suffer from vaginal infection or recurrent cystitis

Gestone® (Nordic) PoM

Injection, progesterone 50 mg/mL, net price 1-mL amp = £4.50, 2-mL amp = £4.50

Dose by deep intramuscular injection into buttock, dysfunctional uterine bleeding, 5–10 mg daily for 5–10 days until 2 days before expected onset of menstruation

Recurrent miscarriage due to inadequate luteal phase (but not recommended, see notes above) or following *in vitro* fertilisation *or* gamete intra-fallopian transfer, 25–100 mg 2–7 times a week from day 15, or day of embryo *or* gamete transfer, until 8–16 weeks of pregnancy; max. 200 mg daily

Lubion® (Pharmasure) PoM

Injection, progesterone, net price 25-mg vial = £8.00

Dose by subcutaneous *or* intramuscular injection, supplementation of luteal phase during assisted reproductive technology (ART) treatment in women for whom vaginal preparations are inappropriate, 25 mg once daily from day of oocyte retrieval up to week 12 of pregnancy

Utrogestan® (Besins) PoM

Capsules, progesterone (micronised) 100 mg, net price 30-cap pack = £5.13; 200 mg 15-cap pack = £5.13. Counselling, administration

Excipients include arachis (peanut) oil

Counselling Capsules should be taken at bedtime on an empty stomach

Dose by mouth, progestogenic opposition of oestrogen HRT 200 mg once daily on days 15–26, *or* 100 mg once daily on days 1–25, of each 28-day oestrogen HRT cycle

Vaginal capsule, progesterone (micronised) 200 mg, net price 21 vaginal capsules = £21.00

Excipients include arachis (peanut) oil

Dose by vagina, supplementation of luteal phase during assisted reproductive technology (ART) cycles, insert 1 vaginal capsule 3 times daily from day of embryo transfer until at least week 7 of pregnancy up to week 12 of pregnancy

Progesterone receptor modulators

Ulipristal acetate is a progesterone receptor modulator with a partial progesterone antagonist effect. Ulipristal is used in the pre-operative treatment of moderate to severe symptoms of uterine fibroids; it is also used as an hormonal emergency contraceptive (see section 7.3.5).

ULIPRISTAL ACETATE

Indications pre-operative treatment of moderate to severe symptoms of uterine fibroids

Cautions uncontrolled severe asthma; non-hormonal contraceptive methods (barrier methods or intrauterine device) should be used during treatment and for 12 days after stopping, if required; **interactions:** see Appendix 1 (ulipristal)

Contra-indications undiagnosed vaginal bleeding, vaginal bleeding not caused by uterine fibroids; uterine, ovarian, cervical, or breast cancer

Hepatic impairment caution in moderate to severe impairment—no information available

Renal impairment caution in severe impairment—no information available

Pregnancy manufacturer advises avoid—no information available

Breast-feeding manufacturer advises avoid—no information available

Side-effects nausea, abdominal pain, oedema, hot flushes, headache, dizziness, malaise, menstrual disturbances, uterine haemorrhage, endometrial thickening, ovarian cyst (including rupture), breast pain,

pelvic pain, myalgia, acne, hyperhidrosis; *less commonly* dyspepsia, dry mouth, flatulence, constipation, epistaxis, anxiety, urinary incontinence

Dose

- ADULT over 18 years, 5 mg daily for up to 3 months starting during the first week of menstruation; if necessary, repeat course once, starting during the second menstruation after first course completed; max. 2 courses of 3 months

Esmya® (Gedeon Richter) ▼ PoM

Tablets, ulipristal acetate 5 mg, net price 28-tab pack = £114.13

6.4.2 Male sex hormones and antagonists

Androgens cause masculinisation; they may be used as replacement therapy in castrated adults and in those who are hypogonadal due to either pituitary or testicular disease. In the normal male they inhibit pituitary gonadotrophin secretion and depress spermatogenesis. Androgens also have an anabolic action which led to the development of anabolic steroids (section 6.4.3).

Androgens are useless as a treatment of impotence and impaired spermatogenesis unless there is associated hypogonadism; they should not be given until the hypogonadism has been properly investigated. Treatment should be under expert supervision.

When given to patients with hypopituitarism they can lead to normal sexual development and potency but not to fertility. If fertility is desired, the usual treatment is with gonadotrophins or pulsatile gonadotrophin-releasing hormone (section 6.5.1) which will stimulate spermatogenesis as well as androgen production.

Caution should be used when androgens or chorionic gonadotrophin are used in treating boys with delayed puberty since the fusion of epiphyses is hastened and may result in short stature; skeletal maturation should be monitored.

Intramuscular depot preparations of **testosterone esters** are preferred for replacement therapy. Testosterone enantate, propionate or undecanoate, or alternatively *Sustanon®*, which consists of a mixture of testosterone esters and has a longer duration of action, may be used. Satisfactory replacement therapy can sometimes be obtained with 1 mL of *Sustanon 250®*, given by intramuscular injection once a month, although more frequent dose intervals are often necessary. Implants of testosterone can be used for hypogonadism; the implants are replaced every 4 to 5 months.

Testosterone implants can be used in postmenopausal women as an adjunct to hormone replacement therapy.

TESTOSTERONE AND ESTERS

Indications see under preparations

Cautions cardiac impairment, elderly, ischaemic heart disease, hypertension, epilepsy, migraine, diabetes mellitus, skeletal metastases (risk of hypercalcaemia), undertake regular examination of the prostate and breast during treatment; monitor full blood count, lipid profile and liver function; pre-pubertal boys (see notes above and under Side-effects); **interactions:** Appendix 1 (testosterone)

Women Regularly assess for androgenic side-effects; women should be advised to report any signs of virilisation e.g. deepening of the voice or hirsutism

Contra-indications breast cancer in men, prostate cancer, history of primary liver tumours, hypercalcaemia, nephrotic syndrome

Hepatic impairment avoid if possible—fluid retention and dose-related toxicity

Renal impairment caution—potential for fluid retention

Pregnancy avoid; causes masculinisation of female fetus

Breast-feeding avoid; may cause masculinisation in the female infant or precocious development in the male infant; high doses suppress lactation

Side-effects prostate abnormalities and prostate cancer, headache, depression, gastro-intestinal bleeding, nausea, vomiting, cholestatic jaundice, changes in libido, gynaecomastia, polycythaemia, anxiety, irritability, nervousness, asthenia, paraesthesia, hypertension, electrolyte disturbances including sodium retention with oedema and hypercalcaemia, weight gain; increased bone growth, muscle cramps, arthralgia; androgenic effects such as hirsutism, male-pattern baldness, seborrhoea, acne, pruritus, excessive frequency and duration of penile erection, precocious sexual development and premature closure of epiphyses in pre-pubertal males, suppression of spermatogenesis in men and virilism in women; *rarely* liver tumours; sleep apnoea also reported; *with buccal tablets and gel*, local irritation and allergic reactions, and taste disturbances

Dose

- See under preparations

Oral

Restandol® Testocaps (MSD) CD4-2

Capsules, orange, testosterone undecanoate 40 mg in oily solution, net price 30-cap pack = £8.55; 60-cap pack = £17.10. Label: 21, 25

Dose androgen deficiency, 120–160 mg daily for 2–3 weeks; maintenance 40–120 mg daily

Buccal

Striant® SR (The Urology Co.) CD4-2

Mucoadhesive buccal tablets, m/r, testosterone 30 mg, net price 60-tab pack = £28.00. Counselling, see under Dose below

Dose hypogonadism, 30 mg every 12 hours; CHILD and ADOLESCENT under 18 years not recommended

Counselling Place rounded side of tablet on gum above front teeth and hold lip firmly over the gum for 30 seconds. If tablet detaches within 4 hours of next dose, replace with new tablet which is considered the second dose for the day.

Intramuscular

Testosterone Enantate (Non-proprietary) CD4-2

Injection (oily), testosterone enantate 250 mg/mL, net price 1-mL amp = £19.62

Dose by slow intramuscular injection, hypogonadism, initially 250 mg every 2–3 weeks; maintenance 250 mg every 3–6 weeks

Breast cancer, 250 mg every 2–3 weeks

Nebido® (Bayer) CD4-2

Injection (oily), testosterone undecanoate 250 mg/mL, net price 4-mL amp = £80.00; 4-mL vial = £80.00

Dose by deep intramuscular injection over 2 minutes, hypogonadism in men over 18 years, 1 g every 10–14 weeks; if necessary, second dose may be given after 6 weeks to achieve rapid steady state plasma testosterone levels and then every 10–14 weeks

Sustanon 250® (MSD) CD4-2

Injection (oily), testosterone propionate 30 mg, testosterone phenylpropionate 60 mg, testosterone isocaproate 60 mg, and testosterone decanoate 100 mg/mL, net price 1-mL amp = £2.45

Excipients include arachis (peanut) oil, benzyl alcohol (see Excipients p. 2)

Dose by deep intramuscular injection, androgen deficiency, 1 mL usually every 3 weeks

Virormone® (Nordic) CD4-2

Injection, testosterone propionate 50 mg/mL, net price 2-mL amp = £4.50

Dose by intramuscular injection, androgen deficiency, 50 mg 2–3 times weekly

Delayed puberty, 50 mg weekly

Breast cancer in women, 100 mg 2–3 times weekly

Implant

Testosterone (MSD) CD4-2

Implant, testosterone 100 mg, net price = £9.99; 200 mg = £15.17

Dose by implantation, male hypogonadism, 100–600 mg; 600 mg usually maintains plasma-testosterone concentration within the normal range for 4–5 months

Transdermal preparations

Testim® (Ferring) CD4-2

Gel, testosterone 50 mg/5 g tube, net price 30-tube pack = £32.00. Counselling, administration

Excipients include propylene glycol (see section 13.1.3)

Dose hypogonadism due to testosterone deficiency in men (over 18 years), 50 mg testosterone (5 g gel) applied once daily; subsequent application adjusted according to response; max. 100 mg (10 g gel) daily

Counselling Squeeze entire content of tube on to one palm and apply as a thin layer on clean, dry, healthy skin of shoulder or upper arm, preferably in the morning after washing or bathing (if 2 tubes required use 1 per shoulder or upper arm); rub in and allow to dry before putting on clothing to cover site; wash hands with soap after application; avoid washing application site for at least 6 hours

Avoid skin contact with application sites to prevent testosterone transfer to other people, especially pregnant women and children—consult product literature

Testogel® (Bayer) CD4-2

Gel, testosterone 50 mg/5 g sachet, net price 30-sachet pack = £31.11. Counselling, administration

Dose hypogonadism due to androgen deficiency in men (over 18 years), 50 mg testosterone (5 g gel) to be applied once daily; subsequent application adjusted according to response in 25-mg (2.5 g gel) increments to max. 100 mg (10 g gel) daily

Counselling Apply thin layer of gel on clean, dry, healthy skin such as shoulders, arms or abdomen, immediately after sachet is opened. Not to be applied on genital area as high alcohol content may cause local irritation. Allow to dry for 3–5 minutes before dressing. Wash hands with soap and water after applying gel, avoid shower or bath for at least 6 hours

Avoid skin contact with gel application sites to prevent testosterone transfer to other people, especially pregnant women and children—consult product literature

Tostran® (ProStrakan) CD4-2

Gel, testosterone 2% (10 mg/metered application), net price 60-g multidose dispenser = £28.67. Counselling, administration

Excipients include butylhydroxytoluene, propylene glycol (see section 13.1.3)

Dose hypogonadism due to testosterone deficiency in men (over 18 years), initially 60 mg testosterone (3 g gel) applied once daily; subsequent applications adjusted according to response; max. 80 mg (4 g gel) daily

Counselling Apply gel on clean, dry, intact skin of abdomen or both inner thighs, preferably in the morning. Gently rub in with a finger until dry before dressing. Wash hands with soap and water after applying gel; avoid washing application site for at least 2 hours. Not to be applied on genital area. Avoid skin contact with gel application sites to prevent testosterone transfer to other people, especially pregnant women and children—consult product literature

MESTEROLONE

Indications see under Dose

Cautions see under Testosterone and Esters

Contra-indications see under Testosterone and Esters

Hepatic impairment see under Testosterone and Esters

Renal impairment see under Testosterone and Esters

Pregnancy see under Testosterone and Esters

Breast-feeding see under Testosterone and Esters

Side-effects see under Testosterone and Esters but spermatogenesis unimpaired

Dose

- Androgen deficiency and male infertility associated with hypogonadism, 25 mg 3–4 times daily for several months, reduced to 50–75 mg daily in divided doses for maintenance; CHILD not recommended

Pro-Viron® (Bayer) CD4-2

Tablets, scored, mesterolone 25 mg. Net price 30-tab pack = £4.19

Anti-androgens

Cyproterone acetate

Cyproterone acetate is an anti-androgen used in the treatment of severe hypersexuality and sexual deviation in the male. It inhibits spermatogenesis and produces reversible infertility (but is not a male contraceptive); abnormal sperm forms are produced. Fully informed consent is recommended and an initial spermatogram. As hepatic tumours have been produced in *animal* studies, careful consideration should be given to the risk/benefit ratio before treatment. Cyproterone acetate is also used as an adjunct in prostatic cancer (section 8.3.4.2) and in the treatment of acne and hirsutism in women (section 13.6.2).

CYPROTERONE ACETATE

Indications see notes above; prostate cancer (section 8.3.4.2)

Cautions ineffective for male hypersexuality in chronic alcoholism (relevance to prostate cancer not known); blood counts initially and throughout treatment; monitor hepatic function regularly (liver function tests should be performed before treatment, see also under Side-effects below); monitor adrenocortical function regularly; diabetes mellitus (see also Contra-indications)

Driving Fatigue and lassitude may impair performance of skilled tasks (e.g. driving)

Contra-indications (do not apply in prostate cancer), severe diabetes (with vascular changes), sickle-cell anaemia, liver-disease including Dubin-Johnson and Rotor syndromes, previous or existing liver tumours, malignant or wasting diseases, meningioma or history of meningioma, severe depression, history of thromboembolic disorders; youths under 18 years (may arrest bone maturation and testicular development)

Hepatic impairment avoid—dose-related toxicity; see also side-effects, p. 643

Side-effects fatigue and lassitude, breathlessness, weight changes, reduced sebum production (may clear acne), changes in hair pattern, gynaecomastia (rarely leading to galactorrhoea and benign breast nodules); rarely hypersensitivity reactions, rash and osteoporosis; inhibition of spermatogenesis (see notes above); hepatotoxicity reported (including jaundice, hepatitis and hepatic failure (fatalities reported at dosages of 100 mg and above, usually in men treated for advanced prostate cancer), see section 8.3.4.2 for details and warnings)

Dose

- ADULT over 18 years, male hypersexuality, 50 mg twice daily after food

Cyproterone Acetate (Non-proprietary) PoM
Tablets, cyproterone acetate 50 mg, net price 56-tab pack = £29.00. Label: 21, counselling, driving

Androcur® (Bayer) PoM
Tablets, scored, cyproterone acetate 50 mg, net price 56-tab pack = £29.25. Label: 21, counselling, driving

Dutasteride and finasteride

Dutasteride and **finasteride** are specific inhibitors of the enzyme 5α-reductase, which metabolises testosterone into the more potent androgen, dihydrotestosterone. This inhibition of testosterone metabolism leads to reduction in prostate size, with improvement in urinary flow rate and in obstructive symptoms. Dutasteride and finasteride are alternatives to alpha-blockers (section 7.4.1) particularly in men with a significantly enlarged prostate. Finasteride is also licensed for use with doxazosin in the management of benign prostatic hyperplasia.

A low strength of finasteride is licensed for treating male-pattern baldness in men (section 13.9).

Cautions Dutasteride and finasteride decrease serum concentration of prostate cancer markers such as prostate-specific antigen; reference values may need adjustment. Both dutasteride and finasteride are excreted in semen and use of a condom is recommended if sexual partner is pregnant or likely to become pregnant. Women of childbearing potential should avoid handling crushed or broken tablets of finasteride and leaking capsules of dutasteride.

Side-effects The side-effects of dutasteride and finasteride include impotence, decreased libido, ejaculation disorders, and breast tenderness and enlargement.

DUTASTERIDE

Indications benign prostatic hyperplasia

Cautions see notes above; **interactions:** Appendix 1 (dutasteride)

Male breast cancer Cases of male breast cancer have been reported. Patients or their carers should be told to promptly report to their doctor any changes in breast tissue such as lumps, pain, or nipple discharge

Hepatic impairment avoid in severe impairment—no information available

Side-effects see notes above

Dose

- 500 micrograms daily, review treatment at 3–6 months and then every 6–12 months (may require several months treatment before benefit is obtained)

Avodart® (GSK) PoM
Capsules, yellow, dutasteride 500 micrograms, net price 30-cap pack = £29.77. Label: 25

With tamsulosin
Section 7.4.1

FINASTERIDE

Indications benign prostatic hyperplasia; male-pattern baldness in men (section 13.9)

Cautions see notes above; also obstructive uropathy

Male breast cancer Cases of male breast cancer have been reported. Patients or their carers should be told to promptly report to their doctor any changes in breast tissue such as lumps, pain, or nipple discharge

Side-effects see notes above; also testicular pain, hypersensitivity reactions (including lip and face swelling, pruritus and rash); male breast cancer also reported (see Cautions above)

Dose

- 5 mg daily, review treatment at 3–6 months and then every 6–12 months (may require several months' treatment before benefit is obtained)

Finasteride (Non-proprietary) PoM
Tablets, finasteride 5 mg, net price 28-tab pack = £1.48

Proscar® (MSD) PoM
Tablets, blue, f/c, finasteride 5 mg, net price 28-tab pack = £13.94

6.4.3 Anabolic steroids

Anabolic steroids have some androgenic activity but they cause less virilisation than androgens in women. They are used in the treatment of some *aplastic anaemias* (section 9.1.3). Anabolic steroids have been given for osteoporosis in women but they are no longer advocated for this purpose.

The protein-building properties of anabolic steroids have not proved beneficial in the clinical setting. Their use as body builders or tonics is unjustified; some athletes abuse them.

NANDROLONE

Indications osteoporosis in postmenopausal women (but not recommended, see notes above); aplastic anaemia (section 9.1.3)

Cautions cardiac impairment, hypertension, diabetes mellitus, epilepsy, migraine; monitor skeletal maturation in young patients; skeletal metastases (risk of hypercalcaemia); **interactions:** Appendix 1 (anabolic steroids)

Contra-indications prostate cancer, male breast cancer, acute porphyria (section 9.8.2)

Hepatic impairment use in severe hepatic impairment only if benefit outweighs risk

Renal impairment use with caution—may cause sodium and water retention

Side-effects acne, sodium retention with oedema, virilisation with high doses including voice changes

(sometimes irreversible), amenorrhoea, inhibition of spermatogenesis, premature epiphyseal closure; abnormal liver-function tests reported with high doses; liver tumours reported occasionally on prolonged treatment with anabolic steroids

Dose

- See below

Deca-Durabolin® (MSD) CD4-2

Injection (oily), nandrolone decanoate 50 mg/mL, net price 1-mL amp = £3.17

Excipients include arachis (peanut) oil, benzyl alcohol (see Excipients, p. 2)

Dose by deep intramuscular injection, 50 mg every 3 weeks

6.5 Hypothalamic and pituitary hormones and anti-oestrogens

Use of preparations in these sections requires detailed prior investigation of the patient and *should be reserved for specialist centres.*

6.5.1 Hypothalamic and anterior pituitary hormones and anti-oestrogens

Anti-oestrogens

The anti-oestrogens **clomifene** (clomiphene) and **tamoxifen** (section 8.3.4.1) are used in the treatment of female infertility due to oligomenorrhoea or secondary amenorrhoea (e.g. associated with polycystic ovarian disease). They induce gonadotrophin release by occupying oestrogen receptors in the hypothalamus, thereby interfering with feedback mechanisms; chorionic gonadotrophin is sometimes used as an adjunct. Patients should be warned that there is a risk of multiple pregnancy (*rarely* more than twins).

CLOMIFENE CITRATE

(Clomiphene Citrate)

Indications anovulatory infertility—see notes above

Cautions see notes above; polycystic ovary syndrome (cysts may enlarge during treatment, also risk of exaggerated response to usual doses), ovarian hyperstimulation syndrome, uterine fibroids, ectopic pregnancy, incidence of multiple births increased (consider ultrasound monitoring), visual symptoms (discontinue and initiate ophthalmological examination)

CSM Advice The CSM has recommended that clomifene should not normally be used for longer than 6 cycles (possibly increased risk of ovarian cancer)

Contra-indications ovarian cysts, hormone-dependent tumours or abnormal uterine bleeding of undetermined cause

Hepatic impairment avoid in severe liver disease

Pregnancy exclude pregnancy before treatment; possible effects on fetal development

Breast-feeding may inhibit lactation

Side-effects visual disturbances (withdraw), ovarian hyperstimulation (withdraw), hot flushes, abdominal discomfort, occasionally nausea, vomiting, depression, insomnia, breast tenderness, headache, intermenstrual spotting, menorrhagia, endometriosis, convulsions, weight gain, rashes, dizziness, hair loss

Dose

- 50 mg daily for 5 days, starting within about 5 days of onset of menstruation (preferably on 2nd day) or at any time (normally preceded by a progestogen-induced withdrawal bleed) if cycles have ceased; second course of 100 mg daily for 5 days may be given in absence of ovulation; most patients who are going to respond will do so to first course; 3 courses should constitute adequate therapeutic trial; long-term cyclical therapy not recommended—see CSM advice, above

Clomifene (Non-proprietary) PoM

Tablets, clomifene citrate 50 mg, net price 30-tab pack = £21.74

Clomid® (Sanofi-Aventis) PoM

Tablets, yellow, scored, clomifene citrate 50 mg. Net price 30-tab pack = £8.46

Anterior pituitary hormones

Corticotrophins

Tetracosactide (tetracosactrin), an analogue of corticotropin (ACTH), is used to test adrenocortical function; failure of the plasma cortisol concentration to rise after administration of tetracosactide indicates adrenocortical insufficiency.

Both corticotropin and tetracosactide were formerly used as alternatives to corticosteroids in conditions such as Crohn's disease or rheumatoid arthritis; their value was limited by the variable and unpredictable therapeutic response and by the waning of their effect with time.

TETRACOSACTIDE

(Tetracosactrin)

Indications see notes above

Cautions as for corticosteroids, section 6.3.2; **important:** risk of anaphylaxis (medical supervision; consult product literature); history of atopic allergy (e.g. asthma, eczema, hayfever); history of hypersensitivity; **interactions:** Appendix 1 (corticosteroids)

Contra-indications as for corticosteroids, section 6.3.2; avoid injections containing benzyl alcohol in neonates (see under preparations); history of hypersensitivity to corticotrophins

Hepatic impairment see section 6.3.2

Renal impairment see section 6.3.2

Pregnancy avoid (but may be used diagnostically if essential)

Breast-feeding avoid (but may be used diagnostically if essential)

Side-effects as for corticosteroids, section 6.3.2

Dose

- See under preparations below

Synacthen® (Alliance) PoM
Injection, tetracosactide 250 micrograms (as acetate)/mL. Net price 1-mL amp = £2.93
Dose diagnostic (30-minute test), by intramuscular *or* intravenous injection, 250 micrograms as a single dose

Synacthen Depot® (Alliance) PoM
Injection (aqueous suspension), tetracosactide acetate 1 mg/mL, with zinc phosphate complex. Net price 1-mL amp = £4.18
Excipients include benzyl alcohol (avoid in neonates, see Excipients p. 2)
Dose diagnostic (5-hour test), by intramuscular injection, 1 mg as a single dose
Note Formerly used therapeutically by intramuscular injection, in an initial dose of 1 mg daily (or every 12 hours in acute cases); reduced to 1 mg every 2–3 days, then 1 mg weekly (or 500 micrograms every 2–3 days) but value was limited (see notes above)

Gonadotrophins

Follicle-stimulating hormone (FSH) and luteinising hormone (LH) together (as in **human menopausal gonadotrophin**), follicle-stimulating hormone alone (as in **follitropin**), or chorionic gonadotrophin, are used in the treatment of infertility in women with proven hypopituitarism or who have not responded to clomifene, or in superovulation treatment for assisted conception (such as *in vitro* fertilisation).

The gonadotrophins are also occasionally used in the treatment of hypogonadotrophic hypogonadism and associated oligospermia. There is no justification for their use in primary gonadal failure.

Chorionic gonadotrophin has also been used in delayed puberty in the male to stimulate endogenous testosterone production, but has little advantage over testosterone (section 6.4.2).

CHORIONIC GONADOTROPHIN

(Human Chorionic Gonadotrophin; HCG)

A preparation of a glycoprotein fraction secreted by the placenta and obtained from the urine of pregnant women having the action of the pituitary luteinising hormone

Indications see notes above

Cautions cardiac impairment, asthma, epilepsy, migraine; prepubertal boys (risk of premature epiphyseal closure or precocious puberty)

Contra-indications androgen-dependent tumours

Renal impairment use with caution

Side-effects oedema (particularly in males—reduce dose), headache, tiredness, mood changes, gynaecomastia, local reactions; may aggravate ovarian hyperstimulation, multiple pregnancy

Dose

- By subcutaneous *or* intramuscular injection, according to patient's response

Choragon® (Ferring) CD4-2
Injection, powder for reconstitution, chorionic gonadotrophin. Net price 5000-unit amp (with solvent) = £3.26. For intramuscular injection

Pregnyl® (MSD) CD4-2
Injection, powder for reconstitution, chorionic gonadotrophin. Net price 1500-unit amp = £2.12; 5000-unit amp = £3.15 (both with solvent). For subcutaneous or intramuscular injection

CHORIOGONADOTROPIN ALFA

(Human chorionic gonadotropin)

Indications see notes above

Cautions acute porphyria (section 9.8.2)

Contra-indications ovarian enlargement or cyst (unless caused by polycystic ovarian disease); ectopic pregnancy in previous 3 months; active thromboembolic disorders; hypothalamus, pituitary, ovarian, uterine or mammary malignancy

Side-effects nausea, vomiting, abdominal pain; headache, tiredness; injection-site reactions; ovarian hyperstimulation syndrome; rarely diarrhoea, depression, irritability, breast pain; ectopic pregnancy and ovarian torsion reported

Dose

- By subcutaneous injection, according to patient's response

Ovitrelle® (Merck Serono) CD4-2
Injection, choriogonadotropin alfa, net price 6500-unit/0.5 mL (250-micrograms/0.5 mL) prefilled syringe or prefilled pen = £31.38

CORIFOLLITROPIN ALFA

Indications controlled ovarian stimulation in combination with a gonadotrophin-releasing hormone antagonist

Cautions risk factors for thromboembolism; risk of ovarian hyperstimulation syndrome; acute porphyria (section 9.8.2)

Contra-indications ovarian enlargement or cyst; polycystic ovarian syndrome; tumours of hypothalamus, pituitary, ovaries, uterus, or breast; vaginal bleeding of unknown cause; history of ovarian hyperstimulation syndrome

Renal impairment avoid

Breast-feeding avoid

Side-effects nausea; headache, fatigue; ovarian hyperstimulation, pelvic pain, breast pain; *less commonly* vomiting, abdominal distension and pain, diarrhoea, constipation, dizziness, ovarian torsion; *also reported* ectopic pregnancy, miscarriage, and multiple pregnancies

Dose

- By subcutaneous injection, body-weight under 60 kg, 100 micrograms; body-weight over 60 kg, 150 micrograms

Elonva® (MSD) ▼ PoM
Injection, prefilled syringe, corifollitropin alfa, net price 100 micrograms/0.5 mL = £638.00; 150 micrograms/0.5 mL = £638.00

FOLLITROPIN ALFA and BETA

(Recombinant human follicle stimulating hormone)

Indications see notes above

Cautions acute porphyria (section 9.8.2)

Contra-indications see under Human Menopausal Gonadotrophins

Pregnancy avoid

Breast-feeding avoid

Side-effects see under Human Menopausal Gonadotrophins

Dose

- By subcutaneous *or* intramuscular injection, according to patient's response

Follitropin alfa

Gonal-F® (Merck Serono) PoM

Injection, powder for reconstitution, follitropin alfa. Net price 75-unit amp = £21.02; 450 units/0.75 mL, multidose vial = £126.10; 1050 units/1.75 mL, multidose vial = £294.22 (all with solvent). For subcutaneous injection

Injection, prefilled pen, follitropin alfa 600 units/mL, net price 0.5 mL (300 units) = £94.00, 0.75 mL (450 units) = £141.00, 1.5 mL (900 units) = £282.00. For subcutaneous injection

Follitropin alfa with lutropin alfa

Pergoveris® (Merck Serono) PoM

Injection, powder for reconstitution, follitropin alfa 150 units (11 micrograms), lutropin alfa 75 units (3 micrograms), net price per vial (with solvent) = £60.29. For subcutaneous injection

Electrolytes $Na^+ < 1$ mmol/vial

Follitropin beta

Puregon® (MSD) PoM

Injection, follitropin beta 100 units/mL, net price 0.5-mL (50-unit) vial = £18.03; 200 units/mL, 0.5-mL (100-unit) vial = £36.06; 0.36-mL (300-unit) cartridge = £97.41, 0.72-mL (600-unit) cartridge = £194.82, 1.08-mL (900-unit) cartridge = £292.23, (cartridges for use with *Puregon®* pen). For subcutaneous (cartridges and vials) or intramuscular injection (vials)

Excipients may include neomycin and streptomycin

HUMAN MENOPAUSAL GONADOTROPHINS

Indications see notes above

Cautions acute porphyria (section 9.8.2)

Contra-indications ovarian cysts (not caused by polycystic ovarian syndrome); tumours of pituitary, hypothalamus, breast, uterus, ovaries, testes or prostate; vaginal bleeding of unknown cause

Pregnancy avoid

Breast-feeding avoid

Side-effects ovarian hyperstimulation, increased risk of multiple pregnancy and miscarriage, hypersensitivity reactions, gastro-intestinal disturbances, headache, joint pain, fever, injection site reactions, *very rarely* thromboembolism; gynaecomastia, acne, and weight gain reported in men

Dose

- By deep intramuscular *or* subcutaneous injection, according to patient's response

Menotrophin

Purified extract of human post-menopausal urine containing follicle-stimulating hormone (FSH) and luteinising hormone (LH) in a ratio of 1:1

Merional® (Pharmasure) PoM

Injection, powder for reconstitution, menotrophin as follicle-stimulating hormone 75 units and luteinising hormone 75 units, net price per vial (with solvent) = £27.90; follicle-stimulating hormone 150 units, luteinising hormone 150 units, net price per vial (with solvent) = £55.80. For intramuscular or subcutaneous injection

Menopur® (Ferring) PoM

Injection, powder for reconstitution, menotrophin as follicle-stimulating hormone 75 units and luteinising hormone 75 units, net price per vial (with solvent) = £16.38; follicle-stimulating hormone 150 units and luteinising hormone 150 units, net price per vial (with solvent) = £32.76; follicle-stimulating hormone 600 units and luteinising hormone 600 units, net price per multidose vial (with solvent) = £131.04; follicle-stimulating hormone 1200 units and luteinising hormone 1200 units, net price per multidose vial (with solvent) = £262.08. For intramuscular or subcutaneous injection

Urofollitropin

Purified extract of human post-menopausal urine containing follicle-stimulating hormone (FSH)

Fostimon® (Pharmasure) PoM

Injection, powder for reconstitution, urofollitropin as follicle-stimulating hormone 75 units, net price per vial (with solvent) = £27.90; follicle-stimulating hormone 150 units, net price per vial (with solvent) = £55.80. For intramuscular or subcutaneous injection

LUTROPIN ALFA

(Recombinant human luteinising hormone)

Indications see notes above

Cautions acute porphyria (section 9.8.2)

Contra-indications ovarian enlargement or cyst (unless caused by polycystic ovarian disease); undiagnosed vaginal bleeding; tumours of hypothalamus and pituitary; ovarian, uterine or mammary carcinoma

Side-effects nausea, vomiting, abdominal and pelvic pain; headache, somnolence; injection-site reactions; ovarian hyperstimulation syndrome, ovarian cyst, breast pain, ectopic pregnancy; thromboembolism, adnexal torsion, and haemoperitoneum

Dose

- By subcutaneous injection, in conjunction with follicle-stimulating hormone, according to response

Luveris® (Merck Serono) PoM

Injection, powder for reconstitution, lutropin alfa, net price 75-unit vial = £31.38 (with solvent)

Growth hormone

Growth hormone is used to treat deficiency of the hormone in children and in adults (see NICE guidance below). In children it is used in Prader-Willi syndrome, Turner syndrome, chronic renal insufficiency, short children considered small for gestational age at birth, and short stature homeobox-containing gene (SHOX) deficiency.

Growth hormone of human origin (HGH; somatotrophin) has been replaced by a growth hormone of human sequence, **somatropin**, produced using recombinant DNA technology.

NICE guidance

Somatropin for the treatment of growth failure in children (May 2010)

Somatropin is recommended for children with growth failure who:

- have growth-hormone deficiency;
- have Turner syndrome;
- have Prader-Willi syndrome;
- have chronic renal insufficiency;
- are born small for gestational age with subsequent growth failure at 4 years of age or later;
- have short stature homeobox-containing gene (SHOX) deficiency.

Treatment should be discontinued if growth velocity increases by less than 50% from baseline in the first year of treatment.

www.nice.org.uk/TA188

NICE guidance

Somatropin for adults with growth hormone deficiency (August 2003)

Somatropin is recommended in adults **only** if the following 3 criteria are fulfilled:

- Severe growth hormone deficiency, established by an appropriate method,
- Impaired quality of life, measured by means of a specific questionnaire,
- Already receiving treatment for another pituitary hormone deficiency.

Somatropin treatment should be discontinued if the quality of life has not improved sufficiently by 9 months.

Severe growth hormone deficiency developing after linear growth is complete but before the age of 25 years should be treated with growth hormone; treatment should continue until adult peak bone mass has been achieved. Treatment for adult-onset growth hormone deficiency should be stopped only when the patient and the patient's physician consider it appropriate.

Treatment with somatropin should be initiated and managed by a physician with expertise in growth hormone disorders; maintenance treatment can be prescribed in the community under a shared-care protocol.

www.nice.org.uk/TA64

Mecasermin, a human insulin-like growth factor-I (rhIGF-I), is licensed to treat growth failure in children and adolescents with severe primary insulin-like growth factor-I deficiency (section 6.7.4).

SOMATROPIN

(Recombinant Human Growth Hormone)

Indications see under Dose

Cautions diabetes mellitus (adjustment of antidiabetic therapy may be necessary), papilloedema (see under Side-effects), relative deficiencies of other pituitary hormones (notably hypothyroidism—manufacturers recommend periodic thyroid function tests but limited evidence of clinical value), history of malignant disease, disorders of the epiphysis of the hip (monitor for limping), resolved intracranial hypertension (monitor closely), initiation of treatment close to puberty not recommended in child born small for gestational age; Silver-Russell syndrome; rotate subcutaneous injection sites to prevent lipoatrophy; **interactions:** Appendix 1 (somatropin)

Contra-indications evidence of tumour activity (complete antitumour therapy and ensure intracranial lesions inactive before starting); not to be used after renal transplantation or for growth promotion in children with closed epiphyses (or near closure in Prader-Willi syndrome); severe obesity or severe respiratory impairment in Prader-Willi syndrome

Pregnancy discontinue if pregnancy occurs—no information available

Breast-feeding no information available

Side-effects headache, funduscopy for papilloedema recommended if severe or recurrent headache, visual problems, nausea and vomiting occur—if papilloedema confirmed consider benign intracranial hypertension (rare cases reported); fluid retention (peripheral oedema), arthralgia, myalgia, carpal tunnel syndrome, paraesthesia, antibody formation, hypothyroidism, insulin resistance, hyperglycaemia, hypoglycaemia, reactions at injection site; leukaemia in children with growth hormone deficiency also reported

Dose

- Gonadal dysgenesis (Turner syndrome), by subcutaneous injection, 45–50 micrograms/kg daily *or* 1.4 mg/m^2 daily
- Deficiency of growth hormone in children, by subcutaneous *or* intramuscular injection, 23–39 micrograms/kg daily *or* 0.7–1 mg/m^2 daily
- Growth disturbance in short children born small for gestational age whose growth has not caught up by 4 years or later, by subcutaneous injection, 35 micrograms/kg daily or 1 mg/m^2 daily
- Prader-Willi syndrome, by subcutaneous injection in children with growth velocity greater than 1 cm/year, in combination with energy-restricted diet, 35 micrograms/kg daily *or* 1 mg/m^2 daily; max. 2.7 mg daily
- Chronic renal insufficiency in children (renal function decreased to less than 50%), by subcutaneous injection, 45–50 micrograms/kg daily *or* 1.4 mg/m^2 daily (higher doses may be needed) adjusted if necessary after 6 months
- Adult growth hormone deficiency, by subcutaneous injection, initially 150–300 micrograms daily, gradually increased if required to max. 1 mg daily; use minimum effective dose (requirements may decrease with age)
- SHOX deficiency in children, by subcutaneous injection, 45–50 micrograms/kg daily

Note Dose formerly expressed in units; somatropin 1 mg ≡ 3 units

Genotropin® (Pharmacia) CD4-2

Injection, two-compartment cartridge containing powder for reconstitution, somatropin (rbe) and diluent, net price 5.3-mg (16-unit) cartridge = £92.15, 12-mg (36-unit) cartridge = £208.65. For use with *Genotropin® Pen* NHS device (available free of charge from clinics). For subcutaneous injection GoQuick® injection, two-compartment, multi-dose disposable, prefilled pen containing powder for reconstitution, somatropin (rbe) and diluent, net price 5.3-mg (16-unit) prefilled pen = £92.15; 12-mg (36-unit) prefilled pen = £208.65. For subcutaneous injection

MiniQuick® injection, two-compartment single-dose syringe containing powder for reconstitution, somatropin (rbe) and diluent, net price 0.2-mg (0.6-unit) syringe = £3.48; 0.4-mg (1.2-unit) syringe = £6.95; 0.6-mg (1.8-unit) syringe = £10.43; 0.8-mg (2.4-unit) syringe = £13.91; 1-mg (3-unit) syringe = £17.39; 1.2-mg (3.6-unit) syringe = £20.87; 1.4-mg (4.2-unit) syringe = £24.34; 1.6-mg (4.8-unit) syringe = £27.82; 1.8-mg (5.4-unit) syringe = £31.30; 2-mg (6-unit) syringe = £34.77. For subcutaneous injection

Humatrope® (Lilly) CD4-2

Injection, powder for reconstitution, somatropin (rbe), net price 6-mg (18-unit) cartridge = £108.00; 12-mg (36-unit) cartridge = £216.00; 24-mg (72-unit) cartridge = £432.00; all supplied with diluent. For subcutaneous or intramuscular injection; cartridges for subcutaneous injection

Norditropin® (Novo Nordisk) CD4-2

SimpleXx® injection, somatropin (epr) 3.3 mg (10 units)/mL, net price 1.5-mL (5-mg, 15-unit) cartridge = £106.35; 6.7 mg (20 units)/mL, 1.5-mL (10-mg, 30-unit) cartridge = £212.70; 10 mg (30 units)/mL, 1.5-mL (15-mg, 45-unit) cartridge = £319.05. For use with appropriate *NordiPen®* NHS device (available free of charge from clinics). For subcutaneous injection

NordiFlex® injection, multidose disposable prefilled pen, somatropin (rbe) 10 mg (30 units)/mL, net price 1.5 mL (15-mg, 45-unit) prefilled pen = £347.70. For use with *NovoFine®* or *NovoTwist®* needles. For subcutaneous injection

NutropinAq® (Ipsen) CD4-2

Injection, somatropin (rbe), net price 10 mg (30 units) 2-ml cartridge = £203.00. For use with *NutropinAq® Pen* NHS device (available free of charge from clinics). For subcutaneous injection

Omnitrope® (Sandoz) CD4-2

Injection, somatropin (rbe) 3.3 mg (10 units)/mL, net price 1.5 mL (5-mg, 15-unit) cartridge = £73.75; 6.7 mg (20 units)/mL, 1.5 mL (10-mg, 30-unit) cartridge = £147.50. For use with *Omnitrope Pen 5®* NHS and *Omnitrope Pen 10®* NHS devices respectively (available free of charge from clinics). For subcutaneous injection

Excipients include benzyl alcohol (in 5-mg cartridge) (avoid in neonates, see Excipients, p. 2)

Note Biosimilar medicine, see p. 1

Saizen® (Merck Serono) CD4-2

Injection, somatropin (rmc), 5.83 mg (17.5 units)/mL, net price 1.03-mL (6-mg, 18-unit) cartridge = £139.08; 8 mg (24 units)/mL, 1.5-mL (12-mg, 36-unit) cartridge = £278.16, 2.5-mL (20-mg, 60-unit) cartridge = £463.60. For use with *cool.click®* NHS needle-free autoinjector device or *easypod®* NHS autoinjector device (available free of charge from clinics). For subcutaneous injection

Click.easy®, powder for reconstitution, somatropin (rmc), net price 8-mg (24-unit) vial (in *click.easy®* device with diluent) = £185.44. For use with *one.click®* NHS autoinjector device *or cool.click®* NHS needle-free autoinjector device or *easypod®* NHS autoinjector device (available free of charge from clinics). For subcutaneous injection

Zomacton® (Ferring) CD4-2

Injection, powder for reconstitution, somatropin (rbe), net price 4-mg (12-unit) vial (with diluent) = £79.69, for use with *ZomaJet 2® Vision* NHS needle-free device (available free of charge from clinics) or with needles and syringes; 10 mg (30-unit) vial (with diluent) = £199.23, for use with *ZomaJet Vision X®* NHS needle-free device (available free of charge from clinics) or with needles and syringes. For subcutaneous injection

Excipients include benzyl alcohol (in 4-mg vial) (avoid in neonates, see Excipients p. 2)

Growth hormone receptor antagonists

Pegvisomant is a genetically modified analogue of human growth hormone and is a highly selective growth hormone receptor antagonist. Pegvisomant is licensed for the treatment of acromegaly in patients with inadequate response to surgery, radiation, or both, and to treatment with somatostatin analogues. Pegvisomant should be initiated only by physicians experienced in the treatment of acromegaly.

PEGVISOMANT

Indications see notes above

Cautions liver disease (monitor liver enzymes every 4–6 weeks for 6 months or if symptoms of hepatitis develop); diabetes mellitus (adjustment of antidiabetic therapy may be necessary); possible increase in female fertility

Pregnancy avoid

Breast-feeding avoid

Side-effects diarrhoea, constipation, nausea, vomiting, abdominal distension, dyspepsia, flatulence, elevated liver enzymes; hypertension; headache, asthenia, dizziness, drowsiness, tremor, sleep disturbances; influenza-like syndrome, weight gain, hyperglycaemia, hypoglycaemia; arthralgia, myalgia; injection-site reactions (rotate injection sites to avoid lipohypertrophy), sweating, pruritus, rash; fatigue; hypercholesterolaemia; less commonly thrombocytopenia, leucopenia, leucocytosis, bleeding tendency

Dose

- By subcutaneous injection, initially 80 mg, then 10 mg daily, increased in steps of 5 mg daily according to response; max. 30 mg daily; CHILD not recommended

Somavert® (Pfizer) PoM

Injection, powder for reconstitution, pegvisomant, net price 10-mg vial = £50.00; 15-mg vial = £75.00; 20-mg vial = £100.00 (all with solvent)

Thyrotrophin

Thyrotropin alfa is a recombinant form of thyrotrophin (thyroid stimulating hormone). It is licensed for use with or without radioiodine imaging, together with serum thyroglobulin testing, for the detection of thyroid remnants and thyroid cancer in post-thyroidectomy patients. It is also licensed to increase radio-iodine uptake for the ablation of thyroid remnant tissue in suitable post-thyroidectomy patients.

THYROTROPIN ALFA

(Recombinant human thyroid stimulating hormone, rhTSH)

Indications see notes above and product literature

Cautions presence of thyroglobulin autoantibodies may give false negative results

Contra-indications hypersensitivity to bovine or human thyrotrophin

Pregnancy avoid

Breast-feeding avoid

Side-effects nausea, vomiting; headache, dizziness, fatigue; *less commonly* asthenia, paraesthesia, back pain, influenza-like symptoms, rash, urticaria; *rarely* diarrhoea; *very rarely* palpitation, flushing, dyspnoea, pain at site of metastases, tremor, arthralgia, myalgia, hyperhidrosis, and injection-site reactions including pain, pruritus, and rash

Dose

- By intramuscular injection into the gluteal muscle, 900 micrograms every 24 hours for 2 doses, consult product literature

Thyrogen® (Genzyme) PoM

Injection, powder for reconstitution, thyrotropin alfa 900 micrograms/vial, net price = £291.52

Hypothalamic hormones

Gonadorelin when injected intravenously in normal subjects leads to a rapid rise in plasma concentrations of both luteinising hormone (LH) and follicle-stimulating hormone (FSH). It has not proved to be very helpful, however, in distinguishing hypothalamic from pituitary lesions. **Gonadorelin analogues** are indicated in endometriosis and infertility (section 6.7.2) and in breast and prostate cancer (section 8.3.4).

GONADORELIN

(Gonadotrophin-releasing hormone; GnRH; LH–RH)

Indications see preparations below

Cautions pituitary adenoma

Pregnancy avoid

Breast-feeding avoid

Side-effects rarely, nausea, headache, abdominal pain, increased menstrual bleeding; rarely, hypersensitivity reaction on repeated administration of large doses; irritation at injection site

Dose

- See under preparations

Gonadorelin (Intrapharm) PoM

Injection, powder for reconstitution, gonadorelin. Net price 100-microgram vial (with diluent) = £67.00 (hosp. only)

Excipients include benzyl alcohol (avoid in neonates, see Excipients p. 2)

Dose for assessment of pituitary function (adults), by subcutaneous *or* intravenous injection, 100 micrograms

6.5.2 Posterior pituitary hormones and antagonists

Posterior pituitary hormones

Diabetes insipidus **Vasopressin** (antidiuretic hormone, ADH) is used in the treatment of *pituitary* ('cranial') *diabetes insipidus* as is its analogue **desmopressin**. Dosage is tailored to produce a slight diuresis every 24 hours to avoid water intoxication. Treatment may be required for a limited period only in diabetes insipidus following trauma or pituitary surgery.

Desmopressin is more potent and has a longer duration of action than vasopressin; unlike vasopressin it has no vasoconstrictor effect. It is given by mouth or intranasally for maintenance therapy, and by injection in the postoperative period or in unconscious patients. Desmopressin is also used in the differential diagnosis of diabetes insipidus. Following a dose of 2 micrograms intramuscularly or 20 micrograms intranasally, restoration of the ability to concentrate urine after water deprivation confirms a diagnosis of cranial diabetes insipidus. Failure to respond occurs in nephrogenic diabetes insipidus.

In *nephrogenic* and *partial pituitary diabetes insipidus* benefit may be gained from the paradoxical antidiuretic effect of thiazides (section 2.2.1) e.g. chlortalidone 100 mg twice daily reduced to maintenance dose of 50 mg daily.

Carbamazepine (section 4.8.1) is sometimes useful in partial pituitary diabetes insipidus (in a dose of 200 mg once or twice daily) [unlicensed]; it may act by sensitising the renal tubules to the action of remaining endogenous vasopressin.

Other uses Desmopressin is also used to boost factor VIII concentration in mild to moderate haemophilia and in von Willebrand's disease; it is also used to test fibrinolytic response. For a comment on use of desmopressin in nocturnal enuresis see section 7.4.2.

Vasopressin infusion is used to control variceal bleeding in portal hypertension, prior to more definitive treatment and with variable results. **Terlipressin**, a derivative of vasopressin with reportedly less pressor and antidiuretic activity, is used similarly.

Oxytocin, another posterior pituitary hormone, is indicated in obstetrics (section 7.1.1).

DESMOPRESSIN

Indications see under Dose

Cautions see under Vasopressin; less pressor activity, but still considerable caution in cardiovascular disease and in hypertension (not indicated for nocturnal enuresis or nocturia in these circumstances); elderly (avoid for nocturnal enuresis and nocturia in those over 65 years); also considerable caution in cystic fibrosis; in nocturia and nocturnal enuresis limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards; in nocturia periodic blood pressure and weight checks needed to monitor for fluid overload; **interactions:** Appendix 1 (desmopressin)

Hyponatraemic convulsions Patients being treated for primary nocturnal enuresis should be warned to avoid fluid overload (including during swimming) and to stop taking desmopressin during an episode of vomiting or diarrhoea (until fluid balance normal). The risk of hyponatraemic convulsions can also be minimised by keeping to the recommended starting doses and by avoiding concomitant use of drugs which increase secretion of vasopressin (e.g. tricyclic antidepressants)

Contra-indications cardiac insufficiency and other conditions treated with diuretics; psychogenic polydipsia and polydipsia in alcohol dependence

Renal impairment use with caution; antidiuretic effect may be reduced

Pregnancy small oxytocic effect in third trimester; increased risk of pre-eclampsia

Breast-feeding not known to be harmful

Side-effects fluid retention, and hyponatraemia (in more serious cases with convulsions) on administration without restricting fluid intake; stomach pain,

headache, nausea, vomiting, allergic reactions, and emotional disturbance in children also reported; epistaxis, nasal congestion, rhinitis with nasal spray

Dose

- By mouth (as desmopressin acetate)

  Diabetes insipidus, treatment, ADULT and CHILD initially 300 micrograms daily (in 3 divided doses); maintenance, 300–600 micrograms daily in 3 divided doses; range 0.2–1.2 mg daily

  Primary nocturnal enuresis, ADULT (under 65 years) and CHILD over 5 years 200 micrograms at bedtime, only increased to 400 micrograms if lower dose not effective (**important:** see also Cautions); withdraw for at least 1 week for reassessment after 3 months

  Postoperative polyuria or polydipsia, adjust dose according to urine osmolality

- Sublingually (as desmopressin base)

  Diabetes insipidus, treatment, ADULT and CHILD initially 180 micrograms daily in 3 divided doses; range 120–720 micrograms daily

  Primary nocturnal enuresis, ADULT (under 65 years) and CHILD over 5 years 120 micrograms at bedtime, only increased to 240 micrograms if lower dose not effective (**important:** see also Cautions); withdraw for at least 1 week for reassessment after 3 months

  Polyuria or polydipsia after hypophysectomy, adjust dose according to urine osmolality

- Intranasally (as desmopressin acetate)

  Diabetes insipidus, diagnosis, ADULT and CHILD 20 micrograms (limit fluid intake to 500 mL from 1 hour before to 8 hours after administration)

  Diabetes insipidus, treatment, ADULT 10–40 micrograms daily (in 1–2 divided doses); CHILD 5–20 micrograms daily; infants may require lower doses

  Nocturia associated with multiple sclerosis (when other treatments have failed), ADULT (under 65 years) 10–20 micrograms at bedtime (**important:** see also Cautions), dose not to be repeated within 24 hours

  Renal function testing (empty bladder at time of administration and limit fluid intake to 500 mL from 1 hour before until 8 hours after administration), ADULT 40 micrograms; INFANT under 1 year 10 micrograms (restrict fluid intake to 50% at next 2 feeds to avoid fluid overload), CHILD 1–15 years 20 micrograms

  Mild to moderate haemophilia and von Willebrand's disease, ADULT 300 micrograms (one 150-microgram spray into each nostril) 30 minutes before surgery or when bleeding; may be repeated at intervals of 12 hours (or at intervals of at least 3 days if self-administered)

  Fibrinolytic response testing, ADULT 300 micrograms (one 150-microgram spray into each nostril); blood sampled after 1 hour for fibrinolytic activity

- By injection (as desmopressin acetate)

  Diabetes insipidus, diagnosis (subcutaneous *or* intramuscular), ADULT and CHILD 2 micrograms (limit fluid intake to 500 mL from 1 hour before to 8 hours after administration)

  Diabetes insipidus, treatment (subcutaneous, intramuscular *or* intravenous), ADULT 1–4 micrograms daily; INFANT and CHILD 400 nanograms

  Renal function testing (empty bladder at time of administration and limit fluid intake to 500 mL from 1 hour before until 8 hours after administration) (subcutaneous *or* intramuscular), ADULT and CHILD 2 micrograms; INFANT 400 nanograms (restrict fluid intake to 50% at next 2 feeds)

  Mild to moderate haemophilia and von Willebrand's disease, (subcutaneous *or* intravenous), ADULT and CHILD over 1 month 300 nanograms/kg as a single dose immediately before surgery or after trauma; may be repeated at intervals of 12 hours

  Fibrinolytic response testing, (subcutaneous *or* intravenous), ADULT and CHILD 300 nanograms/kg; blood sampled after 20 minutes for fibrinolytic activity

  Lumbar-puncture-associated headache, consult product literature

Desmopressin acetate (Non-proprietary) PoM

Tablets, desmopressin acetate 100 micrograms, net price 90-tab pack = £61.40; 200 micrograms, 30-tab pack = £9.02, 90-tab pack = £39.20. Counselling, fluid intake, see above

Nasal spray, desmopressin acetate 10 micrograms/metered spray, net price 6-mL unit (60 metered sprays) = £9.34. Counselling, fluid intake, see above

Brands include *Presinex*®

Note Children requiring dose of less than 10 micrograms should be given *DDAVP*® intranasal solution

DDAVP® (Ferring) PoM

Tablets, both scored, desmopressin acetate 100 micrograms, net price 90-tab pack = £44.12; 200 micrograms, 90-tab pack = £88.23. Counselling, fluid intake, see above

Oral lyophilisates (DDAVP® Melt), desmopressin (as acetate) 60 micrograms, net price 100-tab pack = £50.53; 120 micrograms, 100-tab pack = £101.07; 240 micrograms, 100-tab pack = £202.14. Label: 26, counselling, fluid intake, see above. For sublingual administration

Intranasal solution, desmopressin acetate 100 micrograms/mL. Net price 2.5-mL dropper bottle and catheter = £9.72. Counselling, fluid intake, see above

Injection, desmopressin acetate 4 micrograms/mL. Net price 1-mL amp = £1.32

DesmoMelt® (Ferring) PoM

Oral lyophilisates, desmopressin (as acetate) 120 micrograms, net price 30-tab pack = £30.34; 240 micrograms, 30-tab pack = £60.68. Label: 26, counselling, fluid intake, see above. For sublingual administration

Desmotabs® (Ferring) PoM

Tablets, scored, desmopressin acetate 200 micrograms, net price 30-tab pack = £29.43. Counselling, fluid intake, see above

Desmospray® (Ferring) PoM

Nasal spray, desmopressin acetate 10 micrograms/metered spray. Net price 6-mL unit (60 metered sprays) = £25.02. Counselling, fluid intake, see above

Note Children requiring dose of less than 10 micrograms should be given *DDAVP*® *intranasal solution*

Octim® (Ferring) PoM

Nasal spray, desmopressin acetate 150 micrograms/metered spray, net price 2.5-mL unit (25 metered sprays) = £576.60. Counselling, fluid intake, see above

Injection, desmopressin acetate 15 micrograms/mL, net price 1-mL amp = £19.22

TERLIPRESSIN ACETATE

Indications bleeding from oesophageal varices

Cautions elderly; uncontrolled hypertension; vascular disease; heart disease; history of QT-interval prolongation; concomitant use of drugs that prolong the QT-interval; arrhythmia; respiratory disease; septic shock; electrolyte and fluid disturbances

Renal impairment use with caution in chronic renal failure

Pregnancy avoid unless benefits outweigh risk—uterine contractions and increased intra-uterine pressure in early pregnancy, and decreased uterine blood flow reported

Breast-feeding avoid unless benefits outweigh risk—no information available

Side-effects abdominal cramps, diarrhoea, hypertension, hypotension, peripheral ischaemia, pallor, arrhythmia, bradycardia, headache; *less commonly* nausea, vomiting, hot flushes, angina, myocardial infarction, tachycardia, intestinal ischaemia, bronchospasm, respiratory failure, pulmonary oedema, convulsions, hyponatraemia; *rarely* dyspnoea; *very rarely* stroke, hyperglycaemia; *also reported* heart failure, skin necrosis

Dose

- See under preparations

Glypressin® (Ferring) PoM

Injection, powder for reconstitution, terlipressin acetate, net price 1-mg vial with 5 mL diluent = £18.47

Injection, solution for injection, terlipressin acetate, 0.12 mg/mL, net price 1-mg (8.5 mL) amp = £19.39

Dose by intravenous injection, 2 mg every 4 hours until bleeding controlled (after initial dose, may reduce to 1 mg every 4 hours if not tolerated or body-weight under 50 kg); max. duration 48 hours; CHILD under 18 years see *BNF for Children*

Variquel® (Sinclair IS) PoM

Injection, powder for reconstitution, terlipressin acetate, net price 1-mg vial with 5 mL diluent = £17.90

Dose by intravenous injection over 1 minute, initially 1 mg if body-weight under 50 kg (initial dose 1.5 mg if body-weight 50–70 kg, or 2 mg if body-weight over 70 kg), then 1 mg every 4–6 hours for up to 72 hours; CHILD under 18 years see *BNF for Children*

VASOPRESSIN

Indications pituitary diabetes insipidus; bleeding from oesophageal varices

Cautions heart failure, hypertension, asthma, epilepsy, migraine or other conditions which might be aggravated by water retention; avoid fluid overload

Contra-indications vascular disease (especially disease of coronary arteries) unless extreme caution, chronic nephritis (until reasonable blood nitrogen concentrations attained)

Renal impairment see Contra-indications

Pregnancy oxytocic effect in third trimester

Breast-feeding not known to be harmful

Side-effects fluid retention, pallor, tremor, sweating, vertigo, headache, nausea, vomiting, belching, abdominal cramps, desire to defaecate, hypersensitivity reactions (including anaphylaxis), constriction of coronary arteries (may cause anginal attacks and myocardial ischaemia), peripheral ischaemia and rarely gangrene

Dose

- By subcutaneous *or* intramuscular injection, diabetes insipidus, 5–20 units every four hours
- By intravenous infusion, initial control of variceal bleeding, 20 units over 15 minutes

Synthetic vasopressin

Argipressin (Non-proprietary) PoM

Injection, argipressin (synthetic vasopressin) 20 units/mL, net price 1-mL amp = £22.50 (hosp. only)

Antidiuretic hormone antagonists

Demeclocycline (section 5.1.3) can be used in the treatment of hyponatraemia resulting from inappropriate secretion of antidiuretic hormone, if fluid restriction alone does not restore sodium concentration or is not tolerable. Demeclocycline is thought to act by directly blocking the renal tubular effect of antidiuretic hormone. Initially 0.9–1.2 g is given daily in divided doses, reduced to 600–900 mg daily for maintenance.

Tolvaptan

Tolvaptan is a vasopressin V_2-receptor antagonist licensed for the treatment of hyponatraemia secondary to syndrome of inappropriate antidiuretic hormone secretion; treatment duration with tolvaptan is determined by the underlying disease and its treatment.

Rapid correction of hyponatraemia during tolvaptan therapy can cause osmotic demyelination, leading to serious neurological events; close monitoring of serum-sodium concentration and fluid balance is essential

TOLVAPTAN

Indications see notes above

Cautions ensure adequate fluid intake (monitor for dehydration in patients who are fluid-restricted); monitor serum-sodium concentration and fluid balance no later than 6 hours after initiating treatment and every 6 hours during the first 1–2 days of treatment and until dose stabilised; discontinue if rapid rise in serum-sodium concentration (greater than 12 mmol/litre in 24 hours or 18 mmol/litre in 48 hours); diabetes mellitus; pseudohyponatraemia associated with diabetes mellitus (exclude before treatment); increased risk of demyelination syndrome in alcoholism, hypoxia, or malnutrition if rapid correction of hyponatraemia; avoid concomitant drugs that increase serum-sodium concentration; discontinue and perform liver-function tests promptly if symptoms of hepatic impairment (anorexia, nausea, vomiting, fatigue, abdominal pain, jaundice, dark urine, pruritus); **interactions:** Appendix 1 (tolvaptan)

Contra-indications anuria; volume depletion; hypovolaemic hyponatraemia; hypernatraemia; impaired perception of thirst

Hepatic impairment use with caution in severe impairment—no information available; see also Cautions above

Renal impairment no information available in severe impairment

Pregnancy avoid—toxicity in *animal* studies

Breast-feeding avoid—present in milk in *animal* studies

Side-effects nausea, constipation, dry mouth, postural hypotension, thirst, decreased appetite, fever, malaise, hyperglycaemia, urinary frequency, hyperkalaemia, dehydration, ecchymosis, increased blood creatinine, pruritus, neurological disturbance (following rapid correction of hyponatraemia); *less commonly* taste disturbance, renal impairment; *also reported* hepatic impairment (discontinue), hypernatraemia, hyperuricaemia, hypoglycaemia, syncope, dizziness

Dose

- ADULT over 18 years, 15 mg once daily, increased as required to max. 60 mg daily

Samsca® (Otsuka) PoM

Tablets, blue, tolvaptan 15 mg, net price 10-tab pack = £746.80; 30 mg, 10-tab pack = £746.80

6.6 Drugs affecting bone metabolism

See also calcium (section 9.5.1.1), phosphorus (section 9.5.2), vitamin D (section 9.6.4), and oestrogens in postmenopausal osteoporosis (section 6.4.1.1).

Osteoporosis

Osteoporosis occurs most commonly in postmenopausal women and in those taking long-term oral corticosteroids (glucocorticosteroids). Other risk factors for osteoporosis include low body weight, cigarette smoking, excess alcohol intake, lack of physical activity, family history of osteoporosis, and early menopause.

Those at risk of osteoporosis should maintain an adequate intake of **calcium and vitamin D** and any deficiency should be corrected by increasing dietary intake or taking supplements.

Elderly patients, especially those who are housebound or live in residential or nursing homes, are at increased risk of calcium and vitamin D deficiency and may benefit from supplements (section 9.5.1.1 and section 9.6.4). Reversible secondary causes of osteoporosis such as hyperthyroidism, hyperparathyroidism, osteomalacia or hypogonadism should be excluded, in both men and women, before treatment for osteoporosis is initiated.

Postmenopausal osteoporosis The **bisphosphonates** (alendronic acid and risedronate, section 6.6.2) are effective for preventing postmenopausal osteoporosis. **Hormone replacement therapy** (HRT section 6.4.1.1) is an option where other therapies are contra-indicated, cannot be tolerated, or if there is a lack of response. The CSM has advised that HRT should **not** be considered first-line therapy for long-term prevention of osteoporosis in women over 50 years of age. HRT is of most benefit for the prophylaxis of postmenopausal osteoporosis if started early in menopause and continued for up to 5 years, but bone loss resumes (possibly at an accelerated rate) on stopping HRT. Women of Afro-Caribbean origin appear to be less susceptible to osteoporosis than those who are white or of Asian origin.

Postmenopausal osteoporosis may be *treated* with a **bisphosphonate** (section 6.6.2). The bisphosphonates (such as alendronate and risedronate) decrease the risk of vertebral fracture; alendronate and risedronate have also been shown to reduce non-vertebral fractures. If bisphosphonates are unsuitable **calcitriol** (section 9.6.4) or **strontium ranelate** (but see section 6.6.2) may be considered. **Calcitonin** is no longer recommended for the treatment of postmenopausal osteoporosis as the benefits are outweighed by the risk of malignancy associated with long-term use. Calcitonin [unlicensed indication] has been used for pain relief for up to 3 months after a vertebral fracture when other analgesics were ineffective, but the benefits of treatment should be balanced against the risks. **Parathyroid hormone**, and **teriparatide** (section 6.6.1) have been introduced for the treatment of postmenopausal osteoporosis.

Raloxifene (section 6.4.1.1) is licensed for the *prophylaxis* and *treatment* of vertebral fractures in postmenopausal women.

NICE guidance

Alendronate, etidronate, risedronate, raloxifene and strontium ranelate for the primary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008)

Alendronate is recommended as a treatment option for the primary prevention of osteoporotic fractures in the following susceptible postmenopausal women:

- Women over 70 years who have an independent risk factor for fracture (parental history of hip fracture, alcohol intake of 4 or more units per day, or rheumatoid arthritis) *or* an indicator of low bone mineral density (body mass index under 22 kg/m^2, ankylosing spondylitis, Crohn's disease, prolonged immobility, untreated premature menopause, or rheumatoid arthritis) **and** confirmed osteoporosis
- Women aged 65–69 years who have an independent risk factor for fracture **and** confirmed osteoporosis
- Women under 65 years who have an independent risk factor for fracture **and** at least one additional indicator of low bone mineral density **and** confirmed osteoporosis

Risedronate or **etidronate** [now discontinued] are recommended as alternatives for women:

- in whom alendronate is contra-indicated or not tolerated **and**
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance[1]

Strontium ranelate [but see also Strontium Ranelate, p. 518] is recommended as an alternative for women:

- in whom alendronate and either risedronate or editronate are contra-indicated or not tolerated **and**
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance[1]

Raloxifene is **not** recommended as a treatment option in postmenopausal women for primary prevention of osteoporotic fractures.

www.nice.org.uk/TA160

1. Available at www.nice.org.uk/TA160

NICE guidance

Alendronate, etidronate, risedronate, raloxifene, strontium ranelate, and teriparatide for the secondary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008)

This guideline recommends treatment options for the secondary prevention of osteoporotic fractures in postmenopausal women with confirmed osteoporosis who have also sustained a clinically apparent osteoporotic fracture.

Alendronate is recommended as a treatment option for the secondary prevention of osteoporotic fractures in susceptible postmenupausal women.

Risedronate or **etidronate** [now discontinued] are recommended as alternatives for women:

- in whom alendronate is contra-indicated or not tolerated **and**
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture (parental history of hip fracture, alcohol intake of 4 or more units per day, or rheumatoid arthritis, as indicated in the full NICE guidance[1]

Strontium ranelate [but see also Strontium Ranelate, p. 518] or **raloxifene** are recommended as alternatives for women:

- in whom alendronate and either risedronate or editronate are contra-indicated or not tolerated **and**
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance[1]

Teriparatide is recommended as an alternative for women:

- in whom alendronate and either risedronate or editronate, *or* strontium ranelate are contra-indicated or not tolerated, **or** where treatment with alendronate, risedronate or editronate has been unsatisfactory (indicated by another fragility fracture and a decline in bone mineral density despite treatment for 1 year) **and**
- who comply with particular combinations of bone mineral density measurement, age, and number of fractures, as indicated in the full NICE guidance[1]

www.nice.org.uk/TA161

Corticosteroid-induced osteoporosis To reduce the risk of osteoporosis doses of oral corticosteroids should be as low as possible and courses of treatment as short as possible. The risk of osteoporosis may be related to cumulative dose of corticosteroids; even intermittent courses can therefore increase the risk. The greatest rate of bone loss occurs during the first 6–12 months of corticosteroid use and so early steps to prevent the development of osteoporosis are important. Long-term use of high-dose inhaled corticosteroids may also contribute to corticosteroid-induced osteoporosis (section 3.2).

Patients taking (or who are likely to take) an oral corticosteroid for 3 months or longer should be assessed and where necessary given prophylactic treatment; those aged over 65 years are at greater risk. Patients taking oral corticosteroids who have sustained a low-trauma fracture should receive treatment for osteoporosis. The therapeutic options for *prophylaxis* and *treatment* of corticosteroid-induced osteoporosis are the same:

- a bisphosphonate (section 6.6.2);
- calcitriol [unlicensed indication] (section 9.6.4);
- hormone replacement (HRT in women (section 6.4.1), testosterone in men [unlicensed indication] (section 6.4.2)).

1. Available at www.nice.org.uk/TA161

6.6.1 Calcitonin and parathyroid hormone

Calcitonin is involved with parathyroid hormone in the regulation of bone turnover and hence in the maintenance of calcium balance and homoeostasis. **Calcitonin (salmon)** (**salcatonin**, synthetic or recombinant salmon calcitonin) is used to lower the plasma-calcium concentration in patients with hypercalcaemia associated with malignancy, see also section 9.5.1.2. Calcitonin is also licensed for treatment of Paget's disease of bone when other treatments are ineffective or inappropriate; it is also licensed for the prevention of acute bone loss due to sudden immobility. Calcitonin is no longer recommended for the prevention or treatment of postmenopausal osteoporosis because the benefits are outweighed by the risk of malignancy associated with long-term use.

Recombinant **parathyroid hormone** is used for the treatment of postmenopausal osteoporosis. **Teriparatide** (a recombinant fragment of parathyroid hormone) is used for the treatment of postmenopausal osteoporosis, osteoporosis in men at increased risk of fracture, and corticosteroid-induced osteoporosis. *The Scottish Medicines Consortium*, p. 4 has advised (February 2007) that parathyroid hormone (*Preotact*®) should be initiated by specialists experienced in the treatment of osteoporosis; also that the use of teriparatide (*Forsteo*®) (December 2003) in postmenopausal women should be restricted to the treatment of established (severe) osteoporosis and should be initiated by specialists experienced in the treatment of osteoporosis.

Cinacalcet (section 9.5.1.2) is licensed for the treatment of hypercalcaemia in parathyroid carcinoma.

CALCITONIN (SALMON)/ SALCATONIN

Indications see notes above

Cautions history of allergy (skin test advised); heart failure; avoid prolonged use—risk of malignancy (use lowest effective dose for shortest possible time)

Contra-indications hypocalcaemia

Renal impairment use with caution

Pregnancy avoid unless potential benefit outweighs risk (toxicity in *animal* studies)

Breast-feeding avoid; inhibits lactation in *animals*

Side-effects nausea, vomiting, diarrhoea, abdominal pain, taste disturbances, flushing, dizziness, headache, fatigue, malignancy (with long-term use), musculoskeletal pain; *less commonly* hypertension, oedema, cough, polyuria, visual disturbances, injection-site

reactions, rash, hypersensitivity reactions including pruritus; *also reported* tremor

Dose

- Hypercalcaemia of malignancy (see also section 9.5.1.2), ADULT over 18 years, by subcutaneous *or* intramuscular injection, 100 units every 6–8 hours adjusted according to response; max. 400 units every 6–8 hours; in severe or emergency cases, by intravenous infusion, up to 10 units/kg over at least 6 hours
- Paget's disease of bone, ADULT over 18 years, by subcutaneous *or* intramuscular injection, 50 units 3 times weekly to 100 units daily adjusted according to response; max. duration of treatment 3 months (6 months in exceptional circumstances)
- Prevention of acute bone loss due to sudden immobility, ADULT over 18 years, by subcutaneous *or* intramuscular injection, 100 units daily in 1–2 divided doses, reduced to 50 units daily at start of mobilisation; duration of treatment 2 weeks, max. 4 weeks

Miacalcic® (Novartis) PoM

Injection, calcitonin (salmon) 50 units/mL, net price 1-mL amp = £3.42; 100 units/mL, 1-mL amp = £6.84; 200 units/mL, 2-mL vial = £24.60

For subcutaneous or intramuscular injection and for dilution and use as an intravenous infusion

PARATHYROID HORMONE

(Human recombinant parathyroid hormone)

Indications treatment of osteoporosis in postmenopausal women at high risk of fractures (to reduce the risk of vertebral fractures) (see also notes above)

Cautions monitor serum or urinary calcium concentration at 1, 3 and 6 months after initiation of treatment (consult product literature for guidance if serum-calcium concentration raised); active or previous urolithiasis; concomitant cardiac glycosides

Contra-indications previous radiation therapy to skeleton, pre-existing hypercalcaemia, metabolic bone disease (including hyperparathyroidism and Paget's disease), unexplained raised levels of alkaline phosphatase

Hepatic impairment avoid

Renal impairment avoid if eGFR less than 30 mL/minute/1.73m^2

Pregnancy avoid

Breast-feeding avoid

Side-effects nausea, vomiting, dyspepsia, constipation, diarrhoea; palpitation; headache, dizziness, fatigue, asthenia; transient hypercalcaemia, hypercalciuria; muscle cramp, pain in extremities, back pain; injection-site reactions; *less commonly* abdominal pain, altered sense of smell, taste disturbance, anorexia, influenza, hyperuricaemia

Dose

- By subcutaneous injection, 100 micrograms daily, max. duration of treatment 24 months

Preotact® (Nycomed) PoM

Injection, dual-chamber cartridge containing powder for reconstitution, parathyroid hormone (rdna) and diluent, net price 1.61-mg (14-dose) cartridge = £156.24. For use with *Preotact®* pen device.

TERIPARATIDE

Indications treatment of osteoporosis in postmenopausal women and in men at increased risk of fractures; treatment of corticosteroid-induced osteoporosis; see also notes above

Contra-indications pre-existing hypercalcaemia, skeletal malignancies or bone metastases, metabolic bone diseases, including Paget's disease and hyperparathyroidism, unexplained raised alkaline phosphatase, previous radiation therapy to the skeleton

Renal impairment caution in moderate impairment; avoid if severe

Pregnancy avoid

Breast-feeding avoid

Side-effects gastro-intestinal disorders (including nausea, reflux and haemorrhoids); palpitation; dyspnoea; headache, fatigue, asthenia, depression, dizziness, vertigo; anaemia, increased sweating, muscle cramps, sciatica, myalgia, arthralgia; *less commonly* urinary disorders, hypercalcaemia; injection-site reactions; *rarely* hypersensitivity reactions

Dose

- By subcutaneous injection, 20 micrograms daily; max. duration of treatment 24 months (course not to be repeated)

Forsteo® (Lilly) PoM

Injection, teriparatide 250 micrograms/mL, net price 2.4-mL prefilled pen = £271.88

6.6.2 Bisphosphonates and other drugs affecting bone metabolism

Bisphosphonates

Bisphosphonates are adsorbed onto hydroxyapatite crystals in bone, slowing both their rate of growth and dissolution, and therefore reducing the rate of bone turnover. Bisphosphonates have an important role in the prophylaxis and treatment of osteoporosis and corticosteroid-induced osteoporosis; **alendronic acid** or **risedronate sodium** are considered the drugs of choice for these conditions (see also section 6.6).

Bisphosphonates are also used in the treatment of *Paget's disease*, hypercalcaemia of malignancy (section 9.5.1.2), and in bone metastases in breast cancer (section 8.3.4.1). Etidronate disodium can impair bone mineralisation when used continuously or in high doses.

Bisphosphonates: osteonecrosis of the jaw

The risk of osteonecrosis of the jaw is substantially greater for patients receiving intravenous bisphosphonates in the treatment of cancer than for patients receiving oral bisphosphonates for osteoporosis or Paget's disease.

Risk factors for developing osteonecrosis of the jaw that should be considered are: potency of bisphosphonate (highest for zoledronate), route of administration, cumulative dose, duration and type of malignant disease, concomitant treatment, smoking, comorbid conditions, and history of dental disease.

All patients should have a dental check-up (and any necessary remedial work should be performed) before bisphosphonate treatment, or as soon as possible after starting treatment.

During bisphosphonate treatment patients should maintain good oral hygiene, receive routine dental check-ups, and report any oral symptoms.

Guidance for dentists in primary care is included in *Oral Health Management of Patients Prescribed Bisphosphonates: Dental Clinical Guidance*, Scottish Dental Clinical Effectiveness Programme, April 2011 (available at www.sdcep.org.uk).

MHRA/CHM advice
Bisphosphonates: atypical femoral fractures (June 2011)

Atypical femoral fractures have been reported rarely with bisphosphonate treatment, mainly in patients receiving long-term treatment for osteoporosis.

The need to continue bisphosphonate treatment for osteoporosis should be re-evaluated periodically based on an assessment of the benefits and risks of treatment for individual patients, particularly after 5 or more years of use.

Patients should be advised to report any thigh, hip, or groin pain during treatment with a bisphosphonate.

Discontinuation of bisphosphonate treatment in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of continued treatment.

ALENDRONIC ACID

Indications see under Dose

Cautions upper gastro-intestinal disorders (dysphagia, symptomatic oesophageal disease, gastritis, duodenitis, or ulcers—see also under Contra-indications and Side-effects); history (within 1 year) of ulcers, active gastro-intestinal bleeding, or surgery of the upper gastro-intestinal tract; correct disturbances of calcium and mineral metabolism (e.g. vitamin-D deficiency, hypocalcaemia) before starting and monitor serum-calcium concentration during treatment; consider dental check-up before initiating bisphosphonate (risk of osteonecrosis of the jaw, see Bisphosphonates: Osteonecrosis of the Jaw, above); exclude other causes of osteoporosis; atypical femoral fractures, see MHRA/CHM advice, above; **interactions:** Appendix 1 (bisphosphonates)

Contra-indications abnormalities of oesophagus and other factors which delay emptying (e.g. stricture or achalasia), hypocalcaemia

Renal impairment avoid if eGFR less than 35 mL/minute/1.73 m^2

Pregnancy avoid

Breast-feeding no information available

Side-effects oesophageal reactions (see below), abdominal pain and distension, dyspepsia, regurgitation, melaena, diarrhoea or constipation, flatulence, musculoskeletal pain, headache; *rarely* rash, pruritus, erythema, photosensitivity, uveitis, scleritis, transient decrease in serum calcium and phosphate; nausea, vomiting, gastritis, peptic ulceration, hypersensitivity reactions (including urticaria and angioedema), atypical femoral fractures with long-term use (see MHRA/CHM advice, above); myalgia, malaise, and fever at initiation of treatment; *very rarely* severe skin reactions (including Stevens-Johnson syndrome), osteonecrosis of the jaw (see Bisphosphonates: Osteonecrosis of the Jaw, above)

Oesophageal reactions Severe oesophageal reactions (oesophagitis, oesophageal ulcers, oesophageal stricture and oesophageal erosions) have been reported; patients should be advised to stop taking the tablets and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain

Dose

- Treatment of postmenopausal osteoporosis, 10 mg daily *or* 70 mg once weekly
- Treatment of osteoporosis in men, 10 mg daily
- Prevention and treatment of corticosteroid-induced osteoporosis in postmenopausal women not receiving hormone replacement therapy, 10 mg daily

Counselling Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after taking tablet

Alendronic acid (Non-proprietary) PoM

Tablets, alendronic acid (as sodium alendronate) 10 mg, net price 28-tab pack = £1.28; 70 mg, 4-tab pack = 84p. Counselling, administration

Oral solution, sugar-free, alendronic acid (as sodium alendronate) 70 mg/100 mL, net price 4 × 100-mL = £22.80. Counselling, administration

Counselling Oral solution should be swallowed as a single 100 mL dose with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patients should stand or sit upright for at least 30 minutes after taking the solution.

Fosamax® (MSD) PoM

Tablets, alendronic acid (as sodium alendronate) 10 mg, net price 28-tab pack = £23.12. Counselling, administration

Fosamax® Once Weekly (MSD) PoM

Tablets, alendronic acid (as sodium alendronate) 70 mg, net price 4-tab pack = £22.80. Counselling, administration

With colecalciferol

For prescribing information on colecalciferol, see section 9.6.4

Fosavance® (MSD) PoM

Tablets, alendronic acid (as sodium alendronate) 70 mg, colecalciferol 70 micrograms (2 800 units), net price 4-tab pack = £22.80. Counselling, administration

Dose treatment of postmenopausal osteoporosis in women at risk of vitamin D deficiency, 1 tablet once weekly

Counselling Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after taking tablet

ETIDRONATE DISODIUM

Indications Paget's disease of bone

Cautions consider dental check-up before initiating bisphosphonate (risk of osteonecrosis of the jaw, see Bisphosphonates: Osteonecrosis of the Jaw, p. 513); atypical femoral fractures, see MHRA/CHM advice, p. 513; **interactions:** Appendix 1 (bisphosphonates)

Contra-indications osteomalacia

Renal impairment reduce dose in mild impairment; avoid in moderate to severe renal impairment

Pregnancy avoid

Breast-feeding no information available

Side-effects nausea, diarrhoea or constipation, abdominal pain, increased bone pain, also increased risk of fractures with high doses (discontinue if fractures occur); *rarely* exacerbation of asthma, skin reactions (including angioedema, rash, urticaria and pruritus), transient hyperphosphataemia, headache, paraesthesia, peripheral neuropathy, atypical femoral fractures (see MHRA/CHM advice, p. 513); *very rarely* osteonecrosis of the jaw (see Bisphosphonates: Osteonecrosis of the Jaw, p. 513); blood disorders (including leucopenia, agranulocytosis and pancytopenia) also reported

Dose

- Paget's disease of bone, 5 mg/kg as a single daily dose for up to 6 months; doses above 10 mg/kg daily for up to 3 months may be used with caution but doses above 20 mg/kg daily are not recommended; after interval of not less than 3 months may be repeated where evidence of reactivation—including biochemical indices (avoid premature retreatment)

  Monitoring Serum phosphate, serum alkaline phosphatase, and (if possible) urinary hydroxyproline should be measured before starting and at intervals of 3 months—consult product literature for further details

  Counselling Avoid food for at least 2 hours before and after treatment, particularly calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids

Didronel® (Warner Chilcott) PoM

Tablets, etidronate disodium 200 mg. Net price 60-tab pack = £19.48. Counselling, food and calcium (see above)

IBANDRONIC ACID

Indications see under Dose

Cautions consider dental check-up before initiating bisphosphonate (risk of osteonecrosis of the jaw, see Bisphosphonates: Osteonecrosis of the Jaw, p. 513); atypical femoral fractures, see MHRA/CHM advice, p. 513; monitor renal function and serum calcium, phosphate and magnesium; cardiac disease (avoid fluid overload); **interactions:** Appendix 1 (bisphosphonates)

Contra-indications hypocalcaemia; *oral route* abnormalities of the oesophagus and other factors which delay emptying (e.g. stricture or achalasia)

Renal impairment for treatment of osteoporosis, avoid if eGFR less than 30 mL/minute/1.73 m^2; for reduction of bone damage in bone metastases, if eGFR 30–50 mL/minute/1.73 m^2 reduce *intravenous dose* to 4 mg and infuse over 1 hour, reduce *oral dose* to 50 mg on alternative days, if eGFR less than 30 mL/minute/1.73 m^2 reduce *intravenous dose* to 2 mg and infuse over 1 hour, reduce *oral dose* to 50 mg once weekly

Pregnancy avoid

Breast-feeding avoid—present in milk in *animal* studies

Side-effects hypocalcaemia, hypophosphataemia, influenza-like symptoms (including fever, chills, and muscle pain), bone pain; oesophageal reactions (see below), diarrhoea, nausea, vomiting, gastritis, abdominal pain, dyspepsia, pharyngitis; headache, asthenia, rash; *rarely* anaemia, atypical femoral fractures (see MHRA/CHM advice, p. 513), hypersensitivity reactions (pruritus, bronchospasm and angioedema reported); urticaria; injection-site reactions; *very rarely* osteonecrosis of the jaw (see Bisphosphonates: Osteonecrosis of the Jaw, p. 513)

Oesophageal reactions Severe oesophageal reactions reported with all **oral** bisphosphonates; patients should be advised to stop tablets and seek medical attention for symptoms of oesophageal irritation such as dysphagia, pain on swallowing, retrosternal pain, or heartburn

Dose

- Reduction of bone damage in bone metastases in breast cancer, by mouth, 50 mg daily, *or* by intravenous infusion, 6 mg every 3–4 weeks
- Hypercalcaemia of malignancy by intravenous infusion, according to serum calcium concentration, 2–4 mg in single infusion
- Treatment of postmenopausal osteoporosis, by mouth, 150 mg once a month *or* by intravenous injection over 15–30 seconds, 3 mg every 3 months
- CHILD not recommended

  Counselling Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes (ibandronic acid tablets, 50 mg) or 1 hour (*Bonviva®* tablets, 150 mg) before first food or drink (other than water) of the day, or another oral medicine; patient should stand or sit upright for at least 1 hour after taking tablet

Ibandronic acid (Non-proprietary) PoM

Tablets, ibandronic acid 50 mg, net price 28-tab pack = £11.99. Counselling, administration

Brands include *Iasibon®*

Bondronat® (Roche) PoM

Tablets, f/c, ibandronic acid 50 mg, net price 28-tab pack = £183.69. Counselling, administration

Concentrate for intravenous infusion, ibandronic acid 1 mg/mL, net price 2-mL vial = £89.36, 6-mL vial = £183.69

Bonviva® (Roche) PoM

Tablets, f/c, ibandronic acid 150 mg, net price 1-tab pack = £18.40, 3-tab pack = £55.21. Counselling, administration

Injection, ibandronic acid 1 mg/mL, net price 3-mL prefilled syringe = £68.64

PAMIDRONATE DISODIUM

Pamidronate disodium was formerly called aminohydroxypropylidenediphosphonate disodium (APD)

Indications see under Dose

Cautions assess renal function before each dose; ensure adequate hydration; cardiac disease (especially in elderly); previous thyroid surgery (risk of hypocalcaemia); monitor serum electrolytes, calcium and phosphate—possibility of convulsions due to electrolyte changes; avoid concurrent use with other

bisphosphonates; consider dental check-up before initiating bisphosphonate (risk of osteonecrosis of the jaw, see Bisphosphonates: Osteonecrosis of the Jaw, p. 513); atypical femoral fractures, see MHRA/CHM advice, p. 513; **interactions:** Appendix 1 (bisphosphonates)

Driving Patients should be warned against driving or operating machinery immediately after treatment (somnolence or dizziness can occur)

Hepatic impairment caution in severe hepatic impairment—no information available

Renal impairment max. infusion rate 20 mg/hour; avoid if eGFR less than 30 mL/minute/1.73 m^2, except in life-threatening hypercalcaemia if benefit outweighs risk; if renal function deteriorates in patients with bone metastases, withhold dose until serum creatinine returns to within 10% of baseline value

Pregnancy avoid

Breast-feeding avoid

Side-effects hypophosphataemia, fever and influenza-like symptoms (sometimes accompanied by malaise, rigors, fatigue and flushes); nausea, vomiting, anorexia, abdominal pain, diarrhoea, constipation; symptomatic hypocalcaemia (paraesthesia, tetany), hypomagnesaemia, headache, insomnia, drowsiness; hypertension; anaemia, thrombocytopenia, lymphocytopenia; rash; arthralgia, myalgia, bone pain; *rarely* muscle cramps, atypical femoral fractures (see MHRA/CHM advice, p. 513), dyspepsia, agitation, confusion, dizziness, lethargy; leucopenia, hypotension, pruritus, hyperkalaemia or hypokalaemia, and hypernatraemia; osteonecrosis of the jaw (see Bisphosphonates: Osteonecrosis of the Jaw, p. 513), isolated cases of seizures, hallucinations, haematuria, acute renal failure, deterioration of renal disease, conjunctivitis and other ocular symptoms; atrial fibrillation, and reactivation of herpes simplex and zoster also reported; also injection-site reactions

Dose

- By slow intravenous infusion (via cannula in a relatively large vein), see also Appendix 4

  Hypercalcaemia of malignancy, according to serum calcium concentration 15–60 mg in single infusion or in divided doses over 2–4 days; max. 90 mg per treatment course

  Osteolytic lesions and bone pain in bone metastases associated with breast cancer or multiple myeloma, 90 mg every 4 weeks (or every 3 weeks to coincide with chemotherapy in breast cancer)

  Paget's disease of bone, 30 mg once a week for 6 weeks (total dose 180 mg) *or* 30 mg in first week then 60 mg every other week (total dose 210 mg); max. total 360 mg (in divided doses of 60 mg) per treatment course; may be repeated every 6 months
- CHILD not recommended

Calcium and vitamin D supplements Oral supplements are advised to minimise potential risk of hypocalcaemia for those with mainly lytic bone metastases or multiple myeloma at risk of calcium or vitamin D deficiency (e.g. through malabsorption or lack of exposure to sunlight) and in those with Paget's disease

Pamidronate disodium (Non-proprietary) PoM

Concentrate for intravenous infusion, pamidronate disodium 3 mg/mL, net price 5-mL vial = £13.33, 10-mL vial = £26.66; 6 mg/mL, 10-mL vial = £53.33; 9 mg/mL, 10-mL vial = £80.00; 15 mg/mL, 1-mL vial = £29.83, 2-mL vial = £59.66, 4-mL vial = £119.32, 6-mL vial £170.46

Aredia Dry Powder® (Novartis) PoM

Intravenous infusion, powder for reconstitution, pamidronate disodium, net price 15-mg vial = £29.83; 30-mg vial = £59.66; 90-mg vial = £170.45 (all with diluent)

RISEDRONATE SODIUM

Indications see under Dose

Cautions oesophageal abnormalities and other factors which delay transit or emptying (e.g. stricture or achalasia—see also under Side-effects); correct hypocalcaemia before starting, correct other disturbances of bone and mineral metabolism (e.g. vitamin-D deficiency) at onset of treatment; consider dental check-up before initiating bisphosphonate (risk of osteonecrosis of the jaw, see Bisphosphonates: Osteonecrosis of the Jaw, p. 513); atypical femoral fractures, see MHRA/CHM advice, p. 513; **interactions:** Appendix 1 (bisphosphonates)

Contra-indications hypocalcaemia (see Cautions above)

Renal impairment avoid if eGFR less than 30 mL/minute/1.73 m^2

Pregnancy avoid

Breast-feeding avoid

Side-effects abdominal pain, dyspepsia, nausea, diarrhoea, constipation, headache, musculoskeletal pain; *less commonly* oesophagitis, oesophageal ulcer, dysphagia, gastritis, duodenitis, uveitis; *rarely* glossitis, oesophageal stricture, atypical femoral fractures (see MHRA/CHM advice, p. 513); *also reported* gastroduodenal ulceration, hepatic disorders, Stevens-Johnson syndrome, toxic epidermal necrolysis, hair loss, cutaneous vasculitis, osteonecrosis of the jaw (see Bisphosphonates: Osteonecrosis of the Jaw, p. 513)

Oesophageal reactions Patients should be advised to stop taking the tablets and seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, pain on swallowing, retrosternal pain, or heartburn

Dose

- Paget's disease of bone, 30 mg daily for 2 months; may be repeated if necessary after at least 2 months
- Treatment of postmenopausal osteoporosis to reduce risk of vertebral or hip fractures, 5 mg daily *or* 35 mg once weekly
- Prevention of osteoporosis (including corticosteroid-induced osteoporosis) in postmenopausal women, 5 mg daily
- Treatment of osteoporosis in men at high risk of fractures, 35 mg once weekly
- CHILD see *BNF for Children*

Counselling Swallow tablets whole with full glass of water; on rising, take on an empty stomach at least 30 minutes before first food or drink of the day **or**, if taking at any other time of the day, avoid food and drink for at least 2 hours before or after risedronate (particularly avoid calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids); stand or sit upright for at least 30 minutes; do not take tablets at bedtime or before rising

Risedronate Sodium (Non-proprietary) PoM

Tablets, risedronate sodium 5 mg, net price 28-tab pack = £13.24; 30 mg, 28-tab pack = £105.70; 35 mg, 4-tab pack = £1.08. Counselling, administration, food, and calcium (see above)

Actonel® (Warner Chilcott) PoM

Tablets, f/c, risedronate sodium 5 mg (yellow), net price 28-tab pack = £17.99; 30 mg (white), 28-tab pack = £143.95. Counselling, administration, food and calcium (see above)

Actonel Once a Week® (Warner Chilcott) PoM

Tablets, f/c, orange, risedronate sodium 35 mg, net price 4-tab pack = £19.12. Counselling, administration, food and calcium (see above)

With calcium carbonate and colecalciferol

For cautions, contra-indications, and side-effects of calcium carbonate, see section 9.5.1.1 and of colecalciferol, see section 9.6.4

Actonel® Combi (Warner Chilcott) PoM

Tablets, f/c, orange, risedronate sodium 35 mg (*Actonel Once a Week®*);

Granules, effervescent, lemon flavour, calcium carbonate 2.5 g (calcium 1 g or Ca^{2+} 25 mmol) and colecalciferol 22 micrograms (880 units)/sachet, net price 24-sachet plus 4-tab pack = £19.12. Counselling, administration, food and calcium (see above)

Dose treatment of postmenopausal osteoporosis to reduce risk of vertebral or hip fractures, given in weekly cycles, 1 *Actonel Once a Week®* tablet on the first day followed by 1 calcium and colecalciferol sachet daily for 6 days

Counselling Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after taking tablet. Granules should be stirred into a glass of water and after dissolution complete taken immediately

SODIUM CLODRONATE

Indications see under Dose

Cautions monitor renal and hepatic function and white cell count; also monitor serum calcium and phosphate periodically; renal dysfunction reported in patients receiving concomitant NSAIDs; maintain adequate fluid intake during treatment; consider dental check-up before initiating bisphosphonate (risk of osteonecrosis of the jaw, see Bisphosphonates: Osteonecrosis of the Jaw, p. 513); atypical femoral fractures, see MHRA/CHM advice, p. 513;**interactions:** Appendix 1 (bisphosphonates)

Contra-indications acute gastro-intestinal inflammatory conditions

Renal impairment use half normal dose if eGFR 10–30 mL/minute/1.73 m^2; avoid if eGFR less than 10 mL/minute/1.73 m^2

Pregnancy avoid

Breast-feeding manufacturer advises avoid—no information available

Side-effects nausea, vomiting, diarrhoea, skin reactions, bronchospasm; *rarely* atypical femoral fractures (see MHRA/CHM advice, p. 513); *very rarely* osteonecrosis of the jaw (see Bisphosphonates: Osteonecrosis of the Jaw, p. 513); *also reported* renal impairment

Dose

- Osteolytic lesions, hypercalcaemia and bone pain associated with skeletal metastases in patients with breast cancer or multiple myeloma, by mouth, 1.6 g daily in single or 2 divided doses increased if necessary to a max. of 3.2 g daily in 2 divided doses

Counselling Avoid food for 2 hours before and 1 hour after treatment, particularly calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids; maintain adequate fluid intake

Bonefos® (Bayer) PoM

Capsules, yellow, sodium clodronate 400 mg, net price 120-cap pack = £139.83. Counselling, food and calcium

Tablets, f/c, scored, sodium clodronate 800 mg, net price 60-tab pack = £146.43. Counselling, food and calcium

Clasteon® (Beacon) PoM

Capsules, blue/white, sodium clodronate 400 mg, net price 30-cap pack = £34.96, 120-cap pack = £139.83. Counselling, food and calcium

Tablets, f/c, sodium clodronate 800 mg, net price 60-tab pack = £146.43. Counselling, food and calcium

Loron 520® (Intrapharm) PoM

Tablets, f/c, scored, sodium clodronate 520 mg, net price 60-tab pack = £152.59. Label: 10, patient information leaflet, counselling, food and calcium

Dose 2 tablets daily in single or two divided doses; may be increased to max. 4 tablets daily

ZOLEDRONIC ACID

Indications see under preparations

Cautions correct disturbances of calcium metabolism (e.g. vitamin D deficiency, hypocalcaemia) before starting; monitor serum electrolytes, calcium, phosphate and magnesium; cardiac disease (avoid fluid overload); consider dental check-up before initiating bisphosphonate (risk of osteonecrosis of the jaw, see Bisphosphonates: Osteonecrosis of the Jaw, p. 513); atypical femoral fractures, see MHRA/CHM advice, p. 513; **interactions:** Appendix 1 (bisphosphonates)

Renal function Renal impairment and renal failure have been reported. Before each dose ensure patient is hydrated and assess renal function. Continue to monitor renal function in patients at risk, such as those with pre-existing renal impairment, those of advanced age, those taking concomitant nephrotoxic drugs or diuretics, or those who are dehydrated. Use with caution with concomitant medicines that affect renal function

Contra-indications women of child-bearing potential

Hepatic impairment caution in severe hepatic impairment—limited information available

Renal impairment avoid if serum creatinine above 400 micromol/litre in tumour-induced hypercalcaemia; in advanced malignancies involving bone, if eGFR 50–60 mL/minute/1.73 m^2 reduce dose to 3.5 mg every 3–4 weeks, if eGFR 40–50 mL/minute/1.73 m^2 reduce dose to 3.3 mg every 3–4 weeks, if eGFR 30–40 mL/minute/1.73 m^2 reduce dose to 3 mg every 3–4 weeks, avoid if eGFR less than 30 mL/minute/1.73 m^2 (or if serum creatinine greater than 265 micromol/litre); if renal function deteriorates in patients with bone metastases, withhold dose until serum creatinine returns to within 10% of baseline value; avoid in Paget's disease, treatment of postmenopausal osteoporosis and osteoporosis in men if eGFR less than 35 mL/minute/1.73 m^2; see also Cautions above

Pregnancy avoid—toxicity in *animal* studies

Breast-feeding avoid—no information available

Side-effects hypophosphataemia, anaemia, influenza-like symptoms including bone pain, myalgia, arthralgia, fever and rigors; gastro-intestinal disturbances; atrial fibrillation; headache, dizziness, conjunctivitis, renal impairment (rarely acute renal failure); *less commonly* anorexia, taste disturbance, dry mouth, stomatitis, chest pain, hypertension, hypotension, dyspnoea, cough, paraesthesia, tremor, anxiety, lethargy, sleep disturbance, blurred vision, weight gain, pruritus, rash, sweating, muscle cramps, haematuria, proteinuria, urinary frequency, hypersensitivity reactions (including angioedema), asthenia, peripheral oedema, thrombocytopenia, leucopenia, hypomagnesaemia, hypokalaemia, also injection-site reactions; *rarely* bradycardia, confusion, hyperkalaemia, hypernatraemia, pancytopenia, osteonecrosis of the jaw (see Bisphosphonates: Osteonecrosis of the Jaw, p. 513), atypical femoral fractures (see MHRA/CHM advice, p. 513); *very rarely* uveitis and episcleritis

Dose

- See under preparations

Aclasta® (Novartis) PoM

Intravenous infusion, zoledronic acid 50 micrograms/mL, net price 100-mL bottle = £253.38

Dose treatment of Paget's disease of bone, by intravenous infusion, 5 mg as a single dose over at least 15 minutes

Note At least 500 mg elemental calcium twice daily (with vitamin D, section 9.6.4) for at least 10 days is recommended following infusion

Treatment of postmenopausal osteoporosis and osteoporosis in men (including corticosteroid-induced osteoporosis), by intravenous infusion, 5 mg over at least 15 minutes once a year

Note In patients with a recent low-trauma hip fracture, the dose should be given 2 or more weeks following hip fracture repair; before first infusion give 50 000–125 000 units of vitamin D (section 9.6.4)

Note The *Scottish Medicines Consortium* (p. 4) has advised (February 2008) that in postmenopausal women *Aclasta®* is accepted for restricted use within the NHS Scotland for the treatment of osteoporosis in those for whom oral treatment options for osteoporosis are inappropriate and when initiated by a specialist

Zometa® (Novartis) PoM

Concentrate for intravenous infusion, zoledronic acid, 800 micrograms/mL, net price 5-mL (4-mg) vial = £174.17

Solution for intravenous infusion, zoledronic acid, 40 micrograms/mL, net price 100-mL (4-mg) bottle = £174.14

Dose reduction of bone damage in advanced malignancies involving bone, by intravenous infusion, 4 mg over at least 15 minutes every 3–4 weeks; CHILD not recommended

Note Calcium 500 mg daily and vitamin D 400 units daily should also be taken

Hypercalcaemia of malignancy, by intravenous infusion, 4 mg as a single dose over at least 15 minutes; CHILD not recommended

Note The *Scottish Medicines Consortium* (p. 4) has advised (May 2003) that for the prevention of skeletal related events *Zometa®* is accepted for restricted use within NHS Scotland for the treatment of patients with breast cancer and multiple myeloma if prescribed by an oncologist

Denosumab

Denosumab is a human monoclonal antibody that inhibits osteoclast formation, function, and survival, thereby decreasing bone resorption.

NICE guidance

Denosumab for the prevention of osteoporotic fractures in postmenopausal women (October 2010)

Denosumab is recommended as a treatment option for the *primary prevention* of osteoporotic fragility fractures in postmenopausal women at increased risk of fractures:

- who are unable to comply with the special instructions for administering alendronate and either risedronate or etidronate, or have an intolerance of, or a contra-indication to, those treatments **and**
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance (available at www.nice.org.uk/TA204).

Denosumab is recommended as a treatment option for the *secondary prevention* of osteoporotic fragility fractures only in postmenopausal women at increased risk of fractures who are unable to comply with the special instructions for administering alendronate and either risedronate or etidronate, or have an intolerance of, or a contra-indication to, those treatments.

www.nice.org.uk/TA204

The *Scottish Medicines Consortium* (p. 4) has advised (November 2010) that denosumab (*Prolia®*) is accepted for restricted use within NHS Scotland for the treatment of osteoporosis in postmenopausal women at increased risk of fractures who have a bone mineral density T-score <–2.5 and ≥–4.0 and for whom bisphosphonates are unsuitable.

NICE guidance

Denosumab for the prevention of skeletal-related events in adults with bone metastases from solid tumours (October 2012)

Denosumab is recommended for the prevention of skeletal-related events in adults with bone metastases from breast cancer and from solid tumours other than prostate if:

- bisphosphonates would otherwise be prescribed, **and**
- the manufacturer provides denosumab with the discount agreed in the patient access scheme.

Denosumab is **not** recommended for preventing skeletal-related events in adults with bone metastases from prostate cancer.

Patients with bone metastases from solid tumours currently receiving denosumab whose disease does not meet the above criteria can continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA265

MHRA/CHM advice

Denosumab: atypical femoral fractures (February 2013)

Atypical femoral fractures have been reported rarely in patients receiving denosumab for the long-term treatment (2.5 or more years) of postmenopausal osteoporosis.

Patients should be advised to report any new or unusual thigh, hip, or groin pain during treatment with denosumab.

Discontinuation of denosumab in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of continued treatment.

DENOSUMAB

Indications see under preparations

Cautions correct hypocalcaemia and vitamin D deficiency before starting (monitor plasma-calcium concentration during therapy); consider dental check-up and carry out invasive procedures before initiating treatment (risk of osteoneocrosis of the jaw); atypical femoral fractures (see MHRA/CHM advice, above)

Renal impairment increased risk of hypocalcaemia if eGFR less than 30 mL/minute/1.73 m^2—monitor plasma-calcium concentration

Pregnancy avoid

Breast-feeding avoid

Side-effects diarrhoea, constipation, dyspnoea, urinary tract infection, upper respiratory tract infection, pain in extremity, sciatica, hypocalcaemia (fatal cases reported), hypophosphataemia, cataracts, rash, sweating; *less commonly* diverticulitis, cellulitis (seek prompt medical attention), ear infection; *rarely* osteonecrosis of the jaw, atypical femoral fractures (see MHRA/CHM advice, above)

Dose

- See under preparations

Prolia® (Amgen) ▼ PoM

Injection, denosumab 60 mg/mL, net price 1-mL prefilled syringe = £183.00

Dose treatment of postmenopausal osteoporosis in women at increased risk of fractures and bone loss associated with hormone ablation in men with prostate cancer at increased risk of fractures, by subcutaneous injection, 60 mg every 6 months

Note Supplement with calcium and vitamin D

XGEVA® (Amgen) ▼ PoM

Injection, denosumab 70 mg/mL, net price 1.7-mL (120-mg) vial = £309.86

Dose reduction of bone damage in patients with bone metastases from solid tumours, ADULT over 18 years, by subcutaneous injection, 120 mg every 4 weeks

Note Calcium 500 mg daily and vitamin D 400 units daily should also be taken

Strontium ranelate

Strontium ranelate stimulates bone formation and reduces bone resorption. Strontium ranelate treatment has been associated with an increased risk of serious cardiovascular disease, including myocardial infarction, and the risk should be assessed before treatment and regularly during treatment. Strontium ranelate should be initiated only by specialists for the treatment of severe osteoporosis in postmenopausal women or men at high risk of fracture for whom other treatments are contra-indicated or not tolerated.

STRONTIUM RANELATE

Indications see notes above

Cautions predisposition to cardiovascular disease—assess risk before and every 6–12 months during treatment; interferes with colorimetric measurements of calcium in blood and urine; **interactions**: Appendix 1 (strontium ranelate)

Contra-indications current or previous venous thromboembolic event, ischaemic heart disease, peripheral arterial disease, cerebrovascular disease, or uncontrolled hypertension; temporary or prolonged immobilisation

Renal impairment avoid if eGFR less than 30 mL/minute/1.73 m^2

Side-effects nausea, diarrhoea, venous thromboembolism, myocardial infarction, headache, dermatitis, eczema; *very rarely* hypersensitivity reactions, including rash, pruritus, urticaria, and angioedema—see Severe Allergic Reactions, below; *also reported* gastro-oesophageal reflux, dyspepsia, abdominal pain, vomiting, constipation, flatulence, stomatitis, peripheral oedema, bone marrow suppression, alopecia

Severe allergic reactions

Severe allergic reactions, including drug rash with eosinophilia and systemic symptoms (DRESS), have been reported in patients taking strontium ranelate. DRESS starts with rash, fever, swollen glands, and increased white cell count, and it can affect the liver, kidneys and lungs; DRESS can also be fatal.

Patients should be advised to stop taking strontium ranelate and consult their doctor immediately if skin rash develops. Treatment with strontium ranelate should not be restarted.

Dose

- 2 g once daily in water, preferably at bedtime

Counselling Avoid food for 2 hours before and after taking granules, particularly calcium-containing products e.g. milk; also preferably avoid concomitant antacids containing aluminium and magnesium hydroxides for 2 hours after taking granules

Protelos® (Servier) ▼ PoM

Granules, yellow, strontium ranelate, 2 g/sachet, net price 28-sachets = £27.08. Label: 5, 13, counselling, food and calcium

Excipients include aspartame (section 9.4.1)

6.7 Other endocrine drugs

6.7.1 Bromocriptine and other dopaminergic drugs

Bromocriptine is a stimulant of dopamine receptors in the brain; it also inhibits release of prolactin by the pituitary. Bromocriptine is used for the treatment of galactorrhoea, and for the treatment of prolactinomas (when it reduces both plasma prolactin concentration and tumour size). Bromocriptine also inhibits the release of growth hormone and is sometimes used in the treat-

ment of acromegaly, but somatostatin analogues (such as octreotide, section 8.3.4.3) are more effective.

Cabergoline has actions and uses similar to those of bromocriptine, but its duration of action is longer. It has similar side-effects to bromocriptine, however patients intolerant of bromocriptine may be able to tolerate cabergoline (and *vice versa*).

Quinagolide is a non-ergot dopamine D_2 agonist; it has actions and uses similar to those of ergot-derived dopamine agonists, but its side-effects differ slightly.

Cautions see notes below; also bromocriptine and cabergoline should be used with caution in patients with a history of peptic ulcer, particularly in acromegalic patients. Treatment should be withdrawn if gastro-intestinal bleeding occurs. In hyperprolactinaemic patients, the source of the hyperprolactinaemia should be established (i.e. exclude pituitary tumour before treatment). Bromocriptine and cabergoline should be used with caution in patients with Raynaud's syndrome and cardiovascular disease (see also Contra-indications under Bromocriptine, below). Monitor for fibrotic disease (see Fibrotic Reactions, below). Caution is also advised in patients with a history of serious mental disorders (especially psychotic disorders) and in those with acute porpyhria (see section 9.8.2). Tolerance may be reduced by alcohol.

Contra-indications Bromocriptine and cabergoline should not be used in patients with hypersensitivity to ergot alkaloids. They are contra-indicated in those with cardiac valvulopathy (exclude before treatment, see Fibrotic Reactions, below). They should also be avoided in pre-eclampsia (see also Contra-indications under Bromocriptine, below).

Side-effects Nausea, constipation, and headache are common side-effects of bromocriptine and cabergoline. Paraesthesia has been reported rarely. Other reported side-effects include hypotension (see also Hypotensive Reactions, below), drowsiness (see also Driving, below), dyskinesia, pathological gambling, increased libido, hypersexuality, leg cramps, allergic skin reactions, alopecia, and peripheral oedema. Bromocriptine and cabergoline have been associated with pleuritis, pleural effusion, cardiac valvulopathy, pericardial effusion, constrictive pericarditis, and retroperitoneal, pleural, and pulmonary fibrosis (see Fibrotic Reactions).

Fibrotic reactions

Ergot-derived dopamine-receptor agonists, bromocriptine, cabergoline, lisuride [discontinued], and pergolide have been associated with pulmonary, retroperitoneal, and pericardial fibrotic reactions.

Exclude cardiac valvulopathy with echocardiography before starting treatment with these ergot derivatives for chronic endocrine disorders (excludes suppression of lactation) or Parkinson's disease; it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatinine and to obtain a chest X-ray. Patients should be monitored for dyspnoea, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful. Patients taking cabergoline or pergolide should be regularly monitored for cardiac fibrosis, by echocardiography (within 3–6 months of initiating treatment and subsequently at 6–12 month intervals).

Driving

Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with dopaminergic drugs.

Patients starting treatment with these drugs should be warned of the possibility of these effects and of the need to exercise caution when driving or operating machinery.

Patients who have suffered excessive sedation or sudden onset of sleep should refrain from driving or operating machines until those effects have stopped recurring.

Hypotensive reactions Hypotensive reactions can be disturbing in some patients during the first few days of treatment with bromocriptine, cabergoline, or quinagolide—monitor blood pressure for a few days after starting treatment and following dosage increases; particular care should be exercised when driving or operating machinery.

Suppression of lactation Although bromocriptine and cabergoline are licensed to suppress lactation, they are **not** recommended for routine suppression (or for the relief of symptoms of postpartum pain and engorgement) that can be adequately treated with simple analgesics and breast support. If a dopamine-receptor agonist is required, cabergoline is preferred. Quinagolide is not licensed for the suppression of lactation.

BROMOCRIPTINE

Indications see notes above and under Dose; Parkinson's disease (section 4.9.1)

Cautions see notes above; also specialist evaluation—monitor for pituitary enlargement, particularly during pregnancy; monitor visual field to detect secondary field loss in macroprolactinoma; contraceptive advice if appropriate (oral contraceptives may increase prolactin concentration); **interactions:** Appendix 1 (bromocriptine)

Contra-indications see notes above; also hypertension in postpartum women or in puerperium (see also below)

Postpartum or puerperium Should not be used postpartum or in puerperium in women with high blood pressure, coronary artery disease, or symptoms (or history) of serious mental disorder; monitor blood pressure carefully (especially during first few days) in postpartum women. Very rarely hypertension, myocardial infarction, seizures or stroke (both sometimes preceded by severe headache or visual disturbances), and mental disorders have been reported in postpartum women given bromocriptine for lactation suppression—caution with antihypertensive therapy and avoid other ergot alkaloids. Discontinue immediately if hypertension, unremitting headache, or signs of CNS toxicity develop

Hepatic impairment dose reduction may be necessary

Pregnancy see Cautions above

Breast-feeding suppresses lactation; avoid breast feeding for about 5 days if lactation prevention fails

Side-effects see notes above; also nasal congestion; *less commonly* vomiting, postural hypotension, fatigue, dizziness, dry mouth; also, particularly with *high doses*, confusion, psychomotor excitation, hallucinations; *rarely* diarrhoea, gastro-intestinal bleeding, gastric ulcer, abdominal pain, tachycardia, bradycardia, arrhythmia, insomnia, psychosis, visual disturbances, tinnitus; *very rarely* vasospasm of fingers and toes particularly in patients with Raynaud's syndrome, and

effects like neuroleptic malignant syndrome on withdrawal; urinary incontinence, leucopenia, thrombocytopenia, hyponatraemia, reversible hearing loss, increased libido, and hypersexuality also reported

Dose

- Prevention or suppression of lactation (but see notes above and under Cautions), 2.5 mg on day 1 (prevention) or daily for 2–3 days (suppression); then 2.5 mg twice daily for 14 days
- Hypogonadism, galactorrhoea, infertility, initially 1–1.25 mg at bedtime, increased gradually; usual dose 7.5 mg daily in divided doses, increased if necessary to max. 30 mg daily, usual dose in infertility without hyperprolactinaemia, 2.5 mg twice daily
- Acromegaly, initially 1–1.25 mg at bedtime, increase gradually to 5 mg every 6 hours
- Prolactinoma, initially 1–1.25 mg at bedtime; increased gradually to 5 mg every 6 hours (occasional patients may require up to 30 mg daily)
- CHILD under 15 years, not recommended

Bromocriptine (Non-proprietary) PoM

Tablets, bromocriptine (as mesilate) 1 mg, net price 100-tab pack =£60.10; 2.5 mg, 30-tab pack = £66.21. Label: 10, 21, counselling, driving, see notes above

Parlodel® (Meda) PoM

Capsules, bromocriptine (as mesilate) 5 mg (blue/white), net price 100-cap pack = £37.57; 10 mg (white), 100-cap pack = £69.50. Label: 10, 21, counselling, driving, see notes above

CABERGOLINE

Indications see notes above and under Dose

Cautions see notes above; also monthly pregnancy tests during the amenorrhoeic period; advise non-hormonal contraception if pregnancy not desired (see also Pregnancy, below); **interactions:** Appendix 1 (cabergoline)

Contra-indications see notes above; history of puerperal psychosis; history of pulmonary, pericardial, or retroperitoneal fibrotic disorders (see Fibrotic Reactions in notes above); cardiac valvulopathy

Hepatic impairment reduce dose in severe hepatic impairment

Pregnancy exclude pregnancy before starting and discontinue 1 month before intended conception (ovulatory cycles persist for 6 months)—discontinue if pregnancy occurs during treatment (specialist advice needed)

Breast-feeding suppresses lactation; avoid breast-feeding if lactation prevention fails

Side-effects see notes above; also cardiac valvulopathy, dyspepsia, gastritis, epigastric and abdominal pain, angina, syncope, depression, confusion, hallucinations, breast pain; *rarely* vomiting, palpitation, epistaxis, digital vasospasm, hot flushes, transient hemianopia, muscle weakness; *also reported* erythromelalgia

Dose

- Prevention of lactation (but see notes above and under Contra-indications), during first day postpartum, 1 mg as a single dose; suppression of established lactation (but see notes above) 250 micrograms every 12 hours for 2 days; CHILD under 16 years, not recommended
- Hyperprolactinaemic disorders, 500 micrograms weekly (as a single dose *or* as 2 divided doses on separate days) increased at monthly intervals in steps of 500 micrograms until optimal therapeutic response (usually 1 mg weekly, range 0.25–2 mg weekly) with monthly monitoring of serum prolactin levels; reduce initial dose and increase more gradually if patient intolerant; over 1 mg weekly give as divided doses; up to 4.5 mg weekly has been used in hyperprolactinaemic patients; CHILD under 16 years, not recommended
- Parkinson's disease, section 4.9.1

Cabergoline (Non-proprietary) PoM

Tablet, scored, cabergoline 500 micrograms, net price 8-tab pack = £34.33. Label: 10, 21, counselling, driving, see notes above

Note Dispense in original container (contains desiccant)

Dostinex® (Pharmacia) PoM

Tablets, scored, cabergoline 500 micrograms. Net price 8-tab pack = £30.04. Label: 10, 21, counselling, driving, see notes above

Note Dispense in original container (contains desiccant)

QUINAGOLIDE

Indications see notes above and under Dose

Cautions see notes above; history of psychotic illness; advise non-hormonal contraception if pregnancy not desired; **interactions:** Appendix 1 (quinagolide)

Contra-indications hypersensitivity to quinagolide (but not ergot alkaloids)

Hepatic impairment avoid—no information available

Renal impairment avoid—no information available

Pregnancy discontinue when pregnancy confirmed unless medical reason for continuing (specialist advice needed)

Breast-feeding suppresses lactation

Side-effects nausea, vomiting, anorexia, abdominal pain, constipation or diarrhoea; syncope, hypotension (see also notes above), oedema, flushing; nasal congestion; headache, dizziness, fatigue, insomnia; *very rarely* psychosis

Dose

- Hyperprolactinaemia, 25 micrograms at bedtime for 3 days; increased at intervals of 3 days in steps of 25 micrograms to usual maintenance dose of 75–150 micrograms daily; for doses higher than 300 micrograms daily increase in steps of 75–150 micrograms at intervals of not less than 4 weeks; CHILD not recommended

Norprolac® (Ferring) PoM

Tablets, quinagolide (as hydrochloride) 75 micrograms (white), net price 30-tab pack = £27.00; starter pack of 3 × 25-microgram tabs (pink) with 3 × 50-microgram tabs (blue) = £4.50. Label: 10, 21, counselling, driving, see notes above

6.7.2 Drugs affecting gonadotrophins

Danazol inhibits pituitary gonadotrophins; it combines androgenic activity with antioestrogenic and antiprogestogenic activity. It is licensed for the treatment of *endometriosis* and for the relief of severe pain and tenderness in *benign fibrocystic breast disease* where other measures have proved unsatisfactory. It may also be effective in the long-term management of *hereditary angioedema* [unlicensed indication].

Cetrorelix and **ganirelix** are luteinising hormone releasing hormone antagonists, which inhibit the release

of gonadotrophins (luteinising hormone and follicle-stimulating hormone). They are used in the treatment of infertility by assisted reproductive techniques.

CETRORELIX

Indications adjunct in the treatment of female infertility (under specialist supervision)

Hepatic impairment avoid in moderate or severe liver impairment

Renal impairment avoid in moderate or severe renal impairment

Pregnancy avoid in confirmed pregnancy

Breast-feeding avoid

Side-effects nausea, headache, injection site reactions; rarely hypersensitivity reactions

Dose

- By subcutaneous injection into the lower abdominal wall,

  either 250 micrograms in the morning, starting on day 5 or 6 of ovarian stimulation with gonadotrophins (*or* each evening starting on day 5 of ovarian stimulation); continue throughout administration of gonadotrophin including day of ovulation induction (*or* evening before ovulation induction)

  or 3 mg on day 7 of ovarian stimulation with gonadotrophins; if ovulation induction not possible on day 5 after 3-mg dose, additional 250 micrograms once daily until day of ovulation induction

Cetrotide® (Merck Serono) PoM

Injection, powder for reconstitution, cetrorelix (as acetate), net price 250-micrograms vial = £22.61; 3-mg vial = £158.26 (both with solvent)

DANAZOL

Indications see notes above and under Dose

Cautions cardiac impairment (avoid if severe), elderly, polycythaemia, epilepsy, diabetes mellitus, hypertension, migraine, lipoprotein disorder, history of thrombosis or thromboembolic disease; withdraw if virilisation (may be irreversible on continued use); non-hormonal contraceptive methods should be used, if appropriate; **interactions:** Appendix 1 (danazol)

Contra-indications ensure that patients with amenorrhoea are not pregnant; thromboembolic disease; undiagnosed genital bleeding; androgen-dependent tumours; acute porphyria (section 9.8.2)

Hepatic impairment caution in hepatic impairment (avoid if severe)

Renal impairment caution in renal impairment (avoid if severe)

Pregnancy avoid; has weak androgenic effects and virilisation of female fetus reported

Breast-feeding no data available but avoid because of possible androgenic effects in infant

Side-effects nausea, dizziness, skin reactions including rashes, photosensitivity and exfoliative dermatitis, fever, backache, nervousness, mood changes, anxiety, changes in libido, vertigo, fatigue, epigastric and pleuritic pain, headache, weight gain; menstrual disturbances, vaginal dryness and irritation, flushing and reduction in breast size; musculo-skeletal spasm, joint pain and swelling, hair loss; androgenic effects including acne, oily skin, oedema, hirsutism, voice changes and rarely clitoral hypertrophy (see also Cautions); temporary alteration in lipoproteins and other metabolic changes, insulin resistance; thrombotic events; leucopenia, thrombocytopenia, eosinophilia, reversible erythrocytosis or polycythaemia reported; headache and visual disturbances may indicate benign intracranial hypertension; rarely cholestatic jaundice, pancreatitis, peliosis hepatis and benign hepatic adenomata

Dose **Note** In women of child-bearing potential, treatment should start during menstruation, preferably on day 1

- Endometriosis, 200–800 mg daily in up to 4 divided doses, adjusted to achieve amenorrhoea, usually for 3–6 months
- Severe pain and tenderness in benign fibrocystic breast disease not responding to other treatment, 300 mg daily in divided doses usually for 3–6 months
- Hereditary angioedema [unlicensed indication], initially 100–200 mg daily, reduced according to response

Danazol (Non-proprietary) CD4-2

Capsules, danazol 100 mg, net price 28-cap pack = £7.64, 60-cap pack = £16.38; 200 mg, 56-cap pack = £54.60

Danol® (Sanofi-Aventis) CD4-2

Capsules, danazol 100 mg (grey/white), net price 60-cap pack = £16.38; 200 mg (pink/white), 60-cap pack = £32.43

GANIRELIX

Indications adjunct in the treatment of female infertility (under specialist supervision)

Hepatic impairment avoid in moderate or severe hepatic impairment

Renal impairment avoid in moderate to severe renal impairment

Pregnancy avoid in confirmed pregnancy—toxicity in *animal* studies

Breast-feeding avoid—no information available

Side-effects nausea, headache, malaise, injection-site reactions; *very rarely* hypersensitivity reactions including rash, facial oedema, and dyspnoea also reported

Dose

- By subcutaneous injection preferably into the upper leg (rotate injection sites to prevent lipoatrophy), 250 micrograms in the morning (or each afternoon) starting on day 5 or day 6 of ovarian stimulation with gonadotrophins; continue throughout administration of gonadotrophins including day of ovulation induction (if administering in afternoon, give last dose in afternoon *before* ovulation induction)

Orgalutran® (MSD) PoM

Injection, ganirelix, 500 micrograms/mL, net price 0.5-mL prefilled syringe = £21.48

Gonadorelin analogues

Administration of **gonadorelin analogues** produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

Gonadorelin analogues are used in the treatment of endometriosis, precocious puberty, infertility, male hypersexuality with severe sexual deviation, anaemia due to uterine fibroids (together with iron supplementa-

tion), breast cancer (section 8.3.4.1), prostate cancer (section 8.3.4.2) and before intra-uterine surgery. Use of leuprorelin and triptorelin for 3 to 4 months before surgery reduces the uterine volume, fibroid size and associated bleeding. For women undergoing hysterectomy or myomectomy, a vaginal procedure is made more feasible following the use of a gonadorelin analogue.

Cautions Non-hormonal, barrier methods of contraception should be used during entire treatment period with gonadorelin analogues; also use with caution in patients with metabolic bone disease because decrease in bone mineral density can occur.

Contra-indications Gonadorelin analogues are contra-indicated for use longer than 6 months in the treatment of endometriosis (do not repeat) and when there is unexplained vaginal bleeding.

Pregnancy The use of gonadorelin analogues in pregnancy is contra-indicated. Pregnancy should be excluded before treatment; the first injection should be given during menstruation or shortly afterwards *or* use barrier contraception for 1 month beforehand.

Breast-feeding Gonadorelin analogues are contra-indicated in breast-feeding.

Side-effects Side-effects of the gonadorelin analogues related to the inhibition of oestrogen production include menopausal-like symptoms (e.g. hot flushes, increased sweating, vaginal dryness, dyspareunia and loss of libido) and a decrease in trabecular bone density; these effects can be reduced by hormone replacement (e.g. with an oestrogen and a progestogen or with tibolone). Side-effects of gonadorelin analogues also include headache (rarely migraine) and hypersensitivity reactions including urticaria, pruritus, rash, asthma and anaphylaxis; when treating uterine fibroids, bleeding associated with fibroid degeneration can occur; spray formulations can cause irritation of the nasal mucosa including nose bleeds; local reactions at injection site can occur; other side-effects also reported with some gonadorelin analogues include palpitation, hypertension, ovarian cysts (may require withdrawal), changes in breast size, musculoskeletal pain or weakness, visual disturbances, paraesthesia, changes in scalp and body hair, oedema of the face and extremities, weight changes, and mood changes including depression.

BUSERELIN

Indications see under Dose; prostate cancer (section 8.3.4.2)

Cautions see notes above; polycystic ovarian disease, depression, hypertension, diabetes

Contra-indications see notes above; hormone-dependent tumours

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above; initially withdrawal bleeding and subsequently breakthrough bleeding, leucorrhoea; nausea, vomiting, constipation, diarrhoea; anxiety, memory and concentration disturbances, sleep disturbances, nervousness, dizziness, drowsiness; breast tenderness, lactation; abdominal pain; fatigue; increased thirst, changes in appetite; acne, dry skin, splitting nails, dry eyes; altered blood lipids, leucopenia, thrombocytopenia; hearing disturbances; reduced glucose tolerance

Dose

- Endometriosis, intranasally, 300 micrograms (one 150-microgram spray in each nostril) 3 times daily (starting on days 1 or 2 of menstruation); max. duration of treatment 6 months (do not repeat)
- Pituitary desensitisation before induction of ovulation by gonadotrophins for *in vitro* fertilisation (under specialist supervision), by subcutaneous injection, 200–500 micrograms daily given as a single injection (occasionally up to 500 micrograms twice daily may be needed) starting in early follicular phase (day 1) *or*, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down-regulation achieved (usually about 1–3 weeks) then maintained during gonadotrophin administration (stopping gonadotrophin and buserelin on administration of chorionic gonadotrophin at appropriate stage of follicular development)

  Intranasally, 150 micrograms (one spray in one nostril) 4 times daily during waking hours (occasionally up to 300 micrograms 4 times daily may be needed) starting in early follicular phase (day 1) *or*, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down-regulation achieved (usually about 2–3 weeks) then maintained during gonadotrophin administration (stopping gonadotrophin and buserelin on administration of chorionic gonadotrophin at appropriate stage of follicular development)

  Counselling Avoid use of nasal decongestants before and for at least 30 minutes after treatment

Suprecur® (Sanofi-Aventis) PoM

Nasal spray, buserelin (as acetate) 150 micrograms/metered spray. Net price 2 × 100-dose pack (with metered dose pumps) = £87.63. Counselling, nasal decongestants

Injection, buserelin (as acetate) 1 mg/mL. Net price 5.5-mL vial = £13.76

GOSERELIN

Indications see under Dose; prostate cancer (section 8.3.4.2); early and advanced breast cancer (section 8.3.4.1)

Cautions see notes above; polycystic ovarian disease; diabetes

Contra-indications see notes above

Pregnancy use non-hormonal contraceptives during treatment; see also notes above

Breast-feeding see notes above

Side-effects see notes above; withdrawal bleeding

Dose

- By subcutaneous injection into anterior abdominal wall (as *Zoladex®*)

  Endometriosis, 3.6 mg every 28 days; max. duration of treatment 6 months (do not repeat)

  Endometrial thinning before intra-uterine surgery, 3.6 mg (may be repeated after 28 days if uterus is large or to allow flexible surgical timing)

  Before surgery in women who have anaemia due to uterine fibroids, 3.6 mg every 28 days (with supplementary iron); max. duration of treatment 3 months

  Pituitary desensitisation before induction of ovulation by gonadotrophins for *in vitro* fertilisation (under specialist supervision), after exclusion of pregnancy,

3.6 mg to achieve pituitary down-regulation (usually 1–3 weeks) then gonadotrophin is administered (stopping gonadotrophin on administration of chorionic gonadotrophin at appropriate stage of follicular development)

Preparation

Section 8.3.4.2

LEUPRORELIN ACETATE

Indications see under Dose; prostate cancer (section 8.3.4.2)

Cautions see notes above; monitor liver function; family history of osteoporosis; chronic use of other drugs which reduce bone density including alcohol and tobacco; diabetes

Contra-indications see notes above

Pregnancy teratogenic in *animal* studies; see also notes above

Breast-feeding see notes above

Side-effects see notes above; breast tenderness; nausea, vomiting, diarrhoea, anorexia; fever, chills; sleep disturbances, dizziness, fatigue, leucopenia, thrombocytopenia, altered blood lipids, pulmonary embolism; spinal fracture, paralysis, hypotension and worsening of depression also reported

Dose

- By subcutaneous *or* intramuscular injection (as *Prostap® SR DCS*)

  Endometriosis, 3.75 mg as a single dose in first 5 days of menstrual cycle then every month for max. 6 months (course not to be repeated)

  Endometrial thinning before intra-uterine surgery, 3.75 mg as a single dose (given between days 3 and 5 of menstrual cycle) 5–6 weeks before surgery

  Reduction of size of uterine fibroids and of associated bleeding before surgery, 3.75 mg as a single dose every month usually for 3–4 months (max. 6 months)
- By intramuscular injection (as *Prostap® 3 DCS*)

  Endometriosis, 11.25 mg as a single dose in first 5 days of menstrual cycle then every 3 months for max. 6 months (course not to be repeated)

Preparations

Section 8.3.4.2

NAFARELIN

Indications see under Dose

Cautions see notes above

Contra-indications see notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above; acne

Dose

- Endometriosis, women over 18 years, 200 micrograms twice daily as one spray in one nostril in the morning and one spray in the other nostril in the evening (starting on days 2–4 of menstruation), max. duration of treatment 6 months (do not repeat)
- Pituitary desensitisation before induction of ovulation by gonadotrophins for *in vitro* fertilisation (under specialist supervision), 400 micrograms (one spray in each nostril) twice daily starting in early follicular phase (day 2) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down-regulation achieved (usually within 4 weeks) then maintained (usually for 8–12 days) during gonadotrophin administration (stopping gonadotrophin and nafarelin on administration of chorionic gonadotrophin at follicular maturity); discontinue if down-regulation not achieved within 12 weeks

  Counselling Avoid use of nasal decongestants before and for at least 30 minutes after treatment; repeat dose if sneezing occurs during or immediately after administration

Synarel® (Pharmacia) PoM

Nasal spray, nafarelin (as acetate) 200 micrograms/metered spray. Net price 30-dose unit = £30.41; 60-dose unit = £52.43. Label: 10, patient information leaflet, counselling, see above

TRIPTORELIN

Indications endometriosis; precocious puberty; reduction in size of uterine fibroids; male hypersexuality with severe sexual deviation; advanced prostate cancer (section 8.3.4.2)

Cautions see notes above

Contra-indications see notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above; also gastro-intestinal disturbances; in precocious puberty, withdrawal bleeding in females may occur in the first month of treatment; asthenia

Dose

- See under preparations below

Decapeptyl® SR (Ipsen) PoM

Injection, (powder for suspension), m/r, triptorelin (as acetate), net price 3-mg vial (with diluent) = £69.00

Dose by intramuscular injection, endometriosis and reduction in size of uterine fibroids, 3 mg every 4 weeks starting during first 5 days of menstrual cycle; for uterine fibroids continue treatment for at least 3 months; max. duration of treatment 6 months (not to be repeated)

Note Each vial includes an overage to allow accurate administration of 3-mg dose

Injection, (powder for suspension), m/r, triptorelin (as acetate), net price 11.25-mg vial (with diluent) = £207.00

Dose by intramuscular injection, endometriosis, 11.25 mg every 3 months starting during first 5 days of menstrual cycle; max. duration of treatment 6 months (not to be repeated)

Precocious puberty, 11.25 mg every 3 months; discontinue when bone maturation consistent with age of 12 years in girls or 13–14 years in boys

Note Each vial includes an overage to allow accurate administration of 11.25-mg dose

Gonapeptyl Depot® (Ferring) PoM

Injection, (powder for suspension), triptorelin (as acetate), net price 3.75-mg prefilled syringe (with prefilled syringe of vehicle) = £81.69

Dose by subcutaneous *or* deep intramuscular injection, endometriosis and reduction in size of uterine fibroids, 3.75 mg every 4 weeks starting during first 5 days of menstrual cycle; max. duration of treatment 6 months (not to be repeated)

Precocious puberty, body-weight over 30 kg, initially 3.75 mg every 2 weeks for 3 doses, then every 3–4 weeks; body-weight 20–30 kg, initially 2.5 mg every 2 weeks for 3 doses, then every 3–4 weeks; body-weight under 20 kg, initially 1.875 mg every 2 weeks for 3 doses, then every 3–4 weeks; discontinue when bone maturation consistent with age over 12 years in girls or over 13 years in boys

Salvacyl® (Ipsen) PoM

Injection, (powder for suspension), triptorelin (as embonate), net price 11.25-mg vial (with diluent) = £248.00

Cautions transient increase in serum testosterone occurs on initiation—consider administration of an anti-androgen; increased risk of sensitivity to restored testosterone if treatment interrupted—consider administration of an anti-androgen before stopping treatment

Contra-indications severe osteoporosis

Dose by intramuscular injection, male hypersexuality with severe sexual deviation, 11.25 mg every 12 weeks

Breast pain (mastalgia)

Once any serious underlying cause for breast pain has been ruled out, most women will respond to reassurance and reduction in dietary fat; withdrawal of an oral contraceptive or of hormone replacement therapy may help to resolve the pain.

Mild, non-cyclical breast pain is treated with simple analgesics (section 4.7.1); moderate to severe pain, cyclical pain or symptoms that persist for longer than 6 months may require specific drug treatment.

Danazol (section 6.7.2) is licensed for the relief of severe pain and tenderness in benign fibrocystic breast disease which has not responded to other treatment.

Tamoxifen (section 8.3.4.1) may be a useful adjunct in the treatment of mastalgia [unlicensed indication] especially when symptoms can definitely be related to cyclic oestrogen production; it may be given on the days of the cycle when symptoms are predicted.

Treatment for breast pain should be reviewed after 6 months and continued if necessary. Symptoms recur in about 50% of women within 2 years of withdrawal of therapy but may be less severe.

6.7.3 Metyrapone

Metyrapone is a competitive inhibitor of 11β-hydroxylation in the adrenal cortex; the resulting inhibition of cortisol (and to a lesser extent aldosterone) production leads to an increase in ACTH production which, in turn, leads to increased synthesis and release of cortisol precursors. It may be used as a test of anterior pituitary function.

Although most types of *Cushing's syndrome* are treated surgically, that which occasionally accompanies carcinoma of the bronchus is not usually amenable to surgery. Metyrapone has been found helpful in controlling the symptoms of the disease; it is also used in other forms of Cushing's syndrome to prepare the patient for surgery. The dosages used are either low, and tailored to cortisol production, or high, in which case corticosteroid replacement therapy is also needed.

METYRAPONE

Indications see notes above and under Dose (specialist supervision in hospital)

Cautions gross hypopituitarism (risk of precipitating acute adrenal failure); hypertension on long-term administration; hypothyroidism (delayed response); many drugs interfere with diagnostic estimation of steroids; avoid in acute porphyria (section 9.8.2)

Driving Drowsiness may affect the performance of skilled tasks (e.g. driving)

Contra-indications adrenocortical insufficiency (see Cautions)

Hepatic impairment use with caution in hepatic impairment (delayed response)

Pregnancy avoid (may impair biosynthesis of fetal-placental steroids)

Breast-feeding avoid—no information available

Side-effects occasional nausea, vomiting, dizziness, headache, hypotension, sedation; rarely abdominal pain, allergic skin reactions, hypoadrenalism, hirsutism

Dose

- Differential diagnosis of ACTH-dependent Cushing's syndrome, 750 mg every 4 hours for 6 doses; CHILD 15 mg/kg (minimum 250 mg) every 4 hours for 6 doses
- Management of Cushing's syndrome, range 0.25–6 g daily, tailored to cortisol production; see notes above
- Resistant oedema due to increased aldosterone secretion in cirrhosis, nephrotic syndrome, and congestive heart failure (with glucocorticoid replacement therapy) 3 g daily in divided doses

Metopirone® (HRA Pharma) PoM

Capsules, ivory, metyrapone 250 mg, net price 100-cap pack = £363.66. Label: 21, counselling, driving

6.7.4 Somatomedins

Somatomedins are a group of polypeptide hormones structurally related to insulin and commonly known as insulin-like growth factors (IGFs). **Mecasermin**, a human insulin-like growth factor-I (rhIGF-I), is the principal mediator of the somatotropic effects of human growth hormone and is used to treat growth failure in children and adolescents with severe primary insulin-like growth factor-I deficiency.

MECASERMIN

(Recombinant human insulin-like growth factor-I; rhIGF-I)

Indications see notes above

Cautions correct hypothyroidism before initiating treatment; diabetes mellitus (adjustment of antidiabetic therapy may be necessary), monitor ECG before and on termination of treatment (and during treatment if ECG abnormal), papilloedema (see under Side-effects), monitor for disorders of the epiphysis of the hip (monitor for limping), monitor for signs of tonsillar hypertrophy (snoring, sleep apnoea, and chronic middle ear effusions)

Contra-indications evidence of tumour activity (discontinue treatment)

Pregnancy avoid unless essential; contraception advised in women of child-bearing potential

Breast-feeding avoid

Side-effects headache, funduscopy for papilloedema recommended if severe or recurrent headache, visual problems, nausea and vomiting occur—if papilloedema confirmed consider benign intracranial hypertension (rare cases reported); cardiomegaly, ventricular hypertrophy, tachycardia; convulsions, sleep apnoea, night terrors, dizziness, nervousness; tonsillar hypertrophy (see Cautions above); hypoglycaemia (especially in first month, and in younger children), hyperglycaemia, gynaecomastia; arthralgia, myalgia;

visual disturbance, impaired hearing; antibody formation; injection-site reactions (rotate site)

Dose

- By subcutaneous injection, ADOLESCENT and CHILD over 2 years, initially 40 micrograms/kg twice daily for 1 week, if tolerated increase dose in steps of 40 micrograms/kg to max. 120 micrograms/kg twice daily; discontinue if no response within 1 year
  Counselling Dose should be administered just before or after food; do not increase dose if a dose is missed
  Note Reduce dose if hypoglycaemia occurs despite adequate food intake; withhold injection if patient unable to eat

Increlex® (Ipsen) ▼ PoM

Injection, mecasermin 10 mg/mL, net price 4-mL vial = £605.00. Counselling, administration

Excipients include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

7 Obstetrics, gynaecology, and urinary-tract disorders

This chapter also includes advice on the drug management of the following:

- emergency contraception, p. 547
- induction of abortion, below
- induction and augmentation of labour, below
- nocturnal enuresis in children, p. 554
- premature labour, p. 530
- prevention and treatment of post-partum haemorrhage, p. 527
- priapism, p. 556

For hormonal therapy of gynaecological disorders see section 6.4.1 (including HRT), section 6.5.1 and section 6.7.2.

7.1 Drugs used in obstetrics

Because of the complexity of dosage regimens in obstetrics, in all cases **detailed specialist literature** should be consulted.

7.1.1 Prostaglandins and oxytocics

Prostaglandins and oxytocics are used to induce abortion or induce or augment labour and to minimise blood loss from the placental site. They include oxytocin, carbetocin, ergometrine, and the prostaglandins. All induce uterine contractions with varying degrees of pain according to the strength of contractions induced.

Induction of abortion **Gemeprost**, a prostaglandin administered vaginally as pessaries, is suitable for the medical induction of late therapeutic abortion; gemeprost is also used to ripen the cervix before surgical abortion, particularly in primigravidas. The prostaglandin **misoprostol** (section 7.1.2) is given by mouth, buccally, sublingually, or vaginally, to induce medical abortion [unlicensed indication]; intravaginal use ripens the cervix before surgical abortion [unlicensed indication]. Extra-amniotic **dinoprostone** is rarely used nowadays.

Pre-treatment with **mifepristone** (section 7.1.2) can facilitate the process of medical abortion. It sensitises the uterus to subsequent administration of a prostaglandin and, therefore, abortion occurs in a shorter time and with a lower dose of prostaglandin.

Induction and augmentation of labour **Dinoprostone** is available as vaginal tablets, pessaries and vaginal gels for the induction of labour. The intravenous solution is rarely used; it is associated with more side-effects.

Oxytocin (*Syntocinon*®) is administered by slow intravenous infusion, using an infusion pump, to induce or augment labour, usually in conjunction with amniotomy. Uterine activity must be monitored carefully and

hyperstimulation avoided. Large doses of oxytocin may result in excessive fluid retention.

Misoprostol is given orally or vaginally for the induction of labour [unlicensed indication].

NICE guidance
Induction of labour (updated July 2008)
Available at guidance.nice.org.uk/CG70

Prevention and treatment of haemorrhage

Bleeding due to incomplete miscarriage or abortion can be controlled with **ergometrine** and **oxytocin** (*Syntometrine*®) given intramuscularly, the dose is adjusted according to the patient's condition and blood loss. This is commonly used before surgical evacuation of the uterus, particularly when surgery is delayed. Oxytocin and ergometrine combined are more effective in early pregnancy than either drug alone.

Active management of the third stage of labour reduces the risk of postpartum haemorrhage; oxytocin is given by intramuscular injection [unlicensed] on delivery of the anterior shoulder or, at the latest, immediately after the baby is delivered. Alternatively, ergometrine 500 micrograms with oxytocin 5 units (*Syntometrine*® 1 mL) can be given by intramuscular injection in the absence of hypertension; oxytocin alone causes less nausea, vomiting, and hypertension than when given with ergometrine.

In excessive uterine bleeding, any placental products remaining in the uterus should be removed. Oxytocic drugs are used to treat postpartum haemorrhage caused by uterine atony; treatment options are as follows:

- oxytocin 5 units by slow intravenous injection (dose may be repeated), followed in severe cases by intravenous infusion of oxytocin 40 units in 500 mL infusion fluid (prolonged administration—see Appendix 4) at a rate that controls uterine atony *or*
- ergometrine 250–500 micrograms by intramuscular injection *or*
- ergometrine 250–500 micrograms by slow intravenous injection (use with caution—risk of hypertension) *or*
- ergometrine 500 micrograms with oxytocin 5 units (*Syntometrine*® 1 mL) by intramuscular injection

Carboprost has an important role in severe postpartum haemorrhage unresponsive to ergometrine and oxytocin.

Misoprostol [unlicensed] can be used in postpartum haemorrhage when oxytocin, ergometrine, and carboprost are not available or are inappropriate.

CARBETOCIN

Indications prevention of uterine atony after caesarean section

Cautions hyponatraemia; cardiovascular disease (avoid if severe); migraine; asthma

Contra-indications pre-eclampsia and eclampsia; epilepsy

Hepatic impairment manufacturer advises avoid

Renal impairment manufacturer advises avoid

Side-effects nausea, vomiting, abdominal pain, metallic taste; flushing, hypotension, chest pain; dyspnoea; headache, tremor, dizziness; anaemia; back pain; pruritus; feeling of warmth, chills; tachycardia and sweating also reported

Dose

- By slow intravenous injection over 1 minute, a single dose of 100 micrograms, as soon as possible after delivery, preferably before removal of placenta

Pabal® (Ferring) PoM
Injection, carbetocin 100 micrograms/mL, net price 1-mL amp = £17.64

CARBOPROST

Indications postpartum haemorrhage due to uterine atony in patients unresponsive to ergometrine and oxytocin

Cautions history of glaucoma or raised intra-ocular pressure, asthma, hypertension, hypotension, anaemia, jaundice, diabetes, epilepsy; uterine scars; excessive dosage may cause uterine rupture; **interactions:** Appendix 1 (prostaglandins)

Contra-indications untreated pelvic infection; cardiac or pulmonary disease

Hepatic impairment manufacturer advises avoid

Renal impairment manufacturer advises avoid

Side-effects nausea, vomiting and diarrhoea, hyperthermia and flushing, bronchospasm; less frequent effects include raised blood pressure, dyspnoea, and pulmonary oedema; chills, headache, diaphoresis, dizziness; cardiovascular collapse also reported; erythema and pain at injection site reported

Dose

- By deep intramuscular injection, 250 micrograms repeated if necessary at intervals of not less than 15 minutes; total dose should not exceed 2 mg (8 doses)

Hemabate® (Pharmacia) PoM
Injection, carboprost as trometamol salt (tromethamine salt) 250 micrograms/mL, net price 1-mL amp = £18.20 (hosp. only)

DINOPROSTONE

Indications see notes above and under preparations below

Cautions history of asthma, glaucoma and raised intra-ocular pressure; hypertension; history of epilepsy; uterine scarring; monitor uterine activity and fetal status (particular care if history of uterine hypertony); uterine rupture; see also notes above; monitor for disseminated intravascular coagulation after parturition; risk factors for disseminated intravascular coagulation; effect of oxytocin enhanced (care needed in monitoring uterine activity when used in sequence); **interactions:** Appendix 1 (prostaglandins)

Contra-indications active cardiac, or pulmonary disease; placenta praevia or unexplained vaginal bleeding during pregnancy, ruptured membranes, major cephalopelvic disproportion or fetal malpresentation, history of caesarean section or major uterine surgery, untreated pelvic infection, fetal distress, grand multiparas and multiple pregnancy, history of difficult or traumatic delivery; avoid extra-amniotic route in cervicitis or vaginitis

Hepatic impairment manufacturers advise avoid

Renal impairment manufacturers advise avoid

Side-effects nausea, vomiting, diarrhoea; other side-effects include uterine hypertonus, severe uterine

contractions, pulmonary or amniotic fluid embolism, abruptio placenta, fetal distress, maternal hypertension, bronchospasm, rapid cervical dilation, fever, backache; uterine hypercontractility with or without fetal bradycardia, low Apgar scores; cardiac arrest, uterine rupture, stillbirth or neonatal death also reported; vaginal symptoms (warmth, irritation, pain); after intravenous administration—flushing, shivering, headache, dizziness, temporary pyrexia and raised white blood cell count; disseminated intravascular coagulation reported; also local tissue reaction and erythema after intravenous administration and possibility of infection after extra-amniotic administration

Dose

- See under preparations, below

Important Do not confuse dose of *Prostin E2*® vaginal **gel** with that of *Prostin E2*® vaginal **tablets**—not bioequivalent.

Propess® (Ferring) PoM

Pessaries (within retrieval device), releasing dinoprostone approx. 10 mg over 24 hours; net price 1-pessary pack = £30.00

Dose by vagina, cervical ripening and induction of labour at term, 1 pessary (in retrieval device) inserted high into posterior fornix and removed when cervical ripening adequate; if oxytocin necessary, remove 30 minutes before oxytocin infusion; remove if cervical ripening inadequate after 24 hours (dose not to be repeated)

Prostin E2® (Pharmacia) PoM

Intravenous solution ◢, for dilution and use as an infusion, dinoprostone 1 mg/mL, net price 0.75-mL amp = £8.52; 10 mg/mL, 0.5-mL amp = £18.40 (both hosp. only; rarely used, consult product literature for dose and indications)

Extra-amniotic solution ◢, dinoprostone 10 mg/mL, net price 0.5-mL amp (with diluent) = £18.40 (hosp. only; less commonly used nowadays, consult product literature for dose and indications)

Vaginal gel, dinoprostone 400 micrograms/mL, net price 2.5 mL (1 mg) = £13.28; 800 micrograms/mL, 2.5 mL (2 mg) = £13.28

Dose by vagina, induction of labour, inserted high into posterior fornix (avoid administration into cervical canal), 1 mg (unfavourable primigravida 2 mg), followed after 6 hours by 1–2 mg if required; max. [gel] 3 mg (unfavourable primigravida 4 mg)

Vaginal tablets, dinoprostone 3 mg, net price 8-vaginal tab pack = £106.23

Dose by vagina, induction of labour, inserted high into posterior fornix, 3 mg, followed after 6–8 hours by 3 mg if labour is not established; max. 6 mg [vaginal tablets]

Note *Prostin E2 Vaginal Gel* and *Vaginal Tablets* are **not** bioequivalent

ERGOMETRINE MALEATE

Indications see notes above

Cautions cardiac disease; hypertension; multiple pregnancy; acute porphyria (section 9.8.2); **interactions:** Appendix 1 (ergot alkaloids)

Contra-indications induction of labour, first and second stages of labour, vascular disease, severe cardiac disease, sepsis, severe hypertension, eclampsia

Hepatic impairment manufacturer advises caution in mild or moderate impairment and avoid in severe impairment

Renal impairment manufacturer advises caution in mild or moderate impairment and avoid in severe impairment

Side-effects nausea, vomiting, abdominal pain; chest pain, arrhythmias (including bradycardia), palpitation, hypertension, vasoconstriction; dyspnoea, pulmonary oedema; headache, dizziness; tinnitus; rash; *very rarely* myocardial infarction

Dose

- See notes above

Ergometrine (Non-proprietary) PoM

Injection, ergometrine maleate 500 micrograms/mL, net price 1-mL amp = 93p

With oxytocin

Syntometrine® (Alliance) PoM

Injection, ergometrine maleate 500 micrograms, oxytocin 5 units/mL, net price 1-mL amp = £1.57

Dose by intramuscular injection, 1 mL; by intravenous injection, no longer recommended

GEMEPROST

Indications see under Dose

Cautions obstructive airways disease, cardiovascular insufficiency, raised intra-ocular pressure, cervicitis or vaginitis; **interactions:** Appendix 1 (prostaglandins)

Important For warnings relating to use of gemeprost in a patient undergoing induction of abortion with mifepristone, see under Mifepristone and Note below

Contra-indications unexplained vaginal bleeding, uterine scarring, placenta praevia

Renal impairment manufacturer advises avoid

Side-effects vaginal bleeding and uterine pain; nausea, vomiting, or diarrhoea; headache, muscle weakness, dizziness, flushing, chills, backache, dyspnoea, chest pain, palpitation and mild pyrexia; uterine rupture reported (most commonly in multiparas or if history of uterine surgery or if given with intravenous oxytocics); also reported severe hypotension, coronary artery spasm and myocardial infarction

Dose

- By vagina, cervical ripening prior to first trimester surgical abortion, 1 mg inserted into posterior fornix 3 hours before surgery
- Second trimester abortion, 1 mg inserted into posterior fornix every 3 hours for max. of 5 administrations; second course may begin 24 hours after start of treatment (if treatment fails pregnancy should be terminated by another method)
- Second trimester intra-uterine death, 1 mg inserted into posterior fornix every 3 hours for max. of 5 administrations only; monitor for coagulopathy

Note If used in combination with mifepristone, carefully monitor blood pressure and pulse for 3 hours

Gemeprost (Sanofi-Aventis) PoM

Pessaries, gemeprost 1 mg, net price 5-pessary pack = £215.00

OXYTOCIN

Indications see under Dose and notes above

Cautions induction or enhancement of labour—presence of borderline cephalopelvic disproportion (avoid if significant), secondary uterine inertia, mild or moderate pregnancy-induced hypertension or cardiac disease, women over 35 years or with history of lower-uterine segment caesarean section (see also under Contra-indications below); risk factors for disseminated intravascular coagulation; monitor for disseminated intravascular coagulation after parturition; avoid large infusion volumes and restrict fluid

intake by mouth (risk of hyponatraemia and water-intoxication—see also Appendix 4); effects enhanced by concomitant prostaglandins (very careful monitoring of uterine activity); caudal block anaesthesia (may enhance hypertensive effects of sympathomimetic vasopressors); see also **interactions**: Appendix 1 (oxytocin)

Contra-indications hypertonic uterine contractions, fetal distress; any condition where spontaneous labour or vaginal delivery inadvisable; avoid prolonged administration in oxytocin-resistant uterine inertia, severe pre-eclamptic toxaemia, or severe cardiovascular disease

Side-effects nausea, vomiting; arrhythmia; headache; *rarely* disseminated intravascular coagulation, rash, and anaphylactoid reactions (with dyspnoea, hypotension, or shock); uterine spasm (may occur at low doses), uterine hyperstimulation (usually with excessive doses—may cause fetal distress, asphyxia, and death, or may lead to hypertonicity, tetanic contractions, soft-tissue damage or uterine rupture); water intoxication and hyponatraemia associated with high doses with large infusion volumes of electrolyte-free fluid (see also under Dose below); placental abruption and amniotic fluid embolism also reported on overdose

Dose

- Induction of labour for medical reasons or stimulation of labour in hypotonic uterine inertia, by intravenous infusion (not to be started for at least 6 hours after administration of vaginal prostaglandin), initially 0.001–0.004 units/minute, increased at intervals of at least 30 minutes until a maximum of 3–4 contractions occur every 10 minutes (0.01 units/minute is often adequate) up to max. 0.02 units/minute; if regular contractions not established after total of 5 units stop induction attempt (may be repeated next day starting again at 0.001–0.004 units/minute)
  Important Careful monitoring of fetal heart rate and uterine motility essential for dose titration (**avoid** intravenous injection during labour); discontinue immediately in uterine hyperactivity or fetal distress
- Caesarean section, by slow intravenous injection immediately after delivery, 5 units
- Prevention of postpartum haemorrhage, after delivery of placenta, by slow intravenous injection, 5 units (if infusion used for induction or enhancement of labour, increase rate during third stage and for next few hours).
  Important Avoid rapid intravenous injection (may transiently reduce blood pressure)
  Note Can be given in a dose of 10 units by intramuscular injection [unlicensed route] instead of oxytocin with ergometrine (*Syntometrine*®), see notes above
- Treatment of postpartum haemorrhage, by slow intravenous injection, 5 units (dose may be repeated), followed in severe cases by intravenous infusion of 40 units in 500 mL infusion fluid at a rate sufficient to control uterine atony
  Important Avoid rapid intravenous injection (may transiently reduce blood pressure); prolonged administration, see warning below
- Incomplete, inevitable, or missed miscarriage, by slow intravenous injection, 5 units followed if necessary by intravenous infusion, 0.02–0.04 units/minute or faster

Important Prolonged intravenous administration at high doses with large volume of fluid (which is possible in inevitable or missed miscarriage or postpartum haemorrhage) may cause water intoxication with hyponatraemia. To avoid: use electrolyte-containing diluent (i.e. not glucose), increase oxytocin concentration to reduce fluid, restrict fluid intake by mouth; monitor fluid and electrolytes.

Note Oxytocin doses in the BNF may differ from those in the product literature

Syntocinon® (Alliance) PoM
Injection, oxytocin, net price 5 units/mL, 1-mL amp = 80p; 10 units/mL, 1-mL amp = 91p

With ergometrine
See *Syntometrine*®, p. 528

7.1.1.1 Drugs affecting the ductus arteriosus

This section is not included in the BNF. For the management of ductus arteriosus, see *BNF for Children* section 2.14.

7.1.2 Mifepristone

Mifepristone, an antiprogestogenic steroid, sensitises the myometrium to prostaglandin-induced contractions and ripens the cervix. For termination of pregnancy, a single dose of mifepristone is followed by administration of a prostaglandin (gemeprost or misoprostol [unlicensed]). Guidelines of the Royal College of Obstetricians and Gynaecologists (November 2011) include the following [unlicensed] regimens for inducing medical abortion:

- For gestation up to 49 days, mifepristone 200 mg by mouth followed 24–48 hours later by misoprostol 400 micrograms by mouth
- For gestation at 50–63 days, mifepristone 200 mg by mouth followed 24–48 hours later by misoprostol 800 micrograms vaginally, buccally, or sublingually; if abortion has not occurred 4 hours after misoprostol dose, a further dose of misoprostol 400 micrograms may be given vaginally or by mouth
- For gestation between 9 and 13 weeks, mifepristone 200 mg by mouth followed 36–48 hours later by misoprostol 800 micrograms vaginally, followed if necessary by a maximum of 4 further doses at 3-hourly intervals of misoprostol 400 micrograms vaginally or by mouth
- For gestation between 13 and 24 weeks, mifepristone 200 mg by mouth followed 36–48 hours later by misoprostol 800 micrograms vaginally, followed if necessary by a maximum of 4 further doses at 3-hourly intervals of misoprostol 400 micrograms vaginally or by mouth; if abortion has not occurred 3 hours after the last dose of misoprostol, a further dose of mifepristone may be given, and misoprostol may be recommenced 12 hours later

MIFEPRISTONE

Indications see under dose

Cautions asthma (avoid if severe and uncontrolled); haemorrhagic disorders and anticoagulant therapy; prosthetic heart valve or history of endocarditis (see section 5.1 table 2); risk factors for or existing cardiovascular disease; adrenal suppression (may require corticosteroid); **interactions**: Appendix 1 (mifepristone)
Important For warnings relating to use of gemeprost in a patient undergoing induction of abortion with mifepristone, see under Gemeprost

Contra-indications uncontrolled severe asthma; suspected ectopic pregnancy (use other specific means of termination); chronic adrenal failure; acute porphyria (section 9.8.2)

Hepatic impairment manufacturer advises avoid

Renal impairment manufacturer advises avoid

Side-effects gastro-intestinal cramps; uterine contractions, vaginal bleeding (sometimes severe) may occur between administration of mifepristone and surgery (and rarely abortion may occur before surgery); *less commonly* hypersensitivity reactions including rash and urticaria; *rarely* hypotension, malaise, headache, fever, hot flushes, dizziness, and chills; infections (including toxic shock syndrome) also reported

Dose

- Medical termination of intra-uterine pregnancy of up to 49 days gestation, by mouth, mifepristone 600 mg as a single dose under medical supervision followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina *or* misoprostol 400 micrograms by mouth [unlicensed]; alternative regimen, mifepristone 200 mg by mouth as a single dose followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina; observe for at least 3 hours (or until bleeding or pain at acceptable level); follow-up visit within 2 weeks to verify complete expulsion and to assess vaginal bleeding
- Medical termination of intra-uterine pregnancy of 50–63 days gestation, by mouth, mifepristone 600 mg (200 mg also effective) as a single dose under medical supervision, followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina; observe for at least 3 hours (or until bleeding or pain at acceptable level); follow-up visit within 2 weeks to verify complete expulsion and to assess vaginal bleeding
- Cervical ripening before mechanical cervical dilatation for termination of pregnancy of up to 84 days gestation, by mouth, mifepristone 200 mg as a single dose under medical supervision 36–48 hours before procedure
- Termination of pregnancy of 13–24 weeks gestation (in combination with a prostaglandin), by mouth, mifepristone 600 mg (200 mg may be effective) as a single dose under medical supervision followed 36–48 hours later by gemeprost 1 mg by vagina every 3 hours up to max. 5 mg *or* misoprostol (see above [unlicensed]); if abortion does not occur, 24 hours after start of treatment repeat course of gemeprost 1 mg by vagina up to max. 5 mg; follow-up visit after appropriate interval to assess vaginal bleeding recommended
  Note Careful monitoring of blood pressure and pulse essential for 3 hours after administration of gemeprost pessary (risk of profound hypotension)
- Labour induction in fetal death *in utero* where prostaglandin or oxytocin inappropriate, by mouth, mifepristone 600 mg daily as a single dose for 2 days under medical supervision; if labour not started within 72 hours of first dose, another method should be used

Mifegyne® (Nordic) PoM
Tablets, yellow, mifepristone 200 mg, net price 3-tab pack = £52.66 (supplied to NHS hospitals and premises approved under Abortion Act 1967). Label: 10, patient information leaflet

7.1.3 Myometrial relaxants

Tocolytic drugs postpone *premature labour* and they are used with the aim of reducing harm to the child. However, there is no satisfactory evidence that the use of these drugs reduces mortality. The greatest benefit is gained by using the delay to administer corticosteroid therapy or to implement other measures which improve perinatal health (including transfer to a unit with neonatal intensive care facility).

The oxytocin receptor antagonist, **atosiban**, is licensed for the inhibition of uncomplicated premature labour *between 24 and 33 weeks* of gestation. Atosiban may be preferable to a beta$_2$ agonist because it has fewer side-effects.

The dihydropyridine calcium-channel blocker **nifedipine** (section 2.6.2) also has fewer side-effects than a beta$_2$ agonist. Nifedipine [unlicensed indication] can be given initially in a dose of 20 mg followed by 10–20 mg 3–4 times daily adjusted according to uterine activity.

The beta$_2$ agonists **salbutamol** and **terbutaline** are licensed for inhibiting uncomplicated premature labour between 22 and 37 weeks of gestation to permit a delay in delivery of up to 48 hours. Use of high-dose short-acting beta$_2$ agonists in obstetric indications has been associated with serious, sometimes fatal cardiovascular events in the mother and fetus, particularly when used for a prolonged period of time. Oral therapy is no longer recommended and parenteral therapy should be restricted to a maximum duration of 48 hours, given under the supervision of a specialist, and with close monitoring (see under Beta$_2$ agonists).

Indometacin (section 10.1.1), a cyclo-oxygenase inhibitor, also inhibits labour [unlicensed indication] and it can be useful in situations where a beta$_2$ agonist is not appropriate; however, there are concerns about neonatal complications such as transient impairment of renal function and premature closure of ductus arteriosus.

Atosiban

ATOSIBAN

Indications uncomplicated premature labour (see notes above)

Cautions monitor blood loss after delivery; intra-uterine growth restriction; abnormal placental site

Contra-indications eclampsia and severe pre-eclampsia, intra-uterine infection, intra-uterine fetal death, antepartum haemorrhage (requiring immediate delivery), placenta praevia, abruptio placenta, intra-uterine growth restriction with abnormal fetal heart rate, premature rupture of membranes after 30 weeks' gestation

Hepatic impairment no information available

Renal impairment no information available

Side-effects nausea, vomiting, tachycardia, hypotension, headache, dizziness, hot flushes, hyperglycaemia, injection-site reaction; *less commonly* pruritus, rash, fever, insomnia

Dose

- By intravenous injection, initially 6.75 mg over 1 minute, then by intravenous infusion 18 mg/hour for 3 hours, then 6 mg/hour for up to 45 hours; max. duration of treatment 48 hours

Tractocile® (Ferring) PoM
Injection, atosiban (as acetate) 7.5 mg/mL, net price 0.9-mL (6.75-mg) vial = £18.41
Concentrate for intravenous infusion, atosiban (as acetate) 7.5 mg/mL, net price 5-mL vial = £52.82

Beta$_2$ agonists

Cautions Beta agonists should be used with caution in patients with hypertension, mild to moderate pre-eclampsia, hyperthyroidism, and hypokalaemia (particular risk with potassium-depleting diuretics—see also Hypokalaemia, p. 186). Patients with suspected cardiovascular disease should be assessed by a cardiologist before initiating therapy—see also Contra-indications, below). It is important to monitor blood pressure, pulse rate (should not exceed 120 beats per minute), ECG (discontinue treatment if signs of myocardial ischaemia develop), blood glucose and lactate concentrations, and the patient's fluid and electrolyte status (avoid over-hydration—discontinue drug immediately and initiate diuretic therapy if pulmonary oedema occurs). Beta$_2$ agonists should also be used with caution in diabetes—monitor blood glucose (risk of hyperglycaemia and ketoacidosis, especially with intravenous beta$_2$ agonists).

Contra-indications Beta$_2$ agonists are contra-indicated in patients with a history of cardiac disease and in patients with significant risk factors for myocardial ischaemia; they should also be avoided in pulmonary hypertension, antepartum haemorrhage, intra-uterine infection, intra-uterine fetal death, placenta praevia, abruptio placenta, threatened miscarriage, cord compression, and eclampsia or severe pre-eclampsia.

Side-effects Side-effects of the beta$_2$ agonists include nausea, vomiting, pulmonary oedema (see Cautions above), palpitation, tachycardia, arrhythmias, myocardial ischaemia, hypotension, peripheral vasodilation, headache, tremor, hyperglycaemia, hypokalaemia (see Cautions), muscle cramps and tension, and hypersensitivity reactions (including angioedema, urticaria, rash, bronchospasm, hypotension, and collapse).

SALBUTAMOL

(Albuterol)

Indications uncomplicated premature labour under specialist supervision (see notes above); asthma (section 3.1.1)

Cautions see notes above; **interactions:** Appendix 1 (sympathomimetics, beta$_2$)

Contra-indications see notes above

Side-effects see notes above

Dose

- By intravenous infusion, initially 10 micrograms/minute, rate increased gradually according to response at 10-minute intervals until contractions diminish then increase rate slowly until contractions cease (max. rate 45 micrograms/minute); maintain rate for 1 hour after contractions have stopped, then gradually reduce by 50% every 6 hours; max. duration 48 hours

Preparations

Section 3.1.1.1

TERBUTALINE SULFATE

Indications uncomplicated premature labour under specialist supervision (see notes above); asthma (section 3.1.1)

Cautions see notes above; **interactions:** Appendix 1 (sympathomimetics, beta$_2$)

Contra-indications see notes above

Side-effects see notes above; also reported sleep disturbances and behavioural disturbances

Dose

- By intravenous infusion, 5 micrograms/minute for 20 minutes, increased every 20 minutes in steps of 2.5 micrograms/minute until contractions have ceased (more than 10 micrograms/minute should **seldom** be given—20 micrograms/minute should **not** be exceeded), continue for 1 hour then decrease every 20 minutes in steps of 2.5 micrograms/minute to lowest dose that maintains suppression; max. total duration 48 hours

Preparations

Section 3.1.1.1

7.2 Treatment of vaginal and vulval conditions

Symptoms are often restricted to the vulva, but infections almost invariably involve the vagina which should also be treated. Applications to the vulva alone are likely to give only symptomatic relief without cure.

Aqueous medicated douches may disturb normal vaginal acidity and bacterial flora.

Topical anaesthetic agents give only symptomatic relief and may cause sensitivity reactions. They are indicated only in cases of pruritus where specific local causes have been excluded.

Systemic drugs are required in the treatment of infections such as gonorrhoea and syphilis (section 5.1).

7.2.1 Preparations for vaginal and vulval changes

Topical HRT for vaginal atrophy

A cream containing an oestrogen may be applied on a short-term basis to improve the vaginal epithelium in *menopausal atrophic vaginitis*. It is **important** to bear in mind that topical oestrogens should be used in the **smallest effective** amount to minimise systemic effects. Modified-release vaginal tablets and an impregnated vaginal ring are now also available.

The risk of endometrial hyperplasia and carcinoma is increased when *systemic* oestrogens are administered alone for prolonged periods (section 6.4.1.1). The endometrial safety of long-term or repeated use of *topical* vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration given to any symptoms of endometrial hyperplasia or carcinoma.

Topical oestrogens are also used in postmenopausal women before vaginal surgery for prolapse when there is epithelial atrophy.

For a general comment on hormone replacement therapy, including the role of topical oestrogens, see section 6.4.1.1.

OESTROGENS, TOPICAL

Indications see notes above

Cautions see notes above; see also Oestrogens for HRT (section 6.4.1.1); interrupt treatment periodically to assess need for continued treatment

Contra-indications see notes above; see also Oestrogens for HRT (section 6.4.1.1)

Hepatic impairment see Combined Hormonal Contraceptives, section 7.3.1

Pregnancy see Combined Hormonal Contraceptives, section 7.3.1

Breast-feeding avoid; adverse effects on lactation; see also Combined Hormonal Contraceptives, section 7.3.1

Side-effects see notes above; see also Oestrogens for HRT (section 6.4.1.1); local irritation

Gynest® (Marlborough) PoM

Intravaginal cream, estriol 0.01%, net price 80 g with applicator = £4.67

Excipients include arachis (peanut) oil

Condoms may damage latex condoms and diaphragms

Dose insert 1 applicatorful daily, preferably in the evening until improvement occurs, reduced to 1 applicatorful twice a week; attempts to discontinue should be made at 3–6 month intervals with re-examination

Ortho-Gynest® (Janssen) PoM

Pessaries, estriol 500 micrograms, net price 15 pessaries = £4.73

Excipients include butylated hydroxytoluene

Condoms damages latex condoms and diaphragms

Dose insert 1 pessary daily, preferably in the evening, until improvement occurs; maintenance 1 pessary twice a week; attempts to reduce or discontinue should be made at 3–6 month intervals with re-examination

Ovestin® (MSD) PoM

Intravaginal cream, estriol 0.1%, net price 15 g with applicator = £4.45

Excipients include cetyl alcohol, polysorbates, stearyl alcohol

Condoms effect on latex condoms and diaphragms not yet known

Dose insert 1 applicator-dose daily for 2–3 weeks, then reduce to twice a week (discontinue every 2–3 months for 4 weeks to assess need for further treatment); vaginal surgery, 1 applicator-dose daily for 2 weeks before surgery, resuming 2 weeks after surgery

Vagifem® (Novo Nordisk) PoM

Vaginal tablets, f/c, estradiol 10 micrograms in disposable applicators, net price 24-applicator pack = £16.72

Excipients none as listed in section 13.1.3

Condoms no evidence of damage to latex condoms and diaphragms

Dose insert 1 vaginal tablet daily for 2 weeks then reduce to 1 tablet twice weekly

Vaginal ring

Estring® (Pharmacia) PoM

Vaginal ring, releasing estradiol approx. 7.5 micrograms/24 hours, net price 1-ring pack = £31.42. Label: 10, patient information leaflet

Dose for postmenopausal urogenital conditions (not suitable for vasomotor symptoms or osteoporosis prophylaxis), to be inserted into upper third of vagina and worn continuously; replace after 3 months; max. duration of continuous treatment 2 years

Non-hormonal preparations for vaginal atrophy

Replens MD® and *Sylk®* are acidic, non-hormonal vaginal moisturisers; *Replens MD®* provides a high moisture content for up to 3 days.

7.2.2 Vaginal and vulval infections

Effective specific treatments are available for the common vaginal infections.

Fungal infections

Candidal vulvitis can be treated locally with cream, but is almost invariably associated with vaginal infection which should also be treated. *Vaginal candidiasis* is treated primarily with antifungal pessaries or cream inserted high into the vagina (including during menstruation). Single-dose preparations offer an advantage when compliance is a problem. Local irritation may occur on application of vaginal antifungal products.

Imidazole drugs (clotrimazole, econazole, fenticonazole, and miconazole) are effective against candida in short courses of 1 to 14 days according to the preparation used; treatment can be repeated if initial course fails to control symptoms or if symptoms recur. Vaginal applications may be supplemented with antifungal cream for vulvitis and to treat other superficial sites of infection.

Oral treatment of vaginal infection with **fluconazole** or **itraconazole** (section 5.2.1) is also effective.

Vulvovaginal candidiasis in pregnancy Vulvovaginal candidiasis is common during pregnancy and can be treated with vaginal application of an imidazole (such as clotrimazole), and a topical imidazole cream for vulvitis. Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection. Oral antifungal treatment should be avoided during pregnancy.

Recurrent vulvovaginal candidiasis Recurrence of vulvovaginal candidiasis is particularly likely if there are predisposing factors, such as antibacterial therapy, pregnancy, diabetes mellitus, or possibly oral contraceptive use. Reservoirs of infection may also lead to recontamination and should be treated; these include other skin sites such as the digits, nail beds, and umbilicus as well as the gastro-intestinal tract and the bladder. The partner may also be the source of re-infection and, if symptomatic, should be treated with a topical imidazole cream at the same time.

Treatment against candida may need to be extended for 6 months in recurrent vulvovaginal candidiasis. Some recommended regimens [all unlicensed] include:

- initially, fluconazole (section 5.2.1) by mouth 150 mg every 72 hours for 3 doses, then 150 mg once every week for 6 months;
- initially, intravaginal application of a topical imidazole for 10–14 days, then clotrimazole vaginally 500-mg pessary once every week for 6 months;
- initially, intravaginal application of a topical imidazole for 10–14 days, then itraconazole (section 5.2.1) by mouth 50–100 mg daily for 6 months.

PREPARATIONS FOR VAGINAL AND VULVAL CANDIDIASIS

Indications see notes above

Cautions **interactions:** Appendix 1 (miconazole)

Pregnancy see notes above

Side-effects occasional local irritation

Dose

- See under preparations below

Clotrimazole (Non-proprietary)

Cream (topical), clotrimazole 1%, net price 20 g = £1.26; 50 g = £3.15

Condoms check with manufacturer of cream for effect on latex condoms and diaphragms

Dose apply to anogenital area 2–3 times daily

Pessary, clotrimazole 500 mg, net price 1 pessary with applicator = £3.12

Dose insert 1 pessary at night as a single dose; can be repeated once if necessary

Canesten® (Bayer Consumer Care)

Cream (topical), clotrimazole 1%, net price 20 g = £2.14; 50 g = £3.50

Excipients include benzyl alcohol, cetostearyl alcohol, polysorbates

Condoms damages latex condoms and diaphragms

Dose apply to anogenital area 2–3 times daily

Thrush Cream (topical), clotrimazole 2%, net price 20 g = £4.46

Excipients include benzyl alcohol, cetostearyl alcohol, polysorbates

Condoms damages latex condoms and diaphragms

Dose apply to anogenital area 2–3 times daily

Intravaginal cream (*10% VC®*) PoM, clotrimazole 10%, net price 5-g applicator pack = £4.50

Excipients include benzyl alcohol, cetostearyl alcohol, polysorbates

Condoms damages latex condoms and diaphragms

Dose insert 5 g at night as a single dose; can be repeated once if necessary

Note Brands for sale to the public include *Canesten® Internal Cream*

Cream Combi, clotrimazole 10% vaginal cream and 2% topical cream, net price 5-g vaginal cream (with applicator) and 10-g topical cream = £8.21

Excipients include benzyl alcohol, cetostearyl alcohol, polysorbates

Condoms damages latex condoms and diaphragms

Dose see under individual components

Pessaries, clotrimazole 100 mg, net price 6 pessaries with applicator = £3.50; 200 mg, 3 pessaries with applicator = £3.10

Condoms damages latex condoms and diaphragms

Dose insert 200 mg for 3 nights *or* 100 mg for 6 nights; course can be repeated once if necessary

Pessary, clotrimazole 500 mg, net price 1 pessary with applicator = £2.00

Condoms damages latex condoms and diaphragms

Dose insert 1 pessary at night as a single dose; can be repeated once if necessary

Pessary Combi, clotrimazole 500-mg pessary and cream (topical) 2%, net price 1 pessary and 10-g cream = £8.21

Condoms damages latex condoms and diaphragms**Excipients** include benzyl alcohol, cetostearyl alcohol, polysorbates

Dose see under individual components

Soft Gel Pessary, clotrimazole 500 mg, net price 1 pessary with applicator = £6.41

Condoms damages latex condoms and diaphragms

Dose insert 1 pessary at night as a single dose; can be repeated once if necessary

Soft Gel Pessary Combi, clotrimazole 500-mg soft gel pessary and cream (topical) 2%, net price 1 pessary and 10-g cream = £5.73

Excipients include benzyl alcohol, cetostearyl alcohol, polysorbates

Condoms damages latex condoms and diaphragms

Dose see under individual components

Gyno-Daktarin® (Janssen) PoM

Intravaginal cream, miconazole nitrate 2%, net price 78 g with applicators = £4.33

Excipients include butylated hydroxyanisole

Condoms damages latex condoms and diaphragms

Dose insert 5-g applicatorful once daily for 10–14 days *or* twice daily for 7 days; course can be repeated once if necessary; *topical*, apply to anogenital area twice daily

Ovule (= vaginal capsule) (*Gyno-Daktarin 1®*), miconazole nitrate 1.2 g in a fatty basis, net price 1 ovule = £2.94

Excipients include hydroxybenzoates (parabens)

Condoms damages latex condoms and diaphragms

Dose insert 1 ovule at night as a single dose; can be repeated once if necessary

Gyno-Pevaryl® (Janssen) PoM

Cream, econazole nitrate 1%, net price 15 g = £2.11; 30 g = £3.78

Excipients none as listed in section 13.1.3

Condoms damages latex condoms and diaphragms

Dose insert 5-g applicatorful intravaginally and apply to vulva at night for at least 14 nights; course can be repeated once if necessary

Note Applicator available separately from Marlborough

Pessaries, econazole nitrate 150 mg, net price 3 pessaries = £4.17

Excipients none as listed in section 13.1.3

Condoms damages latex condoms and diaphragms

Dose ADULT and CHILD over 16 years, insert 1 pessary for 3 nights; course can be repeated once if necessary

Pessary (*Gyno-Pevaryl 1®*), econazole nitrate 150 mg, formulated for single-dose therapy, net price 1 pessary with applicator = £3.69

Excipients none as listed in section 13.1.3

Condoms damages latex condoms and diaphragms

Dose ADULT and CHILD over 16 years, insert 1 pessary at night as a single dose; can be repeated once if necessary

Gynoxin® (Recordati) PoM

Intravaginal cream, fenticonazole nitrate 2%, net price 30 g with applicator = £3.74

Excipients include cetyl alcohol, hydrogenated wool fat, propylene glycol

Condoms damages latex condoms and diaphragms

Dose insert 5-g applicatorful intravaginally twice daily for 3 days

Vaginal capsule, fenticonazole nitrate 200 mg, net price 3 vaginal capsules = £2.42

Excipients include hydrobenzoates (parabens)

Condoms damages latex condoms and diaphragms

Dose insert 1 vaginal capsule at night for 3 nights

Vaginal capsule, fenticonazole nitrate 600 mg, net price 1 vaginal capsule = £2.62

Excipients include hydrobenzoates (parabens)

Condoms damages latex condoms and diaphragms

Dose insert 1 vaginal capsule at night as a single dose

Nizoral® (Janssen) PoM

Cream (topical), ketoconazole 2%, net price 30 g = £4.24

Excipients include polysorbates, propylene glycol, stearyl alcohol

Condoms effect on latex condoms and diaphragms not yet known

Dose ADULT over 18 years, apply to anogenital area once or twice daily

Other infections

Trichomonal infections commonly involve the lower urinary tract as well as the genital system and need systemic treatment with metronidazole or tinidazole (section 5.1.11).

Bacterial infections with Gram-negative organisms are particularly common in association with gynaecological operations and trauma. Metronidazole is effective against certain Gram-negative organisms, especially *Bacteroides* spp. and can be used prophylactically in gynaecological surgery.

Clindamycin cream and metronidazole gel are indicated for bacterial vaginosis.

Vaginal preparations intended to restore normal acidity may prevent recurrence of vaginal infections and permit the re-establishment of the normal vaginal flora.

The antiviral drugs aciclovir, famciclovir, and valaciclovir can be used in the treatment of genital infection due to *herpes simplex virus*, the HSV type 2 being a major cause of genital ulceration; they have a beneficial effect on virus shedding and healing, generally giving relief from pain and other symptoms. See section 5.3.2.1 for systemic preparations, and section 13.10.3 for topical preparations.

PREPARATIONS FOR OTHER VAGINAL INFECTIONS

Balance Activ Rx® (BBI Healthcare)

Vaginal gel, lactic acid 4.9%, glycogen 0.1%, net price 7 x 5 mL-tube = £5.25

Excipients include propylene glycol

Dose prevention of bacterial vaginosis, insert contents of 1 tube once or twice weekly

Dalacin® (Pharmacia) PoM

Cream, clindamycin 2% (as phosphate), net price 40-g pack with 7 applicators = £10.86

Excipients include benzyl alcohol, cetostearyl alcohol, polysorbates, propylene glycol

Condoms damages latex condoms and diaphragms

Side-effects irritation, cervicitis, and vaginitis; poorly absorbed into the blood—low risk of systemic effects, see section 5.1.6

Dose bacterial vaginosis, insert 5-g applicatorful at night for 3–7 nights

Relactagel® (KoRa)

Vaginal gel, lactic acid 4.5%, glycogen 0.1%, net price 7 × 5 mL-tube = £5.25

Excipients include propylene glycol

Cautions not recommended if trying to conceive

Side-effects mild irritation

Dose prevention of bacterial vaginosis, ADULT over 18 years insert contents of 1 tube at night for 2–3 nights after menstruation

Zidoval® (Meda) PoM

Vaginal gel, metronidazole 0.75%, net price 40-g pack with 5 applicators = £4.31

Excipients include disodium edetate, hydroxybenzoates (parabens), propylene glycol

Cautions not recommended during menstruation; some absorption may occur, see section 5.1.11 for systemic effects

Side-effects local effects including irritation, candidiasis, abnormal discharge, pelvic discomfort

Dose bacterial vaginosis, insert 5-g applicatorful at night for 5 nights

7.3 Contraceptives

The Fraser Guidelines[1] should be followed when prescribing contraception for women under 16 years. The UK Medical Eligibility Criteria for Contraceptive Use (available at www.fsrh.org) is published by the Faculty of Sexual and Reproductive Healthcare; it categorises the risks of using contraceptive methods with pre-existing medical conditions.

Hormonal contraception is the most effective method of fertility control, but can have major and minor side-effects, especially for certain groups of women.

Intra-uterine devices are a highly effective method of contraception but may produce undesirable local side-effects. They may be used in women of all ages irrespective of parity, but are less appropriate for those with an increased risk of pelvic inflammatory disease.

Barrier methods alone (condoms, diaphragms, and caps) are less effective but can be reliable for well-motivated couples if used in conjunction with a **spermicide**. Occasionally sensitivity reactions occur. A female condom (*Femidom®*) is also available; it is prelubricated but does not contain a spermicide.

7.3.1 Combined hormonal contraceptives

Oral contraceptives containing an oestrogen and a progestogen ('combined oral contraceptives') are effective preparations for general use. Advantages of combined oral contraceptives include:

- reliable and reversible;
- reduced dysmenorrhoea and menorrhagia;
- reduced incidence of premenstrual tension;
- less symptomatic fibroids and functional ovarian cysts;
- less benign breast disease;
- reduced risk of ovarian and endometrial cancer;
- reduced risk of pelvic inflammatory disease.

Combined oral contraceptives containing a fixed amount of an oestrogen and a progestogen in each active tablet are termed 'monophasic'; those with varying amounts of the two hormones are termed 'phasic'. A transdermal patch and a vaginal ring, both containing an oestrogen with a progestogen, are also available.

Choice The majority of combined oral contraceptives contain ethinylestradiol as the oestrogen component; mestranol and estradiol are also used. The ethinylestradiol content of combined oral contraceptives ranges from 20 to 40 micrograms. Generally a preparation with the lowest oestrogen and progestogen content

1. See Department of Health Guidance (July 2004): Best practice guidance for doctors and other health professionals on the provision of advice and treatment to young people under 16 on contraception, sexual and reproductive health. Available at tinyurl.com/bpg16

which gives good cycle control and minimal side-effects in the individual woman is chosen. It is recommended that combined hormonal contraceptives are not continued beyond 50 years of age since more suitable alternatives exist.

- *Low strength preparations* (containing ethinylestradiol 20 micrograms) are particularly appropriate for women with risk factors for circulatory disease, provided a combined oral contraceptive is otherwise suitable.
- *Standard strength preparations* (containing ethinylestradiol 30 or 35 micrograms or in 30–40 microgram *phased* preparations) are appropriate for standard use—but see Risk of Venous Thromboembolism below. Phased preparations are generally reserved for women who *either* do not have withdrawal bleeding *or* who have breakthrough bleeding with monophasic products.

The progestogens desogestrel, drospirenone, and gestodene (in combination with ethinylestradiol) may be considered for women who have side-effects (such as acne, headache, depression, breast symptoms, and breakthrough bleeding) with other progestogens. Drospirenone, a derivative of spironolactone, has anti-androgenic and anti-mineralocorticoid activity; it should be used with care if an increased plasma-potassium concentration might be hazardous.

The progestogen dienogest is combined with estradiol in the combined oral contraceptive *Qlaira*®. Nomegestrol is the progestogen contained in the combined oral contraceptive *Zoely*®, in combination with estradiol.

The progestogen norelgestromin is combined with ethinylestradiol in a transdermal patch (*Evra*®).

The vaginal contraceptive ring contains the progestogen etonogestrel combined with ethinylestradiol (*NuvaRing*®).

Risk of venous thromboembolism There is an increased risk of venous thromboembolic disease in users of combined hormonal contraceptives particularly during the first year and possibly after restarting combined hormonal contraceptives following a break of four weeks or more. This risk is considerably smaller than that associated with pregnancy (about 60 cases of venous thromboembolic disease per 100 000 pregnancies). In all cases the risk of venous thromboembolism increases with age and in the presence of other risk factors, such as obesity. The risk also varies depending on the type of progestogen, see the Combined Hormonal Contraception and Risk of Venous Thromboembolism table for details.

Provided that women are informed of the relative risks of venous thromboembolism and accept them, the choice of oral contraceptive is for the woman together with the prescriber jointly to make in light of her individual medical history and any contra-indications.

Combined hormonal contraceptives also slightly increase the risk of *arterial* thromboembolism; however, there is no evidence to suggest that this risk varies between different preparations.

Travel Women taking oral contraceptives or using the patch or vaginal ring are at an increased risk of deep-vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

Combined Hormonal Contraception and Risk of Venous Thromboembolism

Progestogen in Combined Hormonal Contraceptive	Estimated incidence per 10 000 women per year of use
Non-pregnant, not using combined hormonal contraception	2
Levonorgestrel[1]	5–7
Norgestimate[1]	
Norethisterone[1]	
Etonogestrel[1]	6–12
Norelgestromin[1]	
Gestodene[1]	9–12
Desogestrel[1]	
Drospirenone[1]	
Dienogest[2]	Not known—insufficient data
Nomegestrol acetate[2]	

1. Combined with ethinylestradiol
2. Combined with estradiol

Missed pill The critical time for loss of contraceptive protection is when a pill is omitted at the *beginning* or *end* of a cycle (which lengthens the pill-free interval).

If a woman forgets to take a pill, it should be taken as soon as she remembers, and the next one taken at the normal time (even if this means taking 2 pills together). A missed pill is one that is 24 or more hours late; for women taking *Qlaira*® or *Zoely*®, see below. If a woman misses only one pill, she should take an active pill as soon as she remembers and then resume normal pill-taking. No additional precautions are necessary.

If a woman misses 2 or more pills (especially from the first 7 in a packet), she may not be protected. She should take an active pill as soon as she remembers and then resume normal pill-taking. In addition, she must either abstain from sex or use an additional method of contraception such as a condom for the next 7 days. If these 7 days run beyond the end of the packet, the next packet should be started at once, omitting the pill-free interval (or, in the case of *everyday* (ED) pills, omitting the 7 inactive tablets).

A missed pill for a woman taking *Qlaira*® or *Zoely*® is one that is 12 hours or more late; for information on how to manage missed pills in women taking *Qlaira*® or *Zoely*®, refer to product literature.

Emergency contraception (section 7.3.5) is recommended if 2 or more combined oral contraceptive tablets are missed from the first 7 tablets in a packet and unprotected intercourse has occurred since finishing the last packet.

Delayed application or detached patch If a patch is partly detached for less than 24 hours, reapply to the same site or replace with a new patch immediately; no additional contraception is needed and the next patch should be applied on the usual 'change day'. If a patch remains detached for more than 24 hours or if the user is not aware when the patch became detached, then stop the current contraceptive cycle and start a new cycle by applying a new patch, giving a new 'Day 1'; an additional non-hormonal contraceptive must be used concurrently for the first 7 days of the new cycle. If application of a new patch at the start of a new cycle is delayed, contraceptive protection is lost. A new patch

should be applied as soon as remembered giving a new 'Day 1'; additional non-hormonal methods of contraception should be used for the first 7 days of the new cycle. If application of a patch in the middle of the cycle is delayed (i.e. the patch is not changed on day 8 or day 15):

- for up to 48 hours, apply a new patch immediately; next patch 'change day' remains the same and no additional contraception is required;
- for more than 48 hours, contraceptive protection may have been lost. Stop the current cycle and start a new 4-week cycle immediately by applying a new patch giving a new 'Day 1'; additional non-hormonal contraception should be used for the first 7 days of the new cycle.

If the patch is not removed at the end of the cycle (day 22), remove it as soon as possible and start the next cycle on the usual 'change day', the day after day 28; no additional contraception is required.

Expulsion, delayed insertion or removal, or broken vaginal ring If the vaginal ring is expelled for *less than 3 hours*, rinse the ring with cool water and reinsert immediately; no additional contraception is needed.

If the ring remains outside the vagina for *more than 3 hours* or if the user does not know when the ring was expelled, contraceptive protection may be reduced:

- If ring expelled during week 1 or 2 of cycle, rinse ring with cool water and reinsert; use additional precautions (barrier methods) for next 7 days;
- If ring expelled during week 3 of cycle, either insert a new ring to start a new cycle *or* allow a withdrawal bleed and insert a new ring no later than 7 days after ring was expelled; latter option only available if ring was used continuously for at least 7 days before expulsion.

If insertion of a new ring at the start of a new cycle is delayed, contraceptive protection is lost. A new ring should be inserted as soon as possible; additional precautions (barrier methods) should be used for the first 7 days of the new cycle. If intercourse occurred during the extended ring-free interval, pregnancy should be considered.

No additional contraception is required if removal of the ring is delayed by up to 1 week (4 weeks of continuous use). The 7-day ring-free interval should be observed and subsequently a new ring should be inserted. Contraceptive protection may be reduced with continuous use of the ring for more than 4 weeks—pregnancy should be ruled out before inserting a new ring.

If the ring breaks during use, remove it and insert a new ring immediately; additional precautions (barrier methods) should be used for the first 7 days of the new cycle.

Diarrhoea and vomiting Vomiting and persistent, severe diarrhoea can interfere with the absorption of combined oral contraceptives. If vomiting occurs within 2 hours of taking a combined oral contraceptive another pill should be taken as soon as possible. In cases of persistent vomiting or severe diarrhoea lasting more than 24 hours, additional precautions should be used during and for 7 days (9 days for *Qlaira*®) after recovery (see also under Missed pill, above). If the vomiting and diarrhoea occurs during the last 7 tablets, the next pill-free interval should be omitted (in the case of ED tablets the inactive ones should be omitted).

Interactions The effectiveness of *combined* oral contraceptives, *progestogen-only* oral contraceptives (section 7.3.2.1), contraceptive patches, and vaginal rings can be considerably reduced by interaction with drugs that induce hepatic enzyme activity (e.g. **carbamazepine**, **eslicarbazepine**, **nevirapine**, **oxcarbazepine**, **phenytoin**, **phenobarbital**, **primidone**, **ritonavir**, **St John's Wort**, **topiramate**, and, above all, **rifabutin** and **rifampicin**). A condom together with a long-acting method, such as an injectable contraceptive, may be more suitable for patients with HIV infection or at risk of HIV infection; advice on the possibility of interaction with antiretroviral drugs should be sought from HIV specialists.

Women taking combined hormonal contraceptives who require enzyme-inducing drugs should be advised to change to a contraceptive method that is unaffected by enzyme-inducers (e.g. some parenteral progestogen-only contraceptives (p. 543), intra-uterine devices) for the duration of treatment and for 4 weeks after stopping. If a change in contraceptive method is undesirable or inappropriate the following options should be discussed:

- For a *short course (2 months or less) of an enzyme-inducing drug*, continue with a combined oral contraceptive providing ethinylestradiol 30 micrograms or more daily and use a 'tricycling' regimen (i.e. taking 3 packets of monophasic tablets without a break followed by a shortened tablet-free interval of 4 days [unlicensed use]). Additional contraceptive precautions should also be used whilst taking the enzyme-inducing drug and for 4 weeks after stopping. Another option (except for rifampicin or rifabutin—see below) is to follow the advice for long-term courses, below.

  For women using combined hormonal contraceptive patches or vaginal rings, additional contraceptive precautions are also required whilst taking the enzyme-inducing drug and for 4 weeks after stopping. If concomitant administration runs beyond the 3 weeks of patch or vaginal ring use, a new treatment cycle should be started immediately, without a patch-free or ring-free break.
- For a *long-term course (over 2 months) of an enzyme-inducing drug* (except rifampicin or rifabutin—see below), adjust the dose of combined oral contraceptive to provide ethinylestradiol 50 micrograms or more daily [unlicensed use] and use a 'tricycling' regimen (as above); continue for the duration of treatment with the enzyme-inducing drug and for 4 weeks after stopping.

  If breakthrough bleeding occurs (and all other causes are ruled out) it is recommended that the dose of ethinylestradiol is increased by increments of 10 micrograms up to a maximum of 70 micrograms daily [unlicensed use], or to use additional precautions, or to change to a method unaffected by enzyme-inducing drugs.

  Contraceptive patches and vaginal rings are not recommended for women taking enzyme-inducing drugs over a long period.
- For a *long-term course (over 2 months) of* ***rifampicin*** *or* ***rifabutin***, an alternative method of contraception (such as an IUD) is **always** recommended because they are such potent enzyme-inducing drugs; the alternative method of contraception should be continued for 4 weeks after stopping the enzyme-inducing drug.

For information on interactions of oral progestogen-only contraceptives, see also p. 539; for information on interactions of parenteral progestogen-only contraceptives, see also p. 543; for information on interactions of the intra-uterine progestogen-only device, see also p. 544; for information on interactions of hormonal emergency contraception, see also p. 547.

Antibacterials that do not induce liver enzymes Latest recommendations are that no additional contraceptive precautions are required when *combined* oral contraceptives are used with antibacterials that do not induce liver enzymes, unless diarrhoea or vomiting occur (see above). These recommendations should be discussed with the woman, who should also be advised that guidance in patient information leaflets may differ.

It is also currently recommended that no additional contraceptive precautions are required when contraceptive patches or vaginal rings are used with antibacterials that do not induce liver enzymes. There have been concerns that some antibacterials that do not induce liver enzymes (e.g. ampicillin, doxycycline) reduce the efficacy of *combined* oral contraceptives by impairing the bacterial flora responsible for recycling ethinylestradiol from the large bowel. However, there is a lack of evidence to support this interaction.

Surgery Oestrogen-containing contraceptives should preferably be discontinued (and adequate alternative contraceptive arrangements made) 4 weeks before major elective surgery and all surgery to the legs or surgery which involves prolonged immobilisation of a lower limb; they should normally be recommenced at the first menses occurring at least 2 weeks after full mobilisation. A progestogen-only contraceptive may be offered as an alternative and the oestrogen-containing contraceptive restarted after mobilisation, as above. When discontinuation of an oestrogen-containing contraceptive is not possible, e.g. after trauma or if a patient admitted for an elective procedure is still on an oestrogen-containing contraceptive, thromboprophylaxis (with unfractionated or low molecular weight heparin and graduated compression hosiery) is advised. These recommendations do not apply to minor surgery with short duration of anaesthesia, e.g. laparoscopic sterilisation or tooth extraction, or to women using oestrogen-free hormonal contraceptives.

Reason to stop immediately Combined hormonal contraceptives or hormone replacement therapy (HRT) should be stopped (pending investigation and treatment), if any of the following occur:

- sudden severe chest pain (even if not radiating to left arm);
- sudden breathlessness (or cough with blood-stained sputum);
- unexplained swelling or severe pain in calf of one leg;
- severe stomach pain;
- serious neurological effects including unusual severe, prolonged headache especially if first time or getting progressively worse *or* sudden partial or complete loss of vision *or* sudden disturbance of hearing or other perceptual disorders *or* dysphasia *or* bad fainting attack or collapse *or* first unexplained epileptic seizure *or* weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body;
- hepatitis, jaundice, liver enlargement;
- blood pressure above systolic 160 mmHg or diastolic 95 mmHg;
- prolonged immobility after surgery or leg injury;
- detection of a risk factor which contra-indicates treatment (see Cautions and Contra-indications under Combined Hormonal Contraceptives below or under Oestrogens for HRT (section 6.4.1.1)).

COMBINED HORMONAL CONTRACEPTIVES

Indications contraception; menstrual symptoms (section 6.4.1.2)

Cautions see notes above; risk factors for venous thromboembolism (see below and also notes above), arterial disease and migraine, see below; personal or family history of hypertriglyceridaemia (increased risk of pancreatitis); hyperprolactinaemia (seek specialist advice); history of severe depression especially if induced by hormonal contraceptive; undiagnosed breast mass; gene mutations associated with breast cancer (e.g. BRCA 1); sickle-cell disease; inflammatory bowel disease including Crohn's disease; reduced efficacy of contraceptive patch in women with body-weight ≥ 90 kg; active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice; **interactions:** see above and Appendix 1 (oestrogens, progestogens)

Risk factors for venous thromboembolism See also notes above. Use with **caution** if any of following factors present but **avoid** if two or more factors present:

- *family history of venous thromboembolism* in first-degree relative aged under 45 years (avoid contraceptive containing desogestrel or gestodene, *or* avoid if known prothrombotic coagulation abnormality e.g. factor V Leiden or antiphospholipid antibodies (including lupus anticoagulant));
- *obesity*—body mass index $\geq 30\,kg/m^2$ (avoid if body mass index $\geq 35\,kg/m^2$ unless no suitable alternative);
- *long-term immobilisation* e.g. in a wheelchair (avoid if confined to bed or leg in plaster cast);
- *history of superficial thrombophlebitis*;
- *age* over 35 years (avoid if over 50 years);
- *smoking*.

Risk factors for arterial disease Use with **caution** if any one of following factors present but **avoid** if two or more factors present:

- *family history of arterial disease* in first degree relative aged under 45 years (avoid if atherogenic lipid profile);
- *diabetes mellitus* (avoid if diabetes complications present);
- *hypertension*—blood pressure above *systolic 140 mmHg* or *diastolic 90 mmHg* (avoid if blood pressure above *systolic 160 mmHg* or *diastolic 95 mmHg*);
- *smoking* (avoid if smoking 40 or more cigarettes daily);
- *age* over 35 years (avoid if over 50 years);
- *obesity* (avoid if body mass index $\geq 35\,kg/m^2$ unless no suitable alternative);
- *migraine without aura* (avoid if *migraine with aura* (focal symptoms), *or* severe migraine frequently lasting over 72 hours despite treatment, *or* migraine treated with ergot derivatives).

Migraine Women should report any increase in headache frequency or onset of focal symptoms (discontinue

immediately and refer urgently to neurology expert if focal neurological symptoms not typical of aura persist for more than 1 hour—see also Reason To Stop Immediately in notes above)

Contra-indications see notes above; personal history of venous or arterial thrombosis, severe or multiple risk factors for arterial disease or for venous thromboembolism (see above), heart disease associated with pulmonary hypertension or risk of embolus; sclerosing treatment for varicose veins; migraine with aura (see also above); transient cerebral ischaemic attacks without headaches; systemic lupus erythematosus with (or unknown) antiphospholipid antibodies; acute porphyria (section 9.8.2); gallstones; history of haemolytic uraemic syndrome or history during pregnancy of pruritus, cholestatic jaundice, chorea, pemphigoid gestationis; history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal methods unacceptable; undiagnosed vaginal bleeding

Hepatic impairment avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours

Pregnancy not known to be harmful; for *Zoely*®—toxicity in *animal* studies

Breast-feeding avoid until weaning or for 6 months after birth (adverse effects on lactation)

Side-effects see notes above; also nausea, vomiting, abdominal cramps, liver impairment, hepatic tumours; fluid retention, thrombosis (more common when factor V Leiden present or in blood groups A, B, and AB; see also notes above), hypertension, changes in lipid metabolism; headache, depression, chorea, nervousness, irritability; changes in libido, breast tenderness, enlargement, and secretion; reduced menstrual loss, 'spotting' in early cycles, absence of withdrawal bleeding, amenorrhoea after discontinuation, changes in vaginal discharge, cervical erosion; contact lenses may irritate, visual disturbances; leg cramps; skin reactions, chloasma, photosensitivity; rarely gallstones and systemic lupus erythematosus

Breast cancer There is a small increase in the risk of having breast cancer diagnosed in women taking the combined oral contraceptive pill; this relative risk may be due to an earlier diagnosis. In users of combined oral contraceptive pills the cancers are more likely to be localised to the breast. The most important factor for diagnosing breast cancer appears to be the age at which the contraceptive is stopped rather than the duration of use; any increase in the rate of diagnosis diminishes gradually during the 10 years after stopping and disappears by 10 years

Cervical cancer Use of combined oral contraceptives for 5 years or longer is associated with a small increased risk of cervical cancer; the risk diminishes after stopping and disappears by about 10 years. The risk of cervical cancer with transdermal patches and vaginal rings is not yet known

Note The possible small increase in the risk of breast cancer and cervical cancer should be weighed against the protective effect against cancers of the ovary and endometrium

Dose

- By mouth , each tablet should be taken at approximately same time each day; if delayed, contraceptive protection may be lost (see missed pill, p. 535)

  21-day combined (monophasic) preparations, 1 tablet daily for 21 days; subsequent courses repeated after a 7-day interval (during which withdrawal bleeding occurs); if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days

  Every day (ED) combined (monophasic) preparations, 1 *active* tablet daily for 21 days, followed by 1 *inactive* tablet daily for 7 days (see also Combined Oral Contraceptives table, below); subsequent courses repeated without interval (withdrawal bleeding occurs when *inactive* tablets being taken); if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days; for *Zoely*® see Combined Oral Contraceptives table, below

  Phasic preparations, see Combined Oral Contraceptives table, below

  Changing to combined preparation containing different progestogen If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start the first *active* tablet of new brand immediately

  Changing to Qlaira®: start the first *active Qlaira*® tablet on the day after taking the last active tablet of the previous brand

  Changing to *Zoely*®: start the first *active Zoely*® tablet on the day after taking the last active tablet of the previous brand or, at the latest, the day after the tablet-free or inactive tablet interval of the previous brand

  Changing from Qlaira® or *Zoely*®: start the new brand after taking the last active tablet; if the inactive tablets are taken before starting new brand, additional precautions (barrier methods) should be used during first 7 days of taking the new brand

  Changing from progestogen-only tablet If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start new brand immediately, additional precautions (barrier methods) necessary for first 7 days

  Changing to Qlaira®: start any day, additional precautions (barrier methods) necessary for first 9 days

  Secondary amenorrhoea (exclude pregnancy) Start any day, additional precautions (barrier methods) necessary during first 7 days (9 days for *Qlaira*®)

  After childbirth (not breast-feeding) Start 3 weeks after birth (increased risk of thrombosis if started earlier); later than 3 weeks postpartum additional precautions (barrier methods) necessary for first 7 days (9 days for *Qlaira*®)

  After abortion or miscarriage Start same day

- By transdermal application, apply first patch on day 1 of cycle, change patch on days 8 and 15; remove third patch on day 22 and apply new patch after 7-day patch-free interval to start subsequent contraceptive cycle

  Note If first patch applied later than day 1, additional precautions (barrier methods) should be used for the next 7 days

  Changing from combined oral contraception Apply patch on the first day of withdrawal bleeding; if no withdrawal bleeding within 5 days of taking last *active* tablet, rule out pregnancy before applying first patch. Unless patch is applied on first day of withdrawal bleeding, additional precautions (barrier methods) should be used concurrently for first 7 days

  Changing from progestogen-only method From an implant, apply first patch on the day implant removed; from an injection, apply first patch when next injection due; from oral progestogen, first patch may be applied on any day after stopping pill. For all methods additional precautions (barrier methods) should be used concurrently for first 7 days

  After childbirth (not breast-feeding) Start 4 weeks after birth; if started later than 4 weeks after birth additional precautions (barrier methods) should be used for first 7 days

  After abortion or miscarriage Before 20 weeks' gestation start immediately; no additional contraception required if started immediately. After 20 weeks' gestation start on day 21 after abortion or on the first day of first spontaneous menstruation; additional precautions (barrier methods) should be used for first 7 days after applying the patch

- By vagina, insert ring into vagina on day 1 of cycle and leave in for 3 weeks; remove ring on day 22; subsequent courses repeated after 7-day ring-free interval (during which withdrawal bleeding occurs)

  Note If first ring inserted later than day 1, additional

precautions (barrier methods) should be used for the next 7 days

Changing from combined hormonal contraception Insert ring at the latest on the day after the usual tablet-free, patch-free, or inactive-tablet interval. If previous contraceptive used correctly, or pregnancy can reasonably be excluded, can switch to ring on any day of cycle

Changing from progestogen-only method From an implant or intra-uterine progestogen-only device, insert ring on the day implant or intra-uterine progestogen-only device removed; from an injection, insert ring when next injection due; from oral preparation, first ring may be inserted on any day after stopping pill. For all methods additional precautions (barrier methods) should be used concurrently for first 7 days

After first trimester abortion Start immediately

After childbirth (not breast-feeding) or second trimester abortion Start 4 weeks after birth or abortion; if started later than 4 weeks after birth or abortion, additional precautions (barrier methods) should be used for first 7 days

Oral (low and standard strength)

For information on these preparations, see Combined Oral Contraceptives table, p. 540

Transdermal (standard strength)

Ethinylestradiol with Norelgestromin

See Risk of Venous Thromboembolism (in notes above) before prescribing

Evra® (Janssen) PoM

Patches, self-adhesive (releasing ethinylestradiol approx. 33.9 micrograms/24 hours and norelgestromin approx. 203 micrograms/24 hours); net price 9-patch pack = £19.51. Counselling, administration

Dose 1 patch to be applied once weekly for three weeks, followed by a 7-day patch-free interval; subsequent courses repeated after 7-day patch-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

Note Adhesives or bandages should not be used to hold patch in place. If patch no longer sticky do not reapply but use a new patch.

The *Scottish Medicines Consortium* has advised (September 2003) that *Evra®* patches should be restricted for use in women who are likely to comply poorly with combined oral contraceptives

Vaginal (low strength)

Ethinylestradiol with Etonogestrel

See Risk of Venous Thromboembolism (in notes above) before prescribing

NuvaRing® (MSD) ▼ PoM

Vaginal ring, releasing ethinylestradiol approx. 15 micrograms/24 hours and etonogestrel approx. 120 micrograms/24 hours, net price 3-ring pack = £27.00. Counselling, administration

Dose 1 ring to be inserted into the vagina, removed on day 22; subsequent courses repeated after 7-day ring-free interval (during which withdrawal bleeding occurs); for starting routines see under Dose above

Counselling The presence of the ring should be checked regularly. In case of expulsion see Expulsion, Delayed Insertion or Removal, or Broken Vaginal Ring, p. 536

7.3.2 Progestogen-only contraceptives

7.3.2.1 Oral progestogen-only contraceptives

Oral progestogen-only preparations alter cervical mucus to prevent sperm penetration and may inhibit ovulation in some women; oral desogestrel-only preparations consistently inhibit ovulation and this is their primary mechanism of action. There is insufficient clinical trial evidence to compare the efficacy of oral progestogen-only contraceptives with each other or with combined hormonal contraceptives. Progestogen-only contraceptives offer a suitable alternative to combined hormonal contraceptives when oestrogens are contraindicated (including those with venous thrombosis or a past history or predisposition to venous thrombosis, heavy smokers, those with hypertension above systolic 160 mmHg or diastolic 95 mmHg, valvular heart disease, diabetes mellitus with complications, and migraine with aura). Menstrual irregularities (oligomenorrhoea, menorrhagia) are more common but tend to resolve on long-term treatment.

Interactions Effectiveness of oral progestogen-only preparations is not affected by antibacterials that do not induce liver enzymes. The efficacy of oral progestogen-only preparations is, however, reduced by enzyme-inducing drugs and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with an enzyme-inducing drug and for at least 4 weeks afterwards—see p. 536 and Appendix 1 (progestogens). For a short course of an enzyme-inducing drug, if a change in contraceptive method is undesirable or inappropriate, the progestogen-only oral method may be continued in combination with additional contraceptive precautions (e.g. barrier methods) for the duration of treatment with the enzyme-inducing drug and for 4 weeks after stopping.

Surgery All progestogen-only contraceptives (including those given by injection) are suitable for use as an alternative to combined hormonal contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

Starting routine One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours (12 hours for desogestrel) contraceptive protection may be lost). Additional contraceptive precautions are not necessary when initiating treatment.

Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

Combined Oral Contraceptives

2. *Dose* 1 tablet daily for 28 days starting on day 1–5 of cycle with first active tablet (withdrawal bleeding occurs when inactive tablets being taken) (if reasonably certain woman is not pregnant, first course can be started on any day of cycle); subsequent courses repeated without interval; for starting and changing routines see under Dose above
3. *Dose* 1 tablet daily for 28 days starting on day 1 of cycle with first active tablet (withdrawal bleeding occurs when inactive tablets being taken); subsequent courses repeated without interval; for starting and changing routines see under Dose above

After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.

Missed pill The following advice is recommended:

'If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours (12 hours for desogestrel) overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days.'

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception (see p. 547) if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours (12 hours for desogestrel) late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

Diarrhoea and vomiting Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours (12 hours for desogestrel) of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery (see also under Missed pill above).

ORAL PROGESTOGEN-ONLY CONTRACEPTIVES

(Progestogen-only pill, 'POP')

Indications contraception

Cautions arterial disease; sex-steroid dependent cancer; past ectopic pregnancy; malabsorption syndromes; active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice; systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies; functional ovarian cysts; history of jaundice in pregnancy; **interactions:** see notes above and Appendix 1 (progestogens)

Other conditions The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory

Contra-indications undiagnosed vaginal bleeding; severe arterial disease; acute porphyria (section 9.8.2); history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable

Hepatic impairment caution in severe liver disease and recurrent cholestatic jaundice; avoid in liver tumour

Pregnancy not known to be harmful

Breast-feeding progestogen-only contraceptives do not affect lactation; see also After Childbirth above

Side-effects menstrual irregularities (see also notes above); nausea, vomiting, headache, dizziness, breast discomfort, depression, skin disorders, disturbance of appetite, changes in libido

Breast cancer There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits

Dose

- 1 tablet daily at same time each day, starting on day 1 of cycle then continuously; if administration delayed for 3 hours (12 hours for desogestrel) or more it should be regarded as a 'missed pill', see notes above

Desogestrel (Non-proprietary) PoM

Tablets, desogestrel 75 micrograms, net price 3 × 28-tab pack = £3.51

Brands include *Aizea*®, *Cerelle*®, *Nacrez*®

Cerazette® (MSD) PoM

Tablets, f/c, desogestrel 75 micrograms, net price 3 × 28-tab pack = £8.68

The *Scottish Medicines Consortium* (p. 4) has advised (September 2003) that *Cerazette*® should be restricted for use in women who cannot tolerate oestrogen-containing contraceptives or in whom such preparations are contra-indicated

Micronor® (Janssen) PoM

Tablets, norethisterone 350 micrograms, net price 3 × 28-tab pack = £1.80

Norgeston® (Bayer) PoM

Tablets, s/c, levonorgestrel 30 micrograms, net price 35-tab pack = 92p

Noriday® (Pharmacia) PoM

Tablets, norethisterone 350 micrograms, net price 3 × 28-tab pack = £2.10

7.3.2.2 Parenteral progestogen-only contraceptives

Medroxyprogesterone acetate (*Depo-Provera*®, *SAYANA PRESS*®) is a long-acting progestogen given by injection; it is at least as effective as the combined oral preparations but because of its prolonged action it should never be given without *full counselling backed by the patient information leaflet*. It may be used as a short-term or long-term contraceptive for women who have been counselled about the likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility. Troublesome bleeding has been reported in patients given medroxyprogesterone acetate in the immediate puerperium; delaying the first injection until 6 weeks after birth may minimise bleeding problems. If the woman is not breast-feeding, the first injection may be given within 5 days postpartum (she should be warned that the risk of troublesome bleeding may be increased). The manufacturers advise that in women who are breast-feeding, the first dose should be delayed until 6 weeks after birth; however, evidence suggests no harmful effect to infant if given earlier. The benefits of using medroxyprogesterone acetate in breast-feeding women outweigh any risks.

Reduction in bone mineral density and, rarely, osteoporosis and osteoporotic fractures have also been reported with medroxyprogesterone acetate. The

reduction in bone mineral density occurs in the first 2–3 years of use and then stabilises. See also below.

- In adolescents, medroxyprogesterone acetate (*Depo-Provera*®, *SAYANA PRESS*®) should be used only when other methods of contraception are inappropriate;
- in all women, the benefits of using medroxyprogesterone acetate beyond 2 years should be evaluated against the risks;
- in women with risk factors for osteoporosis, a method of contraception other than medroxyprogesterone acetate should be considered.

Norethisterone enantate (*Noristerat*®) is a long-acting progestogen given as an oily injection which provides contraception for 8 weeks; it is used as short-term interim contraception e.g. before vasectomy becomes effective.

An **etonogestrel-releasing implant** (*Nexplanon*®) is also available. It is a highly effective long-acting contraceptive, consisting of a single flexible rod that is inserted subdermally into the lower surface of the upper arm and provides contraception for up to 3 years. The manufacturer advises that in heavier women, blood-etonogestrel concentrations are lower and therefore the implant may not provide effective contraception during the third year; they advise that earlier replacement may be considered in such patients—however, evidence to support this recommendation is lacking. Local reactions such as bruising and itching can occur at the insertion site. The contraceptive effect of etonogestrel is rapidly reversed on removal of the implant. *The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.*

Implanon®, also an etonogestrel-releasing implant, has been discontinued (October 2010), but some women may have the implant in place until 2013.

Cautions, contra-indications, and side-effects

The cautions, contra-indications, and side-effects of oral progestogen-only contraceptives apply to parenteral progestogen-only contraceptives, except that parenteral preparations reliably inhibit ovulation and therefore protect against ectopic pregnancy and functional ovarian cysts.

Interactions Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes. The effectiveness of norethisterone intramuscular injection and medroxyprogesterone acetate intramuscular and subcutaneous injections is not affected by enzyme-inducing drugs and they may be continued as normal during courses of these drugs. However, effectiveness of the etonogestrel-releasing implant may be reduced by enzyme-inducing drugs and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with the enzyme-inducing drug and for at least 4 weeks after stopping. For a short course of an enzyme-inducing drug, if a change in contraceptive method is undesirable or inappropriate, the implant may be continued in combination with additional contraceptive precautions (e.g. condom) for the duration of treatment with the enzyme-inducing drug and for 4 weeks after stopping it.

PARENTERAL PROGESTOGEN-ONLY CONTRACEPTIVES

Indications contraception, see also notes above and under preparations (roles vary according to preparation)

Cautions see notes above and under preparations; possible risk of breast cancer, see oral progestogen-only contraceptives (section 7.3.2.1); history during pregnancy of pruritus or of deterioration of otosclerosis, disturbances of lipid metabolism; **interactions:** see notes above and Appendix 1 (progestogens)

Counselling Full counselling backed by *patient information leaflet* required before administration

Contra-indications see notes above; history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable

Hepatic impairment see Oral Progestogen-only Contraceptives, section 7.3.2.1

Pregnancy not known to be harmful; for *Implanon*® or *Nexplanon*® if pregnancy occurs remove implant

Breast-feeding progestogen-only contraceptives do not affect lactation; see also notes above and under preparations

Side-effects see notes above; injection-site reactions; *with medroxyprogesterone acetate injection*, weight gain also reported

Cervical cancer Use of injectable progestogen-only contraceptives may be associated with a small increased risk of cervical cancer, similar to that seen with combined oral contraceptives, see p. 538. The risk of cervical cancer with other progestogen-only contraceptives is not yet known.

Dose

- See under preparations

Injectable preparations

Depo-Provera® (Pfizer) PoM

Injection (aqueous suspension), medroxyprogesterone acetate 150 mg/mL, net price 1-mL prefilled syringe = £6.01, 1-mL vial = £6.01. Counselling, see patient information leaflet

Dose by deep intramuscular injection, 150 mg within first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding); for long-term contraception, repeated every 12 weeks (if interval greater than 12 weeks and 5 days, rule out pregnancy before next injection and advise patient to use additional contraceptive measures (e.g. barrier) for 14 days after the injection)

Noristerat® (Bayer) PoM

Injection (oily), norethisterone enantate 200 mg/mL, net price 1-mL amp = £4.05. Counselling, see patient information leaflet

Dose by deep intramuscular injection given very slowly *into gluteal muscle*, short-term contraception, 200 mg within first 5 days of cycle or immediately after parturition (duration 8 weeks); may be repeated once after 8 weeks (withhold breast-feeding for neonates with severe or persistent jaundice requiring medical treatment)

SAYANA PRESS® (Pfizer) PoM

Injection (suspension), medroxyprogesterone acetate 104 mg/0.65 mL, net price 0.65-mL prefilled injector device = £6.90. Counselling, see patient information leaflet

Dose by subcutaneous injection into anterior thigh or abdomen, no hormonal contraceptive use in previous month, 104 mg within first 5 days of cycle or within 5 days postpartum (delay until 6 weeks postpartum if breast-feeding); for long-term contraception, repeated every 13 weeks (if interval greater than 13 weeks and 7 days, rule out pregnancy before next injection); changing from other hormonal contraceptive, consult product literature

Implants

Nexplanon® (MSD) ▼ PoM

Implant, containing etonogestrel 68 mg in radiopaque flexible rod, net price = £79.46. Counselling, see patient information leaflet

Dose by subdermal implantation, no hormonal contraceptive use in previous month, 1 implant inserted during first 5 days of cycle; postpartum, 1 implant inserted 21–28 days after delivery; in breast-feeding mothers, 1 implant inserted after 28 days postpartum; abortion or miscarriage in the second trimester, 1 implant inserted 21–28 days after abortion or miscarriage; abortion or miscarriage in first trimester, 1 implant inserted within 5 days; changing from other hormonal contraceptive, consult product literature; remove implant within 3 years of insertion

7.3.2.3 Intra-uterine progestogen-only device

The progestogen-only intra-uterine system, *Mirena®*, releases **levonorgestrel** directly into the uterine cavity. It is licensed for use as a contraceptive, for the treatment of primary menorrhagia and for the prevention of endometrial hyperplasia during oestrogen replacement therapy. This may therefore be a contraceptive method of choice for women who have excessively heavy menses.

The effects of the progestogen-only intra-uterine system are mainly local and hormonal including prevention of endometrial proliferation, thickening of cervical mucus, and suppression of ovulation in some women (in some cycles). In addition to the progestogenic activity, the intra-uterine system itself may contribute slightly to the contraceptive effect. Return of fertility after removal is rapid and appears to be complete. *The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.*

Advantages of the progestogen-only intra-uterine system over copper intra-uterine devices are that there may be an improvement in any dysmenorrhoea and a reduction in blood loss; there is also evidence that the frequency of pelvic inflammatory disease may be reduced (particularly in the youngest age groups who are most at risk).

In primary menorrhagia, menstrual bleeding is reduced significantly within 3–6 months of inserting the progestogen-only intra-uterine system, probably because it prevents endometrial proliferation. Another treatment should be considered if menorrhagia does not improve within this time (section 6.4.1.2).

Cautions and contra-indications Generally the cautions and contra-indications for the progestogen-only intra-uterine system are as for standard intra-uterine devices (section 7.3.4). Although the progestogen-only intra-uterine system produces little systemic progestogenic activity, it is usually avoided for 5 years after any evidence of breast cancer. However, the system can be considered for a woman in long-term remission from breast cancer who has menorrhagia and requires effective contraception. Since levonorgestrel is released close to the site of the main contraceptive action (on cervical mucus and endometrium) progestogenic side-effects and interactions are less likely; in particular, enzyme-inducing drugs are unlikely to significantly reduce the contraceptive effect of the progestogen-only intra-uterine system and additional contraceptive precautions are not required.

Side-effects Initially, changes in the pattern and duration of menstrual bleeding (spotting or prolonged bleeding) are common; endometrial disorders should be ruled out before insertion and the patient should be fully counselled (and provided with a patient information leaflet). Improvement in progestogenic side-effects, such as mastalgia and in the bleeding pattern usually occurs a few months after insertion and bleeding may often become very light or absent. Functional ovarian cysts (usually asymptomatic) can occur and usually resolve spontaneously (ultrasound monitoring recommended).

INTRA-UTERINE PROGESTOGEN-ONLY SYSTEM

Indications see under preparation

Cautions see notes above; history of depression; advanced uterine atrophy; systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies; **interactions:** see notes above and Appendix 1 (progestogens)

Contra-indications see notes above; not suitable for emergency contraception

Hepatic impairment see Oral Progestogen-only Contraceptives, section 7.3.2.1

Pregnancy avoid; if pregnancy occurs remove system

Breast-feeding progestogen-only contraceptives do not affect lactation

Side-effects see notes above; also abdominal pain, expulsion, peripheral oedema, depression (sometimes severe), nervousness, salpingitis, pelvic inflammatory disease, pelvic pain, back pain; *rarely* uterine perforation, hirsutism, hair loss, pruritus, migraine, rash

Dose

- See under preparation

Mirena® (Bayer) PoM

Intra-uterine system, T-shaped plastic frame (impregnated with barium sulfate and with threads attached to base) with polydimethylsiloxane reservoir releasing levonorgestrel 20 micrograms/24 hours, net price = £88.00. Counselling, see patient information leaflet

Dose contraception and menorrhagia, insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement, or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately after first-trimester termination by curettage; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 5 years.

Prevention of endometrial hyperplasia during oestrogen replacement therapy, insert during last days of menstruation or withdrawal bleeding or any time if amenorrhoeic; effective for 4 years

Note When system is removed (and not immediately replaced) and pregnancy is not desired, remove during the first few days of menstruation, otherwise additional precautions (e.g. barrier methods) should be used for at least 7 days before removal

7.3.3 Spermicidal contraceptives

Spermicidal contraceptives are useful additional safeguards but do **not** give adequate protection if used alone unless fertility is already significantly diminished (section 6.4.1.1). They have two components: a spermicide

and a vehicle which itself may have some inhibiting effect on sperm activity. They are suitable for use with barrier methods, such as diaphragms or caps; however, spermicidal contraceptives are not generally recommended for use with condoms, as there is no evidence of any additional protection compared with non-spermicidal lubricants.

Spermicidal contraceptives are not suitable for use in those with or at high risk of sexually transmitted infections (including HIV); high frequency use of the spermicide nonoxinol '9' has been associated with genital lesions, which may increase the risk of acquiring these infections.

Products such as petroleum jelly (*Vaseline*®), baby oil and oil-based vaginal and rectal preparations are likely to damage condoms and contraceptive diaphragms made from latex rubber, and may render them less effective as a barrier method of contraception and as a protection from sexually transmitted infections (including HIV).

Gygel® (Marlborough)

Gel, nonoxinol '9' 2%, net price 30 g = £4.25

Excipients include hydroxybenzoates (parabens), propylene glycol, sorbic acid

Condoms no evidence of harm to latex condoms and diaphragms

Pregnancy toxicity in *animal* studies

Breast-feeding present in milk in *animal* studies

7.3.4 Contraceptive devices

Intra-uterine devices

The intra-uterine device (IUD) is a suitable contraceptive for women of all ages irrespective of parity; however, it is less appropriate for those with an increased risk of pelvic inflammatory disease (see below).

The most effective intra-uterine devices have at least 380 mm^2 of copper and have banded copper on the arms. Smaller devices have been introduced to minimise side-effects; these consist of a plastic carrier wound with copper wire or fitted with copper bands; some also have a central core of silver to prevent fragmentation of the copper.

Fertility declines with age and therefore a copper intra-uterine device which is fitted in a woman over the age of 40, may remain in the uterus until menopause.

A frameless, copper-bearing intra-uterine device (*GyneFix*®) is also available. It consists of a knotted, polypropylene thread with 6 copper sleeves; the device is anchored in the uterus by inserting the knot into the uterine fundus.

The timing and technique of fitting an intra-uterine device are critical for its subsequent performance. *The healthcare professional inserting (or removing) the device should be fully trained in the technique and should provide full counselling backed, where available, by the patient information leaflet.* Devices should not be fitted during the heavy days of the period; they are best fitted after the end of menstruation and before the calculated time of implantation.

The main excess risk of infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually transmitted infection. Women are considered to be at a higher risk of sexually transmitted infections if:

- they are under 25 years old *or*
- they are over 25 years old *and*
  - have a new partner *or*
  - have had more than one partner in the past year *or*
  - their regular partner has other partners.

In these women, pre-insertion screening (for chlamydia and, depending on sexual history and local prevalence of disease, *Neisseria gonorrhoeae*) should be performed. If results are unavailable at the time of fitting an intra-uterine device for emergency contraception, appropriate prophylactic antibacterial cover should be given. The woman should be advised to attend *as an emergency* if she experiences sustained pain during the next 20 days.

An intra-uterine device should not be removed in mid-cycle unless an additional contraceptive was used for the previous 7 days. If removal is essential post-coital contraception should be considered.

If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible.

INTRA-UTERINE CONTRACEPTIVE DEVICES

Indications see notes above

Cautions see notes above; also anaemia, menorrhagia (progestogen intra-uterine system might be preferable, section 7.3.2.3), endometriosis, severe primary dysmenorrhoea, history of pelvic inflammatory disease, diabetes, fertility problems, nulliparity and young age, severely scarred uterus (including after endometrial resection) or severe cervical stenosis; drug- or disease-induced immunosuppression (risk of infection—avoid if marked immunosuppression); epilepsy (risk of seizure at time of insertion); increased risk of expulsion if inserted before uterine involution; gynaecological examination before insertion, 6–8 weeks after then annually but counsel women to seek medical attention promptly in case of significant symptoms, especially pain; anticoagulant therapy (avoid if possible)

Contra-indications severe anaemia, recent sexually transmitted infection (if not fully investigated and treated), unexplained uterine bleeding, distorted or small uterine cavity, genital malignancy, active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration), pelvic inflammatory disease, established or marked immunosuppression; *copper devices:* copper allergy, Wilson's disease, medical diathermy

Pregnancy remove device; if pregnancy occurs, increased likelihood that it may be ectopic

Breast-feeding not known to be harmful

Side-effects uterine or cervical perforation, displacement, expulsion; pelvic infection may be exacerbated, menorrhagia, dysmenorrhoea, allergy; *on insertion*: pain (alleviated by NSAID such as ibuprofen 30 minutes before insertion) and bleeding, occasionally epileptic seizure and vasovagal attack

Ancora® 375 Ag (RF Medical)
Intra-uterine device, copper wire with silver core, wound on vertical stem of U-shaped plastic carrier, surface area approx. 375 mm^2, impregnated with barium sulfate for radio-opacity, threads attached to base of vertical stem; preloaded in inserter, net price = £9.95
For uterine length over 6.5 cm; replacement every 5 years (see also notes above)

Ancora® 375 Cu (RF Medical)
Intra-uterine device, copper wire, wound on vertical stem of U-shaped plastic carrier, surface area approx. 375 mm^2, impregnated with barium sulfate for radio-opacity, threads attached to base of vertical stem; pre-loaded in inserter, net price = £7.95
For uterine length over 6.5 cm; replacement every 5 years (see also notes above)

Copper T 380A® (RF Medical)
Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier with copper sleeve on each arm, total surface area approx. 380 mm^2, impregnated with barium sulfate for radio-opacity, threads attached to base of vertical stem; with loading capsule, net price = £8.95
For uterine length 6.5–9 cm; replacement every 10 years (see also notes above)

Cu-Safe® T300 (Williams) MHS
Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 300 mm^2, impregnated with barium sulfate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £9.11
For uterine length over 5 cm; replacement every 5 years (see also notes above)

Flexi-T® 300 (Durbin)
Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 300 mm^2, impregnated with barium sulfate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £9.47
For uterine length over 5 cm; replacement every 5 years (see also notes above)

Flexi-T® + 380 (Durbin)
Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier with copper sleeve on each arm, total surface area approx. 380 mm^2, impregnated with barium sulfate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £10.06
For uterine length over 6 cm; replacement every 5 years (see also notes above)

GyneFix® (Williams)
Intra-uterine device, 6 copper sleeves with surface area of 330 mm^2 on polypropylene thread, net price = £27.11
Suitable for all uterine sizes; replacement every 5 years

Load® 375 (Durbin)
Intra-uterine device, copper wire, wound on vertical stem of U-shaped plastic carrier, surface area approx. 375 mm^2, impregnated with barium sulfate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £8.52
For uterine length over 7 cm; replacement every 5 years (see also notes above)

Mini TT 380® Slimline (Durbin)
Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier with copper sleeves fitted flush on to distal portion of each horizontal arm, total surface area approx. 380 mm^2, impregnated with barium sulfate for radio-opacity, thread attached to base of vertical stem; easy-loading system, no capsule, net price = £12.46
For minimum uterine length 5 cm; replacement every 5 years (see also notes above)

Multiload® Cu375 (MSD)
Intra-uterine device, as *Load® 375*, with copper surface area approx. 375 mm^2 and vertical stem length 3.5 cm, net price = £9.24
For uterine length 6–9 cm; replacement every 5 years (see also notes above)

Multi-Safe® 375 (Williams)
Intra-uterine device, copper wire, wound on vertical stem of U-shaped plastic carrier, surface area approx. 375 mm^2, impregnated with barium sulfate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £8.96
For uterine length over 6–9 cm; replacement every 5 years (see also notes above)

Multi-Safe® 375 Short Stem (Williams) MHS
Intra-uterine device, copper wire, wound on vertical stem of U-shaped plastic carrier, surface area approx. 375 mm^2, impregnated with barium sulfate for radio-opacity, monofilament thread attached to base of vertical stem; preloaded in inserter, net price = £8.80
For uterine length 5–7 cm; replacement every 5 years (see also notes above)

Neo-Safe® T380 (Williams)
Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 380 mm^2, impregnated with barium sulfate for radio-opacity, threads attached to base of vertical stem, net price = £13.31
For uterine length 6.5–9 cm; replacement every 5 years (see also notes above)

Novaplus T 380® Ag (RF Medical)
Intra-uterine device, copper wire with silver core, wound on vertical stem of T-shaped plastic carrier, surface area approx. 380 mm^2, impregnated with barium sulfate for radio-opacity, threads attached to base of vertical stem, net price = £12.50
'*Mini*' size for minimum uterine length 5 cm; '*Normal*' size for uterine length 6.5–9 cm; replacement every 5 years (see also notes above)

Novaplus T 380® Cu (RF Medical)
Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 380 mm^2, impregnated with barium sulfate for radio-opacity, threads attached to base of vertical stem, net price = £10.95
'Mini' size for minimum uterine length 5 cm; *'Normal'* size for uterine length 6.5–9 cm; replacement every 5 years (see also notes above)

Nova-T® 380 (Bayer)
Intra-uterine device, copper wire with silver core, wound on vertical stem of T-shaped plastic carrier, surface area approx. 380 mm^2, impregnated with barium sulfate for radio-opacity, threads attached to base of vertical stem, net price = £15.20
For uterine length 6.5–9 cm; replacement every 5 years (see also notes above)

T-Safe® 380A QuickLoad (Williams)
Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier with copper collar on the distal portion of each arm, total surface area approx. 380 mm^2, impregnated with barium sulfate for radio-opacity, threads attached to base of vertical stem, quick-loading system, net price = £10.29; also available with a capsule loading device (*T-Safe® 380A Capped* NHS), net price = £10.47
For uterine length 6.5–9 cm; replacement every 10 years (see also notes above)

TT 380® Slimline (Durbin)
Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier, with copper sleeves fitted flush on to distal portion of each horizontal arm, total surface area approx. 380 mm^2, impregnated with barium sulfate for radio-opacity, thread attached to base of vertical stem; easy-loading system, no capsule, net price = £12.46
For uterine length 6.5–9 cm; replacement every 10 years (see also notes above)

UT 380 Short® (Durbin)
Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 380 mm^2, impregnated with barium sulfate for radio-opacity, thread attached to base of vertical stem; net price = £11.22
For uterine length 5–7 cm; replacement every 5 years (see also notes above)

UT 380 Standard® (Durbin)
Intra-uterine device, copper wire, wound on vertical stem of T-shaped plastic carrier, surface area approx. 380 mm^2, impregnated with barium sulfate for radio-opacity, thread attached to base of vertical stem; net price = £11.22
For uterine length 6.5–9 cm; replacement every 5 years (see also notes above)

Other contraceptive devices

Silicone contraceptive caps

Silicone Contraceptive Pessary
Silicone, sizes 22, 26, and 30 mm, net price = £15.29
Brands include *FemCap®*

Rubber contraceptive diaphragms

Type A Diaphragm with Flat Metal Spring
Transparent rubber with flat metal spring, sizes 55–95 mm (rising in steps of 5 mm), net price = £6.22
Brands include *Reflexions®*

Silicone contraceptive diaphragms

Type B Diaphragm with Coiled Metal Spring
Silicone with coiled metal spring, sizes 60–90 mm (rising in steps of 5 mm), net price = £9.31
Brands include *Milex Omniflex®*

Type C Arcing Spring Diaphragm
Silicone with arcing spring, sizes 60–90 mm (rising in steps of 5 mm), net price = £8.35
Brands include *Milex Arcing Style®*, *Ortho All-flex®*

7.3.5 Emergency contraception

Hormonal methods

Hormonal emergency contraceptives include **levonorgestrel** and **ulipristal**; either drug should be taken as soon as possible after unprotected intercourse to increase efficacy.

Levonorgestrel is effective if taken within 72 hours (3 days) of unprotected intercourse and may also be used between 72 and 96 hours after unprotected intercourse [unlicensed use], but efficacy decreases with time. Ulipristal, a progesterone receptor modulator, is effective if taken within 120 hours (5 days) of unprotected intercourse.

Levonorgestrel is less effective than insertion of an intra-uterine device (see below). Ulipristal is as effective as levonorgestrel, but its efficacy compared to an intra-uterine device is not yet known.

If vomiting occurs within 2 hours of taking levonorgestrel or within 3 hours of taking ulipristal, a replacement dose should be given.

When prescribing or supplying hormonal emergency contraception, women should be advised:

- that their next period may be early or late;
- that a barrier method of contraception needs to be used until the next period;
- to seek medical attention promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy;
- to return in 3 to 4 weeks if the subsequent menstrual bleed is abnormally light, heavy or brief, or is absent, or if she is otherwise concerned (if there is any doubt as to whether menstruation has occurred, a pregnancy test should be performed at least 3 weeks after unprotected intercourse).

Interactions The effectiveness of levonorgestrel, and possibly ulipristal, is reduced in women taking enzyme-inducing drugs (and possibly for 4 weeks after stopping); a copper intra-uterine device can be offered instead. If the copper intra-uterine device is undesirable or inappropriate, the dose of levonorgestrel should be increased to a total of 3 mg taken as a single dose [unlicensed dose—advise women accordingly]. There is no need to increase the dose for emergency contraception if the patient is taking antibacterials that are not enzyme inducers.

LEVONORGESTREL

Indications emergency contraception
Cautions see notes above; past ectopic pregnancy; severe malabsorption syndromes; active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice; **interactions:** see notes above and Appendix 1 (progestogens)
Contra-indications acute porphyria (section 9.8.2)
Pregnancy not known to be harmful
Breast-feeding progestogen-only contraceptives do not affect lactation
Side-effects menstrual irregularities (see also notes above), nausea, low abdominal pain, fatigue, headache, dizziness, breast tenderness, vomiting

Dose

- 1.5 mg as a single dose as soon as possible after coitus, preferably within 12 hours but no later than after 72 hours (but see also notes above)

[1]**Levonelle® One Step** (Bayer)
Tablets, levonorgestrel 1.5 mg, net price 1-tab pack = £13.83

Levonelle® 1500 (Bayer) PoM
Tablets, levonorgestrel 1.5 mg, net price 1-tab pack = £5.20

ULIPRISTAL ACETATE

Indications emergency contraception; uterine fibroids, see section 6.4.1.2

Cautions see notes above; uncontrolled severe asthma; effectiveness of combined hormonal and progestogen-only contraceptives may be reduced—additional precautions (barrier methods) required for 14 days for combined and parenteral progestogen-only hormonal contraceptives (16 days for *Qlaira®*) and 9 days for oral progestogen-only contraceptives; **interactions:** see notes above and Appendix 1 (ulipristal)

Contra-indications repeated use within a menstrual cycle

Hepatic impairment manufacturer advises avoid in severe impairment—no information available

Pregnancy limited information available

Breast-feeding manufacturer advises avoid for 1 week after administration—present in milk

Side-effects gastro-intestinal disturbances (including nausea, vomiting, diarrhoea, and abdominal pain), dizziness, fatigue, headache, menstrual irregularities (see notes above), back pain, muscle spasms; *less commonly* tremor, hot flushes, uterine spasm, breast tenderness, dry mouth, blurred vision, pruritus, and rash

Dose

- 30 mg as a single dose as soon as possible after coitus, but no later than after 120 hours

ellaOne® (HRA Pharma) PoM
Tablets, ulipristal acetate 30 mg, net price 1-tab pack = £16.95

Intra-uterine device

Insertion of an intra-uterine device is more effective than oral levonorgestrel for emergency contraception. A copper intra-uterine contraceptive device (section 7.3.4) can be inserted up to 120 hours (5 days) after unprotected intercourse; sexually transmitted infections should be tested for and insertion of the device should usually be covered by antibacterial prophylaxis (e.g. azithromycin 1 g by mouth as a single dose). If intercourse has occurred more than 5 days previously, the device can still be inserted up to 5 days after the earliest likely calculated ovulation (i.e. within the minimum period before implantation), regardless of the number of episodes of unprotected intercourse earlier in the cycle.

1. Can be sold to women over 16 years; when supplying emergency contraception to the public, pharmacists should refer to guidance issued by the Royal Pharmaceutical Society

7.4 Drugs for genito-urinary disorders

For drugs used in the treatment of urinary-tract infections see section 5.1.13.

7.4.1 Drugs for urinary retention

Acute retention is painful and is treated by catheterisation.

Chronic retention is painless and often long-standing. Catheterisation is unnecessary unless there is deterioration of renal function. After the cause has initially been established and treated, drugs may be required to increase detrusor muscle tone.

Benign prostatic hyperplasia is treated either surgically or medically with alpha-blockers (see below). Dutasteride and finasteride (section 6.4.2) are alternatives to alpha-blockers, particularly in men with a significantly enlarged prostate. Tadalafil (section 7.4.5), a phosphodiesterase type-5 inhibitor, may also be used in the management of benign prostatic hyperplasia.

Alpha-blockers

The alpha$_1$-selective alpha blockers, **alfuzosin**, **doxazosin**, **indoramin**, **prazosin**, **tamsulosin** and **terazosin** relax smooth muscle in benign prostatic hyperplasia producing an increase in urinary flow-rate and an improvement in obstructive symptoms.

Cautions Since alpha$_1$-selective alpha blockers reduce blood pressure, patients receiving antihypertensive treatment may require reduced dosage and specialist supervision. Caution is required in the elderly and in patients undergoing cataract surgery (risk of intra-operative floppy iris syndrome). For **interactions**, see Appendix 1 (alpha-blockers).

Contra-indications Alpha-blockers should be avoided in patients with a history of postural hypotension and micturition syncope.

Side-effects Side-effects of alpha$_1$-selective alpha blockers include drowsiness, hypotension (notably postural hypotension), syncope, asthenia, dizziness, depression, headache, dry mouth, gastro-intestinal disturbances, oedema, blurred vision, intra-operative floppy iris syndrome (most strongly associated with tamsulosin), rhinitis, erectile disorders (including priapism), tachycardia, and palpitations. Hypersensitivity reactions including rash, pruritus and angioedema have also been reported.

ALFUZOSIN HYDROCHLORIDE

Indications benign prostatic hyperplasia

Cautions see notes above; discontinue if angina worsens; acute heart failure; history of QT-interval pro-

longation; concomitant use with other drugs known to prolong QT interval
Driving May affect performance of skilled tasks e.g. driving

Contra-indications see notes above

Hepatic impairment initial dose 2.5 mg once daily, adjusted according to response to 2.5 mg twice daily in mild to moderate impairment—avoid if severe; avoid modified-release preparations

Renal impairment initial dose 2.5 mg twice daily and adjust according to response; manufacturers advise avoid use of modified-release preparations if eGFR less than 30 mL/minute/1.73 m^2 as limited experience

Side-effects see notes above; also *less commonly* flushes and chest pain; *also reported* liver damage and cholestasis

Dose

- 2.5 mg 3 times daily, max. 10 mg daily; ELDERLY initially 2.5 mg twice daily

First dose effect First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patient should be warned to lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely

Alfuzosin hydrochloride (Non-proprietary) PoM
Tablets, f/c, alfuzosin hydrochloride 2.5 mg, net price 60-tab pack = £4.30. Counselling, initial dose, driving, see above

Xatral® (Sanofi-Aventis) PoM
Tablets, f/c, alfuzosin hydrochloride 2.5 mg, net price 60-tab pack = £20.37. Counselling, initial dose, driving, see above

Modified release

Besavar® XL (Zentiva) PoM
Tablets, m/r, yellow/white, alfuzosin hydrochloride 10 mg, net price 30-tab pack = £12.51. Label: 21, 25, counselling, initial dose, driving, see above
Dose benign prostatic hyperplasia 10 mg once daily
Acute urinary retention associated with benign prostatic hyperplasia in men over 65 years, 10 mg once daily for 2–3 days during catheterisation and for one day after removal; max. 4 days

Vasran® XL (Ranbaxy) PoM
Tablets, m/r, alfuzosin hydrochloride 10 mg, net price 30-tab pack = £11.48. Label: 21, 25, counselling, initial dose, driving, see above
Dose benign prostatic hyperplasia 10 mg once daily

Xatral® XL (Sanofi-Aventis) PoM
Tablets, m/r, yellow/white, alfuzosin hydrochloride 10 mg, net price 10-tab pack = £4.17, 30-tab pack = £12.51. Label: 21, 25, counselling, initial dose, driving, see above
Dose benign prostatic hyperplasia 10 mg once daily
Acute urinary retention associated with benign prostatic hyperplasia in men over 65 years, 10 mg once daily for 2–3 days during catheterisation and for one day after removal; max. 4 days

DOXAZOSIN

Indications benign prostatic hyperplasia; hypertension (section 2.5.4)

Cautions see notes above and section 2.5.4

Contra-indications see notes above

Hepatic impairment section 2.5.4

Side-effects see notes above and section 2.5.4

Dose

- Initially 1 mg daily; dose may be doubled at intervals of 1–2 weeks according to response, up to max. 8 mg daily; usual maintenance 2–4 mg daily

Preparations
Section 2.5.4

INDORAMIN

Indications benign prostatic hyperplasia; hypertension (section 2.5.4)

Cautions see notes above and section 2.5.4

Contra-indications see notes above and section 2.5.4

Hepatic impairment section 2.5.4

Renal impairment section 2.5.4

Side-effects see notes above and section 2.5.4

Dose

- 20 mg twice daily; increased if necessary by 20 mg every 2 weeks to max. 100 mg daily in divided doses; ELDERLY, 20 mg at night may be adequate

Doralese® (Chemidex) PoM
Tablets, yellow, f/c, indoramin 20 mg, net price 60-tab pack = £11.44. Label: 2

PRAZOSIN

Indications benign prostatic hyperplasia; hypertension, congestive heart failure and Raynaud's syndrome (section 2.5.4)

Cautions see notes above and section 2.5.4

Contra-indications see notes above and section 2.5.4

Hepatic impairment section 2.5.4

Renal impairment section 2.5.4

Side-effects see notes above and section 2.5.4

Dose

- Initially 500 micrograms twice daily for 3–7 days, subsequently adjusted according to response; usual maintenance (and max.) 2 mg twice daily; ELDERLY initiate with lowest possible dose

First dose effect First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patient should be warned to lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely

Preparations
Section 2.5.4

TAMSULOSIN HYDROCHLORIDE

Indications benign prostatic hyperplasia

Cautions see notes above
Driving May affect performance of skilled tasks e.g. driving

Contra-indications see notes above

Hepatic impairment avoid in severe impairment

Renal impairment use with caution if eGFR less than 10 mL/minute/1.73 m^2

Side-effects see notes above

Dose

- 400 micrograms daily

[1]Tamsulosin hydrochloride (Non-proprietary) PoM
Capsules, m/r, tamsulosin hydrochloride 400 micrograms, net price 30-cap pack = £5.04. Label: 25, counselling, driving
Brands include *Bazetham® MR, Contiflo® XL, Diffundox® XL, Losinate® MR, Pinexel® PR, Prosurin® XL, Stronazon® MR, Tabphyn® MR*

Flomaxtra® XL (Astellas) PoM
Tablets, m/r, tamsulosin hydrochloride 400 micrograms, net price 30-tab pack = £10.47. Label: 25, counselling, driving

With dutasteride

For prescribing information on dutasteride, see section 6.4.2

Combodart® (GSK) ▼ PoM
Capsules, m/r, brown/orange, tamsulosin hydrochloride 400 micrograms, dutasteride 500 micrograms, net price 30-cap pack = £19.80. Label: 25, counselling, driving
Dose benign prostatic hyperplasia, 1 capsule daily

With solifenacin

For prescribing information on solifenacin, see section 7.4.2

Vesomni® (Astellas) PoM
Tablets, m/r, f/c, red, tamsulosin hydrochloride 400 micrograms, solifenacin succinate 6 mg, net price 30-tab pack = £27.62. Label: 3, 25
Dose ADULT over 18 years, moderate to severe urinary frequency, urgency, and obstructive symptoms associated with benign prostatic hyperplasia when monotherapy ineffective, 1 tablet daily

TERAZOSIN

Indications benign prostatic hyperplasia; hypertension (section 2.5.4)

Cautions see notes above and section 2.5.4
Driving May affect performance of skilled tasks e.g. driving

Contra-indications see notes above

Side-effects see notes above and section 2.5.4

Dose

- Initially 1 mg at bedtime; if necessary dose may be doubled at intervals of 1–2 weeks according to response, up to max. 10 mg once daily; usual maintenance 5–10 mg daily

First dose effect First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patient should be warned to lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely

Terazosin (Non-proprietary) PoM
Tablets, terazosin (as hydrochloride) 2 mg, net price 28-tab pack = £2.17; 5 mg, 28-tab pack = £2.48; 10 mg, 28-tab pack = £7.93. Counselling, initial dose, driving

Hytrin® (AMCo) PoM
Tablets, terazosin (as hydrochloride) 2 mg (yellow) net price, 28-tab pack = £2.20; 5 mg (tan), 28-tab pack = £4.13; 10 mg (blue), 28-tab pack = £8.24; starter pack (for benign prostatic hyperplasia) of 7 × 1-mg tab with 14 × 2-mg tab and 7 × 5-mg tab = £10.97. Counselling, initial dose, driving

1. Tamsulosin hydrochloride 400 microgram capsules can be sold to the public for the treatment of functional symptoms of benign prostatic hyperplasia in men aged 45–75 years to be taken for up to 6 weeks before clinical assessment by a doctor; a proprietary brand *Flomax Relief® MR* is on sale to the public

Parasympathomimetics

The parasympathomimetic **bethanechol** increases detrusor muscle contraction. However, it has only a limited role in the relief of urinary retention; its use has been superseded by catheterisation.

BETHANECHOL CHLORIDE

Indications urinary retention, but see notes above

Cautions autonomic neuropathy (use lower initial dose); **interactions:** Appendix 1 (parasympathomimetics)

Contra-indications peptic ulcer; intestinal or urinary obstruction; conditions where increased motility of the urinary or gastro-intestinal tract could be harmful; cardiovascular disorders (including recent myocardial infarction, bradycardia, and heart block); hypotension; obstructive airways disease; epilepsy; parkinsonism; hyperthyroidism

Pregnancy manufacturer advises avoid—no information available

Breast-feeding manufacturer advises avoid; gastrointestinal disturbances in infant reported

Side-effects nausea, vomiting, diarrhoea, abdominal pain, increased salivation, eructation; flushing, hypotension, bradycardia; bronchoconstriction, rhinorrhoea; headache; increased lacrimation; increased sweating

Dose

- 10–25 mg 3–4 times daily half an hour before food

Myotonine® (Glenwood) PoM
Tablets, scored, bethanechol chloride 10 mg, net price 100-tab pack = £18.51; 25 mg, 100-tab pack = £27.26. Label: 22

7.4.2 Drugs for urinary frequency, enuresis, and incontinence

Urinary incontinence

Incontinence in adults which arises from detrusor instability is managed by combining drug therapy with conservative methods for managing urge incontinence such as pelvic floor exercises and bladder training; stress incontinence is generally managed by non-drug methods. **Duloxetine**, an inhibitor of serotonin and noradrenaline re-uptake can be added and is licensed for the treatment of moderate to severe stress incontinence in women; it may be more effective when used as an adjunct to pelvic floor exercises.

Antimuscarinic drugs reduce symptoms of urgency and urge incontinence and increase bladder capacity. **Oxybutynin** also has a direct relaxant effect on urinary smooth muscle. Side-effects limit the use of oxybutynin, but they may be reduced by starting at a lower dose. A modified-release preparation of oxybutynin is effective and has fewer side-effects; a transdermal patch is also available. The efficacy and side-effects of **tolterodine** are comparable to those of modified-release oxybutynin. **Flavoxate** has less marked side-effects but it is also less effective. **Darifenacin**, **fesoterodine**, **propiverine**, **solifenacin**, and **trospium** are newer antimuscarinic drugs licensed for urinary frequency, urgency, and incontinence. The need for continuing antimuscarinic

drug therapy should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

The *Scottish Medicines Consortium* (p. 4) has advised (June 2008) that fesoterodine (*Toviaz*®) is accepted for restricted use within NHS Scotland as a second-line treatment for overactive bladder syndrome.

Propantheline and tricyclic antidepressants were used for urge incontinence but they are little used now because of their side-effects. The use of imipramine is limited by its potential to cause cardiac side-effects.

Mirabegron, a selective beta$_3$ agonist, is licensed for the treatment of urinary frequency, urgency, and urge incontinence associated with overactive bladder syndrome.

NICE guidance
Mirabegron for treating symptoms of overactive bladder (June 2013)
Mirabegron is recommended as an option only for patients in whom antimuscarinic drugs are ineffective, contra-indicated, or not tolerated; patients currently receiving mirabegron who do not meet these criteria should have the option to continue until they and their clinician consider it appropriate to stop.
www.nice.org.uk/TA290

Purified bovine collagen implant (*Contigen*®, Bard) is indicated for *urinary incontinence* caused by intrinsic sphincter deficiency (poor or non-functioning bladder outlet mechanism). The implant should be inserted only by surgeons or physicians trained in the technique for injection of the implant.

Cautions Antimuscarinic drugs should be used with caution in the elderly (especially if frail), in those with autonomic neuropathy, and in those susceptible to angle-closure glaucoma. They should also be used with caution in hiatus hernia with reflux oesophagitis. Antimuscarinics can worsen hyperthyroidism, coronary artery disease, congestive heart failure, hypertension, prostatic hyperplasia, arrhythmias, and tachycardia. For **interactions**, see Appendix 1 (antimuscarinics).

Contra-indications Antimuscarinic drugs should be avoided in patients with myasthenia gravis, significant bladder outflow obstruction or urinary retention, severe ulcerative colitis, toxic megacolon, and in gastro-intestinal obstruction or intestinal atony.

Side-effects Side-effects of antimuscarinic drugs include dry mouth, gastro-intestinal disturbances including constipation, flatulence, taste disturbances, blurred vision, dry eyes, drowsiness, dizziness, fatigue, difficulty in micturition (less commonly urinary retention), palpitation, and skin reactions (including dry skin, rash, and photosensitivity); also headache, diarrhoea, angioedema, arrhythmias, and tachycardia. Central nervous system stimulation, such as restlessness, disorientation, hallucination, and convulsion may occur; children are at higher risk of these effects. Antimuscarinic drugs can reduce sweating, leading to heat sensations and fainting in hot environments or in patients with fever, and *very rarely* may precipitate angle-closure glaucoma.

DARIFENACIN

Indications urinary frequency, urgency, and incontinence

Cautions see notes above

Contra-indications see notes above

Hepatic impairment max. 7.5 mg daily in moderate impairment; avoid in severe impairment

Pregnancy manufacturer advises avoid—toxicity in *animal* studies

Breast-feeding present in milk in *animal* studies—manufacturer advises caution

Side-effects see notes above; also *less commonly* ulcerative stomatitis, oedema, hypertension, dyspnoea, cough, rhinitis, weakness, insomnia, impotence, and vaginitis

Dose

- ADULT over 18 years, 7.5 mg once daily, increased if necessary after 2 weeks to 15 mg once daily

Emselex® (Merus) PoM
Tablets, m/r, darifenacin (as hydrobromide) 7.5 mg (white), net price 28-tab pack = £25.48; 15 mg (peach), 28-tab pack = £25.48. Label: 3, 25

DULOXETINE

Indications moderate to severe stress urinary incontinence in women; major depressive disorder (section 4.3.4); diabetic neuropathy (section 4.3.4); generalised anxiety disorder (section 4.3.4)

Cautions elderly; cardiac disease; hypertension (avoid if uncontrolled); history of mania; history of seizures; raised intra-ocular pressure, susceptibility to angle-closure glaucoma; bleeding disorders or concomitant use of drugs that increase risk of bleeding; **interactions**: Appendix 1 (duloxetine)
Withdrawal Nausea, vomiting, headache, anxiety, dizziness, paraesthesia, sleep disturbances, and tremor are the most common features of abrupt withdrawal or marked reduction of the dose; dose should be reduced over at least 1–2 weeks

Hepatic impairment manufacturer advises avoid

Renal impairment avoid if eGFR less than 30 mL/minute/1.73 m^2

Pregnancy toxicity in *animal* studies—avoid in patients with stress urinary incontinence; risk of neonatal withdrawal symptoms if used near term

Breast-feeding present in milk—manufacturer advises avoid

Side-effects nausea, vomiting, dyspepsia, constipation, diarrhoea, abdominal pain, weight changes, decreased appetite, flatulence, dry mouth; palpitation, hot flush; insomnia, abnormal dreams, paraesthesia, drowsiness, anxiety, headache, dizziness, fatigue, weakness, tremor, nervousness, anorexia; sexual dysfunction; visual disturbances; sweating, pruritus; *less commonly* gastritis, halitosis, hepatitis, bruxism, dysphagia, tachycardia, hypertension, postural hypotension, syncope, raised cholesterol, vertigo, taste disturbance, cold extremities, impaired temperature regulation, impaired attention, movement disorders, muscle twitching, musculoskeletal pain, thirst, stomatitis, hypothyroidism, urinary disorders, and photosensitivity; *rarely* mania; *very rarely* angle-closure glaucoma; *also reported* supraventricular arrhythmia, chest pain, hallucinations, suicidal behaviour (see Suicidal Behaviour and Antidepressant Therapy, p. 249), seizures, hypersensitivity reactions

including urticaria, angioedema, rash (including Stevens-Johnson syndrome) and anaphylaxis, hyponatraemia (see Hyponatraemia and Antidepressant Therapy, p. 248)

Dose

- ADULT over 18 years, 40 mg twice daily, assess for benefit and tolerability after 2–4 weeks

Note Initial dose of 20 mg twice daily for 2 weeks can minimise side-effects

Yentreve® (Lilly) PoM

Capsules, duloxetine (as hydrochloride) 20 mg (blue), net price 28-cap pack = £18.48, 56-cap pack = £30.80; 40 mg (orange/blue), 56-cap pack = £36.96. Label: 2

Cymbalta® (Lilly) PoM

Section 4.3.4 (major depressive episode, generalised anxiety disorder, and diabetic neuropathy)

FESOTERODINE FUMARATE

Indications urinary frequency, urgency, and urge incontinence

Cautions see notes above; gastro-oesophageal reflux

Contra-indications see notes above

Hepatic impairment manufacturer advises increase dose cautiously; max. 4 mg daily in moderate impairment; avoid in severe impairment; consult product literature before concomitant use of cytochrome P450 enzyme inhibitors

Renal impairment increase dose cautiously if eGFR 30–80 mL/minute/1.73 m^2; max. 4 mg daily if eGFR less than 30 mL/minute/1.73 m^2; consult product literature before concomitant use of cytochrome P450 enzyme inhibitors

Pregnancy manufacturer advises avoid—toxicity in *animal* studies

Breast-feeding manufacturer advises avoid—no information available

Side-effects see notes above; also insomnia; *less commonly* nasal dryness, pharyngolaryngeal pain, cough, and vertigo

Dose

- ADULT over 18 years, 4 mg once daily, increased if necessary to max. 8 mg once daily

Note Max. 4 mg daily with concomitant atazanavir, clarithromycin, indinavir, itraconazole, ritonavir, saquinavir, or telithromycin; in patients with hepatic or renal impairment, consult product literature before concomitant use with amprenavir, aprepitant, atazanavir, clarithromycin, diltiazem, erythromycin, fluconazole, fosamprenavir, indinavir, itraconazole, ritonavir, saquinavir, telithromycin, verapamil, or grapefruit juice

Toviaz® (Pfizer) PoM

Tablets, m/r, f/c, fesoterodine fumarate 4 mg (light blue), net price 28-tab pack = £25.78; 8 mg (blue), 28-tab pack = £25.78. Label: 3, 25

FLAVOXATE HYDROCHLORIDE

Indications urinary frequency and incontinence, dysuria, urgency; bladder spasms due to catheterisation, cystoscopy, or surgery

Cautions see notes above

Contra-indications see notes above; gastro-intestinal haemorrhage

Pregnancy manufacturer advises avoid unless no safer alternative

Breast-feeding manufacturer advises caution—no information available

Side-effects see notes above; also vertigo, eosinophilia, leucopenia, urticaria, erythema, and pruritus

Dose

- ADULT and CHILD over 12 years, 200 mg 3 times daily

Urispas 200® (Recordati) PoM

Tablets, f/c, flavoxate hydrochloride 200 mg, net price 90-tab pack = £11.67. Label: 3

MIRABEGRON

Indications urinary frequency, urgency, and urge incontinence

Cautions history of QT-interval prolongation; concomitant use with drugs that prolong the QT interval; **interactions**: Appendix 1 (mirabegron)

Contra-indications severe hypertension

Hepatic impairment avoid in severe impairment—no information available; reduce dose to 25 mg once daily in moderate impairment; *with concomitant use of strong cytochrome P450 inhibitors such as itraconazole, ritonavir, or clarithromycin* reduce dose to 25 mg once daily in mild impairment and avoid in moderate impairment

Renal impairment avoid if eGFR less than 15 mL/minute/1.73 m^2—no information available; reduce dose to 25 mg once daily if eGFR 15–29 mL/minute/1.73 m^2; *with concomitant use of strong cytochrome P450 inhibitors such as itraconazole, ritonavir, or clarithromycin* reduce dose to 25 mg once daily if eGFR 30–89 mL/minute/1.73 m^2 and avoid if eGFR less than 30 mL/minute/1.73 m^2

Pregnancy avoid—toxicity in *animal* studies; contraception advised in women of child-bearing potential

Breast-feeding avoid—present in milk in *animal* studies

Side-effects tachycardia, urinary-tract infection; *less commonly* dyspepsia, gastritis, palpitation, atrial fibrillation, hypertension, vulvovaginal infection and pruritus, joint swelling, rash, pruritus

Dose

- ADULT over 18 years, 50 mg once daily

Betmiga® (Astellas) ▼ PoM

Tablets, m/r, mirabegron 25 mg (brown), net price 30-tab pack = £29.00; 50 mg (yellow), 30-tab pack = £29.00. Label: 25

OXYBUTYNIN HYDROCHLORIDE

Indications urinary frequency, urgency and incontinence, neurogenic bladder instability, and nocturnal enuresis associated with overactive bladder

Cautions see notes above; acute porphyria (section 9.8.2)

Contra-indications see notes above

Hepatic impairment manufacturer advises caution

Renal impairment manufacturer advises caution

Pregnancy manufacturers advise avoid unless essential—toxicity in *animal* studies

Breast-feeding manufacturers advise avoid—present in milk

Side-effects see notes above; also *less commonly* anorexia, facial flushing; *rarely* night terrors; application site reactions with *patches*; also reported cognitive impairment

Dose

- ADULT and CHILD over 12 years, initially 5 mg 2–3 times daily, increased if necessary to max. 5 mg 4 times daily; ELDERLY initially 2.5–3 mg twice daily, increased to 5 mg twice daily according to response and tolerance; CHILD 5–12 years, neurogenic bladder instability, 2.5–3 mg twice daily, increased to 5 mg 2–3 times daily; CHILD under 5 years see *BNF for Children*; CHILD 5–18 years, nocturnal enuresis associated with overactive bladder, 2.5–3 mg twice daily increased to 5 mg 2–3 times daily (last dose before bedtime)

Oxybutynin Hydrochloride (Non-proprietary) PoM

Tablets, oxybutynin hydrochloride 2.5 mg, net price 56-tab pack = £1.81; 3 mg, 56-tab pack = £14.00; 5 mg, 56-tab pack = £2.71, 84-tab pack = £4.06. Label: 3

Cystrin® (Zentiva) PoM

Tablets, oxybutynin hydrochloride 5 mg (scored), net price 84-tab pack = £21.99. Label: 3

Ditropan® (Sanofi-Aventis) PoM

Tablets, both blue, scored, oxybutynin hydrochloride 2.5 mg, net price 84-tab pack = £1.60; 5 mg, 84-tab pack = £2.90. Label: 3

Elixir, oxybutynin hydrochloride 2.5 mg/5 mL, net price 150-mL pack = £6.88. Label: 3

Modified release

Lyrinel® XL (Janssen) PoM

Tablets, m/r, oxybutynin hydrochloride 5 mg (yellow), net price 30-tab pack = £13.77; 10 mg (pink), 30-tab pack = £27.54. Label: 3, 25

Dose ADULT over 18 years, initially 5 mg once daily, adjusted according to response in steps of 5 mg at weekly intervals; max. 20 mg once daily; CHILD 5–18 years see *BNF for Children*

Note Patients taking immediate-release oxybutynin may be transferred to the nearest equivalent daily dose of *Lyrinel® XL*

Transdermal preparations

Kentera® (Orion) PoM

Patches, self-adhesive, oxybutynin 36 mg (releasing oxybutynin approx. 3.9 mg/24 hours), net price 8-patch pack = £27.20. Label: 3, counselling, administration

Dose ADULT over 18 years, urinary frequency, urgency and incontinence, apply 1 patch twice weekly to clean, dry, unbroken skin on abdomen, hip or buttock, remove after every 3–4 days and site replacement patch on a different area (avoid using same area for 7 days)

Note The *Scottish Medicines Consortium* has advised (July 2005) that *Kentera®* should be restricted for use in patients who benefit from oral oxybutynin but cannot tolerate its side-effects

PROPANTHELINE BROMIDE

Indications adult enuresis

Cautions see notes above; ulcerative colitis

Contra-indications see notes above

Hepatic impairment manufacturer advises caution

Renal impairment manufacturer advises caution

Pregnancy manufacturer advises avoid—no information available

Breast-feeding may suppress lactation

Side-effects see notes above; also facial flushing

Dose

- Initially 15 mg 3 times daily at least one hour before food and 30 mg at bedtime, subsequently adjusted according to response (max. 120 mg daily)

Preparations

Section 1.2

PROPIVERINE HYDROCHLORIDE

Indications urinary frequency, urgency and incontinence; neurogenic bladder instability

Cautions see notes above

Contra-indications see notes above

Hepatic impairment avoid in moderate to severe impairment

Renal impairment doses above 30 mg daily should be used with caution if eGFR less than 30 mL/minute/1.73 m^2

Pregnancy manufacturer advises avoid (restriction of skeletal development in *animals*)

Breast-feeding manufacturer advises avoid—present in milk in *animal* studies

Side-effects see notes above

Dose

- ADULT over 18 years, 15 mg 1–3 times daily, increased if necessary to max. 15 mg 4 times daily

Detrunorm® (AMCo) PoM

Tablets, pink, s/c, propiverine hydrochloride 15 mg, net price 56-tab pack = £18.00. Label: 3

Modified release

Detrunorm® XL (AMCo) PoM

Capsules, orange/white, m/r, propiverine hydrochloride 30 mg, net price 28-cap pack = £24.45. Label: 3, 25

Dose ADULT over 18 years, urinary frequency, urgency, and incontinence, 30 mg once daily

SOLIFENACIN SUCCINATE

Indications urinary frequency, urgency and urge incontinence

Cautions see notes above; neurogenic bladder disorder; susceptibility to QT-interval prolongation

Contra-indications see notes above

Hepatic impairment max. 5 mg daily (in combination with tamsulosin, max. 1 *Vesomni®* tablet daily) in moderate impairment; avoid in moderate impairment in those already taking potent inhibitors of cytochrome P450 enzyme CYP3A4 (such as itraconazole or ritonavir); avoid in severe impairment

Renal impairment max. 5 mg daily (in combination with tamsulosin, max. 1 *Vesomni®* tablet daily) if eGFR less than 30 mL/minute/1.73 m^2; avoid if eGFR less than 30 mL/minute/1.73 m^2 in those already taking potent inhibitors of cytochrome P450 enzyme CYP3A4 (such as itraconazole or ritonavir)

Pregnancy manufacturer advises caution—no information available

Breast-feeding manufacturer advises avoid—present in milk in *animal* studies

Side-effects see notes above; also *less commonly* gastro-oesophageal reflux, oedema; *also reported* reduced appetite, hepatic impairment, torsade de pointes, dysphonia, hyperkalaemia, muscle weakness

Dose

- ADULT over 18 years, 5 mg daily, increased if necessary to 10 mg once daily

  Note Max. 5 mg daily (in combination with tamsulosin, max. 1 *Vesomni*® tablet daily) with concomitant potent inhibitors of cytochrome P450 enzyme CYP3A4 (such as itraconazole or ritonavir)

Vesicare® (Astellas) PoM

Tablets, f/c, solifenacin succinate 5 mg (yellow), net price 30-tab pack = £27.62; 10 mg (pink), 30-tab pack = £35.91. Label: 3

With tamsulosin

Section 7.4.1

TOLTERODINE TARTRATE

Indications see under Dose

Cautions see notes above; history of QT-interval prolongation; concomitant use with other drugs known to prolong QT interval

Contra-indications see notes above

Hepatic impairment reduce dose to 1 mg twice daily; avoid modified-release preparations

Renal impairment reduce dose to 1 mg twice daily and avoid modified-release preparations if eGFR less than 30 mL/minute/1.73 m^2

Pregnancy manufacturer advises avoid—toxicity in *animal* studies

Breast-feeding manufacturer advises avoid—no information available

Side-effects see notes above; also chest pain, peripheral oedema; sinusitis, bronchitis; paraesthesia, fatigue, vertigo, weight gain; *less commonly* memory impairment; *also reported* flushing

Dose

- Urinary frequency, urgency, and incontinence, ADULT over 18 years, 2 mg twice daily; reduce to 1 mg twice daily if necessary to minimise side-effects; CHILD 2–18 years see *BNF for Children*
- Nocturnal enuresis associated with overactive bladder, CHILD 5–18 years see *BNF for Children*

Tolterodine Tartrate (Non-proprietary) PoM

Tablets, tolterodine tartrate 1 mg, net price 56-tab pack = £2.72; 2 mg, 56-tab pack = £2.68. Label: 3

Detrusitol® (Pfizer) PoM

Tablets, f/c, tolterodine tartrate 1 mg, net price 56-tab pack = £29.03; 2 mg, 56-tab pack = £30.56. Label: 3

Modified release

Tolterodine Tartrate (Non-proprietary) PoM

Capsules, m/r, tolterodine tartrate 4 mg, net price 28-cap pack = £25.78. Label: 3, 25

Brands include *Santizor XL*®

Dose urinary frequency, urgency, and incontinence, ADULT over 18 years, 4 mg once daily

Detrusitol® XL (Pfizer) PoM

Capsules, blue, m/r, tolterodine tartrate 4 mg, net price 28-cap pack = £25.78. Label: 3, 25

Dose urinary frequency, urgency and incontinence, ADULT over 18 years, 4 mg once daily

TROSPIUM CHLORIDE

Indications urinary frequency, urgency and incontinence

Cautions see notes above

Contra-indications see notes above

Hepatic impairment manufacturer advises caution in mild to moderate impairment; avoid in severe impairment

Renal impairment use with caution; reduce dose to 20 mg once daily or 20 mg on alternate days if eGFR 10–30 mL/minute/1.73 m^2; avoid *Regurin® XL*

Pregnancy manufacturer advises caution

Breast-feeding manufacturer advises caution

Side-effects see notes above; *rarely* chest pain, dyspnoea, and asthenia; *very rarely* myalgia and arthralgia

Dose

- ADULT and CHILD over 12 years, 20 mg twice daily before food

Trospium Chloride (Non-proprietary) PoM

Tablets, f/c, trospium chloride 20 mg, net price 60-tab pack = £25.21. Label: 23

Brands include *Flotros*®

Regurin® (Speciality European) PoM

Tablets, brown-yellow, f/c, trospium chloride 20 mg, net price 60-tab pack = £26.00. Label: 23

Modified release

Regurin® XL (Speciality European) PoM

Capsules, orange/white, m/r, trospium chloride 60 mg, net price 28-cap pack = £23.05. Label: 23, 25

Dose ADULT over 18 years, 60 mg once daily

Nocturnal enuresis in children

Nocturnal enuresis is common in young children, but persists in a small proportion by 10 years of age. For children under 5 years, reassurance and advice on the management of nocturnal enuresis can be useful for some families. Treatment may be considered in children over 5 years depending on their maturity and motivation, the frequency of nocturnal enuresis, and the needs of the child and their family.

Initially, advice should be given on fluid intake, diet, toileting behaviour, and reward systems; for children who do not respond to this advice, further treatment may be necessary. An **enuresis alarm** should be first-line treatment for motivated, well-supported children; alarms have a lower relapse rate than drug treatment when discontinued. Treatment should be reviewed after 4 weeks, and, if there are early signs of response, continued until a minimum of 2 weeks' uninterrupted dry nights have been achieved. If complete dryness is not achieved after 3 months, only continue if the condition is still improving and the child remains motivated to use the alarm. If initial alarm treatment is unsuccessful, consider combination treatment with desmopressin (see below), or **desmopressin** alone if the alarm is no longer appropriate or desirable.

Desmopressin (section 6.5.2), an analogue of vasopressin, is given by oral or by sublingual administration; it should not be given intranasally for nocturnal enuresis due to an increased incidence of side-effects. Desmopressin alone can be offered to children over 5 years of age if an alarm is inappropriate or undesirable, or when rapid or short-term results are the priority (for example to cover periods away from home); desmopressin alone can also be used if there has been a partial response to a combination of desmopressin and an alarm following initial treatment with an alarm. Treatment should be assessed after 4 weeks and continued for 3 months if there are signs of response. Desmopressin should be

withdrawn at regular intervals (for 1 week every 3 months) for full reassessment. Particular care is needed to avoid fluid overload by restricting fluid intake from 1 hour before taking desmopressin until 8 hours after. When stopping treatment with desmopressin, gradual withdrawal should be considered.

Nocturnal enuresis associated with daytime symptoms (overactive bladder) can be managed with anti-muscarinic drugs (see Urinary incontinence, p. 550) in combination with desmopressin. Treatment should be prescribed only after specialist assessment and should be continued for 3 months; the course can be repeated if necessary.

The tricyclic antidepressant **imipramine** (section 4.3.1) may be considered for children who have not responded to all other treatments and have undergone specialist assessment, however, behavioural disturbances can occur and relapse is common after withdrawal. Treatment should not normally exceed 3 months unless a physical examination is made and the child is fully re-assessed; toxicity following overdosage with tricyclics is of particular concern.

7.4.3 Drugs used in urological pain

The acute pain of *ureteric colic* may be relieved with **pethidine** (section 4.7.2). **Diclofenac** by injection or as suppositories (section 10.1.1) is also effective and compares favourably with pethidine; other non-steroidal anti-inflammatory drugs are occasionally given by injection.

Lidocaine gel is a useful topical application in *urethral pain* or to relieve the discomfort of catheterisation (section 15.2).

Alkalinisation of urine

Alkalinisation of urine can be undertaken with **potassium citrate**. The alkalinising action may relieve the discomfort of *cystitis* caused by lower urinary tract infections. **Sodium bicarbonate** is used as a urinary alkalinising agent in some metabolic and renal disorders (section 9.2.1.3).

POTASSIUM CITRATE

Indications relief of discomfort in mild urinary-tract infections; alkalinisation of urine

Cautions cardiac disease; elderly; **interactions:** Appendix 1 (potassium salts)

Renal impairment close monitoring required—high risk of hyperkalaemia; avoid in severe impairment

Side-effects hyperkalaemia on prolonged high dosage, mild diuresis

Dose

- See under preparation

Potassium Citrate Mixture BP
(Potassium Citrate Oral Solution)
Oral solution, potassium citrate 30%, citric acid monohydrate 5% in a suitable vehicle with a lemon flavour. Extemporaneous preparations should be recently prepared according to the following formula: potassium citrate 3 g, citric acid monohydrate 500 mg, syrup 2.5 mL, quillaia tincture 0.1 mL, lemon spirit 0.05 mL, double-strength chloroform water 3 mL, water to 10 mL. Contains about 28 mmol K^+/10 mL. Label: 27
Dose 10 mL 3 times daily well diluted with water
Proprietary brands of potassium citrate are on sale to the public for the relief of discomfort in mild urinary-tract infections

SODIUM BICARBONATE

Indications relief of discomfort in mild urinary-tract infections; alkalinisation of urine

Cautions cardiac disease; patients on sodium-restricted diet; elderly; avoid prolonged use; **interactions:** Appendix 1 (antacids)

Hepatic impairment section 1.1.1

Renal impairment avoid; specialised role in some forms of renal disease, see section 9.2.1.3

Pregnancy use with caution

Side-effects eructation, alkalosis on prolonged use

Dose

- 3 g in water every 2 hours until urinary pH exceeds 7; maintenance of alkaline urine 5–10 g daily

Preparations
Section 9.2.1.3

SODIUM CITRATE

Indications relief of discomfort in mild urinary-tract infections

Cautions cardiac disease; hypertension; patients on a sodium-restricted diet; elderly; **interactions:** Appendix 1 (sodium citrate)

Renal impairment section 1.1.1

Pregnancy use with caution

Side-effects mild diuresis

Note Proprietary brands of sodium citrate are on sale to the public for the relief of discomfort in mild urinary-tract infections

Other preparations for urinary disorders

A terpene mixture (*Rowatinex*®) is claimed to be of benefit in *urolithiasis* for the expulsion of calculi.

Rowatinex® (Rowa) PoM
Capsules, yellow, e/c, anethol 4 mg, borneol 10 mg, camphene 15 mg, cineole 3 mg, fenchone 4 mg, pinene 31 mg, net price 50 = £7.35. Label: 25
Dose 1–2 capsules 3–4 times daily before food; CHILD not recommended

7.4.4 Bladder instillations and urological surgery

Bladder infection Various solutions are available as irrigations or washouts.

Aqueous **chlorhexidine** (section 13.11.2) can be used in the management of common infections of the bladder but it is ineffective against most *Pseudomonas* spp. Solutions containing chlorhexidine 1 in 5000 (0.02%) are used but they may irritate the mucosa and cause burning and haematuria (in which case they should be discontinued); sterile **sodium chloride solution 0.9%** (physiological saline) is usually adequate and is preferred as a mechanical irrigant.

Continuous bladder irrigation with **amphotericin** 50 micrograms/mL (section 5.2.3) may be of value in mycotic infections.

Dissolution of blood clots Clot retention is usually treated by irrigation with sterile **sodium chloride solution 0.9%** but sterile **sodium citrate solution for bladder irrigation 3%** may also be helpful.

Bladder cancer Bladder instillations of **doxorubicin** (section 8.1.2) and **mitomycin** (section 8.1.2) are used for recurrent superficial bladder tumours. Such instillations reduce systemic side-effects; adverse effects on the bladder (e.g. micturition disorders and reduction in bladder capacity) may occur.

Instillation of **epirubicin** (section 8.1.2) is used for treatment and prophylaxis of certain forms of superficial bladder cancer; instillation of **doxorubicin** (section 8.1.2) is also used for some papillary tumours.

Instillation of **BCG** (Bacillus Calmette-Guérin), a live attenuated strain derived from *Mycobacterium bovis* (section 8.2.4), is licensed for the treatment of primary or recurrent bladder carcinoma *in-situ* and for the prevention of recurrence following transurethral resection.

Interstitial cystitis **Dimethyl sulfoxide** may be used for symptomatic relief in patients with interstitial cystitis (Hunner's ulcer). 50 mL of a 50% solution (*Rimso-50*®—available from 'special-order' manufacturers or specialist importing companies, p. 1104) is instilled into the bladder, retained for 15 minutes, and voided by the patient. Treatment is repeated at intervals of 2 weeks. Bladder spasm and hypersensitivity reactions may occur and long-term use requires ophthalmic, renal, and hepatic assessment at intervals of 6 months. **Interactions:** see Appendix 1 (dimethyl sulfoxide).

SODIUM CITRATE

Indications bladder washouts, see notes above

Sterile Sodium Citrate Solution for Bladder Irrigation

sodium citrate 3%, dilute hydrochloric acid 0.2%, in purified water, freshly boiled and cooled, and sterilised

Urological surgery

There is a high risk of fluid absorption from the irrigant used in endoscopic surgery within the urinary tract; if this occurs in excess, hypervolaemia, haemolysis, and renal failure may result. **Glycine irrigation solution 1.5%** is the irrigant of choice for transurethral resection of the prostate gland and bladder tumours; **sterile sodium chloride solution 0.9%** (physiological saline) is used for percutaneous renal surgery.

GLYCINE

Indications bladder irrigation during urological surgery; see notes above

Cautions see notes above

Side-effects see notes above

Glycine Irrigation Solution (Non-proprietary)

Irrigation solution, glycine 1.5% in water for injections

Maintenance of indwelling urinary catheters

The deposition which occurs in catheterised patients is usually chiefly composed of phosphate and to minimise this the catheter (if latex) should be changed at least as often as every 6 weeks. If the catheter is to be left for longer periods a silicone catheter should be used together with the appropriate use of catheter maintenance solutions. Repeated blockage usually indicates that the catheter needs to be changed.

CATHETER PATENCY SOLUTIONS

Chlorhexidine 0.02%

Brands include *Uro-Tainer Chlorhexidine*®, net price 100-mL sachet = £2.70

Sodium chloride 0.9%

Brands include *OptiFlo S*®, net price 50- and 100-mL sachets = £3.30; *Uriflex S*®, 100-mL sachet = £3.45; *Uriflex SP*®, with integral drug additive port, 100-mL sachet = £3.45; *Uro-Tainer Sodium Chloride*®, 50- and 100-mL sachets = £3.45; *Uro-Tainer M*®, with integral drug additive port, 50- and 100-mL sachets = £2.90

Solution G

Citric acid 3.23%, magnesium oxide 0.38%, sodium bicarbonate 0.7%, disodium edetate 0.01%. Brands include *OptiFlo G*®, net price 50- and 100-mL sachets = £3.50; *Uriflex G*®, 100-mL sachet = £2.40; *Uro-Tainer*® *Twin Suby G*, 2 × 30-mL = £4.72

Solution R

Citric acid 6%, gluconolactone 0.6%, magnesium carbonate 2.8%, disodium edetate 0.01%. Brands include *OptiFlo R*®, net price 50- and 100-mL sachets = £3.50; *Uriflex R*®, 100-mL sachet = £2.40; *Uro-Tainer*® *Twin Solutio R*, 2 × 30-mL = £4.72

Diluents for bladder instillation

SODIUM CHLORIDE

Indications diluent for instillation of drugs to the bladder

Sodium Chloride 0.9% Solution for Intravesical Use (Non-proprietary)

Intravesical instillation, sodium chloride 0.9%, net price 50-mL bag = £9.66

7.4.5 Drugs for erectile dysfunction

Reasons for failure to produce a satisfactory erection include *psychogenic*, *vascular*, *neurogenic*, and *endocrine abnormalities*; impotence can also be drug-induced. Intracavernosal injection or urethral application of vasoactive drugs under careful medical supervision is used for both diagnostic and therapeutic purposes.

Erectile disorders may also be treated with drugs given by mouth which increase the blood flow to the penis. Drugs should be used with caution if the penis is deformed (e.g. in angulation, cavernosal fibrosis, and Peyronie's disease).

Priapism If priapism occurs with alprostadil, treatment should not be delayed more than 6 hours and is as follows:

Initial therapy by penile aspiration—using aseptic technique a 19–21 gauge butterfly needle inserted into the corpus cavernosum and 20–50 mL of blood aspirated; if necessary the procedure may be repeated on the opposite side.

If initial aspiration is unsuccessful a second 19–21 gauge butterfly needle can be inserted into the opposite corpus cavernosum and sterile physiological saline introduced through the first needle and drained through the second.

If aspiration and lavage of corpora are unsuccessful, *cautious* intracavernosal injection of a sympathomimetic (section 2.7.2) with action on alpha-adrenergic receptors, continuously monitoring blood pressure and pulse (*extreme caution:* coronary heart disease, hypertension, cerebral ischaemia or if taking antidepressant) as follows:

- intracavernosal injections of phenylephrine 100–200 micrograms (0.5–1 mL of a 200 microgram/mL solution) every 5–10 minutes; max. total dose 1 mg [unlicensed indication] [*important:* if suitable strength of phenylephrine injection not available may be specially prepared by diluting 0.1 mL of the phenylephrine 1% (10 mg/mL) injection (section 2.7.2) to 5 mL with sodium chloride 0.9%];
  alternatively
- intracavernosal injections of adrenaline 10–20 micrograms (0.5–1 mL of a 20 microgram/mL solution) every 5–10 minutes; max. total dose 100 micrograms [unlicensed indication] [*important:* if suitable strength of adrenaline not available may be specially prepared by diluting 0.1 mL of the adrenaline 1 in 1000 (1 mg/mL, section 3.4.3) injection to 5 mL with sodium chloride 0.9%];
  alternatively
- intracavernosal injection of metaraminol (*caution: has been associated with fatal hypertensive crises*); metaraminol 1 mg (0.1 mL of 10 mg/mL metaraminol injection, section 2.7.2) is diluted to 50 mL with sodium chloride injection 0.9% and given carefully by slow injection into the corpora in 5-mL injections every 15 minutes [unlicensed indication].

If necessary the sympathomimetic injections can be followed by further aspiration of blood through the same butterfly needle.

If sympathomimetics unsuccessful, urgent surgical referral for management (possibly including shunt procedure).

Prescribing on the NHS Drug treatments for erectile dysfunction may only be prescribed on the NHS under certain circumstances (see individual preparations). The Department of Health (England) has recommended that treatment should also be available from specialist services when the condition is causing severe distress; specialist centres should use form FP10(HP) or form HBP in Scotland or form WP10HP in Wales and endorse them 'SLS' if the treatment is to be dispensed in the community. The following criteria should be considered when assessing distress:

- significant disruption to normal social and occupational activities;
- a marked effect on mood, behaviour, social and environmental awareness;
- a marked effect on interpersonal relationships.

Alprostadil

Alprostadil (prostaglandin E_1) is given by intracavernosal injection or intraurethral application for the management of erectile dysfunction (after exclusion of treatable medical causes); it is also used as a diagnostic test.

ALPROSTADIL

Indications erectile dysfunction (including aid to diagnosis)

Cautions priapism—patients should be instructed to report any erection lasting 4 hours or longer—for management, see section 7.4.5; anatomical deformations of penis (painful erection more likely)—follow up regularly to detect signs of penile fibrosis (consider discontinuation if angulation, cavernosal fibrosis or Peyronie's disease develop); **interactions:** Appendix 1 (prostaglandins)

Contra-indications predisposition to prolonged erection (as in sickle cell anaemia, multiple myeloma or leukaemia); not for use with other agents for erectile dysfunction, in patients with penile implants or when sexual activity medically inadvisable; urethral application also contra-indicated in urethral stricture, severe hypospadia, severe curvature, balanitis, urethritis

Side-effects hypotension, hypertension; dizziness, headache; penile pain, other localised pain (buttocks, leg, testicular, abdominal); influenza-like syndrome; urethral burning, urethral bleeding; injection site reactions including penile fibrosis, penile oedema, penile rash, haematoma, haemosiderin deposits; *less commonly* nausea, dry mouth, vasodilatation, syncope, supraventricular extrasystole, rapid pulse, asthenia, leg cramps, pelvic pain, scrotal or testicular oedema, scrotal erythema, testicular thickening, micturation difficulties, haematuria, mydriasis, and sweating; local reactions including penile warmth, pruritus, irritation, penile numbness or sensitivity, balantitis, phimosis, priapism (see section 7.4.5 and under Cautions), abnormal ejaculation; *rarely* vertigo, urinary-tract infection, and hypersensitivity reactions (including rash, erythema, urticaria, and anaphylaxis)

Dose

- See under preparations below

Intracavernosal injection

[1] **Caverject®** (Pharmacia) PoM NHS

Injection, powder for reconstitution, alprostadil, net price 5-microgram vial = £7.73; 10-microgram vial = £9.24; 20-microgram vial = £11.94; 40-microgram vial = £21.58 (all with diluent-filled syringe, needles and swabs)

1. NHS for treatment of erectile dysfunction except in men who:
   - have diabetes, multiple sclerosis, Parkinson's disease, poliomyelitis, prostate cancer, severe pelvic injury, single gene neurological disease, spina bifida, or spinal cord injury;
   - are receiving dialysis for renal failure;
   - have had radical pelvic surgery, prostatectomy (including transurethral resection of the prostate), or kidney transplant;
   - were receiving *Caverject®*, *Erecnos®*, *MUSE®*, *Viagra®*, or *Viridal®* for erectile dysfunction, at the expense of the NHS, on 14 September 1998;
   - are suffering severe distress as a result of impotence (prescribed in specialist centres only, see notes above).

   The prescription must be endorsed 'SLS'.

Caverject® Dual Chamber, double-chamber cartridges (containing alprostadil and diluent), net price 10-microgram cartridge (for doses 2.5–10 micrograms) = £7.35; 20-microgram cartridge (for doses 5–20 micrograms) = £9.50 (both with needles)

Dose by direct intracavernosal injection, ADULT over 18 years, erectile dysfunction, first dose 2.5 micrograms, second dose 5 micrograms (if some response to first dose) *or* 7.5 micrograms (if no response to first dose), increasing in steps of 5–10 micrograms to obtain dose suitable for producing erection lasting not more than 1 hour (neurological dysfunction, first dose 1.25 micrograms, second dose 2.5 micrograms, third dose 5 micrograms, increasing in steps of 5–10 micrograms to obtain suitable dose); if no response to dose then next higher dose can be given within 1 hour, if there is a response the next dose should not be given for at least 24 hours; usual dose 5–20 micrograms; max. 60 micrograms; max. frequency of injection not more than 3 times per week with at least 24 hour interval between injections

Note The first dose must be given by medically trained personnel; self-administration may only be undertaken after proper training

Aid to diagnosis, 10–20 micrograms as a single dose (where evidence of neurological dysfunction, initially 5 micrograms and max. 10 micrograms)—consult product literature for details

[1] Viridal® Duo (UCB Pharma) PoM NHS

Starter Pack (hosp. only), contents as for *Continuation Pack* below plus *Duoject* applicator, net price 10-microgram starter pack = £20.13, 20-microgram starter pack = £24.54, 40-microgram starter pack = £29.83; *Continuation Pack*, 2 double-chamber cartridges (containing alprostadil and diluent), 2 needles, swabs, 10-microgram continuation pack = £16.55, 20-microgram continuation pack = £21.39, 40-microgram continuation pack = £27.22; replacement *Duoject*® applicators available from UCB Pharma

Dose by direct intracavernosal injection, ADULT over 18 years, erectile dysfunction, initially 5 micrograms (2.5 micrograms in neurogenic erectile dysfunction) increasing in steps of 2.5–5 micrograms to obtain dose suitable for producing erection not lasting more than 1 hour; usual range 10–20 micrograms; max. 40 micrograms; max. frequency of injection not more than 2–3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

Note The first dose must be given by medically trained personnel; self-administration may only be undertaken after proper training

1. NHS for treatment of erectile dysfunction except in men who:

- have diabetes, multiple sclerosis, Parkinson's disease, poliomyelitis, prostate cancer, severe pelvic injury, single gene neurological disease, spina bifida, or spinal cord injury;
- are receiving dialysis for renal failure;
- have had radical pelvic surgery, prostatectomy (including transurethral resection of the prostate), or kidney transplant;
- were receiving *Caverject*®, *Erecnos*®, *MUSE*®, *Viagra*®, or *Viridal*® for erectile dysfunction, at the expense of the NHS, on 14 September 1998;
- are suffering severe distress as a result of impotence (prescribed in specialist centres only, see notes above).

The prescription must be endorsed 'SLS'.

Urethral application

Counselling If partner pregnant barrier contraception should be used

[1] MUSE® (Meda) PoM NHS

Urethral application, alprostadil, net price 250-microgram single-use applicator = £11.30, 500-microgram single-use applicator = £11.30, 1-mg single-use applicator = £11.56 (all strengths also available in packs of 6 applicators)

Condoms no evidence of harm to latex condoms and diaphragms

Dose by direct urethral application, ADULT over 18 years, erectile dysfunction, initially 250 micrograms adjusted according to response (usual range 0.125–1 mg); max. 2 doses in 24 hours and 7 doses in 7 days)

Note During initiation of treatment *MUSE*® should be used under medical supervision; self-administration may only be undertaken after proper training

Aid to diagnosis, 500 micrograms as a single dose

Phosphodiesterase type-5 inhibitors

Avanafil, **sildenafil**, **tadalafil**, and **vardenafil** are phosphodiesterase type-5 inhibitors licensed for the treatment of erectile dysfunction; they are not recommended for use with other treatments for erectile dysfunction. The patient should be assessed appropriately before prescribing avanafil, sildenafil, tadalafil or vardenafil. Since these drugs are given by mouth there is a potential for drug interactions.

Cautions Avanafil, sildenafil, tadalafil, and vardenafil should be used with caution in cardiovascular disease, left ventricular outflow obstruction, anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie's disease), and in those with a predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia). Concomitant treatment with a phosphodiesterase type-5 inhibitor and an alpha-blocker (section 2.5.4 and section 7.4.1) can increase the risk of postural hypotension—initiate treatment with a phosphodiesterase type-5 inhibitor (at a low dose) only once the patient is stable on the alpha-blocker; see also **interactions:** Appendix 1 (avanafil, sildenafil, tadalafil, vardenafil).

Contra-indications Avanafil, sildenafil, tadalafil, and vardenafil are contra-indicated in patients receiving nitrates, in patients in whom vasodilation or sexual activity are inadvisable, or in patients with a previous history of non-arteritic anterior ischaemic optic neuropathy. In the absence of information, manufacturers contra-indicate these drugs in hypotension (avoid if systolic blood pressure below 90 mmHg), recent stroke, unstable angina, and myocardial infarction.

Side-effects The side-effects of avanafil, sildenafil, tadalafil, and vardenafil include dyspepsia, nausea, vomiting, headache (including migraine), flushing, dizziness, myalgia, back pain, visual disturbances (non-arteritic anterior ischaemic optic neuropathy has been reported—stop drug if sudden visual impairment occurs), and nasal congestion. *Less common* side-effects include painful red eyes, palpitation, tachycardia, hypotension, hypertension, epistaxis. Other side-effects reported rarely include syncope, hypersensitivity reactions (including rash, facial oedema, and Stevens-Johnson syndrome), and priapism. Serious cardiovascular events (including arrhythmia, unstable angina, and myocardial infarction), seizures, sudden hearing loss (discontinue drug and seek medical advice), and retinal vascular occlusion have also been reported.

AVANAFIL

Indications erectile dysfunction

Cautions see notes above; also bleeding disorders or active peptic ulceration; **interactions:** Appendix 1 (avanafil)

Contra-indications see notes above; also life-threatening arrhythmia in previous 6 months; blood pressure >170/100 mmHg; mild to severe heart failure; hereditary degenerative retinal disorders

Hepatic impairment use lowest effective initial dose in mild to moderate impairment, adjusted according to response; manufacturer advises avoid in severe impairment—no information available

Renal impairment avoid if eGFR less than 30 mL/minute/1.73 m^2

Side-effects see notes above; also *less commonly* malaise, drowsiness; *rarely* dry mouth, gastritis, abdominal pain, diarrhoea, hyperbilirubinaemia, peripheral oedema, hyperactivity, insomnia, weight gain, genital irritation, pollakiuria, increased serum creatinine, gout, muscle spasms, haematuria

Dose

- ADULT over 18 years, initially 100 mg (patients on alpha-blocker therapy 50 mg) approx. 30 minutes before sexual activity, subsequent doses adjusted according to response to 50–200 mg as a single dose as needed; max. 1 dose in 24 hours (max. single dose 200 mg)
  Note Max. 100 mg once every 48 hours with concomitant moderate inhibitors of cytochrome P450 enzyme CYP3A4 e.g. aprepitant, diltiazem, erythromycin, fluconazole, fosamprenavir, or verapamil
  Note Onset of effect may be delayed if taken with food

Spedra® (Menarini) ▼ PoM NHS
Tablets, all yellow, avanafil 50 mg, net price 4-tab pack = £10.94, 8-tab pack = £19.70; 100 mg, 4-tab pack = £14.08, 8-tab pack = £26.26; 200 mg, 4-tab pack = £21.90, 8-tab pack = £39.40

SILDENAFIL

Indications erectile dysfunction; pulmonary hypertension (section 2.5.1)

Cautions see notes above; also bleeding disorders or active peptic ulceration; **interactions:** Appendix 1 (sildenafil)

Contra-indications see notes above; also hereditary degenerative retinal disorders

Hepatic impairment initial dose 25 mg; manufacturer advises avoid in severe impairment

Renal impairment initial dose 25 mg if eGFR less than 30 mL/minute/1.73 m^2

Side-effects see notes above; also *less commonly* chest pain, drowsiness, hypoaesthesia, vertigo, tinnitus, dry mouth, fatigue; *rarely* cerebrovascular accident and atrial fibrillation

Dose

- ADULT over 18 years initially 50 mg approx. 1 hour before sexual activity, subsequent doses adjusted according to response to 25–100 mg as a single dose as needed; max. 1 dose in 24 hours (max. single dose 100 mg)
  Note Onset of effect may be delayed if taken with food

[1]**Sildenafil** (Non-proprietary) PoM NHS
Tablets, sildenafil (as citrate), 25 mg, net price 4-tab pack = £1.08, 8-tab pack = £2.62; 50 mg, 4-tab pack = £1.15, 8-tab pack = £2.90; 100 mg, 4-tab pack = £1.23, 8-tab pack = £3.10

[1]**Nipatra®** (AMCo) PoM NHS
Chewable tablets, sildenafil (as citrate), 25 mg, net price 4-tab pack = £1.05, 8-tab pack = £2.10; 50 mg, 4-tab pack = £1.03, 8-tab pack = £2.06; 100 mg, 4-tab pack = £1.11, 8-tab pack = £2.22. Label: 24
Excipients include aspartame (section 9.4.1)

[1]**Viagra®** (Pfizer) PoM NHS
Tablets, all blue, f/c, sildenafil (as citrate), 25 mg, net price 4-tab pack = £16.59, 8-tab pack = £33.19; 50 mg, 4-tab pack = £21.27, 8-tab pack = £42.54; 100 mg, 4-tab pack = £23.50, 8-tab pack = £46.99

Revatio® (Pfizer) PoM
Section 2.5.1 (pulmonary hypertension)

TADALAFIL

Indications benign prostatic hyperplasia; erectile dysfunction; pulmonary hypertension (section 2.5.1)

Cautions see notes above; **interactions:** Appendix 1 (tadalafil)

Contra-indications see notes above; also mild to severe heart failure, uncontrolled arrhythmias, uncontrolled hypertension

Hepatic impairment max. dose 10 mg; manufacturer advises caution in severe impairment and for regular once-daily dosing—no information available

Renal impairment max. dose 10 mg if eGFR less than 30 mL/minute/1.73 m^2 (avoid regular once-daily dosing)

Side-effects see notes above; also increased sweating, abdominal pain, and transient amnesia reported

Dose

- Erectile dysfunction, ADULT over 18 years, initially 10 mg at least 30 minutes before sexual activity, subsequent doses adjusted according to response, up to 20 mg as a single dose; max. 1 dose in 24 hours (but daily dose of 10–20 mg not recommended); for patients who anticipate sexual activity at least twice weekly, 5 mg once daily can be taken, reduced to 2.5 mg once daily according to response
  Note Effect of intermittent dosing may persist for longer than 24 hours
- Benign prostatic hyperplasia, ADULT over 18 years, 5 mg once daily

1. NHS for treatment of erectile dysfunction except in men who:
   - have diabetes, multiple sclerosis, Parkinson's disease, poliomyelitis, prostate cancer, severe pelvic injury, single gene neurological disease, spina bifida, or spinal cord injury;
   - are receiving dialysis for renal failure;
   - have had radical pelvic surgery, prostatectomy (including transurethral resection of the prostate), or kidney transplant;
   - were receiving *Caverject®*, *Erecnos®*, *MUSE®*, *Viagra®*, or *Viridal®* for erectile dysfunction, at the expense of the NHS, on 14 September 1998;
   - are suffering severe distress as a result of impotence (prescribed in specialist centres only, see notes above).

   The prescription must be endorsed 'SLS'.

[1]**Cialis®** (Lilly) PoM NHS

Tablets, f/c, tadalafil 2.5 mg (orange), net price 28-tab pack = £54.99; 5 mg (light yellow), 28-tab pack = £54.99; 10 mg (light yellow), 4-tab pack = £26.99; 20 mg (yellow), 4-tab pack = £26.99; 8-tab pack = £53.98

VARDENAFIL

Indications erectile dysfunction

Cautions see notes above; also elderly; bleeding disorders or active peptic ulceration; susceptibility to prolongation of QT interval (including concomitant use of drugs which prolong QT interval); **interactions:** Appendix 1 (vardenafil)

Contra-indications see notes above; also hereditary degenerative retinal disorders

Hepatic impairment initial dose 5 mg in mild to moderate impairment, increased subsequently according to response (max. 10 mg in moderate impairment); manufacturer advises avoid in severe impairment

Renal impairment initial dose 5 mg if eGFR less than 30 mL/minute/1.73 m^2

Side-effects see notes above; also *less commonly* drowsiness, dyspnoea, increased lacrimation, photosensitivity; *rarely* anxiety, transient amnesia, hypertonia, and raised intra-ocular pressure

Dose

- See under preparations

[1]**Levitra®** (Bayer) PoM NHS

Tablets, all orange, f/c, vardenafil (as hydrochloride trihydrate) 5 mg, net price 4-tab pack = £7.56, 8-tab pack = £15.12; 10 mg, 4-tab pack = £14.08, 8-tab pack = £28.16; 20 mg, 4-tab pack = £23.48, 8-tab pack = £46.96

Dose ADULT over 18 years, initially 10 mg (patients on alpha-blocker therapy 5 mg) approx. 25–60 minutes before sexual activity, subsequent doses adjusted according to response up to max. 20 mg as a single dose; max. 1 dose in 24 hours

Note Onset of effect may be delayed if taken with high-fat meal

Orodispersible tablets, vardenafil (as hydrochloride) 10 mg, net price 4–tab pack = £17.88

Excipients include aspartame

Dose ADULT over 18 years, 10 mg approx. 25–60 minutes before sexual activity; max. 10 mg in 24 hours (dose form not suitable for patients with moderate hepatic impairment, or for initiation of therapy in patients taking alpha-blockers, or if eGFR less than 30 mL/minute/1.73m^2)

The *Scottish Medicines Consortium* (p. 4) has advised (September 2011) that vardenafil orodispersible tablets (*Levitra®*) are accepted for restricted use within NHS Scotland for men for whom an orodispersible tablet is an appropriate formulation.

Important *Levitra® 10 mg orodispersible* tablets and *Levitra® 10 mg film coated tablets* are **not** bioequivalent

1. NHS for treatment of erectile dysfunction except in men who:

- have diabetes, multiple sclerosis, Parkinson's disease, poliomyelitis, prostate cancer, severe pelvic injury, single gene neurological disease, spina bifida, or spinal cord injury;
- are receiving dialysis for renal failure;
- have had radical pelvic surgery, prostatectomy (including transurethral resection of the prostate), or kidney transplant;
- were receiving *Caverject®*, *Erecnos®*, *MUSE®*, *Viagra®*, or *Viridal®* for erectile dysfunction, at the expense of the NHS, on 14 September 1998;
- are suffering severe distress as a result of impotence (prescribed in specialist centres only, see notes above).

The prescription must be endorsed 'SLS'.

Papaverine and phentolamine

Although not licensed the smooth muscle relaxant **papaverine** has also been given by intracavernosal injection for erectile dysfunction. Patients with neurological or psychogenic impotence are more sensitive to the effect of papaverine than those with vascular abnormalities. **Phentolamine** is added if the response is inadequate [unlicensed indication].

Persistence of the erection for longer than 4 hours is an emergency, see advice in section 7.4.5.

7.4.6 Drugs for premature ejaculation

Dapoxetine is a short-acting selective serotonin reuptake inhibitor licensed for use in the treatment of premature ejaculation in men who meet all the following criteria: poor control over ejaculation, a history of premature ejaculation over the past 6 months, marked distress or interpersonal difficulty as a consequence of premature ejaculation, and an intravaginal ejaculatory latency time of less than two minutes.

DAPOXETINE

Indications premature ejaculation (see notes above)

Cautions bleeding disorders; concomitant use of drugs that increase risk of bleeding; epilepsy (*avoid* if uncontrolled, discontinue if convulsions develop); susceptibility to angle-closure glaucoma; **interactions**: Appendix 1 (dapoxetine)

Postural hypotension and syncope Postural hypotension and syncope reported. Test for postural hypotension before starting treatment—avoid dapoxetine if postural hypotension occurs. Patients should be advised to maintain hydration and to sit or lie down until prodromal symptoms such as nausea, dizziness, and sweating abate

Contra-indications significant cardiac disease; history of syncope; history of mania, bipolar disorder, or severe depression; discontinue if psychiatric disorder develops

Hepatic impairment avoid in moderate to severe impairment

Renal impairment use with caution if eGFR 30–80 mL/minute/1.73 m^2; avoid if eGFR less than 30 mL/minute/1.73 m^2

Side-effects nausea, vomiting, diarrhoea, constipation, abdominal pain, abdominal distension, dyspepsia, dry mouth, flushing, sweating, hypertension, malaise, irritability, dizziness, headache, anxiety, agitation, abnormal dreams, sleep disturbances, drowsiness, tremor, paraesthesia, impaired attention, sexual dysfunction, visual disturbances, tinnitus; *less commonly* syncope, sinus arrest, bradycardia, tachycardia, hypotension (including postural hypotension), restlessness, taste disturbances, depression, mood disturbances (discontinue), confusion, abnormal thoughts, vertigo, bruxism, mydriasis, eye pain, pru-

ritus; *rarely* defaecation urgency, sudden onset of sleep

Dose

- ADULT 18–64 years, initially 30 mg approx. 1–3 hours before sexual activity, subsequent doses adjusted according to response to max. 60 mg as a single dose; max. 1 dose in 24 hours; review treatment after 4 weeks (or 6 doses) and at least every 6 months thereafter

  Note Max. single dose 30 mg with concomitant aprepitant, clarithromycin, diltiazem, erythromycin, fluconazole, fosamprenavir, and verapamil; use 60-mg dose with caution with concomitant potent inhibitors of cytochrome P450 enzyme CYP2D6

Priligy® (Menarini) ▼ PoM

Tablets, f/c, dapoxetine (as hydrochloride), 30 mg (light grey), net price 3-tab pack = £14.71, 6-tab pack = £26.48; 60 mg (grey), 3-tab pack = £19.12, 6-tab pack = £34.42. Label: 2, 25, counselling, postural hypotension

8 Malignant disease and immunosuppression

8.1 Cytotoxic drugs

The chemotherapy of cancer is complex and should be confined to specialists in oncology. Cytotoxic drugs have both anti-cancer activity and the potential to damage normal tissue; most cytotoxic drugs are teratogenic. Chemotherapy may be given with a curative intent or it may aim to prolong life or to palliate symptoms. In an increasing number of cases chemotherapy may be combined with radiotherapy or surgery or both as either neoadjuvant treatment (initial chemotherapy aimed at shrinking the primary tumour, thereby rendering local therapy less destructive or more effective) or as adjuvant treatment (which follows definitive treatment of the primary disease, when the risk of subclinical metastatic disease is known to be high). All cytotoxic drugs cause side-effects and a balance has to be struck between likely benefit and acceptable toxicity.

Guidelines for handling cytotoxic drugs

- Trained personnel should reconstitute cytotoxics;
- Reconstitution should be carried out in designated pharmacy areas;
- Protective clothing (including gloves, gowns, and masks) should be worn;
- The eyes should be protected and means of first aid should be specified;
- Pregnant staff should avoid exposure to cytotoxic drugs (all females of child-bearing age should be informed of the reproductive hazard);
- Use local procedures for dealing with spillages and safe disposal of waste material, including syringes, containers, and absorbent material;
- Staff exposure to cytotoxic drugs should be monitored.

Combinations of cytotoxic drugs, as continuous or pulsed cycles of treatment, are frequently more toxic than single drugs but have the advantage in certain tumours of enhanced response, reduced development of drug resistance and increased survival. However for some tumours, single-agent chemotherapy remains the treatment of choice.

Cytotoxic drugs fall into a number of classes, each with characteristic antitumour activity, sites of action, and toxicity. A knowledge of sites of metabolism and excretion is important because impaired drug handling as a

result of disease is not uncommon and may result in enhanced toxicity.

Intrathecal chemotherapy

A Health Service Circular (HSC 2008/001) provides guidance on the introduction of safe practice in NHS Trusts where intrathecal chemotherapy is administered; written local guidance covering all aspects of national guidance should be available. Support for training programmes is also available.

Copies, and further information may be obtained from:

Department of Health
PO Box 777
London SE1 6XH
Fax: 01623 724524

It is also available from the Department of Health website (www.dh.gov.uk)

Safe systems for cytotoxic medicines NHS cancer networks have been established across the UK to bring together all stakeholders in all sectors of care, to work collaboratively to plan and deliver high quality cancer services for a given population. NHS cancer networks have websites containing information on local chemotherapy services and treatment (see www.cancer.nhs.uk/networks.htm).

Safe system requirements:

- cytotoxic drugs for the treatment of cancer should be given as part of a wider pathway of care coordinated by a multidisciplinary team;
- cytotoxic drugs should be prescribed, dispensed, and administered only in the context of a written protocol or treatment plan;
- injectable cytotoxic drugs should only be dispensed if they are prepared for administration
- oral cytotoxic medicines should be dispensed with clear directions for use

Risks of incorrect dosing of oral anti-cancer medicines

The National Patient Safety Agency has advised (January 2008) that the prescribing and use of oral cytotoxic medicines should be carried out to the same standard as parenteral cytotoxic therapy. Standards to be followed to achieve this include:

- non-specialists who prescribe or administer on-going oral cytotoxic medication should have access to written protocols and treatment plans, including guidance on the monitoring and treatment of toxicity
- staff dispensing oral cytotoxic medicines should confirm that the prescribed dose is appropriate for the patient. Patients should have written information that includes details of the intended oral anti-cancer regimen, the treatment plan, and arrangements for monitoring, taken from the original protocol from the initiating hospital. Staff dispensing oral cytotoxic medicines should also have access to this information, and to advice from an experienced cancer pharmacist in the initiating hospital

Doses

Doses of cytotoxic drugs are determined using a variety of different methods including body-surface area or body-weight. Alternatively, doses may be fixed. Doses may be further adjusted following consideration of a patient's neutrophil count, renal and hepatic function, and history of previous adverse effects to the cytotoxic drug. Doses may also differ depending on whether a drug is used alone or in combination.

Because of the complexity of dosage regimens in the treatment of malignant disease, dose statements have been omitted from some of the drug entries in this chapter. However, even where dose statements have been provided, detailed specialist literature, individual hospital chemotherapy protocols, or local cancer networks (www.cancer.nhs.uk/networks.htm) should be consulted before prescribing, dispensing, or administering cytotoxic drugs.

Prescriptions should **not** be repeated except on the instructions of a specialist.

Side-effects of cytotoxic drugs

Side-effects common to most cytotoxic drugs are discussed below whilst side-effects characteristic of a particular drug or class of drugs (e.g. neurotoxicity with vinca alkaloids) are mentioned in the appropriate sections. Manufacturers' product literature, hospital-trust protocols, and cancer-network protocols should be consulted for full details of side-effects associated with individual drugs and specific chemotherapy regimes.

Many side-effects of cytotoxic drugs often do not occur at the time of administration, but days or weeks later. It is therefore important that patients and healthcare professionals can identify symptoms that cause concern and can contact an expert for advice. Toxicities should be accurately recorded using a recognised scoring system such as the Common Toxicity Criteria for Adverse Events (CTCAE) developed by the National Cancer Institute.

Extravasation of intravenous drugs A number of cytotoxic drugs will cause severe local tissue necrosis if leakage into the extravascular compartment occurs. To reduce the risk of extravasation injury it is recommended that cytotoxic drugs are administered by appropriately trained staff. For information on the prevention and management of extravasation injury, see section 10.3.

Oral mucositis A sore mouth is a common complication of cancer chemotherapy; it is most often associated with fluorouracil, methotrexate, and the anthracyclines. It is best to prevent the complication. Good oral hygiene (rinsing the mouth frequently and effective brushing of the teeth with a soft brush 2–3 times daily) is probably beneficial. For fluorouracil, sucking ice chips during short infusions of the drug is also helpful.

Once a sore mouth has developed, treatment is much less effective. Saline mouthwashes should be used but there is no good evidence to support the use of antiseptic or anti-inflammatory mouthwashes. In general, mucositis is self-limiting but with poor oral hygiene it can be a focus for blood-borne infection.

Tumour lysis syndrome Tumour lysis syndrome occurs secondary to spontaneous or treatment-related rapid destruction of malignant cells. Patients at risk of tumour lysis syndrome include those with non-Hodgkin's lymphoma (especially if high grade and bulky disease), Burkitt's lymphoma, acute lymphoblastic leukaemia and acute myeloid leukaemia (particularly if high white blood cell counts or bulky disease), and occasionally those with solid tumours. Pre-existing hyperuricaemia, dehydration, and renal impairment are also predisposing factors. Features include hyperkalaemia, hyperuricaemia (see below), and hyperphosphataemia with hypocalcaemia; renal damage and arrhythmias can follow. Early identification of patients at risk, and initiation of prophylaxis or therapy for tumour lysis syndrome, is essential.

Hyperuricaemia Hyperuricaemia, which may be present in high-grade lymphoma and leukaemia, can be markedly worsened by chemotherapy and is associated with acute renal failure. Allopurinol (section 10.1.4) should be started 24 hours before treating such tumours and patients should be adequately hydrated. The dose of mercaptopurine or azathioprine should be reduced if allopurinol needs to be given concomitantly (see Appendix 1).

Rasburicase (section 10.1.4), a recombinant urate oxidase, is licensed for hyperuricaemia in patients with haematological malignancy, for details, see p. 730. It rapidly reduces plasma-uric acid concentration and may be of particular value in preventing complications following treatment of leukaemias or bulky lymphomas.

Nausea and vomiting Nausea and vomiting cause considerable distress to many patients who receive chemotherapy and to a lesser extent abdominal radiotherapy, and may lead to refusal of further treatment; prophylaxis of nausea and vomiting is therefore extremely important. Symptoms may be acute (occurring within 24 hours of treatment), delayed (first occurring more than 24 hours after treatment), or anticipatory (occurring prior to subsequent doses). Delayed and anticipatory symptoms are more difficult to control than acute symptoms and require different management.

Patients vary in their susceptibility to drug-induced nausea and vomiting; those affected more often include women, patients under 50 years of age, anxious patients, and those who experience motion sickness. Susceptibility also increases with repeated exposure to the cytotoxic drug.

Drugs may be divided according to their emetogenic potential and some examples are given below, but the symptoms vary according to the dose, to other drugs administered and to individual susceptibility.

Mildly emetogenic treatment—fluorouracil, etoposide, methotrexate (less than 100 mg/m^2), the vinca alkaloids, and abdominal radiotherapy.

Moderately emetogenic treatment—the taxanes, doxorubicin, intermediate and low doses of cyclophosphamide, mitoxantrone, and high doses of methotrexate (0.1–1.2 g/m^2).

Highly emetogenic treatment—cisplatin, dacarbazine, and high doses of cyclophosphamide.

Prevention of acute symptoms For patients at *low risk of emesis*, pretreatment with dexamethasone (6–10 mg by mouth) or lorazepam (1–2 mg by mouth) may be used.

For patients at *high risk of emesis*, a 5HT$_3$-receptor antagonist (section 4.6), usually given by mouth in combination with dexamethasone and the neurokinin receptor antagonist aprepitant is effective.

Prevention of delayed symptoms For delayed symptoms associated with moderately emetogenic chemotherapy, a combination of dexamethasone and 5HT$_3$-receptor antagonist is effective; for highly emetogenic chemotherapy, a combination of dexamethasone and aprepitant is effective. Metoclopramide is also licensed for delayed chemotherapy-induced nausea and vomiting.

Prevention of anticipatory symptoms Good symptom control is the best way to prevent anticipatory symptoms. Lorazepam can be helpful for its amnesic, sedative, and anxiolytic effects.

Bone-marrow suppression All cytotoxic drugs except vincristine and bleomycin cause bone-marrow suppression. This commonly occurs 7 to 10 days after administration, but is delayed for certain drugs, such as carmustine, lomustine, and melphalan. Peripheral blood counts must be checked before each treatment, and doses should be reduced or therapy delayed if bone-marrow has not recovered.

Cytotoxic drugs may be contra-indicated in patients with acute infection; any infection should be treated before, or when starting, cytotoxic drugs.

Fever in a neutropenic patient (neutrophil count less than 1.0×10^9/litre) requires immediate broad-spectrum antibacterial therapy. Appropriate bacteriological investigations should be conducted as soon as possible. Patients taking cytotoxic drugs who have signs or symptoms of infection should be advised to seek prompt medical attention. All patients should initially be investigated and treated under the supervision of the appropriate oncology or haematology specialist.

In selected patients, the duration and the severity of neutropenia can be reduced by the use of amifostine, p. 567 or recombinant human granulocyte-colony stimulating factors, section 9.1.6.

Symptomatic anaemia is usually treated with red blood cell transfusions. For guidance on the use of erythropoietins in patients with cancer, see MHRA/CHM advice (p. 653) and NICE guidance (p. 653).

For advice on the use of live vaccines in individuals with impaired immune response, see section 14.1.

Alopecia Reversible hair loss is a common complication, although it varies in degree between drugs and individual patients. No pharmacological methods of preventing this are available.

Pregnancy and reproductive function Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Exclude pregnancy before treatment with cytotoxic drugs. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.

Contraceptive advice should be given to men and women before cytotoxic therapy begins (and should cover the duration of contraception required after therapy has ended).

Regimens that do not contain an alkylating drug or procarbazine may have less effect on fertility, but those with an alkylating drug or procarbazine carry

the risk of causing permanent male sterility (there is no effect on potency). Pretreatment counselling and consideration of sperm storage may be appropriate. Women are less severely affected, though the span of reproductive life may be shortened by the onset of a premature menopause. No increase in fetal abnormalities or abortion rate has been recorded in patients who remain fertile after cytotoxic chemotherapy.

Thromboembolism Venous thromboembolism can be a complication of cancer itself, but chemotherapy increases the risk.

Treatment for cytotoxic-induced side-effects

Anthracycline side-effects

Anthracycline-induced cardiotoxicity The anthracycline cytotoxic drugs are associated with dose-related, cumulative, and potentially life-threatening cardiotoxic side-effects.

Dexrazoxane, an iron chelator, is licensed for the prevention of chronic cumulative cardiotoxicity caused by doxorubicin or epirubicin treatment in advanced or metastatic breast cancer patients who have received a prior cumulative dose of 300 mg/m^2 of doxorubicin or a prior cumulative dose of 540 mg/m^2 of epirubicin when further anthracycline treatment is required. Patients receiving dexrazoxane should still be monitored for cardiac toxicity. The myelosuppressive effects of dexrazoxane may be additive to those of chemotherapy. The use of dexrazoxane is restricted to adults with advanced or metastatic breast cancer. Dexrazoxane is contra-indicated in children.

Anthracycline extravasation Dexrazoxane is licensed for the treatment of anthracycline extravasation. The first dose should be given as soon as possible and within six hours after the injury. For further information on the prevention and management of extravasation injury, see section 10.3.

Local guidelines for the management of extravasation should be followed or specialist advice sought.

DEXRAZOXANE

Indications see notes above and under preparations

Cautions see notes above; monitor full blood count

Hepatic impairment monitor liver function

Renal impairment use with caution—risk of accumulation; manufacturer of *Cardioxane*® advises reduce dose by 50% if creatinine clearance less than 40 mL/minute

Pregnancy avoid unless essential (toxicity in *animal* studies); ensure effective contraception during and for at least 3 months after treatment in men and women

Breast-feeding discontinue breast-feeding

Side-effects nausea, vomiting, dyspepsia, abdominal pain, diarrhoea, stomatitis, dry mouth, anorexia; dyspnoea; dizziness, syncope, asthenia, paraesthesia, tremor, fatigue, drowsiness; pyrexia; vaginal haemorrhage; myalgia; blood disorders (including anaemia, leucopenia, neutropenia, thrombocytopenia, and increased myelosuppression); alopecia, pruritus; peripheral oedema, injection-site reactions including phlebitis; *also reported* secondary malignancies

Dose

- See under preparations

Cardioxane® (Clinigen) PoM

Intravenous infusion, powder for reconstitution, dexrazoxane (as hydrochloride), net price 500-mg vial = £156.57

Dose prevention of anthracycline-induced cardiotoxicity, ADULT over 18 years, by intravenous infusion (30 minutes before anthracycline administration), 10 times the doxorubicin-equivalent dose or 10 times the epirubicin-equivalent dose

Savene® (Norgine) PoM

Intravenous infusion, powder for reconstitution, dexrazoxane (as hydrochloride), net price 10 x 500-mg vials (with diluent) = £6750.00

Dose anthracycline extravasation, ADULT over 18 years, by intravenous infusion, 1 g/m^2 (max. 2 g) daily for 2 days, then 500 mg/m^2 for 1 day

Note Local coolants such as ice packs should be removed at least 15 minutes before administration

Chemotherapy-induced mucositis and myelosuppression

Folinic acid (given as calcium folinate) is used to counteract the folate-antagonist action of methotrexate and thus speed recovery from methotrexate-induced mucositis or myelosuppression ('folinic acid rescue').

Folinic acid is also used in the management of methotrexate overdose, together with other measures to maintain fluid and electrolyte balance, and to manage possible renal failure.

Folinic acid does not counteract the antibacterial activity of folate antagonists such as trimethoprim.

When folinic acid and fluorouracil are used together in metastatic colorectal cancer the response-rate improves compared to that with fluorouracil alone.

The calcium salt of **levofolinic acid**, a single isomer of folinic acid, is also used for rescue therapy following methotrexate administration, for cases of methotrexate overdose, and for use with fluorouracil for colorectal cancer. The dose of calcium levofolinate is generally half that of calcium folinate.

The disodium salts of folinic acid and levofolinic acid are also used for rescue therapy following methotrexate therapy, and for use with fluorouracil for colorectal cancer.

Palifermin, a human keratinocyte growth factor, is licensed for the management of oral mucositis in patients with haematological malignancies receiving myeloablative radiochemotherapy with autologous haematopoietic stem-cell support.

FOLINIC ACID

Indications see notes above

Cautions avoid simultaneous administration of methotrexate; **not** indicated for pernicious anaemia or other megaloblastic anaemias caused by vitamin B_{12} deficiency; **interactions:** Appendix 1 (folates)

Contra-indications intrathecal injection

Pregnancy not known to be harmful; benefit outweighs risk

Breast-feeding presence in milk unknown but benefit outweighs risk

Side-effects *rarely* pyrexia after parenteral use; insomnia, agitation, and depression after high doses

Dose

- See under preparations

Calcium folinate

(Calcium leucovorin)

Calcium Folinate (Non-proprietary) PoM

Tablets, scored, folinic acid (as calcium salt) 15 mg, net price 10-tab pack = £47.46, 30-tab pack = £85.74

Brands include *Refolinon*®

Note Not all strengths and pack sizes are available from all manufacturers

Injection, folinic acid (as calcium salt) 3 mg/mL, net price 1-mL amp = £4.00, 10-mL amp = £4.62; 7.5 mg/mL, net price 2-mL amp = £7.80; 10 mg/mL, net price 5-mL vial = £19.41, 10-mL vial = £34.94, 30-mL vial = £89.95, 35-mL vial = £90.98

Brands include *Refolinon*®

Note Not all strengths and pack sizes are available from all manufacturers

Injection, powder for reconstitution, folinic acid (as calcium salt), net price 15-mg vial = £4.46; 30-mg vial = £8.36

Dose

Note Doses expressed as folinic acid

Prevention of methotrexate-induced adverse effects, usually started 12–24 hours after start of methotrexate infusion, by intramuscular injection, *or* by intravenous injection, *or* by intravenous infusion, 15 mg, repeated every 6 hours for 24 hours (may be continued by mouth); consult local treatment protocol for further information

Suspected methotrexate overdosage, by intravenous injection or by intravenous infusion (at a max. rate of 160 mg/minute), initial dose equal to or exceeding dose of methotrexate; consult poisons information service (p. 33) for advice on continuing management

Adjunct to fluorouracil in colorectal cancer, consult product literature

Disodium folinate

Sodiofolin® (Medac) PoM

Injection, folinic acid (as disodium salt) 50 mg/mL, net price 2-mL vial = £35.09, 8-mL vial = £126.25

Dose as an antidote to methotrexate, by intravenous injection or infusion, consult product literature

Adjunct to fluorouracil in colorectal cancer, consult product literature

LEVOFOLINIC ACID

Note Levofolinic acid is an isomer of folinic acid

Indications see notes above

Cautions see Folinic acid

Contra-indications see Folinic acid

Pregnancy see Folinic acid

Breast-feeding see Folinic acid

Side-effects see Folinic acid

Dose

- See under preparations

Calcium levofolinate

Calcium Levofolinate (Non-proprietary) PoM

Injection, levofolinic acid (as calcium salt) 10 mg/mL, net price 17.5-mL vial = £84.63

Isovorin® (Pfizer) PoM

Injection, levofolinic acid (as calcium salt) 10 mg/mL, net price 2.5-mL vial = £11.62, 17.5-mL vial = £81.33

Dose

Note Doses expressed as levofolinic acid

Prevention of methotrexate-induced adverse effects, (usually started 12–24 hours after beginning of methotrexate infusion), by intramuscular injection, *or* by intravenous injection *or* by intravenous infusion, usually 7.5 mg every 6 hours for 10 doses

Suspected methotrexate overdosage, by intravenous injection *or* by intravenous infusion (at a max. rate of 160 mg/minute), initial dose at least 50% of the dose of methotrexate; consult poisons information service (p. 33) for advice on continuing management

Adjunct to fluorouracil in colorectal cancer, consult product literature

Disodium levofolinate

Levofolinic Acid (Non-proprietary) PoM

Injection, levofolinic acid (as disodium salt) 50 mg/mL, net price 1-mL vial = £24.70, 4-mL vial = £80.40

Dose as an antidote to methotrexate, by intravenous injection or infusion, consult product literature

Adjunct to fluorouracil in colorectal cancer, consult product literature

PALIFERMIN

Indications see notes above

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies

Breast-feeding manufacturer advises avoid—no information available

Side-effects oral paraesthesia, taste disturbance, thickening and discoloration of tongue; fever; oedema; arthralgia; rash, pruritus, erythema, skin hyperpigmentation

Dose

- By intravenous injection, 60 micrograms/kg once daily for 3 doses (third dose given 24–48 hours before myeloablative therapy) then 3 further doses at least 24 hours after myeloablative therapy, and more than 4 days after most recent palifermin injection, starting on same day as (but after) stem-cell infusion; CHILD not recommended

Kepivance® (Swedish Orphan) ▼ PoM

Injection, powder for reconstitution, palifermin, net price 6.25-mg vial = £544.24

Chemotherapy-induced neutropenic infection and nephrotoxicity

Amifostine is licensed for the reduction of risk of infection associated with cisplatin- and cyclophosphamide-induced neutropenia in advanced ovarian carcinoma, and for the reduction of nephrotoxicity caused by cisplatin use in advanced solid tumours of non-germ-cell origin. Amifostine is also licensed for protection against xerostomia during radiotherapy for head and neck cancer.

Other drugs for the reduction of risk of infection associated with neutropenia include granulocyte-colony stimulating factors (section 9.1.6).

AMIFOSTINE

Indications see under Dose

Cautions ensure adequate hydration before treatment; infuse with patient supine and monitor arterial blood pressure (interrupt infusion if blood pressure decreases significantly, consult product literature); during chemotherapy interrupt antihypertensive therapy 24 hours before treatment with amifostine and monitor closely; during radiotherapy monitor closely if concomitant antihypertensive therapy; monitor serum-calcium concentration in patients at risk of hypocalcaemia; patients at risk of renal impairment; caution in handling—risk of cutaneous reactions

Hepatic impairment avoid—no information available

Renal impairment avoid—no information available

Pregnancy toxicity in *animal* studies; avoid

Breast-feeding avoid—no information available

Side-effects nausea, vomiting, hiccups; hypotension (managed by infusion of sodium chloride 0.9% and postural management), hypertension, flushing, arrhythmias (including *rarely* atrial fibrillation, supraventricular tachycardia); sneezing; drowsiness, dizziness, syncope; hypocalcaemia; *rarely* chest pain, apnoea, seizures, serious skin reactions (including Stevens-Johnson syndrome, toxic epidermal necrolysis, and *very rarely* exfoliative and bullous dermatitis, toxicoderma), and renal failure; *very rarely* myocardial infarction, laryngeal oedema, and respiratory arrest

Dose

- Reduction of neutropenia-related risk of infection due to cyclophosphamide and cisplatin treatment in patients with advanced ovarian carcinoma, by intravenous infusion over 15 minutes, ADULT under 70 years, 910 mg/m^2 started within 30 minutes before chemotherapy (reduced to 740 mg/m^2 for subsequent cycles if full dose could not be given first time due to hypotension lasting more than 5 minutes after interruption, consult product literature)
- Reduction of nephrotoxicity associated with cisplatin in patients with advanced solid tumours of non-germ-cell origin, consult product literature
- Prevention of xerostomia during radiotherapy for head and neck cancer, consult product literature

Ethyol® (Genopharm) PoM

Intravenous infusion, powder for reconstitution, amifostine, net price 500-mg vial = £144.00

Urothelial toxicity

Haemorrhagic cystitis is a common manifestation of urothelial toxicity which occurs with the oxazaphosphorines, cyclophosphamide and ifosfamide; it is caused by the metabolite acrolein. **Mesna** reacts specifically with this metabolite in the urinary tract, preventing toxicity. Mesna is used routinely (preferably by mouth) in patients receiving ifosfamide, and in patients receiving cyclophosphamide by the intravenous route at a high dose (e.g. more than 2 g) or in those who experienced urothelial toxicity when given cyclophosphamide previously.

MESNA

Indications see notes above

Cautions false positive urinary ketones; false positive or false negative urinary erythrocytes

Contra-indications hypersensitivity to thiol-containing compounds

Pregnancy not known to be harmful; see also Pregnancy and Reproductive Function, p. 564

Side-effects nausea, vomiting, colic, diarrhoea, fatigue, headache, limb and joint pains, depression, irritability, rash, hypotension and tachycardia; *rarely* hypersensitivity reactions (more common in patients with auto-immune disorders)

Dose

- Calculated according to oxazaphosphorine (cyclophosphamide or ifosfamide) treatment—consult product literature

Mesna (Baxter) PoM

Tablets, f/c, mesna 400 mg, net price 10-tab pack = £42.90; 600 mg, 10-tab pack = £61.10

Injection, mesna 100 mg/mL, net price 4-mL amp = £3.95; 10-mL amp = £9.77

Note For oral administration contents of ampoule are taken in a flavoured drink such as orange juice or cola which may be stored in a refrigerator for up to 24 hours in a sealed container

8.1.1 Alkylating drugs

Extensive experience is available with these drugs, which are among the most widely used in cancer chemotherapy. They act by damaging DNA, thus interfering with cell replication. In addition to the side-effects common to many cytotoxic drugs (section 8.1), there are two problems associated with prolonged usage. Firstly, gametogenesis is often severely affected (section 8.1). Secondly, prolonged use of these drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

Cyclophosphamide is used mainly in combination with other agents for treating a wide range of malignancies, including some leukaemias, lymphomas, and solid tumours. It is given by mouth or intravenously; it is inactive until metabolised by the liver. A urinary metabolite of cyclophosphamide, acrolein, can cause haemorrhagic cystitis; this is a rare but serious complication; increased fluid intake for 24–48 hours after intravenous injection, can prevent this complication. When high-dose therapy (e.g. more than 2 g intravenously) is used or when the patient is considered to be at high risk of cystitis (e.g. because of pelvic irradiation), mesna (given initially intravenously then by mouth) can also help prevent cystitis—see under Urothelial Toxicity (section 8.1).

Ifosfamide is related to cyclophosphamide and is given intravenously; mesna (section 8.1) is routinely given with it to reduce urothelial toxicity.

Chlorambucil is used either alone or in combination therapy for some lymphomas and chronic leukaemias. It is given by mouth. Side-effects, apart from bone-marrow suppression, are uncommon. However, patients occasionally develop severe widespread rashes which can progress to Stevens-Johnson syndrome or to toxic epidermal necrolysis. If a rash occurs further chlorambucil is contra-indicated and cyclophosphamide is substituted.

Melphalan is licensed for the treatment of multiple myeloma, polycythaemia vera, childhood neuroblastoma, advanced ovarian adenocarcinoma, and advanced breast cancer. However, in practice, melphalan is rarely used for ovarian adenocarcinoma; it is no longer used for advanced breast cancer. Melphalan is also licensed

for regional arterial perfusion in localised malignant melanoma of the extremities and localised soft-tissue sarcoma of the extremities. Interstitial pneumonitis and life-threatening pulmonary fibrosis are rarely associated with melphalan.

Busulfan is given by mouth to treat chronic myeloid leukaemia. Busulfan given by mouth or intravenously, followed by cyclophosphamide, is also licensed as conditioning treatment before haematopoietic stem-cell transplantation in adults and children. Frequent blood tests are necessary because excessive myelosuppression may result in irreversible bone-marrow aplasia. Rarely, progressive pulmonary fibrosis is associated with busulfan. Skin hyperpigmentation is a common side-effect of oral therapy.

Lomustine is a lipid-soluble nitrosourea and is given by mouth. It is used mainly to treat Hodgkin's disease resistant to conventional therapy, malignant melanoma and certain solid tumours. Bone-marrow toxicity is delayed, and the drug is therefore given at intervals of 4 to 6 weeks. Permanent bone-marrow damage can occur with prolonged use. Nausea and vomiting are common and moderately severe.

Bendamustine given intravenously is licensed for the treatment of chronic lymphocytic leukaemia, non-Hodgkin's lymphoma, and for the treatment of multiple myeloma.

The *Scottish Medicines Consortium* (p. 4) has advised (March 2011) that bendamustine (*Levact*®) is accepted for restricted use within NHS Scotland for the treatment of chronic lymphocytic leukaemia in patients for whom fludarabine combination chemotherapy is not appropriate.

NICE guidance

Bendamustine for the first-line treatment of chronic lymphocytic leukaemia (February 2011)

Bendamustine is recommended as an option for the treatment of chronic lymphocytic leukaemia in patients for whom fludarabine combination chemotherapy is not appropriate.

www.nice.org.uk/TA216

Carmustine given intravenously has similar activity to lomustine; it is given to patients with multiple myeloma, non-Hodgkin's lymphomas, and brain tumours. Cumulative renal damage and delayed pulmonary fibrosis may occur with intravenous use. Carmustine implants are licensed for intralesional use in adults for the treatment of recurrent glioblastoma multiforme as an adjunct to surgery. Carmustine implants are also licensed for high-grade malignant glioma as adjunctive treatment to surgery and radiotherapy.

NICE guidance (carmustine implants and temozolomide for the treatment of newly diagnosed high-grade glioma)

See p. 590

Estramustine is a combination of an oestrogen and chlormethine used predominantly in prostate cancer. It is given by mouth and has both an antimitotic effect and (by reducing testosterone concentration) a hormonal effect.

Treosulfan is given by mouth or by intravenous or intraperitoneal administration and is used to treat ovarian cancer. Skin pigmentation is a common side-effect and allergic alveolitis, pulmonary fibrosis and haemorrhagic cystitis occur rarely.

Thiotepa is licensed in combination with other chemotherapy as conditioning treatment in adults and children with haematological disease or solid tumours before haematopoietic stem cell transplantation.

Mitobronitol is occasionally used to treat chronic myeloid leukaemia; it is available on a named-patient basis from specialist importing companies, see p. 1104.

BENDAMUSTINE HYDROCHLORIDE

Indications see notes above

Cautions see section 8.1; cardiac disorders—monitor serum potassium and ECG; avoid in acute porphyria (but see section 9.8.2); **interactions**: see Appendix 1 (bendamustine)

Contra-indications jaundice; severe bone marrow suppression, low leucocyte or platelet count; major surgery less than 30 days before start of treatment

Hepatic impairment consider a 30% dose reduction in moderate impairment; avoid in severe impairment

Renal impairment no information available on use in patients with creatinine clearance less than 10 mL/minute

Pregnancy avoid (teratogenic and mutagenic in *animal* studies); effective contraception required during treatment in men or women, and for 6 months after treatment in men; see also Pregnancy and Reproductive function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1; also anorexia, diarrhoea, constipation, haemorrhage, hypotension, hypertension, palpitation, angina, arrhythmias, respiratory dysfunction, insomnia, pain, chills, malaise, infection, pyrexia, amenorrhoea, dehydration, electrolyte disturbances (including hypokalaemia); *less commonly* pericardial effusion; *rarely* acute circulatory failure, drowsiness, voice changes, sweating; *very rarely* taste disturbance, tachycardia, myocardial infarction, cardiac failure, pulmonary fibrosis, paraesthesia, peripheral neuropathy, neurological disorders, ataxia, anticholinergic syndrome, encephalitis, phlebitis, multiple organ failure, haemolysis; *also reported* secondary tumours, Stevens-Johnson syndrome, toxic epidermal necrolysis

Dose

- See Doses, p. 563

Levact® (Napp) ▼ PoM

Injection, powder for reconstitution, bendamustine hydrochloride, net price 25-mg vial = £69.45; 100-mg vial = £275.81

BUSULFAN

(Busulphan)

Indications see notes above

Cautions see section 8.1 and notes above; monitor cardiac and liver function; ineffective once in blast crisis phase; high dose or history of seizures—antiepileptic prophylaxis required; previous radiation therapy, three or more cycles of chemotherapy, or previous progenitor cell transplant—increased risk of hepatic veno-occlusive disease; discontinue if lung toxicity develops; risk of second malignancy; avoid in

acute porphyria (but see section 9.8.2); **interactions**: Appendix 1 (busulfan)

Hepatic impairment manufacturer advises caution and regular liver function tests—consult product literature

Pregnancy avoid (teratogenic in *animals*); manufacturers advise effective contraception during and for 6 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above; also hepatotoxicity (including hepatic veno-occlusive disease, hyperbilirubinaemia, jaundice and fibrosis); cardiac tamponade in thalassaemia; pneumonia; skin hyperpigmentation; *rarely* seizures, aplastic anaemia, visual disturbances; *very rarely* myasthenia gravis, gynaecomastia

Dose

Dose may need to be calculated based on body surface area or adjusted ideal body weight in obese patients—consult product literature

- Chronic myeloid leukaemia, induction of remission, by mouth, 60 micrograms/kg daily (max. 4 mg); maintenance, usually 0.5–2 mg daily
- Conditioning treatment before haematopoietic stem-cell transplantation, by mouth *or* by intravenous infusion, consult product literature

Myleran® (Alkopharma) PoM
Tablets, f/c, busulfan 2 mg, net price 25-tab pack = £65.22

Busilvex® (Fabre) PoM
Concentrate for intravenous infusion, busulfan 6 mg/mL, net price 10-mL vial = £201.25

CARMUSTINE

Indications see notes above

Cautions see section 8.1 and notes above; avoid in acute porphyria (but see section 9.8.2); **interactions**: Appendix 1 (carmustine)

Pregnancy avoid (teratogenic and embryotoxic in *animals*); manufacturer advises effective contraception during treatment in men or women; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above; irritant to tissues

Dose

- See Doses, p. 563

Gliadel® (Archimedes) PoM
Implant, carmustine 7.7 mg, net price = £650.38

CHLORAMBUCIL

Indications see notes above

Cautions see section 8.1 and notes above; history of epilepsy and children with nephrotic syndrome (increased risk of seizures); avoid in acute porphyria (but see section 9.8.2)

Hepatic impairment manufacturer advises consider dose reduction in severe impairment—limited information available

Pregnancy avoid; manufacturer advises effective contraception during treatment in men or women; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above

Dose

- See Doses, p. 563

Leukeran® (Alkopharma) PoM
Tablets, f/c, brown, chlorambucil 2 mg, net price 25-tab pack = £40.51

CYCLOPHOSPHAMIDE

Indications see notes above; rheumatoid arthritis (section 10.1.3)

Cautions see section 8.1 and notes above; previous or concurrent mediastinal irradiation—risk of cardiotoxicity; diabetes mellitus; avoid in acute porphyria (but see section 9.8.2); **interactions:** Appendix 1 (cyclophosphamide)

Contra-indications haemorrhagic cystitis

Hepatic impairment reduce dose—consult local treatment protocol for details

Renal impairment reduce dose if serum creatinine concentration greater than 120 micromol/litre

Pregnancy avoid (manufacturer advises effective contraception during and for at least 3 months after treatment in men or women); see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding during and for 36 hours after stopping treatment

Side-effects see section 8.1 and notes above; also anorexia; pancreatitis; cardiotoxicity at high doses; interstitial pulmonary fibrosis; inappropriate secretion of anti-diuretic hormone, disturbances of carbohydrate metabolism; urothelial toxicity; pigmentation of palms, nails, and soles: *rarely* hepatotoxicity and renal dysfunction

Dose

- See Doses, p. 563

Cyclophosphamide (Non-proprietary) PoM
Tablets, s/c, cyclophosphamide (anhydrous) 50 mg, net price 100 = £70.70. Label: 25, 27
Injection, powder for reconstitution, cyclophosphamide, net price 500-mg vial = £9.20; 1-g vial = £17.06

ESTRAMUSTINE PHOSPHATE

Indications prostate cancer

Cautions see section 8.1; cerebrovascular or cardiovascular disease; diabetes; hypertension; hypercalcaemia; congestive heart failure, epilepsy, migraine or other conditions which might be aggravated by fluid retention; avoid in acute porphyria (but see section 9.8.2); **interactions**: Appendix 1 (estramustine)

Contra-indications peptic ulceration, severe cardiovascular disease, thromboembolic disorders

Hepatic impairment manufacturer advises caution and regular liver function tests; avoid in severe impairment

Renal impairment manufacturer advises caution

Pregnancy men should use effective contraceptive methods during treatment

Side-effects see section 8.1; also diarrhoea, congestive heart failure, ischaemic heart disease, myocardial infarction, oedema (rarely angioedema) impotence, gynaecomastia; altered liver function, altered endocrine function

Dose

- 0.14–1.4 g daily in divided doses (usual initial dose 560–840 mg daily)

  Counselling Each dose should be taken not less than 1 hour before or 2 hours after meals and should not be taken with products containing calcium, magnesium or aluminium, including dairy products and antacid medication

Estracyt® (Pharmacia) PoM

Capsules, estramustine phosphate 140 mg (as disodium salt), net price 100-cap pack = £171.28. Label: 5, 23, counselling, see above

IFOSFAMIDE

Indications see notes above

Cautions see section 8.1 and notes above; ensure satisfactory electrolyte balance and renal function before each course (risk of tubular dysfunction, Fanconi's syndrome or diabetes insipidus if renal toxicity not treated promptly); diabetes mellitus; avoid in acute porphyria (but see section 9.8.2); **interactions:** Appendix 1 (ifosfamide)

Contra-indications urinary-tract obstruction; acute infection (including urinary-tract infection); urothelial damage

Hepatic impairment avoid

Renal impairment avoid if serum creatinine concentration greater than 120 micromol/litre

Pregnancy avoid (teratogenic and carcinogenic in *animals*); manufacturer advises adequate contraception during and for at least 6 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above; also drowsiness, confusion, disorientation, restlessness, psychosis; urothelial toxicity, renal toxicity (see Cautions above); *less commonly* severe encephalopathy; *rarely* diarrhoea, constipation, convulsions, anorexia, *very rarely* jaundice, thrombophlebitis, syndrome of inappropriate antidiuretic hormone secretion; acute pancreatitis, arrhythmias, and heart failure also reported

Dose

- See Doses, p. 563

Ifosfamide (Non-proprietary) PoM

Injection, powder for reconstitution, ifosfamide, net price 1-g vial = £66.08; 2-g vial = £130.04 (hosp. only)

LOMUSTINE

Indications see notes above

Cautions see section 8.1 and notes above; avoid in acute porphyria (but see section 9.8.2); **interactions**: Appendix 1 (lomustine)

Contra-indications coeliac disease

Renal impairment avoid in severe impairment

Pregnancy avoid (manufacturer advises effective contraception during and for at least 6 months after treatment in men or women); see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above

Dose

- Used alone, 120–130 mg/m^2 body-surface every 6–8 weeks

Lomustine (Medac) PoM

Capsules, blue/clear, lomustine 40 mg, net price 20-cap pack = £455.62

Note The brand name *CCNU®* has been used for lomustine capsules

MELPHALAN

Indications see notes above

Cautions see section 8.1 and notes above; avoid in acute porphyria (but see section 9.8.2); **interactions:** Appendix 1 (melphalan)

Renal impairment reduce dose initially (consult product literature)

Pregnancy avoid (manufacturer advises adequate contraception during treatment in men or women); see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above

Dose

- By mouth, multiple myeloma, dose may vary according to regimen; typical dose 150 micrograms/kg daily for 4 days, repeated every 6 weeks

  Polycythaemia vera, initially, 6–10 mg daily reduced after 5–7 days to 2–4 mg daily until satisfactory response then further reduce to 2–6 mg **per week**
- By intravenous injection *or* infusion *or* regional arterial perfusion, consult product literature

Alkeran® (Genopharm) PoM

Tablets, melphalan 2 mg, net price 25-tab pack = £42.88

Injection, powder for reconstitution, melphalan 50 mg (as hydrochloride), net price 50-mg vial (with solvent-diluent) = £129.81

THIOTEPA

Indications see notes above

Cautions see section 8.1; avoid in acute porphyria (but see section 9.8.2); **interactions:** Appendix 1 (thiotepa)

Pregnancy avoid (teratogenic and embryotoxic in *animals*); see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1

Dose

- See Doses, p. 563

Tepadina® (Adienne) PoM

Injection, powder for reconstitution, thiotepa, net price 15-mg vial = £123.00; 100-mg vial = £736.00

Note The *Scottish Medicines Consortium* (p. 4) has advised (June 2012) that thiotepa (*Tepadina®*) is **not** recommended for use within NHS Scotland in combination with other chemotherapy as conditioning treatment in adults or children with haematological diseases, or solid tumours prior to haematopoietic stem cell transplantation.

TREOSULFAN

Indications see notes above

Cautions see section 8.1; avoid in acute porphyria (but see section 9.8.2)

Pregnancy avoid; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above

Dose

- Consult product literature

Treosulfan (Medac) PoM

Capsules, treosulfan 250 mg, net price 100-cap pack = £565.54. Label: 25

Injection, powder for reconstitution, treosulfan, net price 1 g = £39.44; 5 g = £152.41 (both in infusion bottle with transfer needle)

8.1.2 Anthracyclines and other cytotoxic antibiotics

Drugs in this group are widely used. Many cytotoxic antibiotics act as radiomimetics and simultaneous use of radiotherapy should be **avoided** because it may markedly increased toxicity.

Daunorubicin, **doxorubicin**, **epirubicin** and **idarubicin** are anthracycline antibiotics. Mitoxantrone is an anthracycline derivative.

Doxorubicin is used to treat the acute leukaemias, Hodgkin's and non-Hodgkin's lymphomas, paediatric malignancies, and some solid tumours including breast cancer. It is given by injection into a fast-running infusion, commonly at 21-day intervals. Extravasation can cause severe tissue necrosis. Doxorubicin is largely excreted in the bile and an elevated bilirubin concentration is an indication for reducing the dose. Diarrhoea, dehydration, and red coloration of the urine can commonly occur, and renal damage has been reported. Supraventricular tachycardia related to drug administration is an uncommon complication. Higher cumulative doses are associated with cardiomyopathy and it is usual to limit total cumulative doses to 450 mg/m^2 because symptomatic and potentially fatal heart failure is common above this dose. Patients should be assessed before treatment by echocardiography; the elderly, and those with cardiac disease, hypertension, or who have received myocardial irradiation, should be treated cautiously. Cardiac monitoring may assist in determining safe dosage. Caution is necessary with concomitant use of cardiotoxic drugs, or drugs that reduce cardiac contractility. Some evidence suggests that weekly low-dose administration may be less cardiotoxic. Doxorubicin is also given by bladder instillation for the treatment of transitional cell carcinoma, papillary bladder tumours and carcinoma *in-situ*.

Liposomal formulations of doxorubicin for intravenous use are also available. They may reduce the incidence of cardiotoxicity and lower the potential for local necrosis, but infusion reactions, sometimes severe, may occur. Hand-foot syndrome (painful, macular reddening skin eruptions) occurs commonly with liposomal doxorubicin and may be dose limiting. It can occur after 2–3 treatment cycles and may be prevented by cooling hands and feet and avoiding socks, gloves, or tight-fitting footwear for 4–7 days after treatment.

NICE guidance (paclitaxel, pegylated liposomal doxorubicin and topotecan for second-line or subsequent treatment of advanced ovarian cancer)

See p. 594

Epirubicin is structurally related to doxorubicin and clinical trials suggest that it is as effective in the treatment of breast cancer. A maximum cumulative dose of 0.9–1 g/m^2 is recommended to help avoid cardiotoxicity. Like doxorubicin it is given intravenously and by bladder instillation. Hyperpigmentation of skin, nails, and oral mucosa, and red coloration of the urine, may occur.

Idarubicin has general properties similar to those of doxorubicin; it is mostly used in the treatment of haematological malignancies. Diarrhoea, abdominal pain, haemorrhage, cardiac disorders, rash, and red pigmentation of the urine are commonly reported. Skin and nail hyperpigmentation have been reported less frequently. Idarubicin is given intravenously and it may also be given by mouth.

Daunorubicin also has general properties similar to those of doxorubicin. It should be given by intravenous infusion and is indicated for acute leukaemias. A liposomal formulation for intravenous use is licensed for advanced AIDS-related Kaposi's sarcoma.

Use with trastuzumab

Concomitant use of anthracyclines with trastuzumab (section 8.1.5) is associated with cardiotoxicity; for details, see p. 612.

Mitoxantrone is structurally related to doxorubicin; it is used for metastatic breast cancer. Mitoxantrone is also licensed for treatment of non-Hodgkin's lymphoma, adult acute non-lymphocytic leukaemia, and non-resectable primary hepatocellular carcinoma. It is given intravenously and is well tolerated, but myelosuppression and dose-related cardiotoxicity occur; cardiac examinations are recommended after a cumulative dose of 160 mg/m^2.

Pixantrone is licensed as monotherapy for the treatment of refractory or multiply relapsed aggressive non-Hodgkin B-cell lymphomas, although the benefits of using it as a fifth-line or greater chemotherapy in refractory patients has not been established. Baseline investigations should include a full blood count, assessment of cardiac function measured by left ventricular ejection fraction, and measurement of serum concentrations of total bilirubin and total creatinine. Severe myelosuppression is a common side-effect, and cardiotoxicity may occur during or following treatment; full blood count and cardiac function should be monitored throughout treatment. Patients with cardiac risk factors should have the risks and benefits of treatment carefully assessed. Photosensitivity is a theoretical risk and patients should be advised to follow sun protection strategies.

NICE guidance

Pixantrone monotherapy for treating multiply relapsed or refractory aggressive non-Hodgkin's B-cell lymphoma (February 2014)

Pixantrone monotherapy is recommended as an option for treating adults with multiply relapsed or refractory aggressive non-Hodgkin's B-cell lymphoma in patients:

- who have previously been treated with rituximab **and**
- who are receiving third- or fourth-line treatment **and**
- if the manufacturer provides pixantrone with the discount agreed in the patient access scheme

www.nice.org.uk/TA306

Bleomycin is given intravenously or intramuscularly to treat metastatic germ cell cancer and, in some regimens,

non-Hodgkin's lymphoma. It causes little bone-marrow suppression but dermatological toxicity is common and increased pigmentation particularly affecting the flexures and subcutaneous sclerotic plaques may occur. Mucositis is also relatively common and an association with Raynaud's phenomenon is reported. Hypersensitivity reactions manifest by chills and fevers commonly occur a few hours after drug administration and may be prevented by simultaneous administration of a corticosteroid, for example hydrocortisone intravenously. The principal problem associated with the use of bleomycin is progressive pulmonary fibrosis. This is dose-related, occurring more commonly at cumulative doses greater than 300 000 units (see Bleomycin, below) and in the elderly. Basal lung crepitations or suspicious chest X-ray changes are an indication to stop therapy with this drug. Patients who have received extensive treatment with bleomycin (e.g. cumulative dose more than 100 000 units—see Bleomycin below) may be at risk of developing respiratory failure if a general anaesthetic is given with high inspired oxygen concentrations. Anaesthetists should be warned of this.

Dactinomycin is principally used to treat paediatric cancers; it is given intravenously. Its side-effects are similar to those of doxorubicin, except that cardiac toxicity is not a problem.

Mitomycin is given intravenously to treat upper gastrointestinal and breast cancers and by bladder instillation for superficial bladder tumours. It causes delayed bone-marrow toxicity and therefore it is usually administered at 6-weekly intervals. Prolonged use may result in permanent bone-marrow damage. It may also cause lung fibrosis and renal damage.

BLEOMYCIN

Indications squamous cell carcinoma; see also notes above

Cautions see section 8.1 and notes above; caution in handling—irritant to tissues; **interactions**: Appendix 1 (bleomycin)

Renal impairment reduce dose by half if serum-creatinine 177–354 micromol/litre; reduce dose further if serum-creatinine greater than 354 micromol/litre

Pregnancy avoid (teratogenic and carcinogenic in *animal* studies); see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above

Dose

- See Doses, p. 563

Bleomycin (Non-proprietary) PoM

Injection, powder for reconstitution, bleomycin (as sulfate), net price 15 000-unit vial = £15.56

Note To conform to the European Pharmacopoeia vials previously labelled as containing '15 units' of bleomycin are now labelled as containing 15 000 units. The amount of bleomycin in the vial has not changed.

Brands include *Bleo-Kyowa*®

DACTINOMYCIN

(Actinomycin D)

Indications see notes above

Cautions see section 8.1 and notes above; caution in handling—irritant to tissues

Pregnancy avoid (teratogenic in *animal* studies); see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above

Dose

- See Doses, p. 563

Dactinomycin (Non-proprietary) PoM

Injection, powder for reconstitution, dactinomycin

Available from 'special-order' manufacturers or specialist importing companies, see p. 1104

DAUNORUBICIN

Indications see notes above

Cautions see section 8.1 and notes above; caution in handling—irritant to tissues; cardiac monitoring essential

Contra-indications myocardial insufficiency, recent myocardial infarction, severe arrhythmia; previous treatment with maximum cumulative doses of daunorubicin or other anthracycline

Hepatic impairment reduce dose according to serum bilirubin concentration—consult local protocol for details; avoid in severe impairment

Renal impairment reduce dose by 25% if serum creatinine 105–265 micromol/litre and by 50% if serum creatinine greater than 265 micromol/litre; avoid in severe impairment

Pregnancy avoid (teratogenic and carcinogenic in *animal* studies); see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above

Dose

- See Doses, p. 563

Daunorubicin (Non-proprietary) PoM

Injection, powder for reconstitution, daunorubicin (as hydrochloride), net price 20-mg vial = £55.00

Note The brand name *Cerubidin*® was formerly used.

Lipid formulation

DaunoXome® (Galen) PoM

Concentrate for intravenous infusion, daunorubicin encapsulated in liposomes. For dilution before use, net price 50-mg vial = £131.75

For advanced AIDS-related Kaposi's sarcoma

DOXORUBICIN HYDROCHLORIDE

Indications see notes above and section 7.4.4

Cautions see section 8.1 and notes above; caution in handling—irritant to tissues; **interactions:** Appendix 1 (doxorubicin)

Contra-indications see notes above; severe myocardial insufficiency, recent myocardial infarction, severe arrhythmia; previous treatment with maximum cumulative doses of doxorubicin or other anthracycline; intravesical use in urinary tract infections, bladder inflammation, and in urethral stenosis with catheterisation difficulties

Hepatic impairment reduce dose according to bilirubin concentration; avoid in severe impairment

Pregnancy avoid (teratogenic and toxic in *animal* studies); manufacturer of liposomal product advises effective contraception during and for at least 6 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above

Dose

- See Doses, p. 563

Doxorubicin (Non-proprietary) PoM

Injection, powder for reconstitution, doxorubicin hydrochloride, net price 10-mg vial = £18.72; 50-mg vial = £100.12

Injection, doxorubicin hydrochloride 2 mg/mL, net price 5-mL vial = £18.54, 25-mL vial = £92.70, 100-mL vial = £370.80

Lipid formulation

Caelyx® (Janssen) PoM

Concentrate for intravenous infusion, pegylated doxorubicin hydrochloride 2 mg/mL encapsulated in liposomes. For dilution before use, net price 10-mL vial = £360.23, 25-mL vial = £712.49

For AIDS-related Kaposi's sarcoma in patients with low CD4 count and extensive mucocutaneous or visceral disease, for advanced ovarian cancer when platinum-based chemotherapy has failed, for progressive multiple myeloma (in combination with bortezomib) in patients who have received at least one prior therapy and who have undergone or are unsuitable for bone-marrow transplantation, and as monotherapy for metastatic breast cancer in patients with increased cardiac risk

Myocet® (TEVA UK) PoM

Injection, powder for reconstitution, doxorubicin hydrochloride (as doxorubicin–citrate complex) encapsulated in liposomes, net price 50-mg vial (with vials of liposomes and buffer) = £456.13

Electrolytes Contains approx. 4.7 mmol Na^+/vial

For use with cyclophosphamide for metastatic breast cancer

EPIRUBICIN HYDROCHLORIDE

Indications see notes above and section 7.4.4

Cautions see section 8.1 and notes above; caution in handling—irritant to tissues; **interactions**: Appendix 1 (epirubicin)

Contra-indications severe myocardial insufficiency, recent myocardial infarction, severe arrhythmia, unstable angina, myocardiopathy; previous treatment with maximum cumulative doses of epirubicin or other anthracycline

Specific contra-indications for intravesical treatment urinary tract infections, bladder inflammation or contraction, haematuria, invasive tumours penetrating the bladder, catheterisation difficulties

Hepatic impairment reduce dose according to bilirubin concentration; avoid in severe impairment

Renal impairment dose reduction may be necessary in severe impairment

Pregnancy avoid (carcinogenic in *animal* studies); see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above

Dose

- See Doses, p. 563

Epirubicin (Non-proprietary) PoM

Injection, epirubicin hydrochloride 2 mg/mL, net price 5-mL vial = £17.38, 25-mL vial = £84.85, 50-mL vial = £95.54, 100-mL vial = £306.20

Injection, powder for reconstitution, epirubicin hydrochloride, net price 50-mg vial = £91.54

Pharmorubicin® Solution for Injection (Pharmacia) PoM

Injection, epirubicin hydrochloride 2 mg/mL, net price 5-mL vial = £21.24, 25-mL vial = £106.19, 100-mL vial = £386.16

IDARUBICIN HYDROCHLORIDE

Indications acute leukaemias (see notes above); advanced breast cancer after failure of first-line chemotherapy (not including anthracyclines)

Cautions see section 8.1 and notes above; caution in handling—irritant to tissues; **interactions**: Appendix 1 (idarubicin)

Contra-indications severe myocardial insufficiency; recent myocardial infarction; severe arrhythmias; previous treatment with maximum cumulative dose of idarubicin or other anthracycline

Hepatic impairment reduce dose according to serum-bilirubin concentration; avoid in severe impairment

Renal impairment reduce dose; avoid in severe impairment

Pregnancy avoid (teratogenic and toxic in *animal* studies); see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above

Dose

- By mouth, acute non-lymphocytic leukaemia, monotherapy, 30 mg/m^2 daily for 3 days *or* in combination therapy, 15–30 mg/m^2 daily for 3 days

  Advanced breast cancer, monotherapy, 45 mg/m^2 as a single dose *or* 15 mg/m^2 daily for 3 consecutive days; repeat every 3–4 weeks

  Note Max. cumulative dose by mouth (for all indications) 400 mg/m^2

- By intravenous administration, consult product literature

Zavedos® (Pharmacia) PoM

Capsules, idarubicin hydrochloride, 5 mg (red), net price 1-cap pack = £41.47; 10 mg (red/white), 1-cap pack = £69.12. Label: 25

Injection, powder for reconstitution, idarubicin hydrochloride, net price 5-mg vial = £87.36; 10-mg vial = £174.72

MITOMYCIN

Indications see notes above and section 7.4.4

Cautions see section 8.1 and notes above; caution in handling—irritant to tissues

Pregnancy avoid (teratogenic in *animal* studies); see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above

Dose

- See Doses, p. 563

Mitomycin C Kyowa® (ProStrakan) PoM

Injection, powder for reconstitution, mitomycin, net price 2-mg vial = £5.88; 10-mg vial = £21.37; 20-mg vial = £39.94; 40-mg vial = £79.88 (hosp. only)

MITOXANTRONE

(Mitozantrone)

Indications see notes above

Cautions see section 8.1 and notes above; intrathecal administration not recommended; **interactions:** Appendix 1 (mitoxantrone)

Hepatic impairment use with caution—consult local treatment protocol

Pregnancy avoid; manufacturer advises effective contraception during and for at least 6 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above, anorexia, diarrhoea, abdominal pain, gastro-intestinal bleeding, constipation, dyspnoea, drowsiness, confusion, paraesthesia, anxiety, amenorrhoea, and transient blue-green discoloration of urine and blue discoloration of skin and nails also reported

Dose

- See Doses, p. 563

Mitoxantrone (Non-proprietary) PoM

Concentrate for intravenous infusion, mitoxantrone (as hydrochloride) 2 mg/mL, net price 10-mL vial = £100.00

Onkotrone® (Baxter) PoM

Concentrate for intravenous infusion, mitoxantrone (as hydrochloride) 2 mg/mL, net price 10-mL vial = £121.85, 12.5-mL vial = £152.33, 15-mL vial = £203.04

PIXANTRONE

Indications see notes above

Cautions see section 8.1 and notes above; history of, or active cardiovascular disease, previous therapy with anthracyclines or anthracenediones, previous or concurrent radiotherapy to the mediastinal area, or concurrent use of cardiotoxic drugs—increased risk of cardiotoxicity; **interactions**: Appendix 1 (pixantrone)

Contra-indications immunisation with live virus vaccines; active severe infection or risk factors for severe infection

Hepatic impairment no information available—manufacturer advises caution in mild to moderate impairment; avoid in severe impairment

Renal impairment no information available—manufacturer advises caution

Pregnancy manufacturer advises avoid—toxicity in *animal* studies; ensure effective contraception during and for at least 6 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding manufacturer advises avoid—no information available

Side-effects see section 8.1 and notes above; loss of appetite, weight loss, taste disturbances, diarrhoea, constipation, abdominal pain, dyspepsia, dry mouth, abnormal liver function tests, cardiac toxicity and disorders, tachycardia, hypotension, pallor, vein discoloration, oedema, dyspnoea, cough, drowsiness, malaise, headache, paraesthesia, infection, pyrexia, biochemical and electrolyte disturbances, chromaturia, proteinuria, haematuria, bone pain, conjunctivitis, skin discoloration, pruritus, nail disorder; *less commonly* oesophagitis, rectal haemorrhage, arrhythmia, vein disorder, pleural effusion, pneumonitis, rhinorrhoea, anxiety, sleep disorder, dizziness, vertigo, spontaneous erection, tumour progression, oliguria, arthralgia, arthritis, musculoskeletal pain and weakness, dry eye, keratitis, night sweats, petechiae, skin ulcer, rash

Dose

- See Doses, p. 563

Pixuvri® (CTI) ▼ PoM

Injection, powder for reconstitution, pixantrone (as dimaleate), net price 29-mg vial = £553.50

Electrolytes Na^+ 1.70 mmol/vial

8.1.3 Antimetabolites

Antimetabolites are incorporated into new nuclear material or combine irreversibly with cellular enzymes, preventing normal cellular division.

Methotrexate inhibits the enzyme dihydrofolate reductase, essential for the synthesis of purines and pyrimidines. It is given by mouth, intravenously, intramuscularly, or intrathecally.

Methotrexate is used as maintenance therapy for childhood acute lymphoblastic leukaemia. Other uses include choriocarcinoma, non-Hodgkin's lymphoma, and a number of solid tumours. Intrathecal methotrexate is used in the CNS prophylaxis of childhood acute lymphoblastic leukaemia, and as a therapy for established meningeal cancer or lymphoma.

Methotrexate causes myelosuppression, mucositis, and rarely pneumonitis. It is **contra-indicated** in significant renal impairment because it is excreted primarily by the kidney. It is also contra-indicated in patients with severe hepatic impairment. It should also be **avoided** in the presence of significant pleural effusion or ascites because it can accumulate in these fluids, and its subsequent return to the circulation may cause myelosuppression. Systemic toxicity may follow intrathecal administration and blood counts should be carefully monitored.

Folinic acid (section 8.1) following methotrexate administration helps to prevent methotrexate-induced mucositis or myelosuppression.

Capecitabine, which is metabolised to fluorouracil, is given by mouth. It is licensed as monotherapy or combination therapy for adjuvant treatment of advanced colon cancer following surgery, for monotherapy or combination therapy of metastatic colorectal cancer, and for first-line treatment of advanced gastric cancer in combination with a platinum-based regimen. Capecitabine is also licensed for second-line treatment of locally advanced or metastatic breast cancer either in combination with docetaxel (where previous therapy included an anthracycline) or alone (after failure of a taxane and anthracycline regimen or where further anthracycline treatment is not indicated). For the role of capecitabine in the treatment of breast cancer, see section 8.3.4.1.

NICE guidance
Capecitabine and oxaliplatin in the adjuvant treatment of stage III (Dukes' C) colon cancer (April 2006)
Capecitabine alone *or* oxaliplatin combined with fluorouracil and folinic acid are options for adjuvant treatment following surgery for stage III (Dukes' C) colon cancer.
www.nice.org.uk/TA100

NICE guidance
Capecitabine and tegafur with uracil for metastatic colorectal cancer (May 2003)
Capecitabine or tegafur with uracil [now discontinued] (in combination with folinic acid) is an option for the first-line treatment of metastatic colorectal cancer.
www.nice.org.uk/TA61

NICE guidance
Capecitabine for the treatment of advanced gastric cancer (July 2010)
Capecitabine in combination with a platinum-based regimen is recommended for the first-line treatment of inoperable advanced gastric cancer.
www.nice.org.uk/TA191

Cytarabine acts by interfering with pyrimidine synthesis. It is given subcutaneously, intravenously, or intrathecally. Its predominant use is in the induction of remission of acute myeloblastic leukaemia. It is a potent myelosuppressant and requires careful haematological monitoring. A liposomal formulation of cytarabine for intrathecal use is licensed for lymphomatous meningitis.

Fludarabine is licensed for the initial treatment of advanced B-cell chronic lymphocytic leukaemia (CLL) or after first-line treatment in patients with sufficient bone-marrow reserves; it is usually given by mouth, but can be given by intravenous injection or infusion. Fludarabine is well tolerated but it does cause myelosuppression, which may be cumulative. Immunosuppression is also common (see panel on cladribine and fludarabine below), and co-trimoxazole is used to prevent pneumocystis infection. Immune-mediated haemolytic anaemia, thrombocytopenia, and neutropenia are less common side-effects.

The *Scottish Medicines Consortium* (p. 4) has advised (October 2006) that fludarabine is accepted for restricted use for the treatment of B-cell chronic lymphocytic leukaemia (CLL) in patients with sufficient bone marrow reserves. First-line treatment should only be initiated in patients with advanced disease, Rai stages III/IV (Binet stage C), or Rai stages I/II (Binet stage A/B) where the patient has disease-related symptoms or evidence of progressive disease.

NICE guidance
Fludarabine for the treatment of B-cell chronic lymphocytic leukaemia (September 2001)
Oral fludarabine is recommended for the second-line treatment of B-cell chronic lymphocytic leukaemia in patients who have either failed, or are intolerant of, first line chemotherapy, and who would otherwise have received combination chemotherapy of either:
- cyclophosphamide, doxorubicin, vincristine and prednisolone (CHOP)
- cyclophosphamide, doxorubicin and prednisolone (CAP) **or**
- cyclophosphamide, vincristine and prednisolone (CVP)

Intravenous fludarabine should only be used when oral fludarabine is contra-indicated.
www.nice.org.uk/TA29

NICE guidance
Fludarabine monotherapy for the first-line treatment of chronic lymphocytic leukaemia (February 2007)
Fludarabine monotherapy is **not** recommended for the first-line treatment of chronic lymphocytic leukaemia.
www.nice.org.uk/TA119

Cladribine is given by intravenous infusion for the treatment of hairy cell leukaemia. It is also given for chronic lymphocytic leukaemia in patients who have failed to respond to standard regimens containing an alkylating agent. Cladribine produces severe myelosuppression, with neutropenia, anaemia, and thrombocytopenia; haemolytic anaemia has also been reported. High doses of cladribine have been associated with acute renal failure and severe neurotoxicity.

Cladribine and **fludarabine** have a potent and prolonged immunosuppresive effect. Patients treated with cladribine or fludarabine are more prone to serious bacterial, opportunistic fungal, and viral infections, and prophylactic therapy is recommended in those at risk. To prevent potentially fatal transfusion-related graft-versus-host reaction, only irradiated blood products should be administered. Prescribers should consult specialist literature when using highly immunosuppressive drugs.

Clofarabine is licensed for the treatment of acute lymphoblastic leukaemia in patients aged 1 to 21 years who have relapsed or are refractory after receiving at least two previous regimens. It is given by intravenous infusion.

Nelarabine is licensed for the treatment of T-cell acute lymphoblastic leukaemia and T-cell lymphoblastic lymphoma in patients who have relapsed or who are refractory after receiving at least two previous regimens. It is given by intravenous infusion. Neurotoxicity is common with nelarabine and close monitoring for neurological adverse events is strongly recommended—discontinue if neurotoxicity occurs.

The *Scottish Medicines Consortium* (p. 4) has advised (March 2008) that the use of nelarabine (*Atriance*®) within NHS Scotland is restricted to bridging treatment before stem cell transplantation.

Gemcitabine is used intravenously; it is given alone for elderly patients or for palliative treatment, or with cisplatin as first-line treatment for locally advanced or metastatic non-small cell lung cancer. It is also used in the treatment of locally advanced or metastatic pancreatic cancer (see NICE guidance below). Combined with cisplatin, gemcitabine is also licensed for the treatment of advanced bladder cancer. Combined with carboplatin, gemcitabine is licensed for the treatment of locally advanced or metastatic epithelial ovarian cancer which has relapsed after a recurrence-free interval of at least 6 months following previous platinum-based therapy. Combined with paclitaxel, gemcitabine is also licensed for the treatment of metastatic breast cancer which has relapsed after previous chemotherapy including an anthracycline (see NICE guidance below). Gemcitabine is generally well tolerated but it can cause mild gastro-intestinal side-effects, musculoskeletal pain, influenza-like symptoms and rashes; renal impairment and pulmonary toxicity have also been reported. Haemolytic uraemic syndrome has been reported rarely and gemcitabine should be discontinued if signs of microangiopathic haemolytic anaemia occur.

The *Scottish Medicines Consortium* has advised (November 2006) that gemcitabine is accepted for restricted use for the treatment of metastatic breast cancer, which has relapsed following previous chemotherapy including an anthracycline (unless contra-indicated).

NICE guidance
Gemcitabine for the treatment of metastatic breast cancer (January 2007)
Gemcitabine, in combination with paclitaxel, is an option for the treatment of metastatic breast cancer **only** when docetaxel monotherapy or docetaxel plus capecitabine are also considered appropriate.
www.nice.org.uk/TA116

NICE guidance
Gemcitabine for the treatment of pancreatic cancer (May 2001)
Gemcitabine is an option for first-line chemotherapy for patients with advanced or metastatic adenocarcinoma of the pancreas and a Karnofsky score of at least 50 [Karnofsky score is a measure of the ability to perform ordinary tasks].
Gemcitabine is not recommended for patients who can have potentially curative surgery. There is insufficient evidence about its use for second-line treatment of pancreatic adenocarcinoma.
www.nice.org.uk/TA25

Fluorouracil is used to treat a number of solid tumours, including gastro-intestinal tract cancers and breast cancer. It is commonly used with folinic acid in advanced colorectal cancer. It may also be used topically for certain malignant and pre-malignant skin lesions. Toxicity is unusual, but may include myelosuppression, mucositis, and rarely a cerebellar syndrome. On prolonged infusion, a desquamative hand–foot syndrome may occur.

NICE guidance
Aflibercept in combination with irinotecan and fluorouracil-based therapy for treating metastatic colorectal cancer that has progressed following prior oxaliplatin-based chemotherapy
See p. 584

Pemetrexed inhibits thymidylate transferase and other folate-dependent enzymes. It is licensed for use with cisplatin for the treatment of unresectable malignant pleural mesothelioma which has not previously been treated with chemotherapy (see NICE guidance, below). Pemetrexed is also licensed for use with cisplatin for the first-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology (see NICE guidance, below), and as monotherapy for its second-line treatment (but see NICE guidance, below). It is also licensed as monotherapy for maintenance treatment in locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology that has not progressed immediately following platinum-based chemotherapy (but see NICE guidance, below). Pemetrexed is given by intravenous infusion.

The *Scottish Medicines Consortium* (p. 4) has advised (July 2005) that pemetrexed (*Alimta*®) in combination with cisplatin is accepted for restricted use within NHS Scotland for previously untreated patients with stage III/IV unresectable malignant pleural mesothelioma.

The *Scottish Medicines Consortium* (p. 4) has advised (January 2010) that pemetrexed (*Alimta*®) is accepted for restricted use within NHS Scotland in combination with cisplatin for the first-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology; it is restricted to patients in whom the histology of the tumour has been confirmed as adenocarcinoma or large cell carcinoma.

The *Scottish Medicines Consortium* (p. 4) has advised (August 2008) that pemetrexed (*Alimta*®) is accepted for restricted use within NHS Scotland as monotherapy for the second-line treatment of locally advanced or metastatic non-small cell lung cancer without predominantly squamous cell histology; it is restricted for use in patients with good performance status who would otherwise be eligible for docetaxel treatment.

NICE guidance
Pemetrexed for the treatment of malignant pleural mesothelioma (January 2008)
Pemetrexed is an option for the treatment of malignant pleural mesothelioma only in patients who have a WHO performance status of 0 or 1 [WHO performance status is a measure of the ability to perform ordinary tasks], who are considered to have advanced disease and for whom surgical resection is considered inappropriate.
www.nice.org.uk/TA135

NICE guidance
Pemetrexed for the first-line treatment of non-small cell lung cancer (September 2009)
Pemetrexed, in combination with cisplatin, is an option for the first-line treatment of locally advanced or metastatic non-small cell lung cancer only if the histology of the tumour has been confirmed as adenocarcinoma or large-cell carcinoma.
www.nice.org.uk/TA181

NICE guidance
Pemetrexed for the treatment of non-small cell lung cancer (August 2007)
Pemetrexed is **not** recommended for the treatment of locally advanced or metastatic non-small cell lung cancer which has previously been treated with chemotherapy.
www.nice.org.uk/TA124

NICE guidance
Pemetrexed for the treatment of non-small cell lung cancer (June 2010)
Pemetrexed is an option for the maintenance treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology that has not progressed immediately following combination therapy of a platinum compound with either gemcitabine, paclitaxel, or docetaxel.
www.nice.org.uk/TA190

NICE guidance
Pemetrexed maintenance treatment following induction therapy with pemetrexed and cisplatin for non-squamous non-small-cell lung cancer (April 2014)
Pemetrexed is **not** recommended for the maintenance treatment of locally advanced or metastatic non-squamous non-small-cell lung cancer in patients whose disease has not progressed immediately following induction therapy with pemetrexed and cisplatin.
www.nice.org.uk/TA309

Raltitrexed, a thymidylate synthase inhibitor, is given intravenously for palliation of advanced colorectal cancer when fluorouracil and folinic acid cannot be used. It is probably of similar efficacy to fluorouracil. Raltitrexed is generally well tolerated, but can cause marked myelosuppression and gastro-intestinal side-effects.

NICE guidance (irinotecan, oxaliplatin and raltitrexed for advanced colorectal cancer)
See p. 593

Mercaptopurine is used as maintenance therapy for the acute leukaemias and in the management of ulcerative colitis and Crohn's disease (section 1.5.3). Azathioprine, which is metabolised to mercaptopurine, is generally used as an immunosuppressant (section 8.2.1 and section 10.1.3). The dose of both drugs should be reduced if the patient is receiving allopurinol since it interferes with their metabolism.

Tegafur is a prodrug of fluorouracil. Tegafur in combination with gimeracil and oteracil is given by mouth; gimeracil inhibits the degradation of fluorouracil and oteracil decreases the activity of fluorouracil in normal gastrointestinal mucosa. Tegafur in combination with gimeracil and oteracil is licensed for the treatment of advanced gastric cancer when used in combination with cisplatin.

Tioguanine is given by mouth for the treatment of acute leukaemias and chronic myeloid leukaemia. It can be given at various stages of treatment in short-term cycles. Tioguanine has a lower incidence of gastrointestinal side-effects than mercaptopurine. Long-term therapy is no longer recommended because of the high risk of liver toxicity; treatment with tioguanine should be discontinued if liver toxicity develops.

Azacitidine is a pyrimidine analogue that is given by subcutaneous injection. It is used in the treatment of intermediate-2 and high-risk myelodysplastic syndromes, chronic myelomonocytic leukaemia, and acute myeloid leukaemia, in adults who are not eligible for haemotopoietic stem cell transplantation.

NICE guidance
Azacitidine for the treatment of myelodysplastic syndromes, chronic myelomonocytic leukaemia and acute myeloid leukaemia (March 2011)
Azacitidine is recommended in adults who are not eligible for haemotopoietic stem cell transplantation as an option for the treatment of intermediate-2 and high-risk myelodysplastic syndromes, chronic myelomonocytic leukaemia, or acute myeloid leukaemia.
www.nice.org.uk/TA218

Decitabine is a pyrimidine analogue and is licensed for the treatment of newly diagnosed acute myeloid leukaemia in patients over 65 years who are not candidates for standard induction chemotherapy.

AZACITIDINE

Indications see notes above

Cautions see section 8.1; history of severe congestive heart failure, unstable cardiac or pulmonary disease—consider cardiopulmonary assessment before and during treatment; monitor for bleeding; monitor liver function tests, serum creatinine, and serum bicarbonate before initiation of treatment and before each treatment cycle; monitor full blood count before initiation of treatment, before each treatment cycle, and as clinically indicated

Contra-indications advanced malignant hepatic tumour

Hepatic impairment caution in severe impairment

Renal impairment delay next treatment cycle if serum-creatinine or blood urea nitrogen greater than twice baseline value and above the upper level of normal until values return to normal or baseline, and then reduce dose by 50% on the next treatment cycle. Reduce dose by 50% on the next treatment cycle if serum-bicarbonate concentration less than 20 mmol/litre

Pregnancy avoid (toxicity in *animal* studies); manufacturer advises effective contraception during and for 3 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1; also gastro-intestinal disturbances (including diarrhoea, constipation, abdominal pain, and dyspepsia), anorexia; hypertension, hypotension; dyspnoea, pneumonia; anxiety, insomnia, dizziness, headache, drowsiness; haematuria; hypokalaemia; arthralgia, myalgia; injection-site reactions, rash, haematoma; haemorrhage (including cerebral haemorrhage); *less commonly* hypersensitivity reactions (including anaphylactic reactions); hepatic coma, hepatic failure and renal failure also reported

Dose

- See Doses, p. 563

Vidaza® (Celgene) PoM

Injection, powder for reconstitution, azacitidine, net price 100-mg vial = £321.00

CAPECITABINE

Indications see notes above

Cautions see section 8.1; history of significant cardiovascular disease, arrhythmias, angina pectoris; monitor plasma-calcium concentration; diabetes mellitus; electrolyte disturbances; nervous system disease; monitor for symptoms of severe skin reactions (including Stevens-Johnson syndrome and toxic epidermal necrolysis)—permanently discontinue treatment immediately if symptoms occur; monitor for symptoms of hand-foot syndrome—interrupt treatment if significant syndrome occurs and refer to product literature; diarrhoea or dehydration—consult product literature for guidance on dose modification and treatment interruption; monitor for eye disorders (including keratitis and corneal disorders); **interactions:** Appendix 1 (fluorouracil)

Contra-indications dihydropyrimidine dehydrogenase deficiency

Hepatic impairment manufacturer advises monitor liver function in mild to moderate impairment—consult product literature for guidance on treatment interruption; avoid in severe impairment

Renal impairment reduce starting dose of 1.25 g/m^2 to 75% if creatinine clearance 30–50 mL/minute; avoid if creatinine clearance less than 30 mL/minute

Pregnancy avoid (teratogenic in *animal* studies); see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1; also see product literature

Dose

- Stage III colon cancer, adjuvant following surgery, monotherapy, ADULT over 18 years 1.25 g/m^2 twice daily for 14 days, subsequent courses repeated after a 7-day interval; recommended duration of treatment 6 months
- Stage III colon cancer, adjuvant following surgery, in combination therapy, ADULT over 18 years 0.8–1 g/m^2 twice daily for 14 days, subsequent courses repeated after a 7-day interval; recommended duration of treatment 6 months
- Metastatic colorectal cancer, monotherapy, ADULT over 18 years 1.25 g/m^2 twice daily for 14 days, subsequent courses repeated after a 7-day interval
- Metastatic colorectal cancer, in combination therapy, ADULT over 18 years 0.8–1 g/m^2 twice daily for 14 days, subsequent courses repeated after a 7-day interval
- Advanced gastric cancer, in combination with a platinum-based regimen, ADULT over 18 years 0.8–1 g/m^2 twice daily for 14 days, subsequent courses repeated after a 7-day interval ***or*** 625 mg/m^2 twice daily given continuously
- Locally advanced or metastatic breast cancer, monotherapy or in combination with docetaxel, ADULT over 18 years 1.25 g/m^2 twice daily for 14 days, subsequent courses repeated after a 7-day interval

Note Adjust dose according to tolerability—consult product literature

Capecitabine (Non-proprietary) PoM

Tablets, capecitabine 150 mg, net price 60-tab pack = £30.00; 500 mg, 120-tab pack = £240.00. Label: 21

Xeloda® (Roche) PoM

Tablets, f/c, peach, capecitabine 150 mg, net price 60-tab pack = £40.02; 500 mg, 120-tab pack = £265.55. Label: 21

CLADRIBINE

Indications see notes above and under preparations

Cautions see section 8.1 and notes above; use irradiated blood only; **interactions**: Appendix 1 (cladribine)

Hepatic impairment regular monitoring recommended

Renal impairment regular monitoring recommended

Pregnancy avoid (teratogenic in *animal* studies); manufacturer advises that men should not father children during and for 6 months after treatment; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above; also constipation, diarrhoea, abdominal pain, flatulence; oedema, tachycardia; cough, dyspnoea; dizziness, insomnia, anxiety, headache; chills, asthenia, malaise; myalgia, arthralgia; sweating, rash, pruritus, and purpura

Dose

- See Doses, p. 563

Leustat® (Janssen) PoM

Concentrate for intravenous infusion, cladribine 1 mg/mL, net price 10-mL vial = £159.70

For hairy cell leukaemia and for B-cell chronic lymphocytic leukaemia in patients who have failed to respond to standard regimens containing an alkylating agent

Litak® (Lipomed) PoM

Injection (for subcutaneous use only—no dilution required), cladribine 2 mg/mL, net price 5-mL vial = £165.00

For hairy cell leukaemia

CLOFARABINE

Indications see notes above

Cautions see section 8.1 and notes above; cardiac disease

Hepatic impairment manufacturer advises caution in mild to moderate impairment; avoid in severe impairment

Renal impairment manufacturer advises caution in mild to moderate impairment; avoid in severe impairment

Pregnancy manufacturer advises avoid (teratogenic in *animal* studies); see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1; also diarrhoea, abdominal pain, jaundice; tachycardia, flushing, hypotension, pericardial effusion, oedema, haematoma; dyspnoea, cough; anxiety, agitation, dizziness, drowsiness, headache, paraesthesia, peripheral neuropathy, restlessness; haematuria; arthralgia, myalgia; rash, pruritus, hand-foot (desquamative) syndrome, sweating; pancreatitis also reported

Dose

- See Doses, p. 563

Evoltra® (Sanofi-Aventis) ▼ PoM

Concentrate for intravenous infusion, clofarabine 1 mg/mL, net price 20-mL vial = £1326.18

Electrolytes Na^+ 3.08 mmol/vial

CYTARABINE

Indications see notes above

Cautions see section 8.1 and notes above; **interactions:** Appendix 1 (cytarabine)

Hepatic impairment reduce dose—consult product literature

Pregnancy avoid (teratogenic in *animal* studies); see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above

Dose

- See Doses, p. 563

Cytarabine (Non-proprietary) PoM

Injection (for intravenous, subcutaneous, or intrathecal use), cytarabine 20 mg/mL, net price 5-mL vial = £3.90

Injection (for intravenous or subcutaneous use), cytarabine 20 mg/mL, net price 5-mL vial = £3.90, 25-mL vial = £19.50; 100 mg/mL, 1-mL vial = £6.00, 5-mL vial = £20.00, 10-mL vial = £39.00, 20-mL vial = £77.50

Lipid formulation for intrathecal use

DepoCyte® (Napp) PoM

Intrathecal injection, cytarabine encapsulated in liposomes, net price 50-mg vial = £1223.75

For lymphomatous meningitis

Note The *Scottish Medicines Consortium* (p. 4) has advised (July 2007) that liposomal cytarabine suspension (*DepoCyte®*) is not recommended for use within NHS Scotland for the intrathecal treatment of lymphomatous meningitis

DECITABINE

Indications see notes above

Cautions see section 8.1; history of severe congestive heart failure or unstable cardiac disease; **interactions:** Appendix 1 (decitabine)

Hepatic impairment manufacturer advises caution—no information available

Renal impairment manufacturer advises caution if creatinine clearance less than 30 mL/minute—no information available

Pregnancy avoid (teratogenic in *animal* studies); ensure effective contraception during treatment; men must avoid fathering a child during and for 3 months after treatment; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1; also diarrhoea, headache, epistaxis; *less commonly* acute febrile neutrophilic dermatosis

Dose

- See Doses, p. 563

Dacogen® (Janssen) ▼ PoM

Injection, powder for reconstitution, decitabine, net price 50-mg vial = £970.86

Electrolytes Na^+ 0.29 mmol/vial, K^+ 0.5 mmol/vial

FLUDARABINE PHOSPHATE

Indications see notes above

Cautions see section 8.1 and notes above; monitor for signs of haemolysis; monitor for neurological toxicity; worsening of existing and increased susceptibility to skin cancer; patients over 65 years—assess creatinine clearance before treatment initiation; **interactions:** Appendix 1 (fludarabine)

Contra-indications haemolytic anaemia

Renal impairment reduce dose by up to 50% if creatinine clearance 30–70 mL/minute; avoid if creatinine clearance less than 30 mL/minute

Pregnancy avoid (embryotoxic and teratogenic in *animal* studies); manufacturer advises effective contraception during and for at least 6 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above; also diarrhoea, anorexia, oedema, pneumonia, cough, peripheral neuropathy, chills, fever, malaise, weakness, myelodysplastic syndrome, acute myeloid leukaemia, visual disturbances, rash; *less commonly* pulmonary toxicity (including pneumonitis and fibrosis), confusion, haemorrhage, autoimmune disorder; *rarely* heart failure, arrhythmia, coma, seizures, agitation, skin cancer, optic neuropathy, blindness, Stevens-Johnson syndrome, toxic epidermal necrolysis; *also reported* haemorrhagic cystitis

Dose

- By mouth, ADULT 40 mg/m^2 for 5 days every 28 days usually for 6 cycles
- By intravenous injection *or* infusion, consult product literature

Fludarabine phosphate (Non-proprietary) PoM

Injection, powder for reconstitution, fludarabine phosphate, net price 50-mg vial = £155.00

Concentrate for intravenous injection or infusion, fludarabine phosphate 25 mg/mL, net price 2-mL vial = £155.00

Note Must be diluted before administration (consult product literature)

Fludara® (Sanofi-Aventis) PoM

Tablets, f/c, pink, fludarabine phosphate 10 mg, net price 15-tab pack = £302.48, 20-tab pack = £403.31

Injection, powder for reconstitution, fludarabine phosphate, net price 50-mg vial = £147.07

FLUOROURACIL

Indications see notes above; pre-malignant and malignant skin lesions (section 13.8.1)

Cautions see section 8.1 and notes above; caution in handling—irritant to tissues; **interactions:** Appendix 1 (fluorouracil)

Hepatic impairment manufacturer advises caution
Pregnancy avoid (teratogenic); see also Pregnancy and Reproductive Function, p. 564
Breast-feeding discontinue breast-feeding
Side-effects see section 8.1 and notes above; also local irritation with topical preparation
Dose
- By intravenous injection *or* infusion *or* by intra-arterial infusion, consult product literature

Fluorouracil (Non-proprietary) PoM
Injection, fluorouracil (as sodium salt) 25 mg/mL, net price 10-mL vial = £3.20, 20-mL vial = £6.40, 100-mL vial = £32.00; 50 mg/mL, 10-mL vial = £6.40, 20-mL vial = £12.80, 50-mL vial = £32.00, 100-mL vial = £64.00

GEMCITABINE

Indications see notes above
Cautions see section 8.1 and notes above; **interactions**: Appendix 1 (gemcitabine)
Hepatic impairment manufacturer advises caution
Renal impairment manufacturer advises caution
Pregnancy avoid (teratogenic in *animal* studies); manufacturer advises effective contraception during treatment; men must avoid fathering a child during and for 6 months after treatment; see also Pregnancy and Reproductive Function, p. 564
Breast-feeding discontinue breast-feeding
Side-effects see section 8.1 and notes above
Dose
- See Doses, p. 563

Gemcitabine (Non-proprietary) PoM
Injection, powder for reconstitution, gemcitabine (as hydrochloride), net price 200-mg vial = £29.80, 1-g vial = £154.62, 1.5-g vial = £213.93, 2-g vial = £324.00

Gemzar® (Lilly) PoM
Injection, powder for reconstitution, gemcitabine (as hydrochloride), net price 200-mg vial = £32.55; 1-g vial = £162.76

MERCAPTOPURINE

(6-Mercaptopurine)

Indications acute leukaemias and chronic myeloid leukaemia; inflammatory bowel disease [unlicensed indication] (section 1.5.3)
Cautions see section 8.1 and notes above; thiopurine methyltransferase status (see section 8.2.1); monitor liver function; **interactions:** Appendix 1 (mercaptopurine)
Hepatic impairment may need dose reduction
Renal impairment reduce dose
Pregnancy avoid (teratogenic); see also Pregnancy and Reproductive Function, p. 564
Breast-feeding discontinue breast-feeding
Side-effects see section 8.1 and notes above; also hepatotoxicity, anorexia; *rarely* transient oligospermia, pancreatitis; *very rarely* intestinal ulceration, lymphoma
Dose
- See preparations below

Important *Puri-Nethol*® tablets and *Xaluprine*® oral suspension are **not** bioequivalent, haematological monitoring is advised when switching formulations

Puri-Nethol® (Alkopharma) PoM
Tablets, yellow, scored, mercaptopurine 50 mg, net price 25-tab pack = £50.47
Dose initially 2.5 mg/kg *or* 50–75 mg/m^2 daily, adjusted according to response

Xaluprine® (Nova) PoM
Oral suspension, mercaptopurine, 20 mg/1 mL, net price 100 mL (raspberry-flavoured)= £170.00
Excipients include aspartame (section 9.4.1)
Dose initially 25–75 mg/m^2 daily, adjusted according to response

METHOTREXATE

Indications see notes above and under Dose; Crohn's disease [unlicensed indication] (section 1.5.3); rheumatoid arthritis (section 10.1.3); psoriasis (section 13.5.3)
Cautions see section 8.1, notes above and section 10.1.3; **interactions:** Appendix 1 (methotrexate)
Hepatic impairment avoid in severe impairment
Renal impairment reduce dose; risk of nephrotoxicty at high doses; avoid in severe impairment
Pregnancy avoid (teratogenic; fertility may be reduced during therapy but this may be reversible); manufacturer advises effective contraception during and for at least 3 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 564
Breast-feeding discontinue breast-feeding—present in milk
Side-effects see section 8.1, notes above and section 10.1.3
Dose
- By mouth, leukaemia in children (maintenance), 15 mg/m^2 weekly in combination with other drugs

Important
Note that the above dose is a **weekly** dose.

- By intravenous injection *or* infusion, *or* by intra-arterial infusion, *or* by intramuscular injection, *or* intrathecal administration, consult product literature

Methotrexate (Non-proprietary) PoM
Injection, methotrexate (as sodium salt) 2.5 mg/mL, net price 2-mL vial = £4.80; 25 mg/mL, 2-mL vial = £2.62, 20-mL vial = £25.07
Injection, methotrexate 100 mg/mL (not for intrathecal use), net price 10-mL vial = £78.00, 50-mL vial = £380.00

Oral preparations

Section 10.1.3

NELARABINE

Indications see notes above
Cautions see section 8.1 and notes above; previous or concurrent intrathecal chemotherapy or craniospinal irradiation (increased risk of neurotoxicity)
Driving May affect performance of skilled tasks (e.g. driving)
Pregnancy avoid (toxicity in *animal* studies); manufacturer advises effective contraception during and for at least 3 months after treatment in men and women; see also Pregnancy and Reproductive Function, p. 564
Breast-feeding discontinue breast-feeding

Side-effects see section 8.1; also abdominal pain, constipation, taste disturbance, anorexia, diarrhoea; hypotension, oedema; pleural effusion, wheezing, dyspnoea, cough; confusion, seizures, amnesia, drowsiness, peripheral neurological disorders, hypoaesthesia, paraesthesia, ataxia, demyelination, tremor, dizziness, headache, asthenia, fatigue; pyrexia; electrolyte disturbances; blurred vision; muscle weakness, myalgia, arthralgia; benign and malignant tumours also reported

Dose

- See Doses, p. 563

Atriance® (GSK) ▼ PoM

Intravenous infusion, nelarabine 5 mg/mL, net price 50-mL vial = £222.00

Electrolytes Na^+ 3.75 mmol/vial

PEMETREXED

Indications see notes above

Cautions see section 8.1 and notes above; history of cardiovascular disease; diabetes; prophylactic folic acid and vitamin B_{12} supplementation required (consult product literature); concomitant nephrotoxic drugs including non-steroidal anti-inflammatory drugs (consult product literature); **interactions**: Appendix 1 (pemetrexed)

Renal impairment manufacturer advises avoid if creatinine clearance less than 45 mL/minute—no information available

Pregnancy avoid (toxicity in *animal* studies); manufacturer advises effective contraception during treatment; men must avoid fathering a child during and for 6 months after treatment; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1; also gastro-intestinal disturbances; oedema; neuropathy; dehydration; conjunctivitis, increased lacrimation; skin disorders; *less commonly* colitis, arrhythmias, and interstitial pneumonitis; *rarely* hepatitis; peripheral ischaemia, acute renal failure, Stevens-Johnson syndrome and toxic epidermal necrolysis also reported

Dose

- See Doses, p. 563

Alimta® (Lilly) PoM

Injection, powder for reconstitution, pemetrexed (as disodium), net price 100-mg vial = £160.00; 500-mg vial = £800.00

Electrolytes Na^+ <0.5 mmol/vial

RALTITREXED

Indications see notes above

Cautions see section 8.1 and notes above; **interactions**: Appendix 1 (raltitrexed)

Hepatic impairment caution in mild to moderate impairment; avoid if severe

Renal impairment reduce dose and increase dosing interval if creatinine clearance less than 65 mL/minute (consult product literature); avoid if creatinine clearance less than 25 mL/minute

Pregnancy pregnancy must be excluded before treatment; ensure effective contraception during and for at least 6 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above

Dose

- See Doses, p. 563

Tomudex® (Hospira) PoM

Injection, powder for reconstitution, raltitrexed, net price 2-mg vial = £175.00

TEGAFUR WITH GIMERACIL AND OTERACIL

Indications see notes above

Cautions see section 8.1; **interactions**: Appendix 1 (fluorouracil)

Contra-indications dihydropyrimidine dehydrogenase deficiency

Renal impairment reduce dose if creatinine clearance 30–50 mL/minute—consult product literature; manufacturer advises avoid if creatinine clearance less than 30 mL/minute

Pregnancy avoid; manufacturer advises effective contraception during and for up to 6 months after treatment; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1; also ocular toxicity and neuropathy

Dose

- See Doses, p. 563

Teysuno® (Nordic) ▼ PoM

Capsules, tegafur 15 mg, gimeracil 4.35 mg, oteracil (as potassium salt) 11.8 mg, net price 126-cap pack = £279.72; Label: 23

Capsules, tegafur 20 mg, gimeracil 5.8 mg, oteracil (as potassium salt) 15.8 mg, net price 84-cap pack = £248.40; Label: 23

Note The *Scottish Medicines Consortium* (p. 4) has advised (August 2012) that tegafur with gimeracil and oteracil (*Teysuno®*) is accepted for restricted use within NHS Scotland for the treatment of advanced gastric cancer, when given in combination with cisplatin, in patients who are unsuitable for an anthracycline, fluorouracil and platinum triplet first-line regimen.

TIOGUANINE

(Thioguanine)

Indications see notes above

Cautions see section 8.1 and notes above; thiopurine methyltransferase status (see section 8.2.1); monitor liver function weekly—discontinue if liver toxicity develops; **interactions**: Appendix 1 (tioguanine)

Hepatic impairment reduce dose

Renal impairment reduce dose

Pregnancy avoid (teratogenicity reported when men receiving tioguanine have fathered children); ensure effective contraception during treatment in men or women; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1; also stomatitis and hepatotoxicity; *rarely* intestinal necrosis and perforation

Dose

- 100–200 mg/m^2 daily

Lanvis® (Alkopharma) PoM

Tablets, yellow, scored, tioguanine 40 mg, net price 25-tab pack = £103.54

8.1.4 Vinca alkaloids and etoposide

The vinca alkaloids, **vinblastine**, **vincristine**, and **vindesine**, are used to treat a variety of cancers including leukaemias, lymphomas, and some solid tumours (e.g. breast and lung cancer). **Vinorelbine** is a semi-synthetic vinca alkaloid; it is given intravenously or orally for the treatment of advanced breast cancer and for advanced non-small cell lung cancer. For the role of vinorelbine in the treatment of breast cancer, see section 8.3.4.1. **Vinflunine** is licensed as monotherapy for the treatment of advanced or metastatic transitional cell carcinoma of the urothelial tract after failure of a platinum-containing regimen.

NICE guidance

Vinflunine for the treatment of advanced or metastatic transitional cell carcinoma of the urothelial tract (January 2013)

Vinflunine is **not** recommended for the treatment of advanced or metastatic transitional cell carcinoma of the urothelial tract that has progressed after treatment with platinum-based chemotherapy.

www.nice.org.uk/TA272

Neurotoxicity, usually as peripheral or autonomic neuropathy, occurs with all vinca alkaloids and is a limiting side-effect of vincristine; it occurs less often with vindesine, vinblastine, vinorelbine, and vinflunine. Patients with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; ototoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced. Motor weakness can also occur, and increasing motor weakness calls for dose reduction or discontinuation of these drugs. Recovery from neurotoxic effects is usually slow but complete.

Myelosuppression is a dose-limiting side-effect of vinblastine, vindesine, vinorelbine, and vinflunine; vincristine causes negligible myelosuppression. The vinca alkaloids cause severe local irritation and care must be taken to avoid extravasation. Severe bronchospasm has been reported following administration of the vinca alkaloids (more commonly when used in combination with mitomycin-C).

Important

Vinblastine, vincristine, vindesine, vinflunine, and vinorelbine injections are for **intravenous administration only**. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

Etoposide may be given orally or by slow intravenous infusion, the oral dose being double the intravenous dose. A preparation containing etoposide phosphate can be given by intravenous injection or infusion. Etoposide is usually given daily for 3–5 days and courses should not be repeated more frequently than at intervals of 21 days. It has particularly useful activity in small cell carcinoma of the bronchus, the lymphomas, and testicular cancer.

ETOPOSIDE

Indications see notes above

Cautions see section 8.1 and notes above; **interactions:** Appendix 1 (etoposide)

Contra-indications see section 8.1 and notes above

Hepatic impairment avoid in severe impairment

Renal impairment consider dose reduction—consult local treatment protocol for details

Pregnancy avoid (teratogenic in *animal* studies); see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1; irritant to tissues

Dose

- By mouth, 120–240 mg/m^2 daily for 5 days
- By intravenous infusion, consult product literature

Etoposide (Non-proprietary) PoM

Concentrate for intravenous infusion, etoposide 20 mg/mL, net price 5-mL vial = £12.15, 10-mL vial = £29.00, 25-mL vial = £60.75

Brands include *Eposin*®

Etopophos® (Bristol-Myers Squibb) PoM

Injection, powder for reconstitution, etoposide (as phosphate), net price 100-mg vial = £26.17 (hosp. only)

Vepesid® (Bristol-Myers Squibb) PoM

Capsules, both pink, etoposide 50 mg, net price 20 = £99.82; 100 mg, 10-cap pack = £87.23 (hosp. only). Label: 23

VINBLASTINE SULFATE

Indications see notes above

Cautions see section 8.1 and notes above; caution in handling; **interactions:** Appendix 1 (vinblastine)

Contra-indications see section 8.1 and notes above

Important Intrathecal injection **contra-indicated**

Hepatic impairment dose reduction may be necessary

Pregnancy avoid (limited experience suggests fetal harm; teratogenic in *animal* studies); see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above; irritant to tissues

Dose

- See Doses, p. 563

Vinblastine (Non-proprietary) PoM

Injection, vinblastine sulfate 1 mg/mL, net price 10-mL vial = £13.09

Velbe® (Genus) PoM

Injection, powder for reconstitution, vinblastine sulfate, net price 10-mg amp = £14.15

VINCRISTINE SULFATE

Indications see notes above

Cautions see section 8.1 and notes above; neuromuscular disease; caution in handling; **interactions:** Appendix 1 (vincristine)

Contra-indications see section 8.1 and notes above

Important Intrathecal injection **contra-indicated**

Hepatic impairment dose reduction may be necessary

Pregnancy avoid (teratogenicity and fetal loss in *animal* studies); see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above; also *rarely* inappropriate secretion of antidiuretic hormone; diarrhoea, intestinal necrosis, paralytic ileus, seizures, urinary retention, muscle wasting, and eye disorders also reported; irritant to tissues

Dose

- See Doses, p. 563

Vincristine (Non-proprietary) PoM

Injection, vincristine sulfate 1 mg/mL, net price 1-mL vial = £10.92; 2-mL vial = £21.17; 5-mL vial = £44.16

Oncovin® (Genus) PoM

Injection, vincristine sulfate 1 mg/mL, net price 1-mL vial = £14.18; 2-mL vial = £28.05

VINDESINE SULFATE

Indications see notes above

Cautions see section 8.1 and notes above; neuromuscular disease; caution in handling; **interactions:** Appendix 1 (vindesine)

Contra-indications see section 8.1 and notes above

Important Intrathecal injection **contra-indicated**

Hepatic impairment dose reduction may be necessary

Pregnancy avoid (teratogenic in *animal* studies); see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above; irritant to tissues

Dose

- See Doses, p. 563

Eldisine® (Genus) PoM

Injection, powder for reconstitution, vindesine sulfate, net price 5-mg vial = £78.30 (hosp. only)

VINFLUNINE

Indications see notes above

Cautions see section 8.1 and notes above; cardiovascular disease; QT-interval prolongation (avoid hypokalaemia or concomitant use of drugs that prolong QT-interval); **interactions:** Appendix 1 (vinflunine)

Contra-indications see notes above

Important Intrathecal injection **contra-indicated**

Hepatic impairment reduce dose—consult product literature

Renal impairment reduce dose if creatinine clearance less than 60 mL/minute—consult product literature

Pregnancy avoid unless essential—teratogenicity and embryotoxicity in *animal* studies; manufacturer advises effective contraception during and for up to 3 months after treatment; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above; also anorexia, diarrhoea, dyspepsia; tachycardia, hypertension, hypotension, thrombosis; oedema; insomnia, fatigue; dehydration; cutaneous reactions, sweating; *less commonly* increased weight, myocardial infarction, renal failure; *also reported* QT-interval prolongation, inappropriate anti-diuretic hormone secretion, blurred vision

Dose

- See Doses, p. 563

Javlor® (Fabre) PoM

Concentrate for intravenous infusion, vinflunine (as ditartrate) 25 mg/mL, net price 2-mL vial = £212.50, 10-mL vial = £1062.50

VINORELBINE

Indications see notes above

Cautions see section 8.1 and notes above; ischaemic heart disease; caution in handling; **interactions**: Appendix 1 (vinorelbine)

Contra-indications see section 8.1 and notes above; *with capsules* previous significant surgical resection of stomach or small bowel, long-term oxygen therapy, concurrent radiotherapy if treating the liver

Important Intrathecal injection **contra-indicated**

Hepatic impairment reduce *oral* dose in moderate impairment, avoid *oral* use in severe impairment; reduce *intravenous* dose in severe impairment; consult product literature

Pregnancy avoid unless essential (teratogenicity, and fetal loss in *animal* studies); manufacturer advises effective contraception during and for 3 months after treatment; men must avoid fathering a child during and for at least 3 months after treatment; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above; also *rarely* pancreatitis; hyponatraemia and inappropriate secretion of antidiuretic hormone also reported; irritant to tissues

Dose

- By mouth, 60 mg/m^2 once weekly for 3 weeks, increased if tolerated to 80 mg/m^2 once weekly; max. 160 mg once weekly
- By intravenous injection *or* infusion, consult product literature

Vinorelbine (Non-proprietary) PoM

Concentrate for intravenous infusion, vinorelbine (as tartrate) 10 mg/mL, net price 1-mL vial = £29.00, 5-mL vial = £139.00

Navelbine® (Fabre) PoM

Concentrate for intravenous infusion, vinorelbine (as tartrate) 10 mg/mL, net price 1-mL vial = £29.75; 5-mL vial = £139.98

Capsules, vinorelbine (as tartrate) 20 mg (brown), net price 1-cap pack = £43.98; 30 mg (pink), 1-cap pack = £65.98; 80 mg (yellow), 1-cap pack = £175.92. Label: 21, 25

8.1.5 Other antineoplastic drugs

Aflibercept

Aflibercept is a recombinant fusion protein that acts as a soluble decoy receptor and binds to vascular endothelial growth factors A and B (VEGF-A, VEGF-B) and placental growth factor (PlGF). Aflibercept inhibits the activation of VEGF receptors and the proliferation of endothelial cells, thereby inhibiting the growth of new vessels

that supply tumours with oxygen and nutrients. It is licensed in combination with irinotecan, fluorouracil and folinic acid (FOLFIRI) chemotherapy, in adults with metastatic colorectal cancer that is resistant to, or has progressed after, an oxaliplatin-containing regimen. An intravitreal preparation is available for the treatment of neovascular age-related macular degeneration, see section 11.8.2

NICE guidance

Aflibercept in combination with irinotecan and fluorouracil-based therapy for treating metastatic colorectal cancer that has progressed following prior oxaliplatin-based chemotherapy (March 2014)

Aflibercept in combination with irinotecan and fluorouracil-based therapy is **not** recommended within its marketing authorisation for treating metastatic colorectal cancer that is resistant to or has progressed after an oxaliplatin-containing regimen.

www.nice.org.uk/TA307

AFLIBERCEPT

Indications see notes above

Cautions see section 8.1; increased risk of hypertension; monitor blood pressure at initiation and at least fortnightly during treatment (do not initiate treatment if pre-existing hypertension is uncontrolled)—consult product literature if hypertension develops during treatment; history of cardiovascular disease (may be exacerbated by hypertension); increased risk of haemorrhage (including fatal events); monitor for signs of gastro-intestinal perforation (discontinue if perforation develops); risk of fistula formation (discontinue if fistula develops); risk of thrombocytopenia and neutropenia (including febrile neutropenia and neutropenic infection)—monitor full blood count, including differential count and platelets at baseline and before each treatment cycle; increased risk of thromboembolic events (consult product literature if event occurs); nephrotic syndrome and thrombotic microangiopathy reported—monitor for proteinuria before each treatment administration (consult product literature if symptoms develop); monitor for signs and symptoms of diarrhoea and dehydration, particularly in elderly—consult product literature if severe diarrhoea occurs; may impair wound healing—withhold treatment for at least 4 weeks before elective surgery and for at least 4 weeks after major surgery, or until wound fully healed; monitor for posterior reversible encephalopathy syndrome (presenting as seizures, altered mental status, nausea, vomiting, headache, or visual disturbance)

Contra-indications uncontrolled hypertension; moderate or severe congestive heart failure

Hepatic impairment caution in severe impairment—no information available

Renal impairment caution in severe impairment—no information available

Pregnancy manufacturer advises avoid—toxicity in *animal* studies; effective contraception required during and for at least 6 months after treatment in men and women; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding avoid—no information available

Side-effects diarrhoea, stomatitis, abdominal pain, decreased appetite, weight loss, fistula, aphthous stomatitis, haemorrhoids, proctalgia, toothache, hypertension, haemorrhage (including nasal, rectal and gastro-intestinal), thromboembolic events (arterial and venous), dyspnoea, oropharyngeal pain, rhinorrhoea, nasopharyngitis, dysphonia, headache, malaise, infection, sepsis, urinary tract infection, leucopenia, neutropenia (including febrile neutropenia), thrombocytopenia, dehydration, proteinuria, hand-foot syndrome, skin hyperpigmentation; *less commonly* gastro-intestinal perforation, posterior reversible encephalopathy syndrome, nephrotic syndrome, thrombotic microangiopathy, impaired wound healing

Dose

- See Doses, p. 563

Zaltrap® (Sanofi-Aventis) ▼ PoM

Concentrate for intravenous infusion, aflibercept 25 mg/mL, net price 4-mL (100-mg) vial = £295.65, 8-mL (200-mg) vial = £591.30

Arsenic trioxide

Arsenic trioxide is licensed for acute promyelocytic leukaemia in patients who have relapsed or failed to respond to previous treatment with a retinoid and chemotherapy.

ARSENIC TRIOXIDE

Indications see notes above

Cautions see section 8.1; correct electrolyte abnormalities before treatment; ECG required before and during treatment—consult product literature; avoid concomitant administration with drugs causing QT interval prolongation, hypokalaemia, and hypomagnesaemia; previous treatment with anthracyclines (increased risk of QT interval prolongation); **interactions**: Appendix 1 (arsenic trioxide)

Hepatic impairment manufacturer advises caution—limited information available

Renal impairment manufacturer advises caution—limited information available

Pregnancy avoid (teratogenic and embryotoxic in *animal* studies); manufacturer advises effective contraception during treatment in men and women; see also Pregnancy and Reproductive function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1; diarrhoea, leucocyte activation syndrome (unexplained fever, dyspnoea, weight gain, pulmonary infiltrates, pleural or pericardial effusions, with or without leucocytosis—treat with high dose corticosteroids, consult product literature); hyperglycaemia, hypokalaemia, QT interval prolongation, atrial fibrillation, atrial flutter, haemorrhage, pleuritic pain, musculoskeletal pain, paraesthesia, fatigue; *less commonly* abdominal pain, tachycardia, vasculitis, hypotension, oedema, pneumonitis, seizures, renal failure, blurred vision, and rash

Dose

- See Doses, p. 563

Trisenox® (TEVA UK) PoM

Concentrate for intravenous infusion, arsenic trioxide 1 mg/mL, net price 10-mL amp = £292.00

Bevacizumab

Bevacizumab is a monoclonal antibody that inhibits vascular endothelial growth factor. It is licensed for the treatment of metastatic colorectal cancer in combination with fluoropyrimidine-based chemotherapy (but see NICE guidance below). It is also licensed for first-line treatment of metastatic breast cancer in combination with paclitaxel, or with capecitabine when treatment with other chemotherapy, including taxanes or anthracyclines is not appropriate; patients who have received adjuvant taxane or anthracyline-containing regimens in the previous 12 months should not be treated with bevacizumab in combination with capecitabine. Bevacizumab is also licensed for advanced or metastatic renal cell carcinoma in combination with interferon alfa-2a (but see NICE Guidance, p. 599). Bevacizumab, in combination with platinum-based chemotherapy, is licensed for first-line treatment of unresectable advanced, metastatic or recurrent non-small cell lung cancer other than predominantly squamous cell histology. It is also licensed, in combination with carboplatin and paclitaxel, for the first-line treatment of advanced (FIGO stages IIIB, IIIC and IV) epithelial ovarian, fallopian tube, or primary peritoneal cancer and, in combination with carboplatin and gemcitabine, for first recurrence of platinum-sensitive epithelial ovarian, fallopian tube, or primary peritoneal cancer in patients who have not been treated previously with bevacizumab or other drugs that target vascular endothelial growth factor. Bevacizumab is given by intravenous infusion.

MHRA/CHM advice

Bevacizumab and sunitinib: risk of osteonecrosis of the jaw (January 2011)

Treatment with bevacizumab or sunitinib may be a risk factor for the development of osteonecrosis of the jaw.

Patients treated with bevacizumab or sunitinib, who have previously received bisphosphonates, or are treated concurrently with bisphosphonates, may be particularly at risk.

Dental examination and appropriate preventive dentistry should be considered before treatment with bevacizumab or sunitinib.

If possible, invasive dental procedures should be avoided in patients treated with bevacizumab or sunitinib who have previously received, or who are currently receiving, intravenous bisphosphonates.

The *Scottish Medicines Consortium* (p. 4) has advised (April 2012) that bevacizumab (*Avastin*®) is **not** recommended for use within NHS Scotland for the the first-line treatment of patients with metastatic breast cancer in whom treatment with other chemotherapy options including taxanes or anthracyclines is not considered appropriate, or (September 2012), in combination with carboplatin and paclitaxel, for the first-line treatment of advanced (FIGO stages IIIB, IIIC and IV) epithelial ovarian, fallopian tube, or primary peritoneal cancer.

NICE guidance

Bevacizumab and cetuximab for the treatment of metastatic colorectal cancer (January 2007)

Bevacizumab in combination with fluorouracil plus folinic acid, with or without irinotecan, is **not** recommended for the first-line treatment of metastatic colorectal cancer; see also NICE guidance Cetuximab, bevacizumab and panitimumab for the treatment of metastatic colorectal cancer after first-line chemotherapy, p. 589.

www.nice.org.uk/TA118

NICE guidance

Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine for the treatment of metastatic colorectal cancer (December 2010)

Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine is **not** recommended for the treatment of metastatic colorectal cancer.

www.nice.org.uk/TA212

NICE guidance

Bevacizumab in combination with a taxane for the first-line treatment of metastatic breast cancer (February 2011)

Bevacizumab in combination with a taxane is **not** recommended for the first-line treatment of metastatic breast cancer.

www.nice.org.uk/TA214

NICE guidance

Bevacizumab in combination with capecitabine for the first-line treatment of metastatic breast cancer (August 2012)

Bevacizumab in combinations with capecitabine is **not** recommended within its marketing authorisation for the first-line treatment of metastatic breast cancer, that is, when treatment with other chemotherapy options including taxanes or anthracyclines is not considered appropriate, or when taxanes or anthracyclines have been used as part of adjuvant treatment in the previous 12 months.

www.nice.org.uk/TA263

NICE guidance

Bevacizumab in combination with paclitaxel and carboplatin for the first-line treatment of advanced ovarian cancer (May 2013)

Bevacizumab in combination with paclitaxel and carboplatin is **not** recommended for the first-line treatment of advanced ovarian cancer (including fallopian tube and primary peritoneal cancer).

www.nice.org.uk/TA284

NICE guidance

Bevacizumab in combination with gemcitabine and carboplatin for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (May 2013)

Bevacizumab in combination with gemcitabine and carboplatin is **not** recommended within its marketing authorisation, that is, for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (including fallopian tube and primary peritoneal cancer) that has not been previously treated with bevacizumab or other vascular endothelial growth factor (VEGF) inhibitors or VEGF receptor-targeted agents.

www.nice.org.uk/TA285

BEVACIZUMAB

Indications see notes above

Cautions see section 8.1; intra-abdominal inflammation (risk of gastro-intestinal perforation and gall bladder perforation); increased risk of fistulas (discontinue permanently if tracheo-oesophageal or grade 4 fistula develops); withhold treatment for elective surgery and avoid for at least 28 days after major surgery or until wound fully healed; monitor for necrotising fasciitis (usually secondary to wound healing complications, gastro-intestinal perforation or fistula formation)—discontinue and initiate treatment promptly; history of hypertension (increased risk of proteinuria—discontinue if nephrotic syndrome); uncontrolled hypertension; monitor blood pressure; history of arterial thromboembolism; history of cardiovascular disease (increased risk of cardiovascular events especially in the elderly); monitor for congestive heart failure; increased risk of haemorrhage (especially tumour-associated haemorrhage); monitor for posterior reversible encephalopathy syndrome (presenting as seizures, headache, altered mental status, visual disturbance or cortical blindness, with or without hypertension); untreated CNS metastases; consider dental check-up before initiating treatment (risk of osteonecrosis of the jaw, see MHRA/CHM advice, above); **interactions:** Appendix 1 (bevacizumab)

Pregnancy avoid—toxicity in *animal* studies; effective contraception required during and for at least 6 months after treatment in women; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding manufacturer advises avoid breast-feeding during and for at least 6 months after treatment

Side-effects see section 8.1; gastro-intestinal perforation, gall bladder perforation, intestinal obstruction, abdominal pain, diarrhoea, constipation, taste disturbances; mucocutaneous bleeding, haemorrhage, hypoxia, arterial thromboembolism, congestive heart failure, syncope, supraventricular tachycardia, hypertension (see also Cautions); dyspnoea, rhinitis; anorexia, drowsiness, headache, peripheral neuropathy, asthenia, lethargy, dysarthria, posterior reversible encephalopathy syndrome; pyrexia; infection, proteinuria; dehydration, neutropenia, thrombocytopenia, anaemia; eye disorders; fistulas, pulmonary hypertension, impaired wound healing, necrotising fasciitis (see Cautions) osteonecrosis of the jaw (see MHRA/CHM advice, above), hand-foot syndrome, exfoliative dermatitis, dry skin, skin discoloration, and hypersensitivity reactions (including flushing, rash, hypotension, chest pain, and rigors) also reported

Dose

- See Doses, p. 563

Avastin® (Roche) ▼ PoM

Concentrate for intravenous infusion, bevacizumab 25 mg/mL, net price 4-ml (100-mg) vial = £242.66, 16-ml (400-mg) vial = £924.40

Bexarotene

Bexarotene is an agonist at the retinoid X receptor, which is involved in the regulation of cell differentiation and proliferation. It is associated with little myelosuppression or immunosuppression. Bexarotene can cause regression of cutaneous T-cell lymphoma. The main adverse effects are hyperlipidaemia, hypothyroidism, leucopenia, headache, rash, and pruritus.

The *Scottish Medicines Consortium* (p. 4) has advised (November 2002) that bexarotene is recommended for restricted use as a second-line treatment for patients with advanced cutaneous T-cell lymphoma.

BEXAROTENE

Indications skin manifestations of cutaneous T-cell lymphoma refractory to previous systemic treatment

Cautions see section 8.1 and notes above; hyperlipidaemia (avoid if uncontrolled), hypothyroidism (avoid if uncontrolled); hypersensitivity to retinoids; avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (bexarotene)

Contra-indications see section 8.1 and notes above; history of pancreatitis, hypervitaminosis A

Hepatic impairment avoid

Pregnancy avoid; manufacturer advises effective contraception during and for at least 1 month after treatment in men or women; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above

Dose

- Initially 300 mg/m^2 daily as a single dose with a meal; adjust dose according to response

Targretin® (TEVA UK) PoM

Capsules, bexarotene 75 mg in a liquid suspension, net price 100-cap pack = £937.50

Bortezomib

Bortezomib, a proteasome inhibitor, is licensed as monotherapy, or in combination with pegylated liposomal doxorubicin or dexamethasone, for the treatment of multiple myeloma that has progressed despite the use of at least one therapy, and where the patient has already had, or is unable to have, haematopoietic stem cell transplantation. It is also licensed for use in combination with melphalan and prednisolone for the treatment of previously untreated multiple myeloma in patients who are not eligible for high-dose chemotherapy with haematopoietic stem cell transplantation. Bortezomib is also licensed in combination with dexamethasone, or with dexamethasone and thalidomide, for the induction treatment of previously untreated multiple myeloma in patients who are eligible for high-dose chemotherapy

with haematopoietic stem cell transplantation. Bortezomib is given by intravenous or subcutaneous injection.

Important

Bortezomib injection is for **intravenous or subcutaneous administration** only. Inadvertent intrathecal administration with fatal outcome has been reported.

The *Scottish Medicines Consortium*, p. 4 has advised (December 2013) that bortezomib (*Velcade*®) is accepted for restricted use within NHS Scotland in combination with dexamethasone and thalidomide for the induction treatment of adults with previously untreated multiple myeloma who are eligible for high-dose chemotherapy with haematopoietic stem cell transplantation.

NICE guidance

Bortezomib monotherapy for relapsed multiple myeloma (October 2007)

Bortezomib monotherapy is an option for the treatment of progressive multiple myeloma in patients who are at first relapse having received one prior therapy and who have undergone, or are unsuitable for, bone-marrow transplantation, under the following circumstances:

- the response to bortezomib is measured using serum M protein after a maximum of four cycles of treatment, and treatment is continued only in patients who have a reduction in serum M protein of 50% or more (where serum M protein is not measurable, an appropriate alternative biochemical measure of response should be used) **and**
- the manufacturer rebates the full cost of bortezomib if there is an inadequate response (as defined above) after four cycles of treatment.

www.nice.org.uk/TA129

NICE guidance

Bortezomib and thalidomide for the first-line treatment of multiple myeloma (July 2011)

Bortezomib in combination with an alkylating drug and a corticosteroid is recommended as an option for the first-line treatment of multiple myeloma if:

- high-dose chemotherapy with stem cell transplantation is considered inappropriate **and**
- the person is unable to tolerate or has contra-indications to thalidomide.

For thalidomide see under Lenalidomide and thalidomide, p. 631

www.nice.org.uk/TA228

NICE guidance

Bortezomib for induction therapy in multiple myeloma before high-dose chemotherapy and autologous stem cell transplantation (April 2014)

Bortezomib is recommended as an option within its marketing authorisation, in combination with dexamethasone, or with dexamethasone and thalidomide, for the induction treatment of adults with previously untreated multiple myeloma, who are eligible for high-dose chemotherapy with haematopoietic stem cell transplantation.

www.nice.org.uk/TA311

BORTEZOMIB

Indications see notes above

Cautions see section 8.1; cardiovascular disease; pulmonary disease (chest x-ray recommended before treatment—discontinue if interstitial lung disease develops); consider antiviral prophylaxis for herpes zoster infection; risk factors for seizures; amyloidosis; history of syncope and concurrent use of medication which may cause hypotension; dehydration; risk of neuropathy—consult product literature; monitor blood-glucose concentration in patients on oral antidiabetics; monitor for symptoms of progressive multifocal leucoencephalopathy (presenting as new or worsening neurological signs or symptoms)—discontinue treatment if diagnosed; **interactions:** Appendix 1 (bortezomib)

Contra-indications acute diffuse infiltrative pulmonary disease; pericardial disease

Hepatic impairment reduce dose in moderate to severe impairment—consult product literature

Renal impairment no information available for creatinine clearance less than 20 mL/minute/1.73 m^2

Pregnancy manufacturer advises effective contraception during and for 3 months after treatment in men or women—toxicity in *animal* studies; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1; also diarrhoea, constipation (cases of ileus reported), hypotension, dyspnoea, fatigue, pyrexia, peripheral neuropathy (including sensory), headache, paraesthesia, decreased appetite, herpes zoster (including reactivation), myalgia, rash; *less commonly* heart failure, pulmonary hypertension, acute diffuse infiltrative pulmonary disorders, seizures, posterior reversible encephalopathy syndrome (discontinue treatment); *rarely* autonomic neuropathy; *very rarely* progressive multifocal leucoencephalopathy; also consult product literature

Dose

- See Doses, p. 563

Velcade® (Janssen) PoM

Injection, powder for reconstitution, bortezomib (as mannitol boronic ester), net price 3.5-mg vial = £762.38

Brentuximab vedotin

Brentuximab vedotin is licensed for the treatment of relapsed or refractory CD-30 positive Hodgkin's disease following autologous stem cell transplant or following at least two prior therapies, when autologous stem cell transplant or muti-agent chemotherapy is not a treatment option. It is also licensed for relapsed or refractory systemic anaplastic large cell lymphoma.

BRENTUXIMAB VEDOTIN

Indications see notes above

Cautions see section 8.1; rapidly proliferating tumours and high tumour burden—risk of tumour lysis syndrome; elevated BMI—risk of hyperglycaemia; monitor for symptoms of progressive multifocal leucoencephalopathy (presenting as new or worsening neurological, cognitive or behavioural signs or symptoms); monitor for new or worsening abdominal pain—investigate and withhold treatment if acute

pancreatitis suspected and discontinue if confirmed (fatal cases reported); monitor for pulmonary toxicity—treat symptoms promptly; routinely monitor hepatic function; monitor for infusion-related (including anaphylactic) reactions; monitor for signs of peripheral neuropathy—consult product literature for treatment adjustment; **interactions:** Appendix 1 (brentuximab vedotin)

Pregnancy avoid unless potential benefit outweighs risk (toxicity in *animal* studies); effective contraception required during treatment and for 6 months after treatment in men and women

Breast-feeding avoid—no information available

Side-effects see section 8.1; diarrhoea, constipation, cough, dyspnoea, fatigue, infusion-related reactions (including anaphylaxis), pyrexia, dizziness, peripheral neuropathy, demyelinating polyneuropathy, hyperglycaemia, myalgia, arthralgia, back pain, pruritus, rash; *less commonly* acute pancreatitis, Stevens-Johnson syndrome; *also reported* progressive multifocal leucoencephalopathy

Dose

- See Doses, p. 563

Adcetris® (Takeda) ▼ PoM

Injection, powder for reconstitution, brentuximab vedotin, net price 50-mg vial = £2500.00

Electrolytes Na^+ 0.57 mmol/vial

Catumaxomab

Catumaxomab is licensed for the treatment of malignant ascites in patients with epithelial cell adhesion molecule (EpCAM) positive carcinomas, where standard therapy is not available or no longer feasible.

Catumaxomab is given by intraperitoneal infusion. Infusion related side-effects have been reported with catumaxomab; premedication with analgesics, antipyretics, or NSAIDs is recommended by the manufacturer.

CATUMAXOMAB

Indications see notes above

Cautions see section 8.1 and notes above; haemodynamic insufficiency, oedema, hypoproteinaemia

Pregnancy avoid—limited information available

Breast-feeding avoid—no information available

Side-effects see section 8.1 and notes above; also abdominal pain, diarrhoea, constipation, dyspepsia, flatulence, ileus, anorexia, dehydration, cholangitis, tachycardia, hypotension, hypertension, flushing, dyspnoea, pleural effusion, cough, hypoxia, insomnia, anxiety, headache, dizziness, infection, hyperglycaemia, electrolyte disturbances, proteinuria, haematuria, leucocyturia, myalgia, arthralgia, vertigo, rash, sweating, skin reactions, *less commonly* gastro-intestinal haemorrhage, intestinal obstruction, seizures, acute renal failure

Dose

- Consult product literature

Removab® (Fresenius Biotech) ▼ PoM

Concentrate for intraperitoneal infusion, catumaxomab 100 micrograms/mL, net price 10-microgram prefilled syringe = £510.00; 50-microgram prefilled syringe = £2550.00

Cetuximab

Cetuximab is licensed for the treatment of wild-type *RAS* metastatic colorectal cancer in patients with tumours expressing epidermal growth factor receptor, as combination therapy, or as monotherapy if oxaliplatin- and irinotecan-based therapy has failed or if irinotecan is not tolerated (but see NICE guidance below). Evidence of non-mutated (wild-type) *RAS* status (at exons 2, 3 and 4 of *KRAS* and *NRAS*) is required before cetuximab is initiated for the treatment of metastatic colorectal cancer, and should be determined by an experienced laboratory using a validated test method. The combination of cetuximab with oxaliplatin-containing chemotherapy is contra-indicated in patients with metastatic colorectal cancer who have mutant or unknown *RAS* status. Cetuximab is also licensed, in combination with radiotherapy, for the treatment of locally advanced squamous cell cancer of the head and neck and in combination with platinum-based chemotherapy for recurrent or metastatic squamous cell cancer of the head and neck (but see NICE guidance below).

Cetuximab is given by intravenous infusion. Patients must receive an antihistamine and a corticosteroid at least one hour before infusion. Resuscitation facilities should be available and treatment should be initiated by a specialist.

MHRA/CHM advice

Epidermal growth factor receptor (EGFR) inhibitors: serious cases of keratitis and ulcerative keratitis (May 2012)

Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors for cancer (cetuximab, erlotinib, gefitinib and panitumumab). In rare cases, this has resulted in corneal perforation and blindness. Patients undergoing treatment with EGFR inhibitors who present with acute or worsening signs and symptoms suggestive of keratitis should be referred promptly to an opthalmology specialist. Treatment should be interupted or discontinued if ulcerative keratitis is diagnosed.

The *Scottish Medicines Consortium* (p. 4) has advised (January 2010) that cetuximab (*Erbitux®*) is accepted for restricted use within NHS Scotland, in combination with chemotherapy, for metastatic colorectal cancer in patients with tumours expressing epidermal growth factor; it is restricted to patients with non-resectable metastases confined to the liver, who have not previously received chemotherapy.

NICE guidance

Cetuximab for the treatment of locally advanced squamous cell cancer of the head and neck (June 2008)

Cetuximab in combination with radiotherapy is an option for the treatment of locally advanced squamous cell cancer of the head and neck in patients who have a Karnofsky performance status of 90% or greater and when all forms of platinum-based chemoradiotherapy treatment are contra-indicated.

www.nice.org.uk/TA145

NICE guidance

Cetuximab for the treatment of recurrent or metastatic squamous cell cancer of the head and neck (June 2009)

Cetuximab in combination with platinum-based chemotherapy is **not** recommended for the treatment of recurrent or metastatic squamous cell cancer of the head and neck.

www.nice.org.uk/TA172

NICE guidance

Cetuximab for the first-line treatment of metastatic colorectal cancer (August 2009)

Cetuximab in combination with fluorouracil, folinic acid and oxaliplatin is an option for the first-line treatment of metastatic colorectal cancer under the following circumstances:

- the primary tumour has been resected or is potentially operable;
- the metastatic disease is confined to the liver and is unresectable; and
- the patient is fit to undergo surgery to resect the primary colorectal tumour and to undergo liver surgery if the metastases become resectable after treatment with cetuximab.

In patients unable to tolerate oxaliplatin, or in whom oxaliplatin is contra-indicated, cetuximab in combination with fluorouracil, folinic acid and irinotecan can be used as an alternative.

In addition, the manufacturer is required to rebate 16% of the amount of cetuximab used per patient when used in combination with fluorouracil, folinic acid, and oxaliplatin.

Patients who meet the above criteria should receive cetuximab for no more than 16 weeks. At 16 weeks, cetuximab should be stopped and the patient should be assessed for resection of liver metastases.

www.nice.org.uk/TA176

NICE guidance

Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy (January 2012)

Cetuximab monotherapy or combination chemotherapy is **not** recommended for the treatment of patients with metastatic colorectal cancer that has progressed after first-line chemotherapy.

Bevacizumab in combination with non-oxaliplatin (fluoropyrimidine-based) chemotherapy is **not** recommended for the treatment of patients with metastatic colorectal cancer that has progressed after first-line chemotherapy; see also NICE guidance Bevacizumab and cetuximab for the treatment of metastatic colorectal cancer (January 2007), p. 585

Panitinumab monotherapy is **not** recommended for the treatment of patients with metastatic colorectal cancer that has progressed after first-line chemotherapy.

www.nice.org.uk/TA242

CETUXIMAB

Indications see notes above and product literature

Cautions cardiovascular disease, cardiopulmonary disease, pulmonary disease—discontinue if interstitial lung disease; history of, or risk factors for keratitis, ulcerative keratitis (including contact lens use), or severe dry eye (see also MHRA/CHM advice above)

Contra-indications *RAS* mutated colorectal tumours (or if *RAS* tumour status unknown)

Pregnancy use only if potential benefit outweighs risk—no information available; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding avoid breast-feeding during and for 2 months after treatment—no information available

Side-effects infusion-related reactions including dyspnoea, dizziness, chills, fever, and severe (sometimes fatal) hypersensitivity reactions (possibly delayed onset) such as rash, urticaria, bronchospasm, hypotension, hypertension, and shock; nausea, vomiting, diarrhoea, headache, aseptic meningitis, hypomagnesaemia, hypocalcaemia, conjunctivitis, blepharitis, keratitis, skin reactions including acne, pruritus, dry skin, desquamation, hypertrichosis, nail disorders; *very rarely* Stevens-Johnson syndrome, toxic epidermal necrolysis

Dose

- See Doses, p. 563

Erbitux® (Merck Serono) PoM

Intravenous infusion, cetuximab 5 mg/mL, net price 20-mL vial = £178.10, 100-mL vial = £890.50

Crisantaspase

Crisantaspase is the enzyme asparaginase produced by *Erwinia chrysanthemi*. It is given *intramuscularly*, *intravenously*, or *subcutaneously* almost exclusively in acute lymphoblastic leukaemia. Facilities for the management of anaphylaxis should be available.

CRISANTASPASE

Indications see notes above

Cautions see notes above

Contra-indications history of pancreatitis related to asparaginase therapy

Pregnancy avoid; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1; also liver dysfunction, pancreatitis, diarrhoea; coagulation disorders; lethargy, drowsiness, confusion, dizziness, neurotoxicity, convulsions, headache; *less commonly* changes in blood lipids, anaphylaxis, hyperglycaemia; *rarely* CNS depression; *very rarely* myalgia; abdominal pain and hypertension also reported

Dose

- See Doses, p. 563

Erwinase® (EUSA Pharma) PoM

Injection, powder for reconstitution, crisantaspase, net price 10 000-unit vial = £613.00

Dacarbazine and temozolomide

Dacarbazine is used to treat metastatic melanoma and, in combination therapy, soft tissue sarcomas. It is also a component of a commonly used combination for

Hodgkin's disease (ABVD—doxorubicin [previously *Adriamycin*®], bleomycin, vinblastine, and dacarbazine). It is given *intravenously*. The predominant side-effects are myelosuppression and severe nausea and vomiting.

Temozolomide is structurally related to dacarbazine. It is given by mouth and is licensed for the treatment of newly diagnosed glioblastoma multiforme in adults (in combination with radiotherapy) and subsequently as monotherapy. It is also licensed for second-line treatment of malignant glioma in adults and children over 3 years.

NICE guidance
Temozolomide for the treatment of recurrent malignant glioma (brain cancer) (April 2001)

Temozolomide may be considered for the treatment of recurrent malignant glioma, which has not responded to first-line chemotherapy.

www.nice.org.uk/TA23

NICE guidance
Carmustine implants and temozolomide for the treatment of newly diagnosed high-grade glioma (June 2007)

Temozolomide is an option for the treatment of newly diagnosed glioblastoma multiforme in patients with a WHO performance status of 0 or 1.

Carmustine implants are an option for the treatment of newly diagnosed high-grade (Grade 3 or 4) glioma **only** for patients in whom at least 90% of the tumour has been resected.

Carmustine implants should only be used within specialist centres.

www.nice.org.uk/TA121

DACARBAZINE

Indications see notes above

Cautions see section 8.1; caution in handling; **interactions**: Appendix 1 (dacarbazine)

Hepatic impairment dose reduction may be required in combined renal and hepatic impairment; avoid in severe impairment

Renal impairment dose reduction may be required in combined renal and hepatic impairment; avoid in severe impairment

Pregnancy avoid (carcinogenic and teratogenic in *animal* studies); ensure effective contraception during and for at least 6 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above; *rarely* liver necrosis due to hepatic vein thrombosis; irritant to skin and tissues

Dose

- See Doses, p. 563

Dacarbazine (Non-proprietary) PoM

Injection, powder for reconstitution, dacarbazine (as citrate), net price 100-mg vial = £5.05; 200-mg vial = £7.50; 500-mg vial = £16.50; 600-mg vial = £22.50; 1-g vial = £31.80

TEMOZOLOMIDE

Indications see notes above

Cautions see section 8.1; *Pneumocystis jirovecii* pneumonia—consult product literature for monitoring and prophylaxis requirements; monitor liver function before treatment initiation, after each treatment cycle and midway through 42-day treatment cycles—consider the balance of benefits and risks of treatment if results are abnormal at any point (fatal liver injury reported); monitor for myelodysplastic syndrome and secondary malignancies; **interactions:** Appendix 1 (temozolomide)

Hepatic impairment use with caution in severe impairment—no information available

Renal impairment manufacturer advises caution—no information available

Pregnancy avoid (teratogenic and embryotoxic in *animal* studies); manufacturer advises adequate contraception during treatment; men should avoid fathering a child during and for at least 6 months after treatment; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Label: 23, 25

Eribulin

Eribulin is licensed for the treatment of locally advanced or metastatic breast cancer when the disease has progressed after treatment with at least 2 chemotherapy regimens. Previous therapy should have included an anthracycline and a taxane unless patients were unsuitable for these treatments. It is given intravenously on day 1 and day 8 of a 21-day cycle. It can cause myelosuppression, peripheral neuropathy, and QT-interval prolongation.

NICE guidance
Eribulin for the treatment of locally advanced or metastatic breast cancer (April 2012)

Eribulin is **not** recommended for the treatment of locally advanced or metastatic breast cancer that has progressed after at least two chemotherapy regimens for advanced disease.

www.nice.org.uk/TA250

ERIBULIN

Indications see notes above

Cautions see section 8.1 and notes above; susceptibility to QT-interval prolongation (including electrolyte disturbances, concomitant use of drugs that prolong QT-interval); **interactions**: Appendix 1 (eribulin)

Hepatic impairment reduce dose

Renal impairment consider dose reduction if creatinine clearance less than 40 mL/minute

Pregnancy avoid unless essential (teratogenic in *animal sudies*); ensure effective contraception during and for up to 3 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Note Contains ethanol

Hydroxycarbamide

Hydroxycarbamide is an orally active drug used mainly in the treatment of chronic myeloid leukaemia. It is also licensed for the treatment of cancer of the cervix in conjunction with radiotherapy. It is occasionally used for polycythaemia (the usual treatment is venesection); patients receiving long-term therapy with hydroxycarbamide should be advised to protect skin from sun exposure and should be monitored for secondary malignancies. Myelosuppression, nausea, and skin reactions are the most common toxic effects.

HYDROXYCARBAMIDE

(Hydroxyurea)

Indications see notes above; sickle-cell disease (section 9.1.3)

Cautions see section 8.1 and notes above; **interactions:** Appendix 1 (hydroxycarbamide)

Hepatic impairment use with caution

Renal impairment use with caution

Pregnancy avoid (teratogenic in *animal* studies); manufacturer advises effective contraception before and during treatment; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above

Dose

- 20–30 mg/kg daily *or* 80 mg/kg every third day

Hydroxycarbamide (Non-proprietary) PoM

Capsules, hydroxycarbamide 500 mg, net price 100-cap pack = £10.55

Hydrea® (Squibb) PoM

Capsules, pink/green, hydroxycarbamide 500 mg, net price 100-cap pack = £10.47

Ipilimumab

Ipilimumab causes T-cell activation. It is licensed for the treatment of unresectable or metastatic advanced melanoma in patients who have received prior therapy. Infusion-related side-effects have been reported with ipilimumab; premedication with paracetamol and an antihistamine is recommended. A corticosteroid can be used after starting ipilimumab, to treat immune-related reactions. The *Scottish Medicines Consortium* (p. 4) has advised (March 2013) that ipilimumab (*Yervoy®*) is accepted for restricted use within NHS Scotland for the treatment of advanced (unresectable or metastatic) melanoma in adults who have received prior therapy, only whilst ipilimumab is available at the price agreed in the patient access scheme.

NICE guidance

Ipilimumab for previously treated advanced (unresectable or metastatic) melanoma (December 2012)

Ipilimumab is recommended as an option for the treatment of advanced (unresectable or metastatic) melanoma in patients who have received prior therapy, only if the manufacturer provides ipilimumab with the discount agreed in the patient access scheme.

www.nice.org.uk/TA268

IPILIMUMAB

Indications see notes above

Cautions see notes above—for full details consult product literature; **interactions**: Appendix 1 (ipilimumab)

Hepatic impairment use with caution if plasma-bilirubin concentration greater than 3 times upper limit of normal range *or* if plasma-transaminase concentration 5 times or greater than the upper limit of normal range

Pregnancy avoid unless potential benefit outweighs risk (toxicity in *animal* studies); use effective contraception

Breast-feeding discontinue breast-feeding—no information available

Side-effects see notes above—for full details (including monitoring and management of side-effects) consult product literature

Dose

- Consult product literature

Yervoy® (Bristol-Myers Squibb) ▼ PoM

Concentrate for intravenous infusion, ipilimumab 5 mg/mL, net price 10-mL vial = £3750.00, 40-mL vial = £15000.00

Electrolytes Contains approx. 0.1 mmol Na^+/mL

Mitotane

Mitotane is licensed for the symptomatic treatment of advanced or inoperable adrenocortical carcinoma. It selectively inhibits the activity of the adrenal cortex, necessitating corticosteroid replacement therapy (section 6.3.1); the dose of glucocorticoid should be increased in case of shock, trauma, or infection.

Gastro-intestinal side-effects such as anorexia, nausea, and vomiting, and endocrine side-effects, such as hypogonadism and thyroid disorders, are very common with mitotane; neurotoxicity occurs in many patients.

MITOTANE

Indications see notes above

Cautions see section 8.1 and notes above; risk of accumulation in overweight patients; monitor plasma-mitotane concentration—consult product literature; avoid in acute porphyria (section 9.8.2); **interactions**: Appendix 1 (mitotane)

Driving CNS effects may affect performance of skilled tasks (e.g. driving)

Counselling Warn patient to contact doctor immediately if injury, infection, or illness occurs (because of risk of acute adrenal insufficiency)

Hepatic impairment manufacturer advises caution in mild to moderate impairment—monitoring of plasma-mitotane concentration recommended; avoid in severe impairment

Renal impairment manufacturer advises caution in mild to moderate impairment—monitoring of plasma-mitotane concentration recommended; avoid in severe impairment

Pregnancy manufacturer advises avoid—women of childbearing age should use effective contraception during and after treatment; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above; also gastro-intestinal disturbances (including nausea, vomiting, diarrhoea, epigastric discomfort), anorexia, liver disorders; hypercholesterolaemia, hypertriglyceridaemia; ataxia, confusion, asthenia, myasthenia, paraesthesia, drowsiness, neuropathy, cognitive impairment, movement disorder, dizziness, headache; gynaecomastia; prolonged bleeding time, leucopenia, thrombocytopenia, anaemia; rash; *rarely* hypersalivation, hypertension, postural hypotension, flushing, pyrexia, haematuria, proteinuria, haemorrhagic cystitis, hypouricaemia, visual disturbances, and ocular disorders

Dose

- ADULT over 18 years, initially 2–3 g daily, (up to 6 g daily in severe illness) in 2–3 divided doses, adjusted according to plasma-mitotane concentration; reduce dose or interrupt treatment if signs of toxicity; discontinue if inadequate response after 3 months

  Note Plasma-mitotane concentration for optimum response 14–20 mg/litre

Lysodren® (HRA Pharma) PoM

Tablets, scored, mitotane 500 mg, net price 100-tab pack = £590.97. Label: 2, 10, 21, counselling, driving, adrenal suppression

Panitumumab

Panitumumab is a monoclonal antibody that binds to the epidermal growth factor receptor (EGFR). It is indicated as combination therapy for the treatment of non-mutated *RAS* metastatic colorectal cancer, or as monotherapy after failure of fluoropyrimidine-, oxaliplatin-, and irinotecan-containing chemotherapy regimens. Evidence of non-mutated *RAS* status (at exons 2, 3 and 4 of *KRAS* and *NRAS*) is required before panitumumab treatment is initiated, and should be determined by an experienced laboratory using a validated test method. The combination of panitumumab with oxaliplatin-containing chemotherapy is contra-indicated in patients with mutant *RAS* metastatic colorectal cancer or for whom *RAS* status is unknown. Panitumumab is given by intravenous infusion.

MHRA/CHM advice

Severe skin reactions

Severe skin reactions have been reported very commonly in patients treated with panitumumab. Patients receiving panitumumab who have severe skin reactions or develop worsening skin reactions should be monitored for the development of inflammatory or infectious sequelae (including cellulitis, sepsis, and necrotising fasciitis). Appropriate treatment should be promptly initiated and panitumumab withheld or discontinued.

NICE guidance

Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy (January 2012)

See p. 589

PANITUMUMAB

Indications see notes above

Cautions monitor for dermatological reactions (see Severe Skin Reactions above and consult product literature); pulmonary disease—discontinue if interstitial lung disease develops; monitor for hypomagnesaemia and hypocalcaemia; history of, or risk factors for keratitis, ulcerative keratitis (including contact lens use), or severe dry eye (see also MHRA/CHM advice Epidermal Growth Factor Receptor (EGFR) Inhibitors: Serious Cases of Keratitis and Ulcerative Keratitis, p. 588)

Contra-indications see notes above; interstitial pulmonary disease

Pregnancy avoid (toxicity in *animal* studies); manufacturer advises effective contraception during and for 6 months after treatment; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding manufacturer advises avoid breast-feeding during and for 2 months after treatment

Side-effects see section 8.1; also infusion-related reactions including hypertension, hypotension, tachycardia, and severe hypersensitivity reactions (possibly delayed onset); diarrhoea, abdominal pain, constipation, dry mouth and nose; dyspnoea, cough, embolism; fatigue, dizziness, headache; hypomagnesaemia, hypocalcaemia, hypokalaemia, dehydration; ocular disorders (including conjunctivitis, increased lacrimation, dry eyes, ocular hyperaemia and keratitis); skin reactions (including rash, erythema, pruritus, dry skin, acne, hand-foot syndrome and exfoliation), mucosal inflammation, hypertrichosis, and nail disorders

Pertuzumab

Pertuzumab is a recombinant humanised monoclonal antibody, and acts by inhibiting human epidermal growth factor receptor 2 protein (HER2) dimerisation. It is indicated for the treatment of HER2-positive metastatic or locally recurrent unresectable breast cancer in combination with trastuzumab and docetaxel, in patients who have not received previous anti-HER2 therapy or chemotherapy. Pertuzumab is given by intravenous infusion; resuscitation facilities should be available and treatment should be initiated by a specialist.

PERTUZUMAB

Indications see notes above

Cautions see section 8.1 and notes above; history of congestive heart failure, impaired left ventricular function or conditions that could impair left ventricular function (including uncontrolled hypertension, recent myocardial infarction, serious cardiac arrhythmia, prior anthracycline exposure, or radiotherapy to the chest area); assess for signs and symptoms of congestive heart failure (including left ventricular ejection fraction) before and during treatment—consult product literature, and withhold treatment if necessary; monitor for febrile neutropenia

Hepatic impairment caution—no information available

Renal impairment caution in severe impairment—no information available

Pregnancy avoid (toxicity in *animal* studies); ensure effective contraception during and for six months after treatment in women of childbearing potential; see also Pregnancy and Reproductive Function

Breast-feeding avoid—no information available

Side-effects see section 8.1; also (when used in combination with trastuzumab and docetaxel) decreased appetite, diarrhoea, constipation, dyspepsia, left ventricular dysfunction, oedema, dyspnoea, cough, pleural effusion, nasopharyngitis, insomnia, peripheral neuropathy, headache, dizziness, taste disturbance, pain, malaise, pyrexia, chills, upper respiratory-tract infection, paronychia, neutropenia (including febrile neutropenia), leucopenia, anaemia, myalgia, arthralgia, increased lacrimation, rash, nail disorder, pruritus, dry skin; infusion-related reactions including severe hypersensitivity reactions; *less commonly* interstitial lung disease

Dose

- See Doses, p. 563

Perjeta (Roche) ▼ PoM

Concentrate for intravenous infusion, pertuzumab 30 mg/mL, net price 14-mL vial = £2395.00

Platinum compounds

Carboplatin is widely used in the treatment of advanced ovarian cancer and lung cancer (particularly the small cell type). It is given *intravenously*. The dose of carboplatin is determined according to renal function rather than body surface area. Carboplatin can be given on an outpatient basis and is better tolerated than cisplatin; nausea and vomiting are reduced in severity and nephrotoxicity, neurotoxicity, and ototoxicity are much less of a problem than with cisplatin. It is, however, more myelosuppressive than cisplatin.

Cisplatin is used alone or in combination for the treatment of testicular, lung, cervical, bladder, head and neck, and ovarian cancer (but carboplatin is preferred for ovarian cancer). It is given *intravenously*. Cisplatin requires intensive intravenous hydration and treatment may be complicated by severe nausea and vomiting. Cisplatin is toxic, causing nephrotoxicity (monitoring of renal function is essential), ototoxicity, peripheral neuropathy, hypomagnesaemia and myelosuppression. It is, however, increasingly given in a day-care setting.

Oxaliplatin is licensed in combination with fluorouracil and folinic acid, for the treatment of metastatic colorectal cancer and as adjuvant treatment of colon cancer after resection of the primary tumour; it is given by intravenous infusion. Neurotoxic side-effects (including sensory peripheral neuropathy) are dose limiting. Other side-effects include gastro-intestinal disturbances, ototoxicity, myelosuppression and transient vision loss (reversible on discontinuation). If unexplained respiratory symptoms occur, oxaliplatin should be discontinued until investigations exclude interstitial lung disease and pulmonary fibrosis. Posterior reversible encephalopathy syndrome has also been reported in patients receiving oxaliplatin combination chemotherapy.

NICE guidance

Irinotecan, oxaliplatin, and raltitrexed for advanced colorectal cancer (August 2005)

A combination of fluorouracil and folinic acid with either irinotecan or oxaliplatin are options for first-line treatment for advanced colorectal cancer.

Irinotecan alone or fluorouracil and folinic acid with oxaliplatin are options for patients who require further treatment subsequently.

Raltitrexed is **not** recommended for the treatment of advanced colorectal cancer. Its use should be confined to clinical studies.

www.nice.org.uk/TA93

NICE guidance (capecitabine and oxaliplatin in the adjuvant treatment of stage III (Dukes' C) colon cancer)
See p. 575

NICE guidance
Paclitaxel for ovarian cancer (January 2003)

Either paclitaxel in combination with a platinum compound (cisplatin or carboplatin) *or* a platinum compound alone are alternatives for the first-line treatment of ovarian cancer (usually following surgery).

www.nice.org.uk/TA55

NICE guidance
Paclitaxel, pegylated liposomal doxorubicin, and topotecan for second-line or subsequent treatment of advanced ovarian cancer (May 2005)

Paclitaxel, combined with a platinum compound (carboplatin or cisplatin), is an option for advanced cancer that relapses 6 months or more after completing initial platinum-based chemotherapy. Paclitaxel alone is an option for advanced ovarian cancer that does not respond to, or relapses within 6 months of completing initial platinum-based chemotherapy.

Pegylated liposomal doxorubicin is an option for advanced ovarian cancer that does not respond to, or relapses within 12 months of completing initial platinum-based chemotherapy.

Paclitaxel alone or pegylated liposomal doxorubicin are options for advanced ovarian cancer in patients who are allergic to platinum compounds. Topotecan alone is an option only for advanced ovarian cancer that does not respond to, or relapses within 6 months of completing initial platinum-based chemotherapy or in those allergic to platinum compounds *and* for whom paclitaxel alone or pegylated liposomal doxorubicin are inappropriate.

www.nice.org.uk/TA91

CARBOPLATIN

Indications see notes above

Cautions see section 8.1 and notes above; **interactions**: Appendix 1 (platinum compounds)

Renal impairment reduce dose and monitor haematological parameters and renal function; avoid if creatinine clearance less than 20 mL/minute

Pregnancy avoid (teratogenic and embryotoxic in *animal* studies); see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above

Dose

- See Doses, p. 563

Carboplatin (Non-proprietary) PoM

Injection, carboplatin 10 mg/mL, net price 5-mL vial = £20.00, 15-mL vial = £50.00, 45-mL vial = £160.00, 60-mL vial = £260.00

CISPLATIN

Indications see notes above

Cautions see section 8.1 and notes above; **interactions:** Appendix 1 (platinum compounds)

Renal impairment avoid if possible; nephrotoxic

Pregnancy avoid (teratogenic and toxic in *animal* studies); see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above

Dose

- See Doses, p. 563

Cisplatin (Non-proprietary) PoM

Injection, cisplatin 1 mg/mL, net price 10-mL vial = £5.90, 50-mL vial = £24.50, 100-mL vial = £50.22

Injection, powder for reconstitution, cisplatin, net price 50-mg vial = £17.00

OXALIPLATIN

Indications metastatic colorectal cancer in combination with fluorouracil and folinic acid; colon cancer—see notes above

Cautions see section 8.1 and notes above; **interactions:** Appendix 1 (platinum compounds)

Contra-indications see section 8.1; peripheral neuropathy with functional impairment

Renal impairment reduce dose in mild to moderate impairment (consult product literature); avoid if creatinine clearance less than 30 mL/minute

Pregnancy manufacturer advises avoid—toxicity in *animal* studies; effective contraception required during and for 4 months after treatment in women and 6 months after treatment in men; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above

Dose

- See Doses, p. 563

Oxaliplatin (Non-proprietary) PoM

Injection, powder for reconstitution, oxaliplatin, net price 50-mg vial = £150.00, 100-mg vial= £299.50

Concentrate for intravenous infusion, oxaliplatin 5 mg/mL, net price 10-mL vial = £155.00, 20-mL vial = £311.00, 40-mL vial = £622.38

Porfimer sodium and temoporfin

Porfimer sodium and **temoporfin** are used in the photodynamic treatment of various tumours. The drugs accumulate in malignant tissue and are activated by laser light to produce a cytotoxic effect.

Porfimer sodium is licensed for photodynamic therapy of non-small cell lung cancer and obstructing oesophageal cancer. Temoporfin is licensed for photodynamic therapy of advanced head and neck cancer.

PORFIMER SODIUM

Indications non-small cell lung cancer; oesophageal cancer; see notes above

Cautions see section 8.1; avoid exposure of skin and eyes to direct sunlight or bright indoor light for at least 30 days

Contra-indications see section 8.1; tracheo-oesophageal or broncho-oesophageal fistula; acute porphyria (section 9.8.2)

Hepatic impairment avoid in severe impairment

Pregnancy manufacturer advises avoid unless essential

Breast-feeding no information available—manufacturer advises avoid

Side-effects see section 8.1; photosensitivity (see Cautions above—sunscreens offer no protection), constipation

Dose

- See Doses, p. 563

Photofrin® (Pinnacle) PoM

Injection, powder for reconstitution, porfimer sodium, net price 15-mg vial = £154.00; 75-mg vial = £770.00

TEMOPORFIN

Indications advanced head and neck squamous cell carcinoma refractory to, or unsuitable for, other treatments

Cautions see section 8.1; avoid exposure of skin and eyes to direct sunlight or bright indoor light for at least 15 days after administration; avoid prolonged exposure of injection site arm to direct sunlight for 6 months after administration, if extravasation occurs protect area from light for at least 3 months; **interactions:** Appendix 1 (temoporfin)

Contra-indications see section 8.1; acute porphyria (section 9.8.2) or other diseases exacerbated by light; elective surgery or ophthalmic slit-lamp examination for 30 days after administration; concomitant photosensitising treatment

Pregnancy toxicity in *animal* studies—manufacturer advises avoid pregnancy for at least 3 months after treatment; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding manufacturer advises avoid breast-feeding for at least 1 month after treatment—no information available

Side-effects see section 8.1; also constipation, dysphagia; haemorrhage, oedema; giddiness, trismus, facial pain; injection site pain, blistering, scarring, erythema, skin necrosis, hyperpigmentation, photosensitivity (see Cautions above; sunscreens ineffective)

Dose

- See Doses, p. 563

Foscan® (Biolitec) ▼ PoM

Injection, temoporfin 1 mg/mL, net price 3-mL vial = £1800.00, 6-mL vial = £3400.00

Procarbazine

Procarbazine is most often used in Hodgkin's disease. It is given *by mouth*. Toxic effects include nausea, myelosuppression, and a hypersensitivity rash preventing further use of this drug. It is a mild monoamine-oxidase inhibitor and dietary restriction is rarely considered necessary. Alcohol ingestion may cause a disulfiram-like reaction.

PROCARBAZINE

Indications see notes above

Cautions see section 8.1 and notes above; cardiovascular or cerebrovascular disease; phaeochromocytoma; epilepsy; **interactions:** Appendix 1 (procarbazine)

Contra-indications pre-existing severe leucopenia or thrombocytopenia

Hepatic impairment caution in mild to moderate impairment; avoid in severe impairment

Renal impairment caution in mild to moderate impairment; avoid in severe impairment

Pregnancy avoid (teratogenic in *animal* studies and isolated reports in humans); see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above; loss of appetite; *also reported* jaundice, hypersensitivity rash (discontinue treatment)

Dose

- See Doses, p. 563

Procarbazine (Non-proprietary) PoM

Capsules, procarbazine (as hydrochloride) 50 mg, net price 50-cap pack = £249.50. Label: 4

Protein kinase inhibitors

Afatinib is a protein kinase inhibitor licensed for the treatment of locally advanced or metastatic non-small cell lung cancer with activating epidermal growth factor receptor (EGFR) mutations, in patients who have not previously been treated with an EGFR tyrosine kinase inhibitor.

NICE guidance

Afatinib for treating epidermal growth factor receptor mutation-positive locally advanced or metastatic non-small-cell lung cancer (April 2014)

Afatinib is recommended as an option, within its marketing authorisation, for treating locally advanced or metastatic non-small-cell lung cancer in adults:

- whose tumour tests positive for the epidermal growth factor receptor tyrosine kinase (EGFR-TK) mutation, **and**
- who have not previously had an EGFR-TK inhibitor, **and**
- if the manufacturer provides afatinib with the discount agreed in the patient access scheme.

www.nice.org.uk/TA310

Axitinib, a tyrosine kinase inhibitor, is licensed for the treatment of advanced renal cell carcinoma following failure of previous treatment with sunitinib or a cytokine (aldesleukin or interferon alfa).

Bosutinib is licensed for the treatment of chronic, accelerated and blast phase Philadelphia chromosome-positive chronic myeloid leukaemia, in those previously treated with one or more tyrosine kinase inhibitors, and for whom imatinib, nilotinib and dasatinib are not clinically appropriate.

NICE guidance
Bosutinib for previously treated chronic myeloid leukaemia (November 2013)
Bosutinib is **not** recommended within its marketing authorisation for treating Philadelphia-chromosome-positive chronic myeloid leukaemia.
www.nice.org.uk/TA299

Crizotinib, a tyrosine kinase inhibitor, is licensed for previously treated anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer.

NICE guidance
Crizotinib for previously treated non-small-cell lung cancer associated with an anaplastic lymphoma kinase fusion gene (September 2013)
Crizotinib is **not** recommended within its marketing authorisation, for treating adults with previously treated anaplastic-lymphoma-kinase-positive advanced non-small-cell lung cancer.
www.nice.org.uk/TA296

Dabrafenib is a BRAF kinase inhibitor licensed as monotherapy for the treatment of unresectable or metastatic melanoma with a BRAF V600 mutation; it should not be used in patients with BRAF wild-type melanoma.

Dasatinib, a tyrosine kinase inhibitor, is licensed for the treatment of chronic myeloid leukaemia in those who have resistance to or intolerance of previous therapy, including imatinib. It is also licensed for newly diagnosed Philadelphia chromosome-positive chronic myeloid leukaemia in the chronic phase and for acute lymphoblastic leukaemia (Philadelphia chromosome positive) in those who have resistance to or intolerance of previous therapy.

The *Scottish Medicines Consortium* (p. 4) has advised (April 2007) that the use of dasatinib (*Sprycel*®) in NHS Scotland is restricted to patients in the chronic phase of chronic myeloid leukaemia.

NICE guidance
Dasatinib, nilotinib and standard-dose imatinib for the first-line treatment of chronic myeloid leukaemia (April 2012)
Standard-dose imatinib is recommended as an option for the first-line treatment of adults with chronic phase Philadelphia-chromosome-positive chronic myeloid leukaemia (CML); see also NICE guidance Imatinib for chronic myeloid leukaemia (October 2003), p. 598.
Nilotinib is recommended as an option for the first-line treatment of adults with chronic phase Philadelphia-chromosome-positive CML if the manufacturer makes nilotinib available with the discount agreed as part of the patient access scheme.
Dasatinib is **not** recommended for the first-line treatment of chronic phase Philadelphia-chromosome-positive CML
www.nice.org.uk/TA251

NICE guidance
Dasatinib, high-dose imatinib and nilotinib for the treatment of imatinib-resistant chronic myeloid leukaemia (CML), and dasatinib and nilotinib for people with CML for whom treatment with imatinib has failed because of intolerance (January 2012)
Nilotinib is recommended for the treatment of chronic or accelerated phase Philadelphia-chromosome-positive chronic myeloid leukaemia (CML) in adults:
- whose CML is resistant to treatment with standard-dose imatinib, **or**
- who have imatinib intolerance, **and**
- if the manufacturer makes nilotinib available with the discount agreed as part of the patient access scheme.

Dasatinib is **not** recommended for the treatment of chronic, accelerated or blast-crisis phase CML in adults with imatinib intolerance or whose CML is resistant to treatment with standard-dose imatinib.
High-dose imatinib is **not** recommended for the treatment of chronic, accelerated or blast-crisis phase Philadelphia-chromosome-positive CML that is resistant to standard-dose imatinib.
www.nice.org.uk/TA241

Erlotinib, a tyrosine kinase inhibitor, is licensed in combination with gemcitabine for the treatment of metastatic pancreatic cancer. It is also licensed for the treatment of locally advanced or metastatic non-small cell lung cancer after failure of previous chemotherapy and as monotherapy for maintenance treatment of locally advanced or metastatic non-small cell lung cancer with stable disease after four cycles of platinum-based chemotherapy.

The *Scottish Medicines Consortium* (p. 4) has advised (May 2006) that erlotinib (*Tarceva*®) is accepted for restricted use within NHS Scotland for the treatment of locally advanced or metastatic non-small cell lung cancer, after failure of at least one chemotherapy regimen. Erlotinib is restricted to use in patients who would otherwise be eligible for treatment with docetaxel monotherapy. The *Scottish Medicines Consortium* (p. 4) has also advised (December 2011) that erlotinib (*Tarceva*®) is accepted for use within NHS Scotland for the first-line treatment of patients with locally advanced or metastatic non-small cell lung cancer (NSCLC) with epidermal growth factor receptor (EGFR) activating mutations.

NICE guidance
Erlotinib for non-small-cell lung cancer (November 2008)
Erlotinib is recommended, as an alternative to docetaxel, as second-line treatment for locally advanced or metastatic non-small-cell lung cancer after failure of previous chemotherapy, on the basis that it is provided by the manufacturer at an overall treatment cost equal to that of docetaxel. Erlotinib is **not** recommended in patients for whom docetaxel is unsuitable or as third-line treatment after docetaxel.
www.nice.org.uk/TA162

NICE guidance
Erlotinib monotherapy for maintenance treatment of non-small-cell lung cancer (June 2011)

Erlotinib monotherapy is **not** recommended for maintenance treatment in people with locally advanced or metastatic non-small-cell lung cancer who have stable disease after platinum-based first-line chemotherapy.

www.nice.org.uk/TA227

NICE guidance
Erlotinib for the first-line treatment of locally advanced or metastatic EGFR-TK mutation-positive non-small-cell lung cancer (June 2012)

Erlotinib is recommended as an option for the first-line treatment of locally advanced or metastatic non-small-cell lung cancer if:

- they test positive for the epidermal growth factor tyrosine kinase (EGFR-TK) mutation **and**
- the manufacturer provides erlotinib at the discounted price agreed under the patient access scheme (as revised in 2012).

www.nice.org.uk/TA258

Everolimus, a protein kinase inhibitor, is licensed for the treatment of advanced renal cell carcinoma when the disease has progressed despite treatment with vascular endothelial growth factor-targeted therapy (see NICE guidance below), and for the treatment of unresectable or metastatic, well- or moderately-differentiated neuroendocrine tumours of pancreatic origin. It is licensed for the treatment of subependymal giant cell astrocytoma associated with tuberous sclerosis complex in patients who require therapeutic intervention but are not amenable to surgery, and for renal angiomyolipoma associated with tuberous sclerosis complex in patients at risk of complications, but who do not require immediate surgery. Everolimus is also licensed for the treatment of hormone-receptor-positive, human epidermal growth factor-2 (HER-2) negative advanced breast cancer, in combination with exemestane, in postmenopausal women without symptomatic visceral disease after recurrence or progression following a non-steroidal aromatase inhibitor.

NICE guidance
Everolimus for the second-line treatment of advanced renal cell carcinoma (April 2011)

Everolimus is **not** recommended for the second-line treatment of advanced renal cell carcinoma.

www.nice.org.uk/TA219

NICE guidance
Everolimus in combination with exemestane for treating advanced HER2-negative hormone-receptor-positive breast cancer after endocrine therapy (August 2013)

Everolimus, in combination with exemestane, is **not** recommended within its marketing authorisation for treating postmenopausal women with advanced human epidermal growth factor receptor 2 (HER2) negative hormone-receptor-positive breast cancer that has recurred or progressed following treatment with a non-steroidal aromatase inhibitor.

www.nice.org.uk/TA295

Gefitinib, a tyrosine kinase inhibitor, is licensed for the treatment of locally advanced or metastatic non-small cell lung cancer with activating mutations of epidermal growth factor receptor.

NICE guidance
Gefitinib for the first-line treatment of locally advanced or metastatic non-small-cell lung cancer (July 2010)

Gefitinib is recommended as an option for the first-line treatment of locally advanced or metastatic non-small-cell lung cancer if the patient tests positive for the epidermal growth receptor tyrosine kinase (EGFR-TK) mutation and the manufacturer provides gefitinib at the fixed price agreed under the patient access scheme.

www.nice.org.uk/TA192

Imatinib, a tyrosine kinase inhibitor, is licensed for the treatment of newly diagnosed chronic myeloid leukaemia where bone marrow transplantation is not considered first-line treatment, and for chronic myeloid leukaemia in chronic phase after failure of interferon alfa, or in accelerated phase, or in blast crisis (see NICE guidance below). It is also licensed for the treatment of c-kit (CD117)-positive unresectable or metastatic malignant gastro-intestinal stromal tumours (GIST), and as adjuvant treatment following resection of c-kit (CD117)-positive GIST, in patients at significant risk of relapse. Imatinib is licensed for the treatment of newly diagnosed acute lymphoblastic leukaemia in combination with other chemotherapy, and as monotherapy for relapsed or refractory acute lymphoblastic leukaemia. Imatinib is also licensed for the treatment of unresectable dermatofibrosarcoma protuberans and for patients with recurrent or metastatic dermatofibrosarcoma protuberans who cannot have surgery.

Imatinib is also licensed for the treatment of myelodysplastic/myeloproliferative diseases associated with platelet-derived growth factor receptor gene rearrangement and for the treatment of advanced hypereosinophilic syndrome and chronic eosinophilic leukaemia.

The *Scottish Medicines Consortium* (p. 4) has advised (March 2002) that imatinib (*Glivec*®) should be used for chronic myeloid leukaemia only under specialist supervision in accordance with British Society of Haematology guidelines (November 2001). The *Scottish Medicines Consortium* (p. 4) has also advised (February 2012) that imatinib (*Glivec*®) is accepted for restricted use within NHS Scotland for the treatment of adult patients who are at significant risk of relapse following resection of a KIT (CD117) positive gastrointestinal

stromal tumour (GIST) and who are at high risk of recurrence following complete resection (according to the Armed Forces Institute of Pathology (AFIP) risk criteria).

NICE guidance
Imatinib for chronic myeloid leukaemia (October 2003)

Imatinib is recommended as first-line treatment for Philadelphia-chromosome-positive chronic myeloid leukaemia in the chronic phase and as an option for patients presenting in the accelerated phase or with blast crisis, provided that imatinib has not been used previously.

See also NICE guidance Dasatinib, nilotinib and standard-dose imatinib for the first-line treatment of chronic myeloid leukaemia (April 2012), p. 596 and NICE guidance Dasatinib, high-dose imatinib and nilotinib for the treatment of imatinib-resistant chronic myeloid leukaemia, and dasatinib and nilotinib for people with CML for whom treatment of imatinib has failed because of intolerance (January 2012), p. 596

www.nice.org.uk/TA70

NICE guidance
Imatinib for the adjuvant treatment of gastro-intestinal stromal tumours (August 2010)

Imatinib is **not** recommended for the adjuvant treatment of gastro-intestinal stromal tumours after surgery.

www.nice.org.uk/TA196

NICE guidance
Imatinib for the treatment of unresectable and/or metastatic gastro-intestinal stromal tumours (October 2004)

Imatinib 400 mg daily is recommended as first-line management of KIT (CD117)-positive unresectable or metastatic, or both, gastro-intestinal stromal tumours. Continued therapy is recommended only if a response to initial treatment [as defined by Southwest Oncology Group criteria available at www.nice.org.uk/TA86] is achieved within 12 weeks. Patients who have responded should be assessed at 12-week intervals. Discontinue if tumour ceases to respond.

www.nice.org.uk/TA86

NICE guidance
Imatinib for the treatment of unresectable and/or metastatic gastro-intestinal stromal tumours (November 2010)

Imatinib 600 mg daily or 800 mg daily is **not** recommended for unresectable or metastatic, or both, gastro-intestinal stromal tumours whose disease has progressed after treatment with imatinib 400 mg daily.

www.nice.org.uk/TA209

Lapatinib, a tyrosine kinase inhibitor, is licensed for the treatment of advanced or metastatic breast cancer in patients with tumours that overexpress human epidermal growth factor receptor-2 (HER2). It is indicated, in combination with capecitabine, for patients who have had previous treatment with an anthracycline, a taxane, and trastuzumab, or for postmenopausal women in combination with an aromatase inhibitor section 8.3.4.1.

NICE guidance
Lapatinib or trastuzumab in combination with an aromatase inhibitor for the first-line treatment of metastatic hormone-receptor-positive breast cancer that overexpresses HER2 (June 2012)

Lapatinib or trastuzumab in combination with an aromatase inhibitor is **not** recommended for first-line treatment in postmenopausal women of metastatic hormone-receptor-positive breast cancer that overexpresses human epidermal growth factor receptor 2 (HER2).

Postmenopausal women currently receiving lapatinib or trastuzumab in combination with an aromatase inhibitor for this indication should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA257

Nilotinib, a tyrosine kinase inhibitor, is licensed for the treatment of newly diagnosed chronic myeloid leukaemia in the chronic phase, and also for patients with chronic or accelerated phase chronic myeloid leukaemia who have resistance to or intolerance of previous therapy, including imatinib.

The *Scottish Medicines Consortium* (p. 4) has advised (February 2008) that nilotinib (*Tasigna*®) is accepted for restricted use within NHS Scotland for the treatment of chronic-phase chronic myeloid leukaemia in adults resistant to or intolerant of at least one previous therapy, including imatinib, and (July 2011) for the treatment of adults with newly diagnosed chronic myeloid leukaemia in the chronic phase.

NICE guidance
Dasatinib, nilotinib and standard-dose imatinib for the first-line treatment of chronic myeloid leukaemia (April 2012)

See p. 596

NICE guidance
Dasatinib, high-dose imatinib and nilotinib for the treatment of imatinib-resistant chronic myeloid leukaemia (CML), and dasatinib and nilotinib for people with CML for whom treatment with imatinib has failed because of intolerance (January 2012)

See p. 596

Pazopanib, a tyrosine kinase inhibitor, is licensed for advanced renal cell carcinoma, as first-line treatment and for patients who have had previous treatment with cytokine therapy for advanced disease. It is also licensed for the treatment of selective subtypes of advanced soft tissue sarcoma (consult product literature for details).

The *Scottish Medicines Consortium* (p. 4) has advised (February 2011) that pazopanib (*Votrient*®) is accepted for restricted use within NHS Scotland for the first-line treatment of advanced renal cell carcinoma and (December 2012) is **not** recommended for use within NHS Scotland for the treatment of selective subtypes of advanced soft tissue sarcoma in patients who have

received prior chemotherapy for metastatic disease, or who have progressed within 12 months after neoadjuvant therapy.

NICE guidance
Pazopanib for the first-line treatment of advanced renal cell carcinoma (updated August 2013)

Pazopanib is recommended as a first-line treatment option for people with advanced renal cell carcinoma:

- who have not received prior cytokine therapy and have an Eastern Cooperative Oncology Group performance status of 0 or 1 **and**
- if the manufacturer provides pazopanib at the discounted price agreed under the patient access scheme.

www.nice.org.uk/TA215

Ponatinib is licensed for the treatment of chronic, accelerated, or blast phase chronic myeloid leukaemia in patients who have the T315I mutation or who have resistance to or intolerance of dasatinib or nilotinib, and for whom subsequent treatment with imatinib is not clinically appropriate. It is also licensed for the treatment of Philadelphia chromosome-positive acute lymphoblastic leukaemia in patients who have the T315I mutation or who have resistance to or intolerance of dasatinib, and for whom subsequent treatment with imatinib is not clinically appropriate.

Regorafenib, an inhibitor of several protein kinases, is licensed for the treatment of metastatic colorectal cancer in patients who have previously been treated with, or who are unsuitable for, standard treatment including fluoropyrimidine-based chemotherapy, a vascular endothelial growth factor inhibitor, and an epidermal growth factor receptor inhibitor.

Ruxolitinib is a selective inhibitor of the Janus-associated tyrosine kinases JAK1 and JAK2 and is licensed for the treatment of disease-related splenomegaly or symptoms in patients with primary myelofibrosis, post-polycythaemia vera myelofibrosis, or post-essential thrombocythaemia myelofibrosis.

NICE guidance
Ruxolitinib for disease-related splenomegaly or symptoms in adults with myelofibrosis (June 2013)

Ruxolitinib is **not** recommended for the treatment of disease-related splenomegaly or symptoms in adult patients with primary myelofibrosis (also known as chronic idiopathic myelofibrosis), post polycythaemia vera myelofibrosis or post essential thrombocythaemia myelofibrosis.

www.nice.org.uk/TA289

Sorafenib, an inhibitor of multiple kinases, is licensed for the treatment of advanced renal cell carcinoma when treatment with interferon alfa or interleukin-2 has failed or is contra-indicated (but see NICE Guidance below). It is also licensed for the treatment of hepatocellular carcinoma.

NICE guidance
Sorafenib for the treatment of advanced hepatocellular carcinoma (May 2010)

Sorafenib is **not** recommended for the treatment of advanced hepatocellular carcinoma in patients for whom surgical or locoregional therapies have failed or are unsuitable.

www.nice.org.uk/TA189

Sunitinib, a tyrosine kinase inhibitor, is licensed for the treatment of advanced or metastatic renal cell carcinoma (but see NICE Guidance, below). It is also licensed for the treatment of unresectable or metastatic malignant gastro-intestinal stromal tumours, after failure of imatinib, and for the treatment of unresectable or metastatic pancreatic neuroendocrine tumours.

The *Scottish Medicines Consortium* (p. 4) has advised (October 2009 and April 2011) that sunitinib (*Sutent*®) is accepted for restricted use within NHS Scotland for the treatment of unresectable or metastatic malignant gastro-intestinal stromal tumours after failure of imatinib and for unresectable or metastatic pancreatic neuroendocrine tumours.

NICE guidance
Sunitinib for advanced or metastatic renal cell carcinoma (March 2009)

Sunitinib is recommended as first-line treatment for advanced or metastatic renal cell carcinoma in patients who are suitable for immunotherapy and have an Eastern Cooperative Oncology Group performance status of 0 or 1.

www.nice.org.uk/TA169

NICE guidance
Sunitinib for the treatment of gastro-intestinal stromal tumours (September 2009)

Sunitinib is recommended as an option for treatment in patients with unresectable or metastatic gastro-intestinal tumours if imatinib treatment has failed because of resistance or intolerance, and the cost of sunitinib for the first treatment cycle is met by the manufacturer.

www.nice.org.uk/TA179

NICE guidance
Bevacizumab (first-line), sorafenib (first- and second-line), sunitinib (second-line) and temsirolimus (first-line) for the treatment of advanced or metastatic renal cell carcinoma (August 2009)

Bevacizumab, sorafenib, and temsirolimus are **not** recommended as first-line treatments for people with advanced or metastatic renal cell carcinoma.

Sorafenib and sunitinib are not recommended as second-line treatments for people with advanced or metastatic renal cell carcinoma.

www.nice.org.uk/TA178

Temsirolimus is a protein kinase inhibitor licensed for the first-line treatment of advanced renal cell carcinoma (see NICE Guidance above), and for the treatment of relapsed or refractory mantle cell lymphoma. Hypersensitivity reactions, including some life-threatening

and rare fatal reactions, are associated with temsirolimus therapy, usually during administration of the first dose. Symptoms include flushing, chest pain, dyspnoea, apnoea, hypotension, loss of consciousness, and anaphylaxis. Where possible, patients should receive an intravenous dose of antihistamine 30 minutes before starting the temsirolimus infusion. The infusion may have to be stopped temporarily for the treatment of infusion-related effects—consult product literature for appropriate management. If adverse reactions are not managed with dose delays, a dose reduction should be considered—consult product literature.

Vandetanib, a tyrosine kinase inhibitor, is licensed for the treatment of aggressive and symptomatic medullary thyroid cancer in patients with unresectable locally advanced or metastatic disease.

Vemurafenib, a BRAF kinase inhibitor, is licensed as a monotherapy for the treatment of BRAF V600 mutation-positive unresectable or metastatic melanoma.

The *Scottish Medicines Consortium* (p. 4) has advised (November 2013) that vemurafenib (*Zelboraf*®) is accepted for restricted use within NHS Scotland as monotherapy for the first-line treatment of BRAF V600 mutation-positive unresectable or metastatic melanoma.

NICE guidance

Vemurafenib for treating locally advanced or metastatic BRAF V600 mutation-positive malignant melanoma (December 2012)

Vemurafenib is recommended as an option for the treatment of BRAF V600 mutation-positive unresectable or metastatic melanoma only if the manufacturer provides vemurafenib with the discount agreed in the patient access scheme.

www.nice.org.uk/TA269

AFATINIB

Indications see notes above

Cautions see section 8.1; diarrhoea—proactive management recommended (consult product literature); new or worsening pulmonary symptoms (including dyspnoea, cough, fever)—interrupt treatment until interstitial lung disease is excluded; history of keratitis, ulcerative keratitis, severe dry eyes or use of contact lenses; signs and symptoms of keratitis—promptly refer to ophthalmologist for assessment; cardiac risk factors and conditions which may affect left ventricular ejection fraction—consider cardiac monitoring, including assessment of left ventricular ejection fraction, at baseline and during treatment; protect skin from exposure to sun; signs and symptoms of skin reaction—treat promptly and interrupt afatinib treatment if severe or if Stevens-Johnson syndrome suspected (consult product literature); **interactions**: Appendix 1 (afatinib)

Driving Ocular adverse reactions may affect performance of skilled tasks e.g. driving

Hepatic impairment monitor hepatic function regularly and consult product literature for dose adjustment in worsening liver function; manufacturer advises avoid in severe hepatic impairment

Renal impairment manufacturer advises avoid in severe renal impairment

Pregnancy manufacturer advises avoid—ensure effective contraception during and for at least one month after treatment in women of childbearing potential; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding manufacturer advises avoid—present in milk in *animal* studies

Side-effects see section 8.1; also diarrhoea, dehydration, weight loss, decreased appetite, dyspepsia, dysgeusia, pyrexia, paronychia, cystitis, renal failure, hypokalaemia, muscle spasms, dry eyes, conjunctivitis, epistaxis, rhinorrhoea, rash (see Cautions), acne, pruritus, dry skin, hand-foot syndrome; *less commonly* interstitial lung disease, keratitis

Dose

- ADULT over 18 years, 40 mg once daily; if tolerated may be increased after 3 weeks to 50 mg once daily (but consult product literature); for dose adjustment due to side-effects, consult product literature

Giotrif® (Boehringer Ingelheim) ▼ PoM

Tablets, f/c, afatinib (as dimaleate) 20 mg (white-yellow), net price 28-tab pack = £2023.28; 30 mg (dark blue), 28-tab pack = £2023.28; 40 mg (light blue), 28-tab pack = £2023.28; 50 mg (dark blue), 28-tab pack = £2023.28. Label: 25, Counselling, administration (see below), driving, see Cautions above

Counselling Tablets should be taken whole on an empty stomach. Food should not be consumed for at least 3 hours before and at least 1 hour after each dose

Note *Giotrif*® tablets may be dispersed in approximately 100 mL of noncarbonated water by stirring occasionally for up to 15 minutes (must not be crushed). The dispersion should be swallowed immediately, and the glass rinsed with the same volume of water which should also be swallowed. The dispersion can also be administered via a gastric tube

AXITINIB

Indications see notes above

Cautions see section 8.1; hypertension (blood pressure should be well-controlled before starting and monitored during treatment); monitor for thyroid dysfunction; monitor haemoglobin or haematocrit before and during treatment; monitor for symptoms of gastro-intestinal perforation or fistula; monitor for proteinuria before and during treatment; monitor liver function before and during treatment; **interactions**: Appendix 1 (axitinib)

Contra-indications untreated brain metastases; recent active gastro-intestinal bleeding

Hepatic impairment reduce starting dose in moderate impairment; avoid in severe impairment—no information available

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk (toxicity in *animal* studies)—effective contraception required during and for up to 1 week after treatment; see also Pregnancy and Reproductive Function, p. 564

Side-effects see section 8.1; also diarrhoea, constipation, abdominal pain, dyspepsia, flatulence, haemorrhoids, gastro-intestinal perforation, anal fistula, hypertension, haemorrhage (including gastro-intestinal, cerebral and haemoptysis), dysphonia, dyspnoea, cough, dysgeusia, headache, dizziness, fatigue, asthenia, decreased appetite, weight loss, hypothyroidism, hyperthyroidism, dehydration, proteinuria, hyperkalaemia, hypercalcaemia, renal failure, myalgia, arthralgia, tinnitus, hand-foot syndrome, rash, dry skin, pruritus, erythema; *less commonly* hypertensive crisis, posterior reversible encephalopathy syndrome, polycythaemia

Dose

- See Doses, p. 563

Inlyta® (Pfizer) ▼ PoM

Tablets, f/c, red, axitinib 1 mg, net price 56-tab pack = £703.40; 5 mg, 56-tab pack = £3517.00. Label: 25

BOSUTINIB

Indications see notes above

Cautions history or risk factors for QT prolongation (including recent cardiac event or concomitant use of drugs that prolong the QT interval)—monitor ECG and correct hypokalaemia and hypomagnesaemia before and during treatment; cardiac disease; significant gastrointestinal disorder; history of pancreatitis—withhold treatment if lipase elevated and abdominal symptoms occur; monitor liver function before treatment initiation, then monthly for the first 3 months and thereafter as clinically indicated—consult product literature for management of raised transaminases; monitor full blood count weekly for the first month and then monthly thereafter or as clinically indicated; monitor for signs and symptoms of fluid retention (including pericardial effusion, pleural effusion and pulmonary oedema); **interactions**: Appendix 1 (bosutinib)

Hepatic impairment caution—no information available

Pregnancy avoid—toxicity in *animal* studies; effective contraception required during treatment in women; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding manufacturer advises avoid—no information available

Side-effects see section 8.1; also decreased appetite, dehydration, diarrhoea, abdominal pain, gastritis, hepatotoxicity, abnormal liver function, pericardial effusion, QT prolongation, oedema, cough, dyspnoea, pleural effusion, headache, dizziness, dysgeusia, malaise, pyrexia, infection, biochemical and electrolyte disturbances, renal impairment and failure, arthralgia, myalgia, rash, urticaria, acne, pruritus; *less commonly* pancreatitis, gastric haemorrhage, pericarditis, pulmonary oedema, respiratory failure, pulmonary hypertension, tinnitus

Dose

- ADULT over 18 years, 500 mg once daily; for dose adjustment due to side-effects, or incomplete haematologic response by week 8, or incomplete cytogenetic response by week 12, consult product literature

Bosulif® (Pfizer) ▼ PoM

Tablets, f/c, bosutinib (as monohydrate) 100 mg (yellow), net price 28-tab pack = £859.17; 500 mg (red), 28-tab pack = £3436.67.Label: 21

CRIZOTINIB

Indications see notes above

Cautions see section 8.1; susceptibility to QT-prolongation (including concomitant use of drugs that prolong QT interval and electrolyte disturbances); monitor liver function twice a month for the first 2 months of treatment, then at least monthly thereafter; pneumonitis reported (monitor patients with pulmonary symptoms and permanently discontinue treatment if treatment-related pneumonitis diagnosed); **interactions**: Appendix 1 (crizotinib)

Hepatic impairment manufacturer advises caution in mild to moderate impairment; avoid in severe impairment

Pregnancy avoid (toxicity in *animal* studies); ensure effective contraception during and for at least 90 days after treatment; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding avoid—no information available

Side-effects see section 8.1; also diarrhoea, constipation, oesophageal-related disorder, dyspepsia, bradycardia, QT-interval prolongation, oedema, pneumonitis, fatigue, neuropathy, dizziness, taste disturbance, decreased appetite, hypophosphataemia, vision disorder; *less commonly* renal cyst; hepatotoxicity also reported

Dose

- ADULT over 18 years, 250 mg twice daily; for dose adjustment due to side effects, consult product literature

Xalkori® (Pfizer) ▼ PoM

Capsules, crizotinib 200 mg (white/pink), net price 60-cap pack = £4689.00; 250 mg (pink), 60-cap pack = £4689.00. Label: 25

DABRAFENIB

Indications see notes above

Cautions pyrexia (interrupt treatment if ≥ 38.5°C and assess for signs and symptoms of infection—consult product literature); assess for cutaneous squamous cell carcinoma and new primary melanoma before treatment, monthly during treatment, and for 6 months after discontinuation or until initiation of alternative treatment; assess and monitor for non-cutaneous secondary or recurrent malignancy before, during, and for 6 months after discontinuation or until initiation of alternative treatment—consult product literature; monitor serum creatinine and other signs of renal failure—consult product literature and interrupt dose as appropriate; monitor for ophthalmologic reactions including uveitis and iritis; promptly investigate signs and symptoms of pancreatitis—consult product literature; monitor ECG and electrolytes (including magnesium) before and one month after treatment initiation and after each dose modification—consult product literature if abnormalities occur; **interactions**: Appendix 1 (dabrafenib)

Driving Ocular adverse reactions and fatigue may affect performance of skilled tasks e.g. driving

Contra-indications BRAF wild-type melanoma; uncorrectable electrolyte abnormalities (including magnesium); long QT syndrome, or concomitant use of drugs that prolong the QT interval

Hepatic impairment manufacturer advises caution in moderate to severe impairment; additional monitoring of ECG and electrolytes required—consult product literature

Renal impairment manufacturer advises caution in severe impairment—no information available

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk (toxicity in *animal* studies)—effective non-hormonal contraception required during and for one month after treatment in women of childbearing potential; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding manufacturer advises avoid

Side-effects see section 8.1; also decreased appetite, diarrhoea, constipation, decrease in left ventricular

ejection fraction, cough, headache, malaise, pyrexia, chills, influenza-like symptoms, hyperglycaemia, basal cell carcinoma, cutaneous squamous cell carcinoma, hypophosphataemia, arthralgia, myalgia, papilloma, keratosis, hyperkeratosis, acrochordon, rash, hand-foot syndrome, dry skin, pruritus, skin lesions, erythema; *less commonly* pancreatitis, QT-interval prolongation, new primary melanoma, nephritis, renal failure, uveitis, panniculitis

Dose

- ADULT over 18 years, 150 mg every 12 hours; for dose adjustment due to side-effects, consult product literature

Tafinlar® (GSK) ▼ PoM

Capsules, dabrafenib (as mesilate) 50 mg (dark red), net price 28-cap pack = £933.33; 75 mg (dark pink), 28-cap pack = £1400.00. Label: 23, 25, counselling, driving, see Cautions above

DASATINIB

Indications see notes above

Cautions see section 8.1; susceptibility to QT-interval prolongation (correct hypokalaemia or hypomagnesaemia before starting treatment); risk of cardiac dysfunction (monitor closely); **interactions**: Appendix 1 (dasatinib)

Pulmonary arterial hypertension Patients should be evaluated for signs and symptoms of underlying cardiopulmonary disease before starting treatment; echocardiography should be performed at the start of treatment in patients with symptoms of cardiac disease and considered for patients with risk factors for cardiac or pulmonary disease.
Treatment should be interrupted or the dose reduced in patients who develop dyspnoea or fatigue, while they are evaluated for common aetiologies (e.g. pleural effusion, pulmonary oedema, anaemia or lung infiltration); pulmonary arterial hypertension should be considered in the absence of these conditions, and if there is no improvement following dose reduction or interruption.
If pulmonary arterial hypertension is confirmed, dasatinib should be permanently discontinued

Hepatic impairment manufacturer advises caution in hepatic impairment

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies; effective contraception required during treatment; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1; also diarrhoea, anorexia, weight changes, abdominal pain, taste disturbance, constipation, dyspepsia, colitis, gastritis; arrhythmias, congestive heart failure, hypertension, chest pain, flushing, haemorrhage (including gastro-intestinal and CNS haemorrhage), palpitation; dyspnoea, pulmonary hypertension, cough, oedema (more common in patients over 65 years old), pleural effusion; depression, dizziness, headache, insomnia, neuropathy; influenza-like symptoms; musculoskeletal pain; visual disturbances; tinnitus; acne, dry skin, sweating, pruritus, dermatitis, urticaria; *less commonly* pancreatitis, hepatitis, cholestasis, cholecystitis, oesophagitis, hypotension, transient ischaemic attack, thrombophlebitis, syncope, asthma, seizures, amnesia, tremor, drowsiness, gynaecomastia, irregular menstruation, urinary frequency, proteinuria, hypocalcaemia, rhabdomyolysis, hypersensitivity reactions (including erythema nodosum), photosensitivity, and pigmentation and nail disorders; *rarely* cor pulmonale; thrombosis and interstitial lung disease also reported

Dose

- Chronic phase chronic myeloid leukaemia, ADULT over 18 years 100 mg once daily, increased if necessary to max. 140 mg once daily
- Accelerated and blast phase chronic myeloid leukaemia, acute lymphoblastic leukaemia, ADULT over 18 years 140 mg once daily, increased if necessary to max. 180 mg once daily

Sprycel® (Bristol-Myers Squibb) PoM

Tablets, f/c, dasatinib (as monohydrate) 20 mg, net price 60-tab pack = £1252.48; 50 mg, 60-tab pack = £2504.96; 80 mg, 30-tab pack = £2504.96; 100 mg, 30-tab pack = £2504.96; 140 mg, 30-tab pack = £2504.96. Label: 25

ERLOTINIB

Indications see notes above

Cautions see section 8.1; pre-existing liver disease or concomitant use with hepatotoxic drugs—monitor liver function; dose adjustment may be necessary if smoking started or stopped during treatment; see MHRA/CHM advice Epidermal Growth Factor Receptor (EGFR) Inhibitors: Serious Cases of Keratitis and Ulcerative Keratitis, p. 588; **interactions:** Appendix 1 (erlotinib)

Hepatic impairment manufacturer advises caution in mild to moderate impairment; avoid in severe impairment

Renal impairment manufacturer advises avoid in severe impairment

Pregnancy manufacturer advises avoid—toxicity in *animal* studies; effective contraception required during and for at least 2 weeks after treatment; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding manufacturer advises avoid—no information available

Side-effects see section 8.1 and notes above; also diarrhoea, abdominal pain, dyspepsia, flatulence; anorexia, depression, neuropathy, headache; fatigue, rigor; conjunctivitis; pruritus, dry skin; *less commonly* gastro-intestinal perforation, interstitial lung disease—discontinue if unexplained symptoms such as dyspnoea, cough or fever occur; eyelash changes; *rarely* hepatic failure; *very rarely* corneal perforation or ulceration, Stevens-Johnson syndrome, and toxic epidermal necrolysis

Dose

- Non-small cell lung cancer, 150 mg once daily
- Pancreatic cancer, 100 mg once daily in combination with gemcitabine

Tarceva® (Roche) ▼ PoM

Tablets, f/c, white-yellow, erlotinib (as hydrochloride) 25 mg, net price 30-tab pack = £378.33; 100 mg, 30-tab pack = £1324.14; 150 mg, 30-tab pack = £1631.53. Label: 23

EVEROLIMUS

Indications see notes above

Cautions see section 8.1; monitor blood-glucose concentration, serum-triglycerides and serum-cholesterol before treatment and periodically thereafter; concomitant use of drugs that increase risk of bleeding; history of bleeding disorders; monitor renal function before treatment and periodically thereafter; reduce dose or discontinue if severe side-effects

occur—consult product literature; **interactions:** Appendix 1 (everolimus)

Pneumonitis Non-infectious pneumonitis reported. Patients should be advised to seek urgent medical advice if new or worsening respiratory symptoms occur

Hepatic impairment consult product literature

Pregnancy manufacturer advises avoid (toxicity in *animal* studies); effective contraception must be used during and for up to 8 weeks after treatment; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding manufacturer advises avoid

Side-effects see section 8.1; also diarrhoea, dry mouth, abdominal pain, dysphagia, anorexia, taste disturbance, chest pain, hypertension, hyperlipidaemia, hypercholesterolaemia, peripheral oedema, pneumonitis (including interstitial lung disease), asthenia, fatigue, headache, insomnia, convulsions, irritability, increased susceptibility to infections (including pneumonia, aspergillosis, and candidiasis), hyperglycaemia, hypoglycaemia, dehydration, renal failure, electrolyte disturbance, arthralgia, eyelid oedema, epistaxis, skin and nail disorders (including hand-foot syndrome); *less commonly* congestive heart failure, flushing, agitation, aggression, rhabdomyolysis and impaired wound healing; hepatitis B reactivation and haemorrhage also reported

Dose

- See under preparations

Afinitor® (Novartis) PoM

Tablets, white-yellow, everolimus, 5 mg, net price 30-tab pack = £2250.00; 10 mg, 30-tab pack = £2970.00. Label: 25, counselling, pneumonitis

Dose renal cell carcinoma, neuroendocrine tumours of pancreatic origin, hormone-receptor-positive breast cancer, ADULT over 18 years, 10 mg once daily

The *Scottish Medicines Consortium* (p. 4) has advised (April 2012) that everolimus (*Afinitor®*) is accepted for restricted use within NHS Scotland for the treatment of unresectable or metastatic, well- or moderately-differentiated neuroendocrine tumours of pancreatic origin (pNET) in adults with progressive disease.

Votubia® (Novartis) ▼ PoM

Tablets, white-yellow, everolimus, 2.5 mg, net price 30-tab pack = £1200.00; 5 mg, 30-tab pack = £2250.00; 10 mg, 30-tab pack = £2970.00. Label: 25, counselling, pneumonitis

Dose subependymal giant cell astrocytoma or renal angiomyolipoma associated with tuberous sclerosis complex, consult product literature

Note *Votubia®* tablets may be dispersed in approximately 30 mL of water by gently stirring, immediately before drinking. After solution has been swallowed, any residue must be re-dispersed in the same volume of water and swallowed

GEFITINIB

Indications see notes above

Cautions monitor liver function—consider discontinuing if severe changes in liver function occur; monitor for worsening of dyspnoea, cough and fever—discontinue if interstitial lung disease confirmed; see MHRA/CHM advice Epidermal Growth Factor Receptor (EGFR) Inhibitors: Serious Cases of Keratitis and Ulcerative Keratitis, p. 588; **interactions:** Appendix 1 (gefitinib)

Hepatic impairment manufacturer advises caution in moderate to severe impairment due to cirrhosis

Renal impairment manufacturer advises caution if creatinine clearance less than 20 mL/minute

Pregnancy manufacturer advises avoid unless essential—toxicity in *animal* studies; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1; also anorexia, diarrhoea, dry mouth; epistaxis, interstitial lung disease—discontinue if confirmed; asthenia; pyrexia; haematuria, proteinuria; dry eye, conjunctivitis, blepharitis; nail disorder, skin reactions (including dry skin, rash, acne, and pruritus); *less commonly* pancreatitis, corneal erosion; *rarely* hepatitis, toxic epidermal necrolysis

Dose

- ADULT over 18 years, 250 mg once daily

Iressa® (AstraZeneca) PoM

Tablets, f/c, brown, gefitinib 250 mg, net price 30-tab pack = £2167.71

IMATINIB

Indications see notes above

Cautions see section 8.1; cardiac disease; risk factors for heart failure; history of renal failure; monitor for fluid retention; monitor liver function (see also Hepatic Impairment, below); monitor growth in children (may cause growth retardation); **interactions:** Appendix 1 (imatinib)

Hepatic impairment max. 400 mg daily; reduce dose further if not tolerated

Renal impairment max. starting dose 400 mg daily if creatinine clearance less than 60 mL/minute; reduce dose further if not tolerated

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk; effective contraception required during treatment; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1; also abdominal pain, appetite changes, constipation, diarrhoea, flatulence, gastro-oesophageal reflux, taste disturbance, weight changes, dry mouth; oedema (including pulmonary oedema, pleural effusion, and ascites), flushing, haemorrhage; cough, dyspnoea; dizziness, headache, insomnia, hypoaesthesia, paraesthesia, fatigue; influenza-like symptoms; cramps, arthralgia; visual disturbances, increased lacrimation, conjunctivitis, dry eyes; epistaxis; dry skin, sweating, rash, pruritus, photosensitivity; *less commonly* gastric ulceration, pancreatitis, hepatic dysfunction (rarely hepatic failure, hepatic necrosis), dysphagia, heart failure, tachycardia, palpitation, syncope, haematoma, hypertension, hypotension, cold extremities, cough, acute respiratory failure, depression, drowsiness, anxiety, peripheral neuropathy, tremor, migraine, impaired memory, vertigo, gynaecomastia, menorrhagia, irregular menstruation, sexual dysfunction, electrolyte disturbances, renal failure, urinary frequency, gout, tinnitus, hearing loss; skin hyperpigmentation; *rarely* intestinal obstruction, gastro-intestinal perforation, inflammatory bowel disease, arrhythmia, atrial fibrillation, myocardial infarction, angina, pulmonary fibrosis, pulmonary hypertension, increased intracranial pressure, convulsions, confusion, haemolytic anaemia, rhabdomyolysis, myopathy, aseptic necrosis of bone, cataract, glaucoma, angioedema, exfoliative dermatitis, and Stevens-Johnson syndrome; *also reported* drug rash with eosinophilia and systemic symptoms (DRESS), growth retardation in children

Dose

- Chronic phase chronic myeloid leukaemia, ADULT 400 mg once daily, increased if necessary to max. 800 mg daily (in 2 divided doses); CHILD consult product literature
- Accelerated phase and blast crisis chronic myeloid leukaemia, ADULT 600 mg once daily, increased if necessary to max. 800 mg daily (in 2 divided doses); CHILD consult product literature
- Acute lymphoblastic leukaemia, ADULT 600 mg once daily; CHILD consult product literature
- Gastro-intestinal stromal tumours, ADULT 400 mg once daily
- Dermatofibrosarcoma protuberans, ADULT 800 mg daily in 2 divided doses
- Myelodysplastic/myeloproliferative diseases, ADULT 400 mg once daily
- Advanced hypereosinophilic syndrome and chronic eosinophilic leukaemia, ADULT 100–400 mg once daily

Glivec® (Novartis) PoM

Tablets, f/c, imatinib (as mesilate) 100 mg (yellow-brown, scored), net price 60-tab pack = £862.19; 400 mg (yellow), 30-tab pack = £1724.39. Label: 21, 27

Counselling Tablets may be dispersed in water or apple juice

LAPATINIB

Indications see notes above

Cautions see section 8.1; low gastric pH (reduced absorption); susceptibility to QT-interval prolongation (including concomitant use of drugs that prolong QT-interval and electrolyte disturbances); monitor left ventricular function; monitor for pulmonary toxicity; monitor liver function before treatment and at monthly intervals; **interactions:** Appendix 1 (lapatinib)

Hepatic impairment caution in moderate to severe impairment—metabolism reduced

Renal impairment caution in severe impairment—no information available

Pregnancy avoid unless potential benefit outweighs risk—toxicity in *animal* studies; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1; anorexia, diarrhoea (treat promptly), decreased left ventricular ejection fraction, cardiac failure (fatal cases reported), malaise, rash, nail disorders, hyperbilirubinaemia, hepatotoxicity (discontinue permanently if severe); *less commonly* interstitial lung disease; respiratory failure (including fatal cases) also reported

Dose

- In combination with capecitabine, ADULT over 18 years, 1.25 g once daily
- In combination with an aromatase inhibitor, ADULT over 18 years, 1.5 g once daily

Counselling Always take at the same time in relation to food: either one hour before or one hour after food. Patients should report unexpected changes in bowel habit

Tyverb® (GSK) ▼ PoM

Tablets, yellow, f/c, lapatinib 250 mg, net price 84-tab pack = £965.16, 105-tab pack = £1206.45. Counselling, administration

NILOTINIB

Indications see notes above

Cautions see section 8.1; history of pancreatitis; susceptibility to QT-interval prolongation (including electrolyte disturbances, concomitant use of drugs that prolong QT interval); **interactions:** Appendix 1 (nilotinib)

Hepatic impairment manufacturer advises caution

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies; effective contraception required during treatment; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding manufacturer advises avoid—present in milk in *animal* studies

Side-effects see section 8.1; also abdominal pain, constipation, diarrhoea, dyspepsia, flatulence, anorexia, weight changes; palpitation, QT-interval prolongation, hypertension, oedema, flushing; dyspnoea, cough, dysphonia; headache, fatigue, asthenia, dizziness, paraesthesia, insomnia, vertigo; hypomagnesaemia, hyperkalaemia, blood glucose changes; bone pain, arthralgia, muscle spasm; urticaria, erythema, hyperhidrosis, dry skin, rash, pruritus; *less commonly* hepatitis, pancreatitis, dry mouth, chest pain, cardiac failure, arrhythmias, pericardial effusion, coronary artery disease, cardiomegaly, cardiac murmur, bradycardia, hypertensive crisis, haemorrhage, melaena, haematoma, pleural effusion, interstitial lung disease, migraine, hypoaesthesia, hyperaesthesia, depression, anxiety, tremor, influenza-like symptoms, hyperthyroidism, breast pain, gynaecomastia, erectile dysfunction, dysuria, urinary frequency, hypokalaemia, hyponatraemia, hypocalcaemia, hypophosphataemia, dehydration, decreased visual acuity, conjunctivitis, dry eyes, epistaxis, and ecchymosis

Dose

- Newly diagnosed chronic myeloid leukaemia, chronic phase, ADULT over 18 years, 300 mg twice daily
- Chronic and accelerated phase chronic myeloid leukaemia (see notes above), ADULT over 18 years, 400 mg twice daily

Tasigna® (Novartis) PoM

Capsules, nilotinib (as hydrochloride monohydrate) 150 mg (red), net price 112-cap pack = £2432.85; 200 mg (yellow), 112-cap pack = £2432.85. Label: 23, 25, 27

PAZOPANIB

Indications see notes above

Cautions see section 8.1; monitor liver function before treatment and at weeks 3, 5, 7, and 9, then at months 3 and 4, and periodically thereafter as clinically indicated—consult product literature if elevated liver enzymes observed; control blood pressure before initiating and monitor blood pressure within 1 week of treatment initiation, then frequently throughout treatment (consider dose reduction or interruption if hypertension uncontrolled despite anti-hypertensive therapy; discontinue if blood pressure persistently elevated despite anti-hypertensive therapy and pazopanib dose reduction—consult product literature); susceptibility to QT-interval prolongation (including electrolyte disturbances, concomitant use of drugs that prolong QT-interval); patients at risk of

thrombotic events including myocardial infarction, ischaemic stroke or transient ischaemic attack; cardiac disease (monitor for signs or symptoms of congestive heart failure—monitor left ventricular ejection fraction in patients at risk of heart failure before and during treatment); patients at increased risk of haemorrhage; patients at increased risk of gastrointestinal perforation or fistulas; discontinue treatment 7 days before elective surgery and restart only if adequate wound healing; monitor thyroid function; monitor for proteinuria; increased risk of thrombotic microangiopathy—permanently discontinue if symptoms develop; monitor for signs and symptoms of posterior reversible encephalopathy syndrome (including headache, hypertension, seizure, lethargy, confusion, visual and neurological disturbances)—permanently discontinue treatment if symptoms occur **interactions**: Appendix 1 (pazopanib)

Contra-indications cerebral or clinically significant gastro-intestinal haemorrhage or haemoptysis in the past 6 months

Hepatic impairment use with caution in mild to moderate impairment—reduce dose to 200 mg once daily in moderate impairment; avoid in severe impairment

Renal impairment use with caution if creatinine clearance less than 30 mL/minute—no information available

Pregnancy avoid unless potential benefit outweighs risk—toxicity in *animal* studies; effective contraception advised during treatment; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1; also abdominal pain, abdominal distension, dyspepsia, diarrhoea, weight loss, anorexia, dry mouth, taste disturbance, flatulence, hepatic dysfunction, hyperbilirubinaemia, hypertension, flushing, chest pain, oedema, venous thromboembolic events, dyspnoea, cough, pneumothorax, hiccups, epistaxis, voice changes, headache, dizziness, malaise, paraesthesia, insomnia, hypothyroidism, proteinuria (discontinue if grade 4), blood disorders (including thrombocytopenia), hyperalbuminaemia, increased amylase, dehydration, muscle spasm, myalgia, blurred vision, sweating, skin reactions, dry skin, hair and skin discoloration, nail disorders; *less commonly* hepatic failure, gastro-intestinal perforation, peritonitis, pancreatitis, fistula, cardiac dysfunction, transient ischaemic attack, stroke, myocardial infarction, myocardial ischaemia, bradycardia, haemorrhage, hypertensive crisis, QT-interval prolongation, pulmonary embolism, peripheral neuropathy, menstrual disturbances, hypomagnesaemia, arthralgia, oropharyngeal pain, photosensitivity reactions; *rarely* thrombotic microangiopathy

Dose

- ADULT over 18 years, 800 mg once daily; adjust dose in steps of 200 mg according to tolerability (max. 800 mg daily)

Votrient® (GSK) PoM

Tablets, f/c, pazopanib (as hydrochloride) 200 mg (pink), net price 30-tab pack = £560.50; 400 mg (white), 30-tab pack = £1121.00. Label: 23, 25, counselling, see below

Counselling Do not take antacids for at least 1 hour before or 2 hours after *Votrient®*

PONATINIB

Indications see notes above

Cautions history of pancreatitis, alcohol abuse or current severe hypertriglyceridaemia—increased risk of pancreatitis; monitor serum lipase every 2 weeks for the first 2 months and periodically thereafter for all patients—withhold treatment if lipase elevated and abdominal symptoms occur; monitor full blood count every 2 weeks for the first 3 months and then monthly thereafter or as clinically indicated; monitor liver function periodically; history of myocardial infarction or stroke—do not use unless potential benefit outweighs potential risk; assess cardiovascular status before treatment—manage risk factors before and during treatment; hypertension—medically control during treatment and interrupt treatment if uncontrolled; monitor for vascular occlusion or thromboembolism—interrupt treatment immediately if this occurs; **interactions**: Appendix 1 (ponatinib)

Hepatic impairment no information available—manufacturer advises caution

Renal impairment no information available—manufacturer advises caution if creatinine clearance less than 50 mL/minute

Pregnancy avoid—toxicity in *animal* studies; ensure effective contraception during treatment in men and women; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding manufacturer advises avoid—no information available

Side-effects see section 8.1; also abdominal discomfort, gastro-oesophageal reflux disease, constipation, diarrhoea, pancreatitis, dyspepsia, dry mouth, dehydration, decreased appetite, weight loss, hypertension, cardiac disorders, cardiac events, cerebrovascular events, vascular occlusion, thromboembolic events, intermittent claudication, atrial fibrillation, pericardial effusion, oedema, flushing, dyspnoea, cough, pleural effusion, dysphonia, malaise, headache, insomnia, dizziness, peripheral neuropathy, altered sensations, pyrexia, infection, biochemistry and electrolyte disturbances, erectile dysfunction, arthralgia, musculoskeletal pain, muscle spasms, blurred vision, dry eyes, epistaxis, dry skin, rash, pruritus, hyperhidrosis, bruising; *less commonly* gastric haemorrhage, atrial flutter, cerebral infarction, cerebral artery stenosis, hepatotoxicity, jaundice, retinal vein thrombosis, retinal vein occlusion, visual impairment, exfoliative dermatitis

Dose

- ADULT over 18 years, 45 mg once daily; for dose adjustment due to side-effects, consult product literature

Iclusig® (ARIAD) ▼ PoM

Tablets, ponatinib 15 mg, net price 60-tab pack = £5050.00; 45 mg, 30-tab pack = £5050.00. Label: 3, 25

REGORAFENIB

Indications see notes above

Cautions predisposition to bleeding or concomitant treatment with drugs that may increase the risk of bleeding (increased risk of haemorrhagic events)—monitor blood count and coagulation parameters and consider permanent discontinuation in event of severe bleeding; history of ischaemic heart disease—

monitor for signs and symptoms of myocardial ischaemia and interrupt treatment if signs of ischaemia or infarction develop; may impair wound healing—withhold treatment for major surgical procedures; hypertension—control blood pressure before treatment initiation and monitor as clinically indicated during treatment (review dose and consider treatment interruption if severe or persistent hypertension develops; discontinue treatment if hypertensive crisis occurs); Gilbert's syndrome—risk of hyperbilirubinaemia; monitor hepatic function before treatment, then at least every two weeks for the first 2 months, then at least monthly thereafter and as clinically indicated—consult product literature if changes in liver function observed; monitor for signs and symptoms of posterior reversible encephalopathy syndrome (including seizure, headache, altered mental status, visual disturbances or cortical blindness, with or without hypertension)—discontinue treatment if symptoms occur; monitor biochemical, electrolyte and metabolic parameters during treatment; ensure measures to prevent hand-foot skin reaction—consult product literature if signs or symptoms develop; **interactions:** Appendix 1 (regorafenib)

Hepatic impairment manufacturer advises caution in moderate impairment; avoid in severe impairment

Renal impairment caution in severe impairment—no information available

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies; women of childbearing potential and men must use effective contraception during treatment and up to 8 weeks after the last dose; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding avoid—present in milk in *animal* studies

Side-effects see section 8.1; also decreased appetite, weight loss, diarrhoea, taste disorders, dry mouth, gastro-oesophageal reflux, gastro-enteritis, haemorrhage (including fatal), hypertension, headache, tremor, dysphonia, malaise, pain, pyrexia, infection, hypothyroidism, biochemical and electrolyte disturbances, abnormal international normalised ratio, musculoskeletal stiffness, hand-foot skin reaction, rash, dry skin, nail disorder, mucosal inflammation; *less commonly* gastro-intestinal perforation and fistula (discontinue treatment), myocardial infarction, myocardial ischaemia, hypertensive crisis, severe (including fatal) liver injury; *rarely* posterior reversible encephalopathy syndrome, keratoacanthoma, squamous cell carcinoma of the skin, Stevens-Johnson syndrome, toxic epidermal necrolysis

Dose

- ADULT over 18 years, 160 mg once daily for 21 consecutive days of repeated 28-day cycles; for dose adjustment due to side-effects, consult product literature

Stivarga® (Bayer) ▼ PoM

Tablets, f/c, pink, regorafenib 40 mg, net price 84-tab pack = £3744.00. Label: 21, counselling, administration

Counselling Tablets should be taken at the same time each day, swallowed whole with water after a light meal that contains less than 30% fat

Electrolytes Na^+ 0.607 mmol/40 mg tablet

RUXOLITINIB

Indications see notes above

Cautions see section 8.1; monitor full blood count (including differential white cell count) before treatment, then every 2–4 weeks until dose stabilised, then as clinically indicated; assess risk of developing infection before treatment—do not initiate until active serious infections are resolved (see also under Tuberculosis below); monitor for infection during treatment; monitor for symptoms of progressive multifocal leucoencephalopathy (presenting as new or worsening neurological, cognitive or psychiatric signs or symptoms)—withhold treatment if suspected; **interactions:** Appendix 1 (ruxolitinib)

Tuberculosis Patients should be evaluated for latent and active tuberculosis before starting treatment and monitored for signs and symptoms of tuberculosis during treatment

Hepatic impairment reduce dose (consult product literature)

Renal impairment reduce dose in severe impairment (consult product literature)

Pregnancy avoid—toxicity in *animal* studies

Breast-feeding avoid—present in milk in *animal* studies

Side-effects see section 8.1; also flatulence, hypercholesterolaemia, dizziness, headache, weight gain; *less commonly* tuberculosis; *also reported* progressive multifocal leucoencephalopathy

Dose

- See Doses, p. 563

Jakavi® (Novartis) ▼ PoM

Tablets, ruxolitinib (as phosphate) 5 mg, net price 56-tab pack = £1680.00; 15 mg, 56-tab pack = £3360.00; 20 mg, 56-tab pack = £3360.00

SORAFENIB

Indications see notes above

Cautions major surgical procedures; cardiac ischaemia; susceptibility to QT-interval prolongation; **interactions:** Appendix 1 (sorafenib)

Hepatic impairment manufacturer advises caution in severe impairment—no information available

Pregnancy manufacturer advises avoid unless essential—toxicity in *animal* studies; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1; also diarrhoea, constipation, dyspepsia, dysphagia, anorexia, hypertension, haemorrhage, flushing, hoarseness, fatigue, asthenia, depression, peripheral neuropathy, fever, erectile dysfunction, renal failure, hypophosphataemia, arthralgia, myalgia, tinnitus, rash, pruritus, erythema, dry skin, desquamation, acne, hand-foot skin reaction; *less commonly* gastro-intestinal perforations, myocardial infarction, congestive heart failure, hypertensive crisis, interstitial lung disease-like events, posterior reversible encephalopathy syndrome, thyroid dysfunction, and Stevens-Johnson syndrome; *rarely* hepatitis

Dose

- ADULT over 18 years, 400 mg twice daily

Nexavar® (Bayer) ▼ PoM

Tablets, f/c, red, sorafenib (as tosylate) 200 mg, net price 112-tab pack = £2980.47 Label: 23

SUNITINIB

Indications see notes above

Cautions see section 8.1; cardiovascular disease—discontinue if congestive heart failure develops; susceptibility to QT-interval prolongation; hypertension; increased risk of bleeding; monitor for thyroid dysfunction; consider dental check-up before initiating treatment (risk of osteonecrosis of the jaw, see MHRA/CHM advice, p. 585); **interactions:** Appendix 1 (sunitinib)

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies; effective contraception required during treatment; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1; also abdominal pain, diarrhoea, constipation, anorexia, taste disturbance, dehydration; hypertension, oedema; dyspnoea, cough; fatigue, dizziness, headache, insomnia, peripheral neuropathy, paraesthesia; hypothyroidism; arthralgia, myalgia; increased lacrimation; epistaxis; skin, hair, and urine discoloration, hand-foot syndrome, dry skin, and rash; gastro-intestinal perforation, fistula formation (interrupt treatment if occurs) pancreatitis, osteonecrosis of the jaw (see MHRA/CHM advice, p. 585), hepatic failure, proteinuria (*rarely* nephrotic syndrome) and seizures reported

Dose

- Gastro-intestinal stromal tumours and metastatic renal cell carcinoma, 50 mg once daily for 4 weeks, followed by a 2-week treatment-free period to complete 6-week cycle; adjust dose in steps of 12.5 mg according to tolerability; dose range 25–75 mg daily
- Pancreatic neuroendocrine tumours, 37.5 mg once daily, without a treatment-free period; adjust dose in steps of 12.5 mg according to tolerability; max. dose 50 mg daily

Sutent® (Pfizer) ▼ PoM

Capsules, sunitinib (as malate) 12.5 mg (orange), net price 28-cap pack = £784.70; 25 mg (caramel/orange), 28-cap pack = £1569.40; 50 mg (caramel), 28-cap pack = £3138.80. Label: 14

TEMSIROLIMUS

Indications see notes above

Cautions see notes above; monitor respiratory function; monitor blood lipids; **interactions:** Appendix 1 (temsirolimus)

Hepatic impairment use with caution; in renal cell carcinoma, reduce dose in severe impairment (consult product literature); in mantle cell lymphoma, avoid in moderate or severe impairment

Renal impairment manufacturer advises caution in severe impairment—no information available

Pregnancy manufacturer advises avoid (toxicity in *animal* studies); ensure effective contraception during treatment in men and women; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding manufacturer advises discontinue breast-feeding

Side-effects see section 8.1; also abdominal pain, diarrhoea, anorexia, taste disturbance, gastro-intestinal haemorrhage, bowel perforation, dysphagia; hypertension, oedema, thrombosis, thrombophlebitis; cough, dyspnoea, chest pain, interstitial lung disease, hypersensitivity reactions (see notes above); insomnia, anxiety, depression, drowsiness, paraesthesia, dizziness, asthenia; increased susceptibility to infection (including urinary-tract infection and pneumonia), pyrexia; hyperglycaemia; renal failure; hypophosphataemia, hypokalaemia, hypercholesterolaemia, hyperlipidaemia; myalgia, arthralgia; eye disorders; rhinitis, epistaxis; skin disorders (including rash and acne), folliculitis, impaired wound healing; *less commonly* intracerebral bleeding

Dose

- See Doses, p. 563

Torisel® (Pfizer) PoM

Infusion, temsirolimus 30 mg concentrate (25 mg/mL), net price 1.2-mL amp (with diluent) = £620.00

Excipients include propylene glycol and ethanol

VANDETANIB

Indications see notes above

Cautions see section 8.1; susceptibility to QT-prolongation (including concomitant use of drugs that prolong QT interval and electrolyte disturbances)—monitor ECG, serum potassium, calcium, magnesium and thyroid stimulating hormone before treatment, then 1, 3, 6 and 12 weeks after starting treatment and following dose adjustment or interruption, then every 3 months for at least 1 year; history of torsades de pointes; phototoxicity reactions reported (wear protective clothing and/or sunscreen); brain metastases (intracranial haemorrhage reported); hypertension; **interactions**: Appendix 1 (vandetanib)

Contra-indications congenital long QT syndrome; QT interval greater than 480 milliseconds

Hepatic impairment manufacturer advises avoid in severe impairment (serum bilirubin greater than 1.5 times the upper limit of normal)

Renal impairment reduce dose to 200 mg if creatinine clearance 30–49 mL/minute; avoid if creatinine clearance less than 30 mL/minute

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk—effective contraception required during and for at least 4 months after treatment; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding avoid—no information available

Side-effects see section 8.1; also abdominal pain, diarrhoea, constipation, dyspepsia, colitis, dry mouth, dysphagia, gastritis, gastrointestinal haemorrhage, cholelithiasis, QT-interval prolongation, hypertension, ischaemic cerebrovascular conditions, oedema, epistaxis, haemoptysis, pneumonitis, headache, paraesthesia, dysaesthesia, dizziness, tremor, lethargy, asthenia, pain, pyrexia, loss of consciousness, balance disorders, taste disturbance, insomnia, depression, anxiety, hypothyroidism, decreased appetite, hyperglycaemia, dehydration, electrolyte disturbances, proteinuria, nephrolithiasis, dysuria, haematuria, pollakiuria, micturition urgency, blurred vision, corneal changes (including corneal deposits and opacity), halo vision, photopsia, glaucoma, conjunctivitis, dry eye, keratopathy, photosensitivivity reactions, hand-foot syndrome, alopecia; *less commonly* pancreatitis, peritonitis, ileus, intestinal perforation, faecal incontinence, heart failure, cardiac conduction, rate and rhythm disorders, ventricular arrhythmia, cardiac arrest, respiratory failure, aspiration pneumonia, interstitial lung disease (sometimes

fatal), convulsions, clonus, brain oedema, posterior reversible encephalopathy syndrome, impaired healing, increased haemoglobin, chromaturia, anuria, cataract, accommodation disorders, bullous dermatitis, erythema multiforme and Stevens-Johnson syndrome

Dose

- ADULT, 300 mg once daily; for dose adjustment due to side effects, consult product literature

Caprelsa® (AstraZeneca) ▼ PoM

Tablets, f/c, vandetanib 100 mg, net price 30-tab pack = £2500.00; 300 mg, 30-tab pack = £5000.00. Alert card

Note *Caprelsa®* tablets may be dispersed in half a glass of water by stirring until dispersed (approximately 10 minutes), immediately before drinking (do not crush). After solution has been swallowed, any residue must be re-dispersed in the same volume of water and swallowed. The solution can also be administered via nasogastric or gastrostomy tubes

VEMURAFENIB

Indications see notes above

Cautions see section 8.1; susceptibility to QT-prolongation (including concomitant use of drugs that prolong QT interval and electrolyte disturbances)—monitor ECG and electrolytes before treatment, after one month and following dose adjustment (treatment not recommended if QT interval greater than 500 milliseconds at baseline); monitor for cutaneous and non-cutaneous squamous cell carcinoma and new primary melanoma before, during and for up to 6 months after treatment—consult product literature; monitor liver function before treatment and periodically thereafter; monitor for uveitis, iritis and retinal vein occlusion; prior or concurrent cancer associated with RAS mutation—increased risk of tumour progression; **interactions**: Appendix 1 (vemurafenib)

Contra-indications wild-type BRAF malignant melanoma

Hepatic impairment manufacturer advises more frequent monitoring in moderate to severe impairment (including monthly ECG monitoring during first 3 months of treatment)

Renal impairment manufacturer advises caution in severe impairment

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk—effective contraception required during and for at least 6 months after treatment; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding avoid—no information available

Side-effects see section 8.1; also diarrhoea, constipation, decreased appetite, cough, peripheral oedema, QT-interval prolongation, fatigue, asthenia, pyrexia, headache, dizziness, taste disturbance, Bell's palsy, new primary melanoma, arthralgia, myalgia, pain in extremities, musculoskeletal pain, arthritis, uveitis, seborrhoeic keratosis, actinic keratosis, keratosis pilaris, skin papilloma, cutaneous squamous cell carcinoma, basal cell carcinoma, photosensitivity reactions, hyperkeratosis, erythema, alopecia, folliculitis, dry skin, hand-foot syndrome, erythema nodosum; *less commonly* vasculitis, peripheral neuropathy, non-cutaneous squamous cell carcinoma, retinal vein occlusion, toxic epidermal necrolysis, Stevens-Johnson syndrome; *rarely* progression of pre-existing NRAS mutated chronic myelomonocytic leukaemia; *also reported* hypersensitivity reactions

Drug rash with eosinophilia and systemic symptoms (DRESS syndrome)

DRESS syndrome has been reported in patients taking vemurafenib. DRESS syndrome starts with rash, fever, swollen glands, and increased white cell count, and it can affect the liver, kidneys and lungs; DRESS can also be fatal.

Patients should be advised to stop taking vemurafenib and consult their doctor immediately if skin rash develops. Treatment with vemurafenib should not be restarted.

Dose

- ADULT over 18 years, 960 mg twice daily; for dose adjustment due to side effects, consult product literature

Zelboraf® (Roche) ▼ PoM

Tablets, f/c, vemurafenib (as co-precipitate of vemurafenib and hypromellose acetate succinate) 240 mg, net price 56-tab pack = £1750.00. Label: 25, counselling

Counselling Food may affect absorption (take at the same time with respect to food)

Taxanes

Paclitaxel is a member of the taxane group of drugs. It is given by *intravenous infusion*, and is available as both conventional and albumin-bound formulations. The different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are not interchangeable. *Conventional* paclitaxel given with carboplatin or cisplatin is used for the treatment of ovarian cancer (see NICE guidance p. 594); the combination is also considered appropriate for women whose ovarian cancer is initially considered inoperable; it is also licensed for the secondary treatment of metastatic breast cancer. There is limited evidence to support its use in non-small cell lung cancer. Routine premedication with a corticosteroid, an antihistamine and a histamine H_2-receptor antagonist is recommended to prevent severe hypersensitivity reactions; hypersensitivity reactions may occur rarely despite premedication, although more commonly only bradycardia or asymptomatic hypotension occur.

Other side-effects of *conventional* paclitaxel include myelosuppression, peripheral neuropathy, and cardiac conduction defects with arrhythmias (which are nearly always asymptomatic). It also causes alopecia and muscle pain; nausea and vomiting is mild to moderate.

Albumin-bound paclitaxel is licensed for monotherapy of metastatic breast cancer following failed first-line treatment for metastatic disease and when standard, anthracycline-containing therapy is not indicated. It is also licensed in combination with gemcitabine for the first-line treatment of metastatic adenocarcinoma of the pancreas. It causes myelosuppression (primarily neutropenia) and commonly febrile neutropenia. Other common side-effects include peripheral neuropathy, tachycardia, arrhythmia, myalgia, arthralgia and gastro-intestinal disorders; bradycardia, cardiac arrest, congestive heart failure, and left ventricular dysfunction are rare but cardiac monitoring should be undertaken, particularly if patients have underlying cardiac disease or

previous exposure to anthracyclines. Patients aged over 75 years with metastatic adenocarcinoma of the pancreas should be treated with caution. Patients should also be monitored for signs and symptoms of pneumonitis and sepsis. Stevens-Johnson syndrome and toxic epidermal necrolysis have also been reported.

NICE guidance
Paclitaxel for the adjuvant treatment of early node-positive breast cancer (September 2006)
Paclitaxel, within its licensed indication, is **not** recommended for the adjuvant treatment of women with early node-positive breast cancer.
www.nice.org.uk/TA108

Docetaxel is licensed for use in locally advanced or metastatic breast cancer and non-small cell lung cancer resistant to other cytotoxic drugs or for initial chemotherapy in combination with other cytotoxic drugs. It is also licensed for hormone-resistant prostate cancer, for use with other cytotoxic drugs for gastric adenocarcinoma and head and neck cancer, and for adjuvant treatment of operable node-positive and operable node-negative breast cancer. Its side-effects are similar to those of paclitaxel but persistent fluid retention (commonly as leg oedema that worsens during treatment) can be resistant to treatment; hypersensitivity reactions also occur. Pretreatment with dexamethasone by mouth is recommended for reducing fluid retention and hypersensitivity reactions.

For the role of taxanes in the treatment of breast cancer, see section 8.3.4.1.

The *Scottish Medicines Consortium* (p. 4) has advised that docetaxel (*Taxotere*®) in combination with cisplatin and fluorouracil is accepted for restricted use within NHS Scotland for the induction treatment of patients with unresectable (May 2007) and resectable (June 2008) locally advanced squamous cell carcinoma of the head and neck.

NICE guidance (paclitaxel, pegylated liposomal doxorubicin and topotecan for second-line or subsequent treatment of advanced ovarian cancer)
See p. 594

NICE guidance
Docetaxel for the treatment of hormone-refractory metastatic prostate cancer (June 2006)
Docetaxel is an option for hormone-refractory metastatic prostate cancer and a Karnofsky score of at least 60% [Karnofsky score is a measure of the ability to perform ordinary tasks].
www.nice.org.uk/TA101

NICE guidance
Docetaxel for the adjuvant treatment of early node-positive breast cancer (September 2006)
Docetaxel, when given concurrently with doxorubicin and cyclophosphamide (TAC regimen), is recommended as an option for the adjuvant treatment of women with early node-positive breast cancer.
www.nice.org.uk/TA109

Cabazitaxel, in combination with prednisone or prednisolone, is licensed for the treatment of hormone refractory metastatic prostate cancer in patients who have previously been treated with a docetaxel-containing regimen. Routine premedication with a corticosteroid, an antihistamine, and a histamine H_2-receptor antagonist is recommended to prevent severe hypersensitivity reactions. Hypersensitivity reactions are common.

Other side-effects of cabazitaxel include weight changes, diarrhoea, constipation, abdominal pain, dyspepsia, gastroesophageal reflux, haemorrhoids, rectal haemorrhage, taste disturbance, dry mouth, chest pain, atrial fibrillation, tachycardia, hypertension, hypotension, flushing, oedema, dyspnoea, cough, peripheral neuropathy, paraesthesia, hypoesthesia, anxiety, confusion, dizziness, headache, malaise, vertigo, chills, hyperglycaemia, urinary retention, urinary incontinence, renal disorders (fatal cases of renal failure reported), dehydration, electrolyte disturbances, sciatica, arthralgia, muscle spasm, myalgia, increased lacrimation, tinnitus, dry skin, erythema.

NICE guidance
Cabazitaxel for hormone-refractory metastatic prostate cancer previously treated with a docetaxel-containing regimen (May 2012)
Cabazitaxel in combination with prednisone or prednisolone is **not** recommended for the treatment of hormone-refractory metastatic prostate cancer previously treated with a docetaxel-containing regimen.
Patients currently receiving cabazitaxel in combination with prednisone or prednisolone for the treatment of hormone-refractory metastatic prostate cancer previously treated with a docetaxel-containing regimen should have the option to continue treatment until they and their clinicians consider it appropriate to stop.
www.nice.org.uk/TA255

CABAZITAXEL

Indications see notes above

Cautions see section 8.1; monitor electrolytes—correct dehydration; avoid in acute porphyria (but see section 9.8.2); **interactions**: Appendix 1 (cabazitaxel)

Hepatic impairment avoid

Renal impairment use with caution if creatinine clearance less than 50 mL/minute

Pregnancy ensure effective contraception during treatment (women) and for up to 6 months after treatment (men); see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above

Dose

- See Doses, p. 563

Jevtana® (Sanofi-Aventis) ▼ PoM
Concentrate for intravenous infusion, cabazitaxel 40 mg/mL, net price 1.5-mL vial (and solvent) = £3696.00
Note Incompatible with PVC. Solvent contains ethanol

DOCETAXEL

Indications adjuvant treatment of operable node-positive and operable node-negative breast cancer, in combination with doxorubicin and cyclophosphamide; with doxorubicin for initial chemotherapy of locally advanced or metastatic breast cancer; monotherapy for locally advanced or metastatic breast cancer where cytotoxic chemotherapy with an anthracycline or an alkylating drug has failed; with capecitabine for locally advanced or metastatic breast cancer where cytotoxic chemotherapy with an anthracycline has failed; with trastuzumab for initial chemotherapy of metastatic breast cancer which overexpresses human epidermal growth factor-2; locally advanced or metastatic non-small cell lung cancer where first-line chemotherapy has failed; with cisplatin for unresectable, locally advanced or metastatic non-small cell lung cancer; with prednisolone for hormone-refractory metastatic prostate cancer; with cisplatin and fluorouracil for initial treatment of metastatic gastric adenocarcinoma, including adenocarcinoma of the gastro-oesophageal junction; with cisplatin and fluorouracil for induction treatment of locally advanced squamous cell carcinoma of the head and neck

Cautions see section 8.1 and notes above; avoid in acute porphyria (but see section 9.8.2); **interactions:** Appendix 1 (docetaxel)

Hepatic impairment monitor liver function—reduce dose according to liver enzymes; avoid in severe impairment

Pregnancy avoid (toxicity and reduced fertility in *animal* studies); manufacturer advises effective contraception during and for at least 3 months after treatment; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above

Dose

Taxotere® (Sanofi-Aventis) PoM

Infusion, docetaxel 20 mg/mL, net price 1-mL vial = £153.47, 4-mL vial = £504.27, 8-mL vial = £1008.54 (hosp. only)

Note Contains ethanol

PACLITAXEL

Indications ovarian cancer (advanced or residual disease following laparotomy) in combination with cisplatin; metastatic ovarian cancer where platinum-containing therapy has failed; locally advanced or metastatic breast cancer (in combination with other cytotoxics or alone if other cytotoxics have failed or are inappropriate); adjuvant treatment of node-positive breast cancer following treatment with anthracycline and cyclophosphamide; non-small cell lung cancer (in combination with cisplatin) when surgery or radiotherapy not appropriate; advanced AIDS-related Kaposi's sarcoma where liposomal anthracycline therapy has failed; *albumin-bound* paclitaxel is licensed for monotherapy of metastatic breast cancer when first-line treatment has failed and standard, anthracycline-containing therapy is not indicated; first-line treatment of metastatic adenocarcinoma of the pancreas in combination with gemcitabine; also see Dose below

Cautions see section 8.1 and notes above, and consult product literature; avoid in acute porphyria (but see section 9.8.2); **interactions:** Appendix 1 (paclitaxel)

Contra-indications see section 8.1 and notes above

Hepatic impairment avoid in severe impairment

Pregnancy avoid (toxicity in *animal* studies); ensure effective contraception during and for at least 6 months after treatment in men or women; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1, notes above, and consult product literature

Dose

- See Doses, p. 563

Note Different preparations of intravenous paclitaxel vary in their licensed indications, pharmacodynamics, pharmacokinetics, dosage, and administration; these preparations should **not** be considered interchangeable. To avoid confusion, prescribers should specify the brand to be dispensed.

Paclitaxel (Non-proprietary) PoM

Infusion, paclitaxel 6 mg/mL, net price 5-mL vial = £66.85, 16.7-mL vial = £200.35, 25-mL vial = £300.52, 50-mL vial = £601.03

Excipients include polyoxyl castor oil (risk of anaphylaxis, see Excipients, p. 2)

Albumin-bound formulation

Abraxane® (Celgene) PoM

Intravenous infusion, powder for reconstitution, paclitaxel as albumin bound nanoparticles, net price 100-mg vial = £246.00

Electrolytes Contains approx. 3.7 mmol Na^+/vial

For monotherapy of metastatic breast cancer when first-line treatment for metastatic disease has failed and standard, anthracycline-containing therapy is not indicated; in combination with gemcitabine for the first-line treatment of metastatic adenocarcinoma of the pancreas

Topoisomerase I inhibitors

Irinotecan and topotecan inhibit topoisomerase I, an enzyme involved in DNA replication.

Irinotecan is licensed for metastatic colorectal cancer in combination with fluorouracil and folinic acid or as monotherapy when treatment containing fluorouracil has failed. It is also licensed in combination with cetuximab for the treatment of epidermal growth factor receptor-expressing metastatic colorectal cancer after failure of chemotherapy that has included irinotecan. Irinotecan is also licensed in combination with fluorouracil, folinic acid and bevacizumab for the first-line treatment of metastatic carcinoma of the colon or rectum. Irinotecan is also licensed in combination with capecitabine with or without bevacizumab for the first-line treatment of metastatic colorectal carcinoma. Irinotecan is given by intravenous infusion.

NICE guidance
Irinotecan, oxaliplatin and raltitrexed for advanced colorectal cancer (August 2005)
See p. 593

NICE guidance
Aflibercept in combination with irinotecan and fluorouracil-based therapy for treating metastatic colorectal cancer that has progressed following prior oxaliplatin-based chemotherapy (March 2014)
See p. 584

Topotecan is given by intravenous infusion or orally in relapsed small-cell lung cancer when retreatment with the first-line regimen is considered inappropriate. Topotecan injection is also licensed for metastatic ovarian cancer when first-line or subsequent treatment has failed. Topotecan injection is licensed in combination with cisplatin for treatment of recurrent carcinoma of the cervix, after radiotherapy, and for patients with stage IVB disease.

In addition to dose-limiting myelosuppression, side-effects of irinotecan and topotecan include gastro-intestinal effects (delayed diarrhoea requiring prompt treatment may follow irinotecan treatment), asthenia, alopecia, and anorexia.

The *Scottish Medicines Consortium* (p. 4) has advised (November 2007) that topotecan (*Hycamtin*®) is accepted for restricted use in combination with cisplatin for treatment of recurrent carcinoma of the cervix after radiotherapy and for stage IVB disease; it is restricted to patients who have not previously received cisplatin treatment.

The *Scottish Medicines Consortium* (p. 4) has advised (March 2009) that use of topotecan capsules within NHS Scotland is restricted to patients in whom standard intravenous chemotherapy is inappropriate and who would otherwise receive best supportive care.

NICE guidance
Topotecan for the treatment of recurrent and stage IVB cervical cancer (October 2009)
Topotecan in combination with cisplatin is recommended as a treatment option for recurrent or stage IVB cervical cancer in patients who have not previously received cisplatin.
www.nice.org.uk/TA183

NICE guidance
Topotecan for the treatment of relapsed small-cell lung cancer (November 2009)
Oral topotecan is recommended as an option for treatment in patients with relapsed small-cell lung cancer only if re-treatment with the first-line regimen is not considered appropriate, and the combination of cyclophosphamide, doxorubicin and vincristine is contra-indicated. Intravenous topotecan is not recommended for people with relapsed small-cell lung cancer.
www.nice.org.uk/TA184

NICE guidance (paclitaxel, pegylated liposomal doxorubicin and topotecan for second-line or subsequent treatment of advanced ovarian cancer)
See p. 594

IRINOTECAN HYDROCHLORIDE

Indications see notes above

Cautions see section 8.1 and notes above; raised plasma-bilirubin concentration (see under Hepatic impairment); risk factors for cardiac disease; monitor respiratory function; **interactions**: Appendix 1 (irinotecan)

Contra-indications see section 8.1 and notes above; also chronic inflammatory bowel disease, bowel obstruction

Hepatic impairment monitor closely for neutropenia if plasma-bilirubin concentration 1.5–3 times upper limit of normal range (consult product literature); avoid if plasma-bilirubin concentration greater than 3 times upper limit of normal range

Renal impairment manufacturer advises avoid—no information available

Pregnancy avoid (teratogenic and toxic in *animal* studies); manufacturer advises effective contraception during and for up to 1 month after treatment in women and up to 3 months after treatment in men; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above; also acute cholinergic syndrome (with early diarrhoea) and delayed diarrhoea (consult product literature); *less commonly* interstitial pulmonary disease

Dose

- See Doses, p. 563

Irinotecan (Non-proprietary) PoM
Infusion, irinotecan hydrochloride 20 mg/mL, net price 2-mL vial = £46.50, 5-mL vial = £114.00, 15-mL vial = £370.50, 25-mL vial = £601.25

Campto® (Pfizer) PoM
Infusion, irinotecan hydrochloride 20 mg/mL, net price 2-mL vial = £53.00; 5-mL vial = £130.00; 15-mL vial = £390.00

TOPOTECAN

Indications see notes above

Cautions see section 8.1 and notes above

Contra-indications see section 8.1 and notes above

Hepatic impairment avoid in severe impairment

Renal impairment reduce dose; avoid infusion if creatinine clearance less than 20 mL/minute; avoid oral route if creatinine clearance less than 60 mL/minute

Pregnancy avoid (teratogenicity and fetal loss in *animal* studies); see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1 and notes above

Dose

- See Doses, p. 563

Intravenous infusion, powder for reconstitution, topotecan (as hydrochloride), net price 1-mg vial = £97.65; 4-mg vial = £290.62

Trabectedin

Trabectedin is licensed for the treatment of advanced soft tissue sarcoma when treatment with anthracyclines and ifosfamide has failed or is contra-indicated and in combination with pegylated liposomal doxorubicin for the treatment of relapsed platinum-sensitive ovarian cancer.

Trabectedin is given by intravenous infusion. A corticosteroid, such as dexamethasone by intravenous infusion, should be given 30 minutes before therapy for its antiemetic and hepatoprotective effects.

NICE guidance

Trabectedin for the treatment of advanced soft tissue sarcoma (February 2010)

Trabectedin is an option for advanced soft tissue sarcoma when treatment with anthracyclines and ifosfamide has failed, is inappropriate or is not tolerated. The cost of trabectedin for treatment after the fifth cycle is met by the manufacturer.

www.nice.org.uk/TA185

NICE guidance

Trabectedin for the treatment of relapsed ovarian cancer (April 2011)

Trabectedin in combination with pegylated liposomal doxorubicin is **not** recommended for the treatment of relapsed platinum-sensitive ovarian cancer.

www.nice.org.uk/TA222

TRABECTEDIN

Indications see notes above

Cautions see section 8.1 and notes above; measure creatine kinase, renal function and hepatic function before starting (consult product literature); monitor haematological and hepatic parameters weekly during first 2 cycles and at least once between treatments in subsequent cycles; concomitant use with hepatotoxic drugs (avoid alcohol)

Hepatic impairment manufacturer advises caution in impairment—consider dose reduction; avoid in patients with raised bilirubin

Renal impairment avoid monotherapy if creatinine clearance less than 30 mL/minute; avoid combination regimens if creatinine clearance less than 60 mL/minute

Pregnancy effective contraception recommended during and for at least 3 months after treatment in women and during and for at least 5 months after treatment in men; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding manufacturer advises avoid breast-feeding during and for 3 months after treatment

Side-effects see section 8.1; also abdominal pain, constipation, diarrhoea, dyspepsia, taste disturbance, hepatobiliary disorders; hypotension, oedema, flushing; dyspnoea, cough; headache, insomnia, peripheral neuropathy, paraesthesia, dizziness, anorexia, asthenia, fatigue; pyrexia; hypokalaemia, dehydration, increased blood creatine kinase; myalgia, arthralgia, back pain

Dose

• See Doses, p. 563

Injection, powder for reconstitution, trabectedin, net price 250-microgram vial = £363.00; 1-mg vial = £1366.00

Trastuzumab

Trastuzumab is licensed for the treatment of early breast cancer which overexpresses human epidermal growth factor receptor-2 (HER2).

Trastuzumab is also licensed, in combination with paclitaxel or docetaxel, for metastatic breast cancer in patients with HER2-positive tumours who have not received chemotherapy for metastatic breast cancer and in whom anthracycline treatment is inappropriate.

Trastuzumab is also licensed, in combination with an aromatase inhibitor, for metastatic breast cancer in postmenopausal patients with hormone-receptor positive HER2-positive tumours not previously treated with trastuzumab.

Trastuzumab is also licensed as monotherapy for metastatic breast cancer in patients with tumours that overexpress HER2 who have received at least 2 chemotherapy regimens including, where appropriate, an anthracycline and a taxane; women with oestrogen-receptor-positive breast cancer should also have received hormonal therapy.

Trastuzumab is also licensed (by intravenous infusion only), in combination with capecitabine or fluorouracil and cisplatin, for metastatic gastric cancer in patients with HER2-positive tumours who have not received treatment for metastatic gastric cancer.

Resuscitation facilities should be available during administration of trastuzumab and treatment should be initiated by a specialist. Trastuzumab is **not** interchangeable with trastuzumab emtansine. See section 8.3.4.1 for the role of trastuzumab in the treatment of breast cancer.

Use with anthracyclines Concomitant use of trastuzumab with anthracyclines (section 8.1.2) is associated with cardiotoxicity. The use of anthracyclines even after stopping trastuzumab can increase the risk of cardiotoxicity and if possible should be avoided for up to 24 weeks. If an anthracycline needs to be used, cardiac function should be monitored closely.

NICE guidance

Guidance on the use of trastuzumab for the treatment of advanced breast cancer (March 2002)

Trastuzumab in combination with paclitaxel is recommended as an option for patients with tumours expressing human epidermal growth factor receptor 2 (HER2) scored at levels of 3+ who have not received chemotherapy for metastatic breast cancer, and in whom anthracycline treatment is inappropriate.

Trastuzumab monotherapy is recommended as an option for patients with tumours expressing HER2 scored at levels of 3+ who have received at least two chemotherapy regimens for metastatic breast cancer. Prior chemotherapy must have included at least an anthracycline and a taxane where these treatments are appropriate. It should also have included hormonal therapy in suitable oestrogen-receptor-positive patients.

www.nice.org.uk/TA34

NICE guidance

Trastuzumab for the adjuvant treatment of early-stage HER2-positive breast cancer (August 2006)

Trastuzumab, given at 3-week intervals for 1 year or until disease recurrence (whichever is the shorter period), is recommended as an option for women with early-stage HER2-positive breast cancer following surgery, chemotherapy (neoadjuvant or adjuvant) and radiotherapy (if applicable).

www.nice.org.uk/TA107

NICE guidance

Trastuzumab for the treatment of HER2-positive metastatic gastric cancer (November 2010)

Trastuzumab in combination with cisplatin and capecitabine or fluorouracil is recommended for human epidermal growth factor receptor-2-positive metastatic adenocarcinoma of the stomach or gastro-oesophageal junction in patients who:

- have not received treatment for metastatic disease **and**
- have tumours expressing high levels of HER2 as defined by a positive immunohistochemistry score of 3.

www.nice.org.uk/TA208

NICE guidance (lapatinib or trastuzumab in combination with an aromatase inhibitor for the first-line treatment of metastatic hormone-receptor-positive breast cancer that overexpresses HER2)

See p. 598

TRASTUZUMAB

Indications see notes above and product literature

Cautions see section 8.1 and notes above; symptomatic heart failure, history of hypertension, coronary artery disease, uncontrolled arrhythmias

Cardiotoxicity Monitor cardiac function before and during treatment—for details of monitoring and managing cardiotoxicity, consult product literature

Contra-indications see section 8.1 and notes above; severe dyspnoea at rest

Pregnancy manufacturer advises avoid—oligohydramnios reported; effective contraception must be used during treatment and for 6 months after stopping; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding avoid breast-feeding during treatment and for 7 months afterwards

Side-effects see section 8.1; also infusion-related side-effects (possibly delayed onset, including chills, fever, hypersensitivity reactions such as anaphylaxis, urticaria, and angioedema), gastro-intestinal symptoms, hepatitis, cardiotoxicity (see also above), chest pain, hypertension, hypotension, pulmonary events (possibly delayed onset), headache, taste disturbance, anxiety, malaise, depression, insomnia, drowsiness, dizziness, paraesthesia, tremor, asthenia, peripheral neuropathy, hypertonia, paresis, mastitis, infection, ecchymosis, oedema, weight loss, arthralgia, myalgia, arthritis, bone pain, leg cramps, dry eye, increased lacrimation, rash, pruritus, sweating, dry skin, alopecia, acne, nail disorders

Dose

- See Doses, p. 563

Herceptin® (Roche) ▼ PoM

Intravenous infusion, powder for reconstitution, trastuzumab, net price 150-mg vial = £407.40

Injection (for subcutaneous use), trastuzumab 120 mg/mL, net price 5-mL vial = £1222.20

Note Subcutaneous preparation not licensed for use in metastatic gastric cancer

Note When prescribing, dispensing or administering, check that this is the correct preparation—trastuzumab and trastuzumab emtansine are **not** interchangeable

Note The *Scottish Medicines Consortium* p. 4 has advised (December 2013) that subcutaneous trastuzumab injection (*Herceptin®*) is accepted for restricted use within NHS Scotland for the treatment of adults with HER2 positive metastatic breast cancer and early breast cancer, when used within licensed indications excluding use in combination with an aromatase inhibitor for the treatment of postmenopausal patients with hormone-receptor positive metastatic breast cancer, not previously treated with trastuzumab

Trastuzumab emtansine

Trastuzumab emtansine is an antibody-drug conjugate that contains trastuzumab covalently linked to DM1, a cytotoxic microtubule inhibitor. Trastuzumab emtansine and trastuzumab are **not** interchangeable; trastuzumab emtansine is indicated as monotherapy for the treatment of HER2-positive, unresectable, locally advanced or metastatic breast cancer, in adult patients who have previously received trastuzumab and a taxane separately or in combination, or who have developed disease recurrence during or within 6 months of completing adjuvant therapy. Resuscitation facilities should be available during administration of trastuzumab emtansine and treatment should be initiated by a specialist. See section 8.3.4.1 for the role of trastuzumab emtansine in the treatment of breast cancer.

TRASTUZUMAB EMTANSINE

Indications see notes above

Cautions see section 8.1; patients over 75 years; dyspnoea at rest—increased risk of pulmonary events; monitor for dyspnoea, cough, fatigue and pulmonary infiltrates—discontinue if interstitial lung

disease or pneumonitis confirmed (fatal cases reported); monitor hepatic function before each dose—see also Hepatic impairment; history of congestive heart failure, serious arrhythmias, recent history of myocardial infarction or unstable angina; risk of left ventricular dysfunction—consult product literature for specific risks with trastuzumab treatment; test cardiac function before treatment and regularly during treatment—delay or discontinue treatment in cases of left ventricular dysfunction; monitor closely for infusion-related and hypersensitivity reactions; monitor platelet count before each dose and as clinically indicated (consult product literature for treatment modification in thrombocytopenia); concomitant anticoagulant medication—increased risk of thrombocytopenia with haemorrhagic events; peripheral neuropathy (temporarily discontinue treatment—consult product literature); monitor for signs and symptoms of neurotoxicity; **interactions:** Appendix 1 (trastuzumab)

Hepatic impairment monitor hepatic function before each dose and consult product literature for initiating treatment, dose modification and discontinuation in cases of abnormal liver function tests

Renal impairment no information available—manufacturer advises caution in severe impairment

Pregnancy manufacturer advises avoid—oligohydramnios reported with trastuzumab; effective contraception must be used during and for 6 months after stopping treatment in women and men; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding manufacturer advises avoid breast-feeding during and for 6 months after treatment

Side-effects see section 8.1; also diarrhoea, constipation, abdominal pain, dry mouth, dyspepsia, gingival bleeding, left ventricular dysfunction (see Cautions), hypertension, peripheral oedema, epistaxis, cough, dyspnoea, insomnia, peripheral neuropathy (see Cautions), headache, dizziness, dysgeusia, memory impairment, malaise, pyrexia, chills, urinary tract infection, thrombocytopenia (see Cautions), haemorrhage, hypokalaemia, infusion-related reactions, arthralgia, myalgia, dry eye, conjunctivitis, blurred vision, increased lacrimation, rash, pruritus, nail disorder, urticaria, hand-foot syndrome; *less commonly* interstitial lung disease including pneumonitis (see Cautions), hepatic toxicity and failure, nodular regenerative hyperplasia, portal hypertension

Dose

- See Doses, p. 563

Kadcyla® (Roche) ▼ PoM

Intravenous infusion, powder for reconstitution, trastuzumab emtansine, net price 100-mg vial = £1641.01; 160-mg vial = £2625.62

Note When prescribing, dispensing or administering, check that this is the correct preparation—trastuzumab emtansine and trastuzumab are **not** interchangeable

Tretinoin

Tretinoin is licensed for the induction of remission in acute promyelocytic leukaemia. It is used in previously untreated patients as well as in those who have relapsed after standard chemotherapy or who are refractory to it.

TRETINOIN

Note Tretinoin is the acid form of vitamin A

Indications see notes above; acne (section 13.6.1); photodamage (section 13.8.1)

Cautions exclude pregnancy before starting treatment; monitor haematological and coagulation profile, liver function, serum calcium and plasma lipids before and during treatment; increased risk of thromboembolism during first month of treatment; **interactions:** Appendix 1 (retinoids)

Hepatic impairment reduce dose to 25 mg/m^2

Renal impairment reduce dose to 25 mg/m^2

Pregnancy teratogenic; effective contraception must be used for at least 1 month before oral treatment, during treatment and for at least 1 month after stopping (oral progestogen-only contraceptives not considered effective); see also Pregnancy and Reproductive Function, p. 564

Breast-feeding avoid

Side-effects retinoic acid syndrome (fever, dyspnoea, acute respiratory distress, pulmonary infiltrates, pleural effusion, hyperleucocytosis, hypotension, oedema, weight gain, hepatic, renal and multi-organ failure) requires immediate treatment—consult product literature; gastro-intestinal disturbances, pancreatitis; arrhythmias, flushing, oedema; headache, benign intracranial hypertension (mainly in children—consider dose reduction if intractable headache in children), shivering, dizziness, confusion, anxiety, depression, insomnia, paraesthesia, visual and hearing disturbances; raised liver enzymes, serum creatinine and lipids; bone and chest pain, alopecia, erythema, rash, pruritus, sweating, dry skin and mucous membranes, cheilitis; thromboembolism, hypercalcaemia, and genital ulceration reported

Dose

- ADULT and CHILD 45 mg/m^2 daily in 2 divided doses, max. duration of treatment 90 days (consult product literature for details of concomitant chemotherapy)

Vesanoid® (Intrapharm) PoM

Capsules, yellow/brown, tretinoin 10 mg, net price 100-cap pack = £160.63. Label: 21, 25

Vismodegib

Vismodegib is a hedgehog pathway inhibitor used in the treatment of basal cell carcinoma. Vismodegib may cause severe birth defects and embryo-foetal death. For women of child-bearing potential, pregnancy must be excluded before initiation of treatment, and monthly during treatment. Women must use two contraceptive methods (including one highly effective method and one barrier method) during treatment and for 24 months after the final dose of vismodegib; men must use a condom during treatment and for 2 months after the final dose. Prescribers and pharmacists must comply with prescribing and dispensing restrictions as specified in the manufacturer's Pregnancy Prevention Programme, and ensure that the patient fully acknowledges the programme's pregnancy prevention measures—consult product literature for further information.

VISMODEGIB

Indications symptomatic metastatic basal cell carcinoma; locally advanced basal cell carcinoma not appropriate for surgery or radiotherapy

Cautions see notes above; **interactions**: Appendix 1 (vismodegib)

Hepatic impairment no information available—manufacturer advises caution in moderate to severe impairment

Renal impairment no information available—manufacturer advises caution in severe impairment

Pregnancy **important: teratogenic risk**; see also notes above

Breast-feeding avoid during treatment and for 24 months after final dose

Side-effects nausea, vomiting, diarrhoea, constipation, abdominal pain, decreased appetite, weight loss, dehydration, dyspepsia, taste disturbances, malaise, amenorrhoea, hyponatraemia, arthralgia, musculoskeletal pain, muscle spasms, alopecia, abnormal hair growth, pruritus, rash

Dose

- ADULT over 18 years, 150 mg once daily

Erivedge® (Roche) ▼ PoM

Capsules, pink/grey, vismodegib 150 mg, net price 28-cap pack = £6285.00. Label: 25, counselling, pregnancy and contraception

Note Patient, prescriber, and supplying pharmacy must comply with the manufacturer's pregnancy prevention programme

8.2 Drugs affecting the immune response

Immunosuppressant therapy

Immunosuppressants are used to suppress rejection in organ transplant recipients and to treat a variety of chronic inflammatory and autoimmune diseases. Solid organ transplant patients are maintained on drug regimens, which may include antiproliferative drugs (azathioprine or mycophenolate mofetil), calcineurin inhibitors (ciclosporin or tacrolimus), corticosteroids, or sirolimus. Choice is dependent on the type of organ, time after transplantation, and clinical condition of the patient. Specialist management is required and other immunomodulators may be used to initiate treatment or to treat rejection.

Impaired immune responsiveness Modification of tissue reactions caused by corticosteroids and other immunosuppressants may result in the rapid *spread of infection*. Corticosteroids may suppress clinical signs of infection and allow diseases such as septicaemia or tuberculosis to reach an advanced stage before being recognised—**important:** for advice on measles exposure, see section 14.5.1, and chickenpox (varicella) exposure, see section 14.5.2. For advice on the use of live vaccines in individuals with impaired immune response, see section 14.1. For general comments and warnings relating to corticosteroids and immunosuppressants, see section 6.3.2.

Pregnancy Transplant patients immunosuppressed with azathioprine should not discontinue it on becoming pregnant. However, there have been reports of premature birth and low birth-weight following exposure to azathioprine, particularly in combination with corticosteroids. Spontaneous abortion has been reported following maternal or paternal exposure. Azathioprine is teratogenic in *animal* studies.

There is less experience of ciclosporin in pregnancy but it does not appear to be any more harmful than azathioprine. The use of these drugs during pregnancy needs to be supervised in specialist units.

8.2.1 Antiproliferative immunosuppressants

Azathioprine is widely used for transplant recipients and it is also used to treat a number of auto-immune conditions, usually when corticosteroid therapy alone provides inadequate control. It is metabolised to mercaptopurine, and doses should be reduced when allopurinol is given concurrently. Blood tests and monitoring for signs of myelosuppression are essential in long-term treatment with azathioprine.

Thiopurine methyltransferase

The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Consider measuring TPMT activity before starting azathioprine, mercaptopurine, or tioguanine therapy. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.

Mycophenolate mofetil is metabolised to mycophenolic acid which has a more selective mode of action than azathioprine. It is licensed for the prophylaxis of acute rejection in renal, hepatic or cardiac transplantation when used in combination with ciclosporin and corticosteroids. There is evidence that compared with similar regimens incorporating azathioprine, mycophenolate mofetil reduces the risk of acute rejection episodes; the risk of opportunistic infections (particularly due to tissue-invasive cytomegalovirus) and the occurrence of blood disorders such as leucopenia may be higher.

Cases of pure red cell aplasia have been reported with azathioprine and with mycophenolate mofetil; dose reduction or discontinuation should be considered under specialist supervision.

Cyclophosphamide (section 8.1.1) is less commonly prescribed as an immunosuppressant.

AZATHIOPRINE

Indications see notes above; inflammatory bowel disease (section 1.5.3); rheumatoid arthritis (section 10.1.3); severe refractory eczema [unlicensed indication] (section 13.5.3)

Cautions reduced thiopurine methyltransferase activity (see notes above); monitor for toxicity throughout treatment; monitor full blood count weekly (more frequently with higher doses or if severe hepatic or renal impairment) for first 4 weeks (manufacturer advises weekly monitoring for 8 weeks but evidence of practical value unsatisfactory), thereafter reduce

frequency of monitoring to at least every 3 months; reduce dose in elderly; **interactions:** Appendix 1 (azathioprine)

Bone marrow suppression Patients should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. inexplicable bruising or bleeding, infection

Contra-indications see notes above; hypersensitivity to mercaptopurine

Hepatic impairment reduce dose; monitor liver function; see also Cautions

Renal impairment reduce dose; see also Cautions

Pregnancy treatment should not generally be initiated during pregnancy; see also p. 615

Breast-feeding present in milk in low concentration; no evidence of harm in small studies—use if potential benefit outweighs risk

Side-effects hypersensitivity reactions (including malaise, dizziness, vomiting, diarrhoea, fever, rigors, myalgia, arthralgia, rash, hypotension and interstitial nephritis—calling for immediate withdrawal); dose-related bone marrow suppression (see also Cautions); liver impairment, cholestatic jaundice, hair loss and increased susceptibility to infections and colitis in patients also receiving corticosteroids; nausea; *rarely* pancreatitis, pneumonitis, hepatic veno-occlusive disease, lymphoma, red cell aplasia—see notes above

Dose

- By mouth, *or* (if oral administration not possible—intravenous solution very irritant, see below) by intravenous injection over at least 1 minute (followed by 50 mL sodium chloride intravenous infusion), *or* by intravenous infusion

  Autoimmune conditions, 1–3 mg/kg daily, adjusted according to response (consider withdrawal if no improvement within 3 months)

  Suppression of transplant rejection, 1–2.5 mg/kg daily adjusted according to response

  Note Azathioprine doses in BNF may differ from those in product literature

  Note Intravenous injection is alkaline and very irritant, intravenous route should therefore be used **only** if oral route not feasible, see also Appendix 4

Azathioprine (Non-proprietary) PoM

Tablets, azathioprine 25 mg, net price 28-tab pack = £3.66; 50 mg, 56-tab pack = £3.42. Label: 21

Brands include *Azamune*®

Imuran® (Aspen) PoM

Tablets, both f/c, azathioprine 25 mg (orange), net price 100-tab pack = £10.99; 50 mg (yellow), 100-tab pack = £7.99. Label: 21

Injection, powder for reconstitution, azathioprine (as sodium salt), net price 50-mg vial = £15.38

MYCOPHENOLATE MOFETIL

Indications prophylaxis of acute renal, cardiac, or hepatic transplant rejection (in combination with ciclosporin and corticosteroids) under specialist supervision

Cautions monitor full blood count every week for 4 weeks then twice a month for 2 months then every month in the first year (consider interrupting treatment if neutropenia develops); exclude pregnancy before starting treatment; elderly (increased risk of infection, gastro-intestinal haemorrhage and pulmonary oedema); children (higher incidence of side-effects may call for temporary reduction of dose or interruption); active serious gastro-intestinal disease (risk of haemorrhage, ulceration and perforation); delayed graft function; increased susceptibility to skin cancer (avoid exposure to strong sunlight); **interactions:** Appendix 1 (mycophenolate)

Bone marrow suppression Patients should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. infection or inexplicable bruising or bleeding

Renal impairment no data available in cardiac or hepatic transplant patients with renal impairment

Pregnancy avoid—congenital malformations reported; effective contraception required before treatment, during treatment, and for 6 weeks after discontinuation of treatment; manufacturer of *Myfortic*® also advise that men should use condoms during treatment and for 13 weeks after last dose

Breast-feeding avoid—present in milk in *animal* studies

Side-effects taste disturbance, gingival hyperplasia, nausea, constipation, flatulence, anorexia, weight loss, vomiting, abdominal pain, gastro-intestinal inflammation, ulceration, and bleeding, hepatitis, jaundice, pancreatitis, stomatitis, oedema, tachycardia, hypertension, hypotension, vasodilatation, cough, dyspnoea, insomnia, agitation, confusion, depression, anxiety, convulsions, paraesthesia, myasthenic syndrome, tremor, dizziness, headache, influenza-like syndrome, infections, hyperglycaemia, renal impairment, malignancy (particularly of the skin), blood disorders (including leucopenia, anaemia, thrombocytopenia, pancytopenia, and red cell aplasia—see notes above), disturbances of electrolytes and blood lipids, arthralgia, alopecia, acne, skin hypertrophy, and rash; *also reported* intestinal villous atrophy, progressive multifocal leucoencephalopathy, interstitial lung disease, pulmonary fibrosis

Dose

- Renal transplantation, by mouth, 1 g twice daily starting within 72 hours of transplantation *or* by intravenous infusion, 1 g twice daily starting within 24 hours of transplantation for max. 14 days (then transfer to oral therapy); CHILD and ADOLESCENT 2–18 years, by mouth 600 mg/m^2 twice daily (max. 2 g daily)

  Note Tablets and capsules not appropriate for dose titration in children with body surface area less than 1.25 m^2

- Cardiac transplantation, by mouth, ADULT over 18 years, 1.5 g twice daily starting within 5 days of transplantation
- Hepatic transplantation, by intravenous infusion, ADULT over 18 years, 1 g twice daily starting within 24 hours of transplantation for 4 days (up to max. 14 days), then by mouth, 1.5 g twice daily as soon as is tolerated

Mycophenolate Mofetil (Non-proprietary) PoM

Capsules, mycophenolate mofetil 250 mg, net price 100-cap pack = £82.26

Tablets, mycophenolate mofetil 500 mg, net price 50-tab pack = £11.82

Brands include Arzip®

CellCept® (Roche) PoM

Capsules, blue/brown, mycophenolate mofetil 250 mg, net price 100-cap pack = £82.26

Tablets, lavender, mycophenolate mofetil 500 mg, net price 50-tab pack = £82.26

Oral suspension, mycophenolate mofetil 1 g/5 mL when reconstituted with water, net price 175 mL = £115.16.

Excipients include aspartame (section 9.4.1)

Intravenous infusion, powder for reconstitution, mycophenolate mofetil (as hydrochloride), net price 500-mg vial = £9.12

Mycophenolic acid

Myfortic® (Novartis) PoM

Tablets, e/c, mycophenolic acid (as mycophenolate sodium) 180 mg (green), net price 120-tab pack = £96.72; 360 mg (orange), 120-tab pack = £193.43. Label: 25

Dose renal transplantation, 720 mg twice daily starting within 72 hours of transplantation

Equivalence to mycophenolate mofetil Mycophenolic acid 720 mg is approximately equivalent to mycophenolate mofetil 1 g but avoid unnecessary switching because of pharmacokinetic differences

8.2.2 Corticosteroids and other immunosuppressants

Prednisolone (section 6.3.2) is widely used in oncology. It has a marked antitumour effect in acute lymphoblastic leukaemia, Hodgkin's disease, and the non-Hodgkin lymphomas. It has a role in the palliation of symptomatic end-stage malignant disease when it may enhance appetite and produce a sense of well-being (see also Prescribing in Palliative Care, p. 21).

The corticosteroids are also powerful immunosuppressants. They are used to prevent organ transplant rejection, and in high dose to treat rejection episodes.

Ciclosporin a calcineurin inhibitor, is a potent immunosuppressant which is virtually non-myelotoxic but markedly nephrotoxic. It has an important role in organ and tissue transplantation, for prevention of graft rejection following bone marrow, kidney, liver, pancreas, heart, lung, and heart-lung transplantation, and for prophylaxis and treatment of graft-versus-host disease.

Tacrolimus is also a calcineurin inhibitor. Although not chemically related to ciclosporin it has a similar mode of action and side-effects, but the incidence of neurotoxicity appears to be greater; cardiomyopathy has also been reported. Disturbance of glucose metabolism also appears to be significant.

Sirolimus is a non-calcineurin inhibiting immunosuppressant licensed for renal transplantation.

Basiliximab is a monoclonal antibody that acts as an interleukin-2 receptor antagonist and prevents T-lymphocyte proliferation; it is used for prophylaxis of acute rejection in allogeneic renal transplantation. It is given with ciclosporin and corticosteroid immunosuppression regimens; its use should be confined to specialist centres.

Belatacept is a fusion protein and co-stimulation blocker that prevents T-cell activation; it is licensed for prophylaxis of graft rejection in adults undergoing renal transplantation who are seropositive for the Epstein-Barr virus. It is used with interleukin-2 receptor antagonist induction, in combination with corticosteroids and a mycophenolic acid.

Antithymocyte immunoglobulin (rabbit) is licensed for the prophylaxis of organ rejection in renal and heart allograft recipients and for the treatment of corticosteroid-resistant allograft rejection in renal transplantation. Tolerability is increased by pretreatment with an intravenous corticosteroid and antihistamine; an antipyretic drug such as paracetamol may also be beneficial.

NICE guidance

Immunosuppressive therapy for renal transplantation in adults (September 2004)
Immunosuppressive therapy for renal transplantation in children and adolescents (April 2006)

For induction therapy in the prophylaxis of organ rejection, either basiliximab or daclizumab [discontinued] are options for combining with a calcineurin inhibitor. For each individual, ciclosporin or tacrolimus is chosen as the calcineurin inhibitor on the basis of side-effects.

Mycophenolate mofetil [mycophenolic acid also available but not licensed for use in children, see above] is recommended as part of an immunosuppressive regimen only if:

- the calcineurin inhibitor is not tolerated, particularly if nephrotoxicity endangers the transplanted kidney; *or*
- there is very high risk of nephrotoxicity from the calcineurin inhibitor, requiring a reduction in the dose of the calcineurin inhibitor or its avoidance.

Sirolimus is recommended as a component of immunosuppressive regimen **only if** intolerance necessitates the withdrawal of a calcineurin inhibitor.

These recommendations may not be consistent with the marketing authorisation of some of the products.

www.nice.org.uk/TA85

ANTITHYMOCYTE IMMUNOGLOBULIN (RABBIT)

Indications see notes above

Cautions see notes above; monitor blood count

Contra-indications infection

Pregnancy manufacturer advises use only if potential benefit outweighs risk—no information available

Breast-feeding manufacturer advises avoid—no information available

Side-effects nausea, vomiting, dysphagia, diarrhoea; hypotension; infusion-related reactions (including cytokine release syndrome and anaphylaxis, see notes above), serum sickness; fever, shivering, increased susceptibility to infection; increased susceptibility to malignancy; lymphopenia, neutropenia, thrombocytopenia; myalgia; pruritus, rash

Dose

- Heart transplantation, by intravenous infusion over at least 6 hours, 1–2.5 mg/kg daily for 3–5 days
- Renal transplantation, by intravenous infusion over at least 6 hours, 1–1.5 mg/kg daily for 3–9 days
- Corticosteroid-resistant renal graft rejection, by intravenous infusion over at least 6 hours, 1.5 mg/kg daily for 7–14 days

Note To avoid excessive dosage in obese patients, calculate dose on the basis of ideal body weight

Thymoglobuline® (Sanofi-Aventis) PoM

Intravenous infusion, powder for reconstitution, rabbit anti-human thymocyte immunoglobulin, net price 25-mg vial = £158.77

BASILIXIMAB

Indications see notes above

Pregnancy avoid—no information available; adequate contraception must be used during treatment and for 16 weeks after last dose

Breast-feeding avoid—no information available

Side-effects severe hypersensitivity reactions and cytokine release syndrome have been reported

Dose

- By intravenous injection *or* by intravenous infusion, 20 mg within 2 hours before transplant surgery and 20 mg 4 days after surgery; withhold second dose if severe hypersensitivity or graft loss occurs; CHILD and ADOLESCENT 1–17 years, body-weight under 35 kg, 10 mg within 2 hours before transplant surgery and 10 mg 4 days after surgery; body-weight over 35 kg, adult dose

Simulect® (Novartis) PoM

Injection, powder for reconstitution, basiliximab, net price 10-mg vial = £758.69, 20-mg vial = £842.38 (both with water for injections). For intravenous infusion

BELATACEPT

Indications see notes above

Cautions increased risk of infection; risk factors for post-transplant lymphoproliferative disorder; avoid excessive exposure to UV light including sunlight; tapering of corticosteroid, particularly in patients with high immunologic risk—increased risk of acute graft rejection

Tuberculosis Patients should be evaluated for latent and active tuberculosis before starting treatment, and monitored for signs and symptoms of tuberculosis during and after treatment

Pregnancy use only if essential; adequate contraception must be used during treatment and for up to 8 weeks after last dose

Breast-feeding avoid—no information available

Side-effects (reported when used in combination with basiliximab, mycophenolate mofetil and corticosteroids) diarrhoea, constipation, nausea, vomiting, hypertension, peripheral oedema, cough, headache, pyrexia, infection, malignancy, anaemia, leucopenia, dehydration, hypophosphataemia; *less commonly* infusion related reactions, progressive multifocal leucoencephalopathy

Dose

- Consult product literature

Nulojix® (Bristol-Myers Squibb) ▼ PoM

Intravenous infusion, powder for reconstitution, belatacept, net price 250-mg vial = £354.52

CICLOSPORIN

(Cyclosporin)

Indications see notes above, and under Dose; severe acute ulcerative colitis [unlicensed indication] (section 1.5.3); rheumatoid arthritis (section 10.1.3); atopic dermatitis and psoriasis (section 13.5.3)

Cautions monitor kidney function—dose dependent increase in serum creatinine and urea during first few weeks may necessitate dose reduction in transplant patients (exclude rejection if kidney transplant) or discontinuation in non-transplant patients; monitor liver function (see Hepatic Impairment below); monitor blood pressure—discontinue if hypertension develops that cannot be controlled by antihypertensives; hyperuricaemia; monitor serum potassium especially in renal dysfunction (risk of hyperkalaemia); monitor serum magnesium; measure blood lipids before treatment and after the first month of treatment; use with tacrolimus specifically contraindicated; for patients other than transplant recipients, preferably avoid other immunosuppressants (increased risk of infection and malignancies, including lymphoma and skin cancer); avoid excessive exposure to UV light, including sunlight; **interactions**: Appendix 1 (ciclosporin)

Additional cautions in nephrotic syndrome ***Contraindicated*** in uncontrolled hypertension, uncontrolled infections, and malignancy; in long-term management, perform renal biopsies at yearly intervals

Additional cautions Atopic Dermatitis and Psoriasis, section 13.5.3; Rheumatoid Arthritis, section 10.1.3

Hepatic impairment dosage adjustment based on bilirubin and liver enzymes may be needed

Renal impairment dose as in normal renal function but see Cautions above; in nephrotic syndrome reduce dose by 25–50% if serum creatinine more than 30% above baseline on more than one measurement; in patients with nephrotic syndrome and renal impairment initially 2.5 mg/kg daily

Pregnancy crosses placenta; see Immunosuppressant Therapy, p. 615

Breast-feeding present in milk—manufacturer advises avoid

Side-effects anorexia, nausea, vomiting, abdominal pain, diarrhoea, gingival hyperplasia, hepatic dysfunction, hypertension, tremor, headache, paraesthesia, fatigue, renal dysfunction (renal structural changes on long-term administration, see also under Cautions), hyperuricaemia, hyperkalaemia, hypomagnesaemia, hyperlipidaemia, hypercholesterolaemia, muscle cramps, myalgia, hypertrichosis; *less commonly* oedema, weight gain, signs of encephalopathy, anaemia, thrombocytopenia; *rarely* pancreatitis, motor polyneuropathy, menstrual disturbances, gynaecomastia, microangiopathic haemolytic anaemia, haemolytic uraemic syndrome, hyperglycaemia, muscle weakness, myopathy, visual disturbances secondary to benign intracranial hypertension (discontinue); *also reported with infusion* anaphylaxis

Dose

- Organ transplantation, used alone, ADULT and CHILD over 3 months 10–15 mg/kg by mouth 4–12 hours before transplantation followed by 10–15 mg/kg daily for 1–2 weeks postoperatively then reduced gradually to 2–6 mg/kg daily for maintenance (dose should be adjusted according to blood-ciclosporin concentration and renal function); dose lower if given concomitantly with other immunosuppressant therapy (e.g. corticosteroids); if necessary one-third corresponding oral dose can be given by intravenous infusion over 2–6 hours
- Bone-marrow transplantation, prevention and treatment of graft-versus-host disease, ADULT and CHILD over 3 months 3–5 mg/kg daily by intravenous infusion over 2–6 hours from day before transplantation to 2 weeks postoperatively (or 12.5–15 mg/kg daily by mouth) then 12.5 mg/kg daily by mouth for 3–6 months then tailed off (may take up to a year after transplantation)
- Nephrotic syndrome, by mouth, 5 mg/kg daily in 2 divided doses; CHILD 6 mg/kg daily in 2 divided doses;

maintenance treatment reduce to lowest effective dose according to proteinuria and serum creatinine measurements; discontinue after 3 months if no improvement in glomerulonephritis or glomerulosclerosis (after 6 months in membranous glomerulonephritis)

Important

Patients should be stabilised on a particular brand of oral ciclosporin because switching between formulations without close monitoring may lead to clinically important changes in blood-ciclosporin concentration. Prescribing and dispensing of ciclosporin should be by brand name to avoid inadvertent switching. If it is necessary to switch a patient to a different brand of ciclosporin, the patient should be monitored closely for changes in blood-ciclosporin concentration, serum creatinine, blood pressure, and transplant function.

Capimune® (Mylan) PoM

Capsules, ciclosporin 25 mg (grey), net price 30-cap pack = £13.50; 50 mg (white), 30-cap pack = £26.80; 100 mg (grey), 30-cap pack = £51.30. Counselling, administration

Excipients include propylene glycol (see Excipients, p. 2)

Note Contains ethanol

Counselling Total daily dose should be taken in 2 divided doses

Capsorin® (Morningside) PoM

Capsules, ciclosporin 25 mg (grey), net price 30-cap pack = £13.11; 50 mg (white), 30-cap pack = £25.65; 100 mg (grey), 30-cap pack = £48.93. Counselling, administration

Note Contains ethanol

Counselling Total daily dose should be taken in 2 divided doses

Deximune® (Dexcel) PoM

Capsules, grey, ciclosporin 25 mg, net price 30-cap pack = £13.06; 50 mg 30-cap pack = £25.60; 100 mg 30-cap pack = £48.90. Counselling, administration

Note Contains ethyl lactate which is metabolised to ethanol

Counselling Total daily dose should be taken in 2 divided doses

Neoral® (Novartis) PoM

Capsules, ciclosporin 10 mg (yellow/white), net price 60-cap pack = £19.40; 25 mg (blue/grey), 30-cap pack = £19.52; 50 mg (yellow/white), 30-cap pack = £38.23; 100 mg (blue/grey), 30-cap pack = £72.57. Counselling, administration

Excipients include propylene glycol (see Excipients, p. 2)

Note Contains ethanol

Oral solution, yellow, sugar-free, ciclosporin 100 mg/mL, net price 50 mL = £108.73. Counselling, administration

Excipients include propylene glycol (see Excipients, p. 2)

Note Contains ethanol

Counselling Total daily dose should be taken in 2 divided doses

Mix solution with orange juice (or squash) or apple juice (to improve taste) or with water immediately before taking (and rinse with more to ensure total dose). Do not mix with grapefruit juice. Keep medicine measure away from other liquids (including water)

Sandimmun® (Novartis) PoM

Concentrate for intravenous infusion (oily), ciclosporin 50 mg/mL. To be diluted before use, net price 1-mL amp = £1.94; 5-mL amp = £9.17

Excipients include polyoxyl castor oil (risk of anaphylaxis, see Excipients, p. 2)

Note Contains ethanol

Note Observe patients for signs of anaphylaxis for at least 30 minutes after starting infusion and at frequent intervals thereafter

Note *Sandimmun®* capsules and oral solution are available direct from Novartis for patients who cannot be transferred to a different oral preparation

SIROLIMUS

Indications prophylaxis of organ rejection in kidney allograft recipients (initially in combination with ciclosporin and corticosteroid, then with corticosteroid only); see also under Dose

Cautions monitor kidney function when given with ciclosporin; monitor whole blood-sirolimus trough concentration (Afro-Caribbean patients may require higher doses); hyperlipidaemia (monitor lipids); monitor urine proteins; increased susceptibility to infection (especially urinary-tract infection); increased susceptibility to lymphoma and other malignancies, particularly of the skin (limit exposure to UV light); **interactions:** Appendix 1 (sirolimus)

Hepatic impairment monitor whole blood-sirolimus level closely and consult local treatment protocol; clearance reduced in mild to moderate impairment; in severe impairment decrease dose by 50% and monitor whole blood-sirolimus trough concentration every 5–7 days until 3 consecutive measurements have shown stable blood-sirolimus concentration

Pregnancy avoid unless essential—(toxicity in *animal* studies); effective contraception must be used during treatment and for 12 weeks after stopping

Breast-feeding discontinue breast-feeding

Side-effects abdominal pain, constipation, nausea, diarrhoea, ascites, stomatitis; oedema, tachycardia, hypertension, hypercholesterolaemia, hypertriglyceridaemia, venous thromboembolism; pleural effusion, pneumonitis; headache; pyrexia; proteinuria, haemolytic uraemic syndrome; anaemia, thrombocytopenia, thrombotic thrombocytopenic purpura, leucopenia, neutropenia, hypokalaemia, hypophosphataemia, hyperglycaemia, lymphocele; arthralgia, osteonecrosis; epistaxis; acne, rash, impaired healing; *less commonly* pancreatitis, pulmonary embolism, pulmonary haemorrhage, pericardial effusion, nephrotic syndrome, pancytopenia; *rarely* interstitial lung disease, alveolar proteinosis, hepatic necrosis, lymphoedema, and hypersensitivity reactions including anaphylactic reactions, angioedema, exfoliative dermatitis, and hypersensitivity vasculitis; focal segmental glomerulosclerosis and reversible impairment of male fertility also reported

Dose

- Initially 6 mg, after surgery (once wound has healed), then 2 mg once daily (dose adjusted according to whole blood-sirolimus trough concentration) in combination with ciclosporin and corticosteroid for 2–3 months (sirolimus given 4 hours after ciclosporin); ciclosporin should then be withdrawn over 4–8 weeks (if not possible, sirolimus should be discontinued and an alternate immunosuppressive regimen used)

Note Manufacturer advises pre-dose ('trough') whole blood-sirolimus concentration (using **chromatographic**

assay) when used with ciclosporin should be 4–12 micrograms/litre (local treatment protocols may differ); after withdrawal of ciclosporin pre-dose whole blood-sirolimus concentration should be 12–20 micrograms/litre (local treatment protocols may differ); close monitoring of whole blood-sirolimus concentration required if concomitant treatment with potent inducers or inhibitors of metabolism and after discontinuing them, or if ciclosporin dose reduced significantly or stopped; see also Hepatic Impairment above

When changing between oral solution and tablets, measurement of whole blood 'trough' sirolimus concentration after 1–2 weeks is recommended

Therapeutic drug monitoring assays Sirolimus whole-blood concentration is measured using either high performance liquid chromatography (HPLC) or immunoassay. Switching between different immunoassays or between an immunoassay and HPLC can lead to clinically significant differences in results and therefore incorrect dose adjustments. Adjustment to the target therapeutic dose range should be made with knowledge of the assay used and corresponding reference range

Rapamune® (Pfizer) PoM

Tablets, coated, sirolimus 500 micrograms (tan), net price 30-tab pack = £69.00; 1 mg (white), 30-tab pack = £86.49; 2 mg (yellow), 30-tab pack = £172.98. Counselling, administration

Important The 500-microgram tablet is not bioequivalent to the 1-mg and 2-mg tablets. Multiples of 500 microgram tablets should **not** be used as a substitute for other tablet strengths

Oral solution, sirolimus 1 mg/mL, net price 60 mL = £162.41. Counselling, administration

Note Contains ethanol

Counselling Food may affect absorption (take at the same time with respect to food). Mix solution with at least 60 mL water or orange juice in a glass or plastic container immediately before taking; refill container with at least 120 mL of water or orange juice and drink immediately (to ensure total dose). Do not mix with any other liquids

TACROLIMUS

Indications prophylaxis of organ rejection in liver, kidney, and heart allograft recipients and allograft rejection resistant to conventional immunosuppressive regimens, see also notes above; moderate to severe atopic eczema (section 13.5.3)

Cautions monitor blood pressure, ECG (**important:** see Cardiomyopathy below), fasting blood-glucose concentration, haematological and neurological (including visual) parameters, electrolytes, hepatic and renal function; monitor whole blood-tacrolimus trough concentration (especially during episodes of diarrhoea)—consult local treatment protocol for details; QT-interval prolongation; neurotoxicity; increased risk of infections, malignancies, and lymphoproliferative disorders; avoid excessive exposure to UV light including sunlight; **interactions:** Appendix 1 (tacrolimus)

Driving May affect performance of skilled tasks (e.g. driving)

Contra-indications hypersensitivity to macrolides; avoid concurrent administration with ciclosporin (care if patient has previously received ciclosporin)

Hepatic impairment dose reduction may be necessary in severe impairment

Pregnancy exclude before treatment; avoid unless potential benefit outweighs risk—risk of premature delivery, intra-uterine growth restriction, and hyperkalaemia

Breast-feeding avoid—present in breast milk

Side-effects nausea, vomiting, diarrhoea, constipation, dyspepsia, flatulence, bloating, weight changes, anorexia, gastro-intestinal inflammation, ulceration, and perforation, hepatic dysfunction, jaundice, cholestasis, ascites, bile-duct abnormalities, oedema, tachycardia, hypertension, haemorrhage, thromboembolic and ischaemic events, dyspnoea, pleural effusion, parenchymal lung disorders, sleep disturbances, tremor, headache, peripheral neuropathy, mood changes, depression, confusion, anxiety, psychosis, seizures, paraesthesia, dizziness, renal impairment, renal failure, renal tubular necrosis, urinary abnormalities, hyperglycaemia, electrolyte disturbances (including hyperkalaemia, hypokalaemia, and hyperuricaemia), blood disorders (including anaemia, leucopenia, pancytopenia, and thrombocytopenia), arthralgia, muscle cramp, visual disturbances, photophobia, tinnitus, impaired hearing, alopecia, sweating, acne; *less commonly* paralytic ileus, gastro-intestinal reflux disease, peritonitis, pancreatitis, heart failure, arrhythmia, cardiac arrest, cerebrovascular accident, cardiomyopathy (**important**: see Cardiomyopathy below), palpitation, respiratory failure, coma, speech disorder, amnesia, paralysis, influenza-like symptoms, encephalopathy, coagulation disorders, photosensitivity, cataract, hypoglycaemia, dysmenorrhoea, hypertonia, dermatitis; *rarely* pericardial effusion, respiratory distress syndrome, posterior reversible encephalopathy syndrome, dehydration, thrombotic thrombocytopenic purpura, blindness, toxic epidermal necrolysis, hirsutism; *very rarely* myasthenia, haemorrhagic cystitis, Stevens-Johnson syndrome; *also reported* pure red cell aplasia, agranulocytosis, haemolytic anaemia

Cardiomyopathy Cardiomyopathy has been reported in children. Patients should be monitored by echocardiography for hypertrophic changes—consider dose reduction or discontinuation if these occur

Dose

- See under preparations

MHRA/CHM advice

Oral tacrolimus products: prescribe and dispense by brand name only, to minimise the risk of inadvertent switching between products, which has been associated with reports of toxicity and graft rejection (June 2012)

Inadvertent switching between oral tacrolimus products has been associated with reports of toxicity and graft rejection. To ensure maintenance of therapeutic response when a patient is stabilised on a particular brand, oral tacrolimus products should be prescribed and dispensed by brand name only.

- *Adoport®*, *Prograf®*, *Capexion®*, *Tacni®*, and *Vivadex®* are immediate-release capsules that are taken twice daily, once in the morning and once in the evening;
- *Modigraf®* granules are used to prepare an immediate-release oral suspension which is taken twice daily, once in the morning and once in the evening;
- *Advagraf®* is a prolonged-release capsule that is taken once daily in the morning.

Switching between tacrolimus brands requires careful supervision and therapeutic monitoring by an appropriate specialist.

Adoport® (Sandoz) PoM

Capsules, tacrolimus (as monohydrate) 500 micrograms (white/ivory), net price 50-cap pack = £42.92; 1 mg (white/brown), 50-cap pack = £55.69,

100-cap pack = £111.36; 5 mg (white/orange), 50-cap pack = £205.74. Label: 23, counselling, driving

Note Tacrolimus is incompatible with PVC

Dose liver transplantation, starting 12 hours after transplantation, by mouth, 100–200 micrograms/kg daily in 2 divided doses; CHILD 300 micrograms/kg daily in 2 divided doses

Renal transplantation, starting within 24 hours of transplantation, by mouth, 200–300 micrograms/kg daily in 2 divided doses; CHILD 300 micrograms/kg daily in 2 divided doses

Heart transplantation with antibody induction (starting within 5 days of transplantation) or without antibody induction (starting within 12 hours of transplantation), by mouth, 75 micrograms/kg daily in 2 divided doses; CHILD, with antibody induction (starting within 5 days of transplantation), 100–300 micrograms/kg daily in 2 divided doses; without antibody induction (starting within 12 hours of transplantation), 300 micrograms/kg daily in 2 divided doses as soon as clinically possible (8–12 hours after discontinuing intravenous infusion)

Maintenance treatment, dose adjusted according to response and whole blood concentration

Rejection therapy, seek specialist advice

Capexion® (Generics) PoM

Capsules, tacrolimus 500 micrograms, (ivory), net price 50-cap pack = £52.50; 1 mg (white), 50-cap pack = £68.20, 100-cap pack = £136.20; 5 mg (red), 50-cap pack = £252.00. Label: 23, counselling, driving

Note Tacrolimus is incompatible with PVC

Dose liver transplantation, starting 12 hours after transplantation, by mouth, 100–200 micrograms/kg daily in 2 divided doses; CHILD 300 micrograms/kg daily in 2 divided doses

Renal transplantation, starting within 24 hours of transplantation, by mouth, 200–300 micrograms/kg daily in 2 divided doses; CHILD 300 micrograms/kg daily in 2 divided doses

Heart transplantation with antibody induction (starting within 5 days of transplantation) or without antibody induction (starting within 12 hours of transplantation), by mouth, 75 micrograms/kg daily in 2 divided doses; CHILD with antibody induction (starting within 5 days of transplantation), 100–300 micrograms/kg daily in 2 divided doses; without antibody induction (starting within 12 hours of transplantation), 300 micrograms/kg daily in 2 divided doses as soon as clinically possible (8–12 hours after discontinuing intravenous infusion)

Maintenance treatment, dose adjusted according to response and whole blood concentration

Rejection therapy, seek specialist advice

Modigraf® (Astellas) PoM

Granules, tacrolimus (as monohydrate), 200 micrograms, net price 50-sachet pack = £71.30; 1 mg, 50-sachet pack = £356.65. Label: 13, 23, counselling, driving

Note Tacrolimus is incompatible with PVC

Dose liver transplantation, starting 12 hours after transplantation, by mouth, 100–200 micrograms/kg daily in 2 divided doses; CHILD 300 micrograms/kg daily in 2 divided doses

Renal transplantation, starting within 24 hours of transplantation, by mouth, 200–300 micrograms/kg daily in 2 divided doses; CHILD 300 micrograms/kg daily in 2 divided doses

Heart transplantation with antibody induction (starting within 5 days of transplantation) or without antibody induction (starting within 12 hours of transplantation), by mouth, 75 micrograms/kg daily in 2 divided doses; CHILD, with antibody induction (starting within 5 days of transplantation), 100–300 micrograms/kg daily in 2 divided doses; without antibody induction (starting within 12 hours of transplantation), 300 micrograms/kg daily in 2 divided doses as soon as clinically possible (8–12 hours after discontinuing intravenous infusion)

Maintenance treatment, dose adjusted according to response and whole blood concentration

Rejection therapy, seek specialist advice

Note The *Scottish Medicines Consortium* (p. 4) has advised (November 2010) that tacrolimus granules for oral suspension (*Modigraf®*) are accepted for restricted use within NHS Scotland in patients for whom tacrolimus is an appropriate choice of immunosuppressive therapy and where small changes (less than 500 micrograms) in dosing increments are required (such as, in paediatric patients) or seriously ill patients who are unable to swallow tacrolimus capsules.

Prograf® (Astellas) PoM

Capsules, tacrolimus (as monohydrate) 500 micrograms (yellow), net price 50-cap pack = £61.88; 1 mg (white), 50-cap pack = £80.28, 100-cap pack = £160.54; 5 mg (greyish-red), 50-cap pack = £296.58. Label: 23, counselling, driving

Note Tacrolimus is incompatible with PVC

Concentrate for intravenous infusion, tacrolimus 5 mg/mL. To be diluted before use. Net price 1-mL amp = £58.45

Excipients include polyoxyl castor oil (risk of anaphylaxis, see Excipients, p. 2)

Note Tacrolimus is incompatible with PVC

Dose liver transplantation, starting 12 hours after transplantation, by mouth, 100–200 micrograms/kg daily in 2 divided doses *or* by intravenous infusion over 24 hours, 10–50 micrograms/kg daily for up to 7 days (then transfer to oral therapy); CHILD by mouth, 300 micrograms/kg daily in 2 divided doses *or* by intravenous infusion over 24 hours, 50 micrograms/kg daily for up to 7 days (then transfer to oral therapy)

Renal transplantation, starting within 24 hours of transplantation, by mouth, 200–300 micrograms/kg daily in 2 divided doses *or* by intravenous infusion over 24 hours, 50–100 micrograms/kg daily for up to 7 days (then transfer to oral therapy); CHILD by mouth, 300 micrograms/kg daily in 2 divided doses *or* by intravenous infusion over 24 hours, 75–100 micrograms/kg daily for up to 7 days (then transfer to oral therapy)

Heart transplantation with antibody induction (starting within 5 days of transplantation) or without antibody induction (starting within 12 hours of transplantation), by mouth, 75 micrograms/kg daily in 2 divided doses *or* by intravenous infusion over 24 hours, 10–20 micrograms/kg daily for up to 7 days (then transfer to oral therapy); CHILD, with antibody induction (starting within 5 days of transplantation), by mouth, 100–300 micrograms/kg daily in 2 divided doses; without antibody induction (starting within 12 hours of transplantation), initially by intravenous infusion over 24 hours, 30–50 micrograms/kg daily, then by mouth, 300 micrograms/kg daily in 2 divided doses as soon as clinically possible (8–12 hours after discontinuing intravenous infusion)

Maintenance treatment, dose adjusted according to response and whole blood concentration

Rejection therapy, seek specialist advice

Tacni® (TEVA UK) PoM

Capsules, tacrolimus 500 micrograms (ivory), net price 50-cap pack = £50.48; 1 mg (white), 50-cap pack = £65.49, 100-cap pack = £130.99; 5 mg (red), 50-cap pack = £242.01. Label: 23, counselling, driving

Note Tacrolimus is incompatible with PVC

Dose liver transplantation, starting 12 hours after transplantation, by mouth, 100–200 micrograms/kg daily in 2 divided doses; CHILD 300 micrograms/kg daily in 2 divided doses

Renal transplantation, starting within 24 hours of transplantation, by mouth, 200–300 micrograms/kg daily in 2 divided doses; CHILD 300 micrograms/kg daily in 2 divided doses

Heart transplantation with antibody induction (starting within 5 days of transplantation) or without antibody

induction (starting within 12 hours of transplantation), by mouth, 75 micrograms/kg daily in 2 divided doses; CHILD with antibody induction (starting within 5 days of transplantation), 100–300 micrograms/kg daily in 2 divided doses; without antibody induction (starting within 12 hours of transplantation), 300 micrograms/kg daily in 2 divided doses as soon as clinically possible (8–12 hours after discontinuing intravenous infusion)

Maintenance treatment, dose adjusted according to response and whole blood concentration

Rejection therapy, seek specialist advice

Vivadex® (Dexcel) PoM

Capsules, tacrolimus 500 micrograms (ivory), net price 50-cap pack = £46.41; 1 mg (white), 50-cap pack = £60.21, 100-cap pack = £120.41; 5 mg (red), 50-cap pack = £222.44. Label: 23, counselling, driving

Note Tacrolimus is incompatible with PVC

Dose liver transplantation, starting 12 hours after transplantation, by mouth, 100–200 micrograms/kg daily in 2 divided doses; CHILD 300 micrograms/kg daily in 2 divided doses

Renal transplantation, starting within 24 hours of transplantation, by mouth, 200–300 micrograms/kg daily in 2 divided doses; CHILD 300 micrograms/kg daily in 2 divided doses

Heart transplantation with antibody induction (starting within 5 days of transplantation) or without antibody induction (starting within 12 hours of transplantation), by mouth, 75 micrograms/kg daily in 2 divided doses; CHILD, with antibody induction (starting within 5 days of transplantation), 100–300 micrograms/kg daily in 2 divided doses; without antibody induction (starting within 12 hours of transplantation), 300 micrograms/kg daily in 2 divided doses as soon as clinically possible (8–12 hours after discontinuing intravenous infusion)

Maintenance treatment, dose adjusted according to response and whole blood concentration

Rejection therapy, seek specialist advice

Modified release

Advagraf® (Astellas) PoM

Capsules, m/r, tacrolimus (as monohydrate) 500 micrograms (yellow/orange), net price 50-cap pack = £35.79; 1 mg (white/orange), 50-cap pack = £71.59, 100-cap pack = £143.17; 3 mg (orange), 50-cap pack = £214.76; 5 mg (red/orange), 50-cap pack = £266.92. Label: 23, 25, counselling, driving

Note Tacrolimus is incompatible with PVC

Dose liver transplantation, starting 12–18 hours after transplantation, by mouth, 100–200 micrograms/kg once daily in the morning

Renal transplantation, starting within 24 hours of transplantation, by mouth, 200–300 micrograms/kg once daily in the morning

Rejection therapy, seek specialist advice

CHILD not recommended

8.2.3 Anti-lymphocyte monoclonal antibodies

The anti-lymphocyte monoclonal antibodies cause lysis of B lymphocytes. Infusion-related side-effects (including cytokine release syndrome) are reported commonly with anti-lymphocyte monoclonal antibodies and occur predominantly during the first infusion; they include fever and chills, nausea and vomiting, allergic reactions (such as rash, pruritus, angioedema, bronchospasm and dyspnoea), flushing and tumour pain. Patients should receive premedication before administration of anti-lymphocyte monoclonal antibodies to reduce these effects—consult product literature for details of individual regimens. The infusion may have to be stopped temporarily and the infusion-related effects treated—consult product literature for appropriate management. Evidence of pulmonary infiltration and features of tumour lysis syndrome should be sought if infusion-related effects occur.

Fatalities following **severe** cytokine release syndrome (characterised by severe dyspnoea) and associated with features of tumour lysis syndrome have occurred after infusions of anti-lymphocyte monoclonal antibodies. Patients with a high tumour burden as well as those with pulmonary insufficiency or infiltration are at increased risk and should be monitored **very closely** (and a slower rate of infusion considered).

Hepatitis B infection and reactivation (including fatal cases) have been reported in patients taking **ofatumumab** and **rituximab**. All patients should be screened before treatment. Patients with positive hepatitis B serology should be referred to a liver specialist for monitoring and initiation of antiviral therapy before treatment initiation; treatment should not be initiated in patients with evidence of current hepatitis B infection until the infection has been adequately treated. Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).

Alemtuzumab is licensed for the treatment of adults with relapsing-remitting multiple sclerosis with active disease defined by clinical or imaging features. It is not recommended for inactive or stable disease. Pretreatment before administration is required (consult product literature) and all patients should receive oral prophylaxis for herpes infection starting on the first day of treatment and continuing for at least a month following each treatment course. Screening patients at high risk of hepatitis B or C is recommended before treatment—patients who are carriers should be treated with caution. HPV screening should be carried out annually in female patients. In patients with active infection, a delay in initiation of alemtuzumab treatment should be considered until the infection is fully controlled, and all patients should be evaluated for active or latent tuberculosis before starting alemtuzumab treatment. The risk of autoimmune mediated conditions may increase during treatment, including immune thrombocytopenic purpura, thyroid disorders, nephropathies, and cytopenias, and should be monitored for throughout the course of treatment (consult product literature). Patients with previous autoimmune conditions other than multiple sclerosis should be treated with caution. Alemtuzumab should be given under the care of a specialist with facilities for the management of hypersensitivity and anaphylactic reactions. Although no longer licensed for oncological and transplant indications, alemtuzumab is also available through a patient access programme for these indications.

NICE guidance

Alemtuzumab for treating relapsing-remitting multiple sclerosis (May 2014)

Alemtuzumab is recommended as an option, within its marketing authorisation, for treating adults with active relapsing-remitting multiple sclerosis

www.nice.org.uk/TA312

Rituximab is licensed for the treatment of chemotherapy-resistant or relapsed stage III–IV follicular non-Hodgkin's lymphoma and, in combination with other

chemotherapy, for previously untreated stage III–IV follicular lymphoma, and for previously untreated or relapsed chronic lymphocytic leukaemia (see NICE guidance below). Rituximab is also licensed for maintenance therapy in patients with follicular non-Hodgkin's lymphoma that has responded to induction therapy (see NICE guidance below). It is also licensed for use in combination with other chemotherapy for the treatment of diffuse large B-cell non-Hodgkin's lymphoma (see NICE guidance below). Rituximab, in combination with glucocorticoids, is also licensed for the induction of remission in patients with severe, active granulomatosis with polyangiitis (Wegener's) and microscopic polyangiitis (see SMC guidance and NICE guidance below). Full resuscitation facilities should be at hand and as with other cytotoxics, treatment should be undertaken under the close supervision of a specialist. See section 10.1.3 for the role of rituximab in rheumatoid arthritis.

Rituximab should be used with caution in patients receiving cardiotoxic chemotherapy or with a history of cardiovascular disease because exacerbation of angina, arrhythmia, and heart failure have been reported. The use of rituximab for the treatment of granulomatosis with polyangiitis or microscopic polyangiitis is contra-indicated in patients with severe heart failure or severe, uncontrolled heart disease. Transient hypotension occurs frequently during infusion and antihypertensives may need to be withheld for 12 hours before infusion. Progressive multifocal leucoencephalopathy (which is usually fatal or causes severe disability) has been reported in association with rituximab; patients should be monitored for cognitive, neurological, or psychiatric signs and symptoms. If progressive multifocal leucoencephalopathy is suspected, suspend treatment until it has been excluded. Severe (including fatal) skin reactions, including toxic epidermal necrolysis and Stevens-Johnson syndrome have been reported—permanently discontinue treatment if severe skin reactions occur.

The *Scottish Medicines Consortium* (p. 4) has advised (August 2013) that Rituximab (*MabThera*®) is accepted for restricted use within NHS Scotland, in combination with glucocorticoids for the induction of remission in adult patients with severe, active granulomatosis with polyangiitis (Wegener's) and microscopic polyangiitis. It is restricted to use in patients who have relapsed following treatment with cyclophosphamide or who are intolerant to or unable to receive cyclophosphamide.

NICE guidance

Rituximab in combination with glucocorticoids for treating anti-neutrophil cytoplasmic antibody-associated vasculitis (March 2014)

Rituximab, in combination with glucocorticoids, is recommended as an option for inducing remission in adults with anti-neutrophil cytoplasmic antibody [ANCA]-associated vasculitis (severely active granulomatosis with polyangiitis [Wegener's] and microscopic polyangiitis), only if:

- further cyclophosphamide treatment would exceed the maximum cumulative cyclophosphamide dose, **or**
- cyclophosphamide is contraindicated or not tolerated, **or**
- the patient has not completed their family, and treatment with cyclophosphamide may materially affect their fertility, **or**
- the disease has remained active or progressed despite a course of cyclophosphamide lasting 3–6 months, **or**
- the patient has had uroepithelial malignancy.

www.nice.org.uk/TA308

NICE guidance

Rituximab for the first-line treatment of stage III-IV follicular lymphoma (January 2012)

Rituximab, in combination with:

- cyclophosphamide, vincristine and prednisolone (CVP);
- cyclophosphamide, doxorubicin, vincristine and prednisolone (CHOP);
- mitoxantrone, chlorambucil and prednisolone (MCP);
- cyclophosphamide, doxorubicin, etoposide, prednisolone and interferon-alfa (CHVPi); *or*
- chlorambucil

is recommended as an option for the treatment of symptomatic stage III and IV follicular lymphoma in previously untreated patients.

www.nice.org.uk/TA243

NICE guidance

Rituximab for the treatment of relapsed or refractory stage III or IV follicular non-Hodgkin's lymphoma (February 2008)

Rituximab, in combination with chemotherapy, is an option for the induction of remission in patients with relapsed stage III or IV follicular non-Hodgkin's lymphoma.

Rituximab monotherapy as maintenance therapy is an option for the treatment of patients with relapsed stage III or IV follicular non-Hodgkin's lymphoma in remission induced with chemotherapy (with or without rituximab).

Rituximab monotherapy is an option for the treatment of patients with relapsed or refractory stage III or IV follicular non-Hodgkin's lymphoma, when all alternative treatment options have been exhausted (that is, if there is resistance to or intolerance of chemotherapy).

www.nice.org.uk/TA137

NICE guidance

Rituximab for the treatment of relapsed or refractory chronic lymphocytic leukaemia (July 2010)

Rituximab in combination with fludarabine and cyclophosphamide is recommended as a treatment option for people with relapsed or refractory chronic lymphocytic leukaemia except when the condition:

- is refractory to fludarabine (that is, it has not responded to fludarabine, or has relapsed within 6 months of treatment), **or**
- has previously been treated with rituximab, unless it was in the context of a clinical trial, at a dose lower than the dose currently licensed for chronic lymphocytic leukaemia or with chemotherapy other than fludarabine and cyclophosphamide.

Rituximab in combination with fludarabine and cyclophosphamide is recommended only in the context of research for patients with relapsed or refractory chronic lymphocytic leukaemia that has previously been treated with rituximab, unless rituximab has been given as specified above.

www.nice.org.uk/TA193

NICE guidance

Rituximab for the first-line maintenance treatment of follicular non-Hodgkin's lymphoma (June 2011)

Rituximab maintenance therapy is recommended as an option for the treatment of people with follicular non-Hodgkins's lymphoma that has responded to first-line induction therapy with rituximab in combination with chemotherapy.

www.nice.org.uk/TA226

NICE guidance

Rituximab for the first-line treatment of chronic lymphocytic leukaemia (July 2009)

Rituximab, in combination with fludarabine and cyclophosphamide, is recommended as an option for the first-line treatment of chronic lymphocytic leukaemia.

www.nice.org.uk/TA174

NICE guidance

Rituximab for aggressive non-Hodgkin's lymphoma (September 2003)

Rituximab, in combination with cyclophosphamide, doxorubicin, vincristine, and prednisolone, is recommended for first-line treatment of CD20-positive diffuse large-B-cell lymphoma at clinical stage II, III or IV.

The use of rituximab for localised (stage I) disease should be limited to clinical trials.

www.nice.org.uk/TA65

Ofatumumab is licensed for treatment of chronic lymphocytic leukaemia in patients refractory to fludarabine and alemtuzumab. Infusion-related side-effects (including cytokine release syndrome—see above) have been reported with ofatumumab; premedication with paracetamol, an antihistamine, and a corticosteroid is recommended.

NICE guidance

Ofatumumab for the treatment of chronic lymphocytic leukaemia refractory to fludarabine and alemtuzumab (October 2010)

Ofatumumab is **not** recommended for the treatment of chronic lymphocytic leukaemia that is refractory to fludarabine and alemtuzumab.

Patients currently receiving ofatumumab for this condition should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA202

ALEMTUZUMAB

Indications see notes above

Cautions see notes above—for full details consult product literature; **interactions:** Appendix 1 (alemtuzumab)

Alert card Patients should be provided with a Patient Alert Card and Patient Guide

Contra-indications human immunodeficiency virus

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies. Autoimmune thyroid disease during treatment may affect fetus (consult product literature); women of childbearing potential should use effective contraception during and for 4 months after treatment

Breast-feeding manufacturer advises avoid during and for 4 months after each treatment course unless potential benefit outweighs risk

Side-effects see notes above—for full details (including monitoring and management of side-effects) consult product literature

Dose

- Consult product literature

Important Patients should receive premedication before administration (consult product literature for details)

Lemtrada® (Genzyme) ▼ PoM

Concentrate for intravenous infusion, alemtuzumab 10 mg/mL, net price 1.2-mL vial = £7045.00

OFATUMUMAB

Indications see notes above

Cautions see notes above—for full details consult product literature

Contra-indications consult product literature

Renal impairment no information available for creatinine clearance less than 30 mL/minute

Pregnancy avoid unless potential benefit outweighs risk; use effective contraception during and for 12 months after treatment

Breast-feeding discontinue breast-feeding during and for 12 months after treatment—no information available

Side-effects see notes above—for full details (including monitoring and management of side-effects) consult product literature

Dose

- See Doses, p. 563

Important Patients should receive premedication before each dose (consult product literature for details)

Arzerra® (GSK) ▼ PoM

Concentrate for intravenous infusion, ofatumumab 100 mg/5 mL, net price 5-mL vial = £182.00, 50-mL vial = £1820.00

Electrolytes Na^+ 5.04 mmol/g

RITUXIMAB

Indications see notes above; severe active rheumatoid arthritis (section 10.1.3)

Cautions see notes above—for full details consult product literature

Alert card Patients treated for granulomatosis with polyangiitis and microscopic polyangiitis should be provided with a patient alert card with each infusion

Contra-indications see notes above—for full details consult product literature

Pregnancy avoid unless potential benefit to mother outweighs risk of B-lymphocyte depletion in fetus—effective contraception required during and for 12 months after treatment

Breast-feeding avoid breast-feeding during and for 12 months after treatment

Side-effects see notes above—but for full details (including monitoring and management of side-effects) consult product literature

Dose

- See Doses, p. 563

Important Patients should receive premedication before each dose (consult product literature for details)

MabThera® (Roche) PoM

Concentrate for intravenous infusion, rituximab 10 mg/mL, net price 10-mL vial = £174.63, 50-mL vial = £873.15

8.2.4 Other immunomodulating drugs

Interferon alfa

Interferon alfa has shown some antitumour effect in certain lymphomas and solid tumours. Interferon alfa preparations are also used in the treatment of chronic hepatitis B, and chronic hepatitis C ideally in combination with ribavirin (section 5.3.3). Side-effects are dose-related, but commonly include anorexia, nausea, diarrhoea, influenza-like symptoms, and lethargy. Ocular side-effects and depression (including suicidal behaviour) have also been reported. Myelosuppression may occur, particularly affecting granulocyte counts. Cardiovascular problems (hypotension, hypertension, palpitation, and arrhythmias), nephrotoxicity and hepatotoxicity have been reported. Hypertriglyceridaemia, sometimes severe, has been observed; monitoring of lipid concentration is recommended. Other side-effects include hypersensitivity reactions, thyroid abnormalities, hyperglycaemia, alopecia, psoriasiform rash, confusion, coma and seizures (usually with high doses in the elderly).

Polyethylene glycol-conjugated ('pegylated') derivatives of interferon alfa (**peginterferon alfa-2a** and **peginterferon alfa-2b**) are available; pegylation increases the persistence of the interferon in the blood. The peginterferons are licensed for the treatment of chronic hepatitis C, ideally in combination with ribavirin (see section 5.3.3.2). Peginterferon alfa-2a is also licensed for the treatment of chronic hepatitis B. For use of interferon alfa and peginterferon alfa in children see *BNF for Children*

NICE guidance (peginterferon alfa, interferon alfa, and ribavirin for chronic hepatitis C)
See p. 429

INTERFERON ALFA

Indications see under preparations

Cautions consult product literature; **interactions:** Appendix 1 (interferons)

Contra-indications consult product literature; avoid injections containing benzyl alcohol in neonates (see under preparations below)

Hepatic impairment close monitoring in mild to moderate impairment; avoid if severe

Renal impairment close monitoring required; avoid in severe impairment

Pregnancy avoid unless potential benefit outweighs risk (toxicity in *animal* studies); effective contraception required during treatment—consult product literature

Breast-feeding unlikely to be harmful

Side-effects see notes above and consult product literature

Dose

- Consult product literature

IntronA® (MSD) PoM

Injection, interferon alfa-2b (rbe) 10 million units/mL, net price 1-mL vial = £41.55, 2.5-mL vial = £103.94. For subcutaneous injection or intravenous infusion

Injection pen, interferon alfa-2b (rbe), net price 15 million units/mL, 1.5-mL cartridge = £74.83; 25 million units/mL, 1.5-mL cartridge = £124.72; 50 million units/mL, 1.5-mL cartridge = £249.45. For subcutaneous injection

Note Each 1.5-mL multidose cartridge delivers 12 doses of 0.1 mL i.e. a total of 1.2 mL

For chronic myelogenous leukaemia (as monotherapy or in combination with cytarabine), hairy cell leukaemia, follicular lymphoma, lymph or liver metastases of carcinoid tumour, chronic hepatitis B, chronic hepatitis C, adjunct to surgery in malignant melanoma and maintenance of remission in multiple myeloma

Roferon-A® (Roche) PoM

Injection, interferon alfa-2a (rbe), net price 6 million units/mL, 0.5-mL (3 million-unit) prefilled syringe = £14.20; 9 million units/mL, 0.5-mL (4.5 million-unit) prefilled syringe = £21.29; 12 million units/mL, 0.5-mL (6 million-unit) prefilled syringe = £28.37; 18 million units/mL, 0.5-mL (9 million-unit) prefilled syringe = £42.57. For subcutaneous injection

Excipients include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

For AIDS-related Kaposi's sarcoma, hairy cell leukaemia, chronic myelogenous leukaemia, advanced renal cell carcinoma, progressive cutaneous T-cell lymphoma, chronic hepatitis B and chronic hepatitis C, follicular non-Hodgkin's lymphoma, adjunct to surgery in malignant melanoma

PEGINTERFERON ALFA

Indications see under preparations

Cautions consult product literature; **interactions:** Appendix 1 (interferons)

Contra-indications consult product literature

Hepatic impairment avoid in severe impairment

Renal impairment close monitoring required—reduce dose in moderate to severe impairment; consult product literature

Pregnancy manufacturers recommend avoid unless potential benefit outweighs risk (toxicity in *animal* studies); effective contraception required during treatment—consult product literature

Breast-feeding manufacturers advise avoid—no information available

Side-effects see notes above and consult product literature

Dose

- Consult product literature

Pegasys® (Roche) PoM

Injection, peginterferon alfa-2a (rbe), net price 90-microgram prefilled syringe = £76.51, 135-microgram prefilled syringe = £107.76, 180-microgram prefilled syringe = £124.40; 135-microgram prefilled pen = £107.76, 180-microgram prefilled pen = £124.40. For subcutaneous injection

Excipients include benzyl alcohol (avoid in neonates, see Excipients, p)

Combined with ribavirin for chronic hepatitis C; as monotherapy for chronic hepatitis C if ribavirin not tolerated or contra-indicated (see section 5.3.3.2); as monotherapy for chronic hepatitis B

ViraferonPeg® (MSD) PoM

Injection, prefilled pen, powder for reconstitution, peginterferon alfa-2b (rbe), net price 50-microgram pen = £66.46, 80-microgram pen = £106.34, 100-microgram pen = £132.92, 120-microgram pen = £159.51, 150-microgram pen = £199.38 (all with needles and swabs). For subcutaneous injection

Combined with ribavirin for chronic hepatitis C; combined with ribavarin and boceprevir for chronic hepatitis C infection of genotype 1 in patients with compensated liver disease; as monotherapy for chronic hepatitis C if ribavarin not tolerated or contra-indicated (see section 5.3.3.2)

Interferon beta

Interferon beta is licensed for use in patients with *relapsing, remitting multiple sclerosis* (characterised by at least two attacks of neurological dysfunction over the previous 2 or 3 years, followed by complete or incomplete recovery) who are able to walk unaided. Not all patients respond and a deterioration in the bouts has been observed in some. It is also licensed for use in patients with a single demyelinating event with an active inflammatory process, if it is severe enough to require treatment with an intravenous corticosteroid, and they are at high risk of developing multiple sclerosis. Interferon beta-1b is also licensed for use in patients with *secondary progressive multiple sclerosis* but its role in this condition has not been confirmed.

Cautions Caution is advised in those with severe hepatic or renal impairment or a history of cardiac disorders, depressive disorders (avoid in severe depression or in those with suicidal ideation), seizures, or severe myelosupression. Patients should be monitored for signs of hepatic injury and nephrotic syndrome.

Contra-indications Avoid treatment with interferon beta in patients with severe depressive illness or those with decompensated liver disease.

Side-effects Side-effects reported most frequently include irritation at injection site (including inflammation, hypersensitivity, necrosis) and influenza-like symptoms (fever, chills, myalgia, or malaise) but these decrease over time; nausea and vomiting occur occasionally. Other side-effects include hypersensitivity reactions (including anaphylaxis and urticaria), blood disorders, menstrual disorders, mood and personality changes, suicide attempts, confusion and convulsions; alopecia, hepatitis, nephrotic syndrome, and thyroid dysfunction have been reported rarely with interferon beta-1b.

NICE guidance
Interferon beta and glatiramer for multiple sclerosis (January 2002)

Interferon beta and glatiramer acetate are **not** recommended for the treatment of multiple sclerosis in the NHS in England and Wales.

Patients who are currently receiving interferon beta or glatiramer acetate for multiple sclerosis, whether as routine therapy or as part of a clinical trial, should have the option to continue treatment until they and their consultant consider it appropriate to stop, having regard to the established criteria for withdrawal from treatment.

www.nice.org.uk/TA32

Provision of disease-modifying therapies for multiple sclerosis

The Department of Health, the National Assembly for Wales, the Scottish Executive, the Northern Ireland Department of Health, Social Services & Public Safety, and the manufacturers have reached agreement on a risk-sharing scheme for the NHS supply of interferon beta and glatiramer acetate for multiple sclerosis. Health Service Circular (HSC 2002/004) explains how patients can participate in the scheme. It is available on the Department of Health website (www.dh.gov.uk).

INTERFERON BETA

Indications see notes above and under preparations

Cautions see notes above and consult product literature

Contra-indications see notes above and consult product literature

Hepatic impairment see notes above

Renal impairment see notes above

Pregnancy avoid unless potential benefit outweighs risk (toxicity in *animal* studies); effective contraception required during treatment—consult product literature

Breast-feeding avoid—no information available

Side-effects see notes above and consult product literature

Dose

- See under preparations

Interferon beta-1a

Avonex® (Biogen) PoM

Injection, interferon beta-1a 60 micrograms (12 million units)/mL, net price 0.5-mL (30-microgram, 6 million-unit) prefilled syringe = £163.50; 0.5-mL (30-microgram, 6 million-unit) prefilled pen = £163.50

Note For intramuscular injection

Injection, powder for reconstitution, interferon beta-1a, net price 30-microgram (6 million-unit) vial with diluent = £163.50

Note For intramuscular injection

Dose for relapsing, remitting multiple sclerosis or for a single demyelinating event with an active inflammatory process (if it is severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis), consult product literature

Rebif® (Merck Serono) PoM

Injection, interferon beta-1a, net price 22-microgram (6 million-unit) prefilled syringe = £48.16; 44-microgram (12 million-unit) prefilled syringe = £67.77; starter pack of 6 × 8.8-microgram (2.4 million-unit) prefilled syringes with 6 × 22-microgram (6 million-unit) prefilled syringes = £552.19

Note For subcutaneous injection

Excipients include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

Injection, interferon beta-1a, 44 micrograms (12 million-units/mL), net price 1.5 mL (66-microgram, 18 million-unit) cartridge = £203.30; 88-micrograms (24 million-units/mL), 1.5 mL (132-microgram, 36 million-unit) cartridge = £171.97; starter pack of 2 × 1.5 mL (132-microgram, 36 million-unit) cartridge = £406.61

Note Cartridges for use with *RebiSmart®* auto-injector device. For subcutaneous injection

Excipients include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

Injection (*RebiDose®*), interferon beta-1a, net price 22-microgram (6 million-unit) prefilled pen = £51.13; 44-microgram (12 million-unit) prefilled pen = £67.77; starter pack of 6 × 8.8-microgram (2.4 million-unit) prefilled pens with 6 × 22-microgram (6 million-unit) prefilled pens = £552.19

Note For subcutaneous injection

Excipients include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

Dose for relapsing, remitting multiple sclerosis or for a single demyelinating event with an active inflammatory process (if alternative diagnoses have been excluded, and patient at high risk of developing multiple sclerosis), consult product literature

Interferon beta-1b

Betaferon® (Bayer) PoM

Injection, powder for reconstitution, interferon beta-1b, net price 300-microgram (9.6 million-unit) vial with diluent = £39.78

Note For subcutaneous injection

Note An autoinjector device (*Betaject® Light*) is available from Bayer Schering

Dose for relapsing, remitting multiple sclerosis, for secondary progressive multiple sclerosis with active disease, or for a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis), consult product literature

Extavia® (Novartis) PoM

Injection, powder for reconstitution, interferon beta-1b. Net price 300-microgram (9.6 million-unit) vial with diluent = £39.78

Note for subcutaneous injection

Dose for relapsing, remitting multiple sclerosis, for secondary progressive multiple sclerosis with active disease, or for a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis), consult product literature

Interferon gamma

Interferon gamma-1b is licensed to reduce the frequency of serious infection in chronic granulomatous disease and in severe malignant osteopetrosis.

INTERFERON GAMMA-1b

(Immune interferon)

Indications see notes above

Cautions seizure disorders (including seizures associated with fever); cardiac disease (including ischaemia, congestive heart failure, and arrhythmias); monitor before and during treatment: haematological tests (including full blood count, differential white cell count, and platelet count), blood chemistry tests (including renal and liver function tests) and urinalysis; avoid simultaneous administration of foreign proteins including immunological products (risk of exaggerated immune response); **interactions:** Appendix 1 (interferons)

Hepatic impairment manufacturer advises caution in severe impairment—risk of accumulation

Renal impairment manufacturer advises caution in severe impairment—risk of accumulation

Pregnancy manufacturers recommend avoid unless potential benefit outweighs risk (toxicity in *animal* studies); effective contraception required during treatment—consult product literature

Breast-feeding manufacturers advise avoid—no information available

Side-effects nausea, vomiting, diarrhoea, abdominal pain; headache, fatigue, fever, chills, depression; myalgia, arthralgia; rash, injection-site reactions; *rarely* confusion and systemic lupus erythematosus; also reported, neutropenia, thrombocytopenia, proteinuria and raised liver enzymes

Dose

- See under preparation

Immukin® (Boehringer Ingelheim) PoM

Injection, recombinant human interferon gamma-1b 200 micrograms/mL, net price 0.5-mL vial = £75.00

Dose By subcutaneous injection, 50 micrograms/m^2 3 times a week; patients with body surface area of 0.5 m^2 or less, 1.5 micrograms/kg 3 times a week; not yet recommended for children under 6 months with chronic granulomatous disease

Aldesleukin

Aldesleukin (recombinant interleukin-2) is licensed for metastatic renal cell carcinoma **excluding** patients in whom all three of the following prognostic factors are present: performance status of Eastern Co-operative Oncology Group of 1 or greater, more than one organ with metastatic disease sites, and a period of less than 24 months between initial diagnosis of primary tumour and date of evaluation of treatment. It is usually given by subcutaneous injection. It is now rarely given by intravenous infusion because of an increased risk of capillary leak syndrome, which can cause pulmonary oedema and hypotension. Aldesleukin produces tumour shrinkage in a small proportion of patients, but it has not been shown to increase survival. Bone-marrow, hepatic, renal, thyroid, and CNS toxicity is common. It is for use in **specialist units only**.

ALDESLEUKIN

Indications see notes above

Cautions consult product literature; **interactions:** Appendix 1 (aldesleukin)

Contra-indications consult product literature

Pregnancy use only if potential benefit outweighs risk (toxicity in *animal* studies); ensure effective contraception during treatment in men and women; see also Pregnancy and Reproductive Function, p. 564

Breast-feeding discontinue breast-feeding

Side-effects see section 8.1, notes above, and consult product literature

Dose

- Consult product literature

Proleukin® (Novartis) PoM

Injection, powder for reconstitution, aldesleukin. Net price 18-million unit vial = £112.00. For subcutaneous injection *or* intravenous infusion (but see notes above)

BCG bladder instillation

BCG (Bacillus Calmette-Guérin) is a live attenuated strain derived from *Mycobacterium bovis*. It is licensed as a bladder instillation for the treatment of primary or recurrent bladder carcinoma and for the prevention of recurrence following transurethral resection.

BACILLUS CALMETTE-GUÉRIN

Indications see notes above; BCG immunisation (section 14.4)

Cautions screen for active tuberculosis (contra-indicated if tuberculosis confirmed); traumatic catheterisation or urethral or bladder injury (delay administration until mucosal damage healed)

Contra-indications impaired immune response, HIV infection, urinary-tract infection, severe haematuria, tuberculosis, fever of unknown origin

Pregnancy avoid

Breast-feeding avoid

Side-effects cystitis, dysuria, urinary frequency, haematuria, malaise, fever, influenza-like syndrome; also systemic BCG infection (with fatalities)—consult product literature; rarely hypersensitivity reactions (such as arthralgia and rash), orchitis, transient urethral obstruction, bladder contracture, renal abscess; ocular symptoms reported

Dose

- Consult product literature

ImmuCyst® (Alliance) PoM

Bladder instillation, freeze-dried powder containing attenuated *Mycobacterium bovis* prepared from the Connaught strain of bacillus of Calmette and Guérin, net price 81-mg vial = £79.23

OncoTICE® (MSD) PoM

Bladder instillation, freeze-dried powder containing attenuated *Mycobacterium bovis* prepared from the TICE strain of bacillus of Calmette and Guérin, net price 12.5-mg vial = £71.61

Canakinumab

Canakinumab is a recombinant human monoclonal antibody that selectively inhibits interleukin-1 beta receptor binding. It is licensed for the treatment of cryopyrin-associated periodic syndrome, including severe forms of familial cold auto-inflammatory syndrome (or familial cold urticaria), Muckle-Wells syndrome, and neonatal-onset multisystem inflammatory disease (also known as chronic infantile neurological cutaneous and articular syndrome). These are rare inherited auto-inflammatory disorders.

CANAKINUMAB

Indications see notes above; acute gout (section 10.1.4)

Cautions history of recurrent infection or predisposition to infection; monitor full blood count including neutrophil count before starting treatment, 1–2 months after starting treatment, and periodically thereafter; patients should receive all recommended vaccinations (including pneumococcal and inactivated influenza vaccine) before starting treatment; avoid live vaccines unless potential benefit outweighs risk—consult product literature and section 14.1 (p. 828) for further information

Tuberculosis Patients should be evaluated for latent and active tuberculosis before starting treatment and monitored for signs and symptoms of tuberculosis during and after treatment

Contra-indications active infection (see also Cautions); leucopenia; neutropenia; concomitant use with tumour necrosis factor inhibitors (possible increased risk of infections)

Hepatic impairment no information available

Renal impairment limited information available but manufacturer advises no dose adjustment required

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk; effective contraception required during treatment and for up to 3 months after last dose

Breast-feeding consider if benefit outweighs risk—not known if present in human milk

Side-effects vertigo, malaise, increased susceptibility to infection (including serious infection), injection-site reactions, neutropenia, back pain; *less commonly* gastro-oesophageal reflux; *also reported* vomiting, malignancy

Dose

- See Doses, p. 563

Ilaris® (Novartis) ▼ PoM

Injection, powder for reconstitution, canakinumab, net price 150-mg vial = £9927.80

Dimethyl fumarate

Dimethyl fumarate has immunomodulatory and anti-inflammatory properties, and is licensed for the treatment of adults with relapsing-remitting multiple sclerosis. Treatment should be initiated by a physician experienced in the treatment of multiple sclerosis.

DIMETHYL FUMARATE

Indications see notes above

Cautions reduced lymphocyte count; severe active gastro-intestinal disease; serious infection—do not start treatment until resolved and consider suspending treatment if infection develops during treatment; monitor full blood count before treatment (within 6 months before initiation), after 6 months of treatment, then every 6 to 12 months thereafter, and as clinically indicated; monitor renal and hepatic function before treatment, after 3 and 6 months of treatment, then every 6 to 12 months thereafter, and as clinically indicated

Hepatic impairment manufacturer advises caution in severe impairment

Renal impairment manufacturer advises caution in severe impairment

Pregnancy manufacturer advises avoid unless essential and potential benefit outweighs risk—toxicity in *animal* studies; contraception required in women of child-bearing potential (consider non-hormonal methods)

Breast-feeding manufacturer advises avoid

Side-effects nausea, vomiting, diarrhoea, abdominal pain, dyspepsia, gastritis, gastroenteritis, flushing (may be severe and indicate hypersensitivity), burning sensation, lymphopenia, leucopenia, proteinuria, pruritus, rash, erythema

Dose

- ADULT over 18 years, 120 mg twice daily; increased to 240 mg twice daily after 7 days; for dose adjustment due to side-effects, consult product literature

Tecfidera® (Biogen) ▼ PoM

Capsules, e/c, dimethyl fumarate 120 mg (green/white), net price 14-cap pack = £343.00; 240 mg (green), 56-cap pack = £1373.00. Label: 21, 25

Fingolimod

Fingolimod is an immunomodulating drug licensed for use in patients with highly active relapsing-remitting multiple sclerosis despite treatment with interferon beta or in those with rapidly evolving severe relapsing-remitting multiple sclerosis. Treatment with fingolimod should be initiated and supervised by a specialist.

MHRA/CHM advice

Fingolimod: not recommended for patients at known risk of cardiovascular events. Advice for extended monitoring for those with significant bradycardia or heart block after the first dose and following treatment interruption (January 2013)

Fingolimod is known to cause transient bradycardias and heart block after the first dose. Fingolimod is not recommended in the following patient groups who are at high risk of cardiovascular events unless the anticipated benefits outweigh the potential risks, and advice from a cardiologist is sought before initiation:

Patients with the following medical conditions:

- 2nd degree Mobitz Type II or higher degree atrioventricular block, sick sinus syndrome, or sino-atrial heart block
- significant QT prolongation (QT-interval greater than 470 milliseconds in women, or greater than 450 milliseconds in men)
- history of symptomatic bradycardia or recurrent syncope, known ischaemic heart disease, cerebrovascular disease, history of myocardial infarction, congestive heart failure, history of cardiac arrest, uncontrolled hypertension, or severe sleep apnoea.

Patients receiving the following antiarrhythmic or heart-rate lowering drugs:

- class Ia or class III antiarrhythmics
- beta blockers
- heart rate-lowering calcium channel blockers
- other substances which may decrease heart rate (e.g. digoxin, anticholinesteratic drugs or pilocarpine).

All patients receiving fingolimod should be monitored at treatment initiation, (first dose monitoring), and after treatment interruption (see note below); monitoring should include:

Pre-treatment

- a 12-lead ECG and blood pressure measurement before starting

During the first 6 hours of treatment

- continuous ECG monitoring for 6 hours
- blood pressure and heart rate measurement every hour

After 6 hours of treatment

- a further 12-lead ECG and blood pressure measurement

If heart rate at the end of the 6 hour period is at its lowest since fingolimod was first administered, monitoring should be extended by at least 2 hours and until heart rate increases.

Extended monitoring, (at least overnight), should be performed in patients with evidence of clinically important cardiac effects during first dose monitoring. Monitoring in patients requiring pharmacological intervention for bradyarrhythmia-related symptoms during first dose monitoring should be extended at least overnight, and first dose monitoring should be repeated after the second dose.

Note

First dose monitoring as above **should be repeated** in all patients whose treatment is interrupted for:

- 1 day or more during the first 2 weeks of treatment
- more than 7 days during weeks 3 and 4 of treatment
- more than 2 weeks after one month of treatment

If the treatment interruption is of shorter duration than the above, repeated monitoring is not required and treatment should be continued with the next dose as planned.

The *Scottish Medicines Consortium* (p. 4) has advised (August 2012) that fingolimod (*Gilenya*®) is accepted for restricted use within NHS Scotland as single disease modifying therapy in highly active relapsing-remitting multiple sclerosis despite treatment with interferon beta, with an unchanged or increased relapse rate or ongoing severe relapses, as compared to the previous year.

NICE guidance
Fingolimod for the treatment of highly active relapsing-remitting multiple sclerosis (April 2012)

Fingolimod is recommended as an option for the treatment of highly active relapsing-remitting multiple sclerosis in adults, only if:

- they have an unchanged or increased relapse rate or ongoing severe relapses compared with the previous year despite treatment with interferon beta, **and**
- the manufacturer provides fingolimod with the discount agreed as part of the patient access scheme.

Patients currently receiving fingolimod whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA254

FINGOLIMOD

Indications see notes above

Cautions see MHRA/CHM advice above; susceptibility to QT-interval prolongation (including electrolyte disturbances, concomitant use of drugs that prolong QT interval); severe respiratory disease; pulmonary fibrosis; chronic obstructive pulmonary disease; risk of macular oedema—eye examination recommended 3–4 months after initiation of treatment (and before initiation of treatment in patients with diabetes or history of uveitis); monitor hepatic transaminases before treatment, then every 3 months for 1 year, then periodically thereafter; monitor full blood count before treatment, at 3 months, then at least yearly thereafter and if signs of infection—interrupt treatment if lymphocyte count reduced—consult product literature; monitor for signs and symptoms of haemophagocytic syndrome (including pyrexia, asthenia, hepato-splenomegaly and adenopathy—may be associated with hepatic failure and respiratory distress; also progressive cytopenia, elevated serum-ferritin concentrations, hypertriglyceridaemia, hypofibrinogenaemia, coagulopathy, hepatic cytolysis, hyponatraemia)—initiate treatment immediately; check varicella zoster virus status—consult product literature for further information; **interactions**: Appendix 1 (fingolimod)

Contra-indications immunosuppression; active infection; active malignancies (except cutaneous basal cell carcinoma)

Hepatic impairment use with caution in mild to moderate impairment; avoid in severe impairment

Pregnancy avoid (toxicity in *animal* studies); exclude pregnancy before treatment and ensure effective contraception during and for at least 2 months after treatment

Breast-feeding avoid

Side-effects diarrhoea, weight loss, AV block, bradycardia, hypertension, cough, dyspnoea, depression, malaise, headache, migraine, dizziness, paraesthesia, influenza, herpes, bronchitis, sinusitis, gastroenteritis, tinea, lymphopenia, leucopenia, back pain, blurred vision, eye pain, eczema, alopecia, pruritus; *less commonly* pneumonia, neutropenia, macular oedema; *also reported* haemophagocytic syndrome (see Cautions above), lymphoma

Dose

- ADULT over 18 years, 500 micrograms once daily

Gilenya® (Novartis) ▼ PoM

Capsules, fingolimod (as hydrochloride), 500 micrograms (yellow/white), net price 7-cap pack = £367.50, 28-cap pack = £1470.00

Glatiramer acetate

Glatiramer is an immunomodulating drug comprising synthetic polypeptides. It is licensed for treating initial symptoms in patients at high risk of developing multiple sclerosis, and also for reducing the frequency of relapses in ambulatory patients with relapsing-remitting multiple sclerosis who have had at least 2 clinical relapses in the past 2 years. Initiation of treatment with glatiramer should be supervised by a specialist.

NICE guidance (interferon beta and glatiramer for multiple sclerosis)
See p. 626

Provision of disease-modifying therapies for multiple sclerosis
See p. 626

GLATIRAMER ACETATE

Indications see notes above

Cautions cardiac disorders

Renal impairment no information available—manufacturer advises caution

Pregnancy manufacturer advises avoid—no information available

Breast-feeding manufacturer advises caution—no information available

Side-effects hypersensitivity reactions; flushing, chest pain, palpitation, tachycardia, and dyspnoea may occur within minutes of injection; nausea, constipation, dyspepsia; syncope, anxiety, asthenia, depression, headache, tremor, sweating; oedema, lymphadenopathy; hypertonia, back pain, arthralgia, influenza-like symptoms; injection-site reactions, rash; *rarely* seizures

Dose

- By subcutaneous injection, ADULT over 18 years, 20 mg daily

Copaxone® (Teva) PoM

Injection, glatiramer acetate 20 mg/mL, net price 1-mL prefilled syringe = £18.36

Histamine

Histamine is licensed for maintenance therapy, in combination with aldesleukin, in patients with acute myeloid leukaemia in first remission.

The *Scottish Medicines Consortium* (p. 4) has advised (December 2010) that histamine dihydrochloride (*Ceplene*®) is **not** recommended for use within NHS Scotland.

HISTAMINE DIHYDROCHLORIDE

Indications see notes above

Cautions consult product literature; **interactions**: Appendix 1 (histamine)

Contra-indications consult product literature

Hepatic impairment increased risk of tachycardia and hypotension in moderate to severe impairment

Renal impairment increased risk of hypotension in severe impairment

Pregnancy manufacturer advises avoid—no information available; ensure effective contraception during treatment in men and women

Breast-feeding manufacturer advises avoid—no information available

Side-effects consult product literature

Dose

- See Doses, p. 563

Ceplene® (Meda) ▼ PoM

Injection, histamine dihydrochloride 1 mg/mL, net price 0.5-mL vial = £84.38

Lenalidomide, pomalidomide, and thalidomide

Lenalidomide is an immunomodulating drug with anti-neoplastic, anti-angiogenic, and pro-erythropoietic properties. It is licensed for the treatment of transfusion-dependent anaemia due to low- or intermediate-1-risk myelodysplastic syndromes (MDS) associated with an isolated deletion 5q cytogenetic abnormality when other treatment options are insufficient or inadequate; it is also licensed in combination with dexamethasone, for the treatment of multiple myeloma in patients who have received at least one previous therapy.

The most serious side-effects of lenalidomide are venous thromboembolism, severe neutropenia, thrombocytopenia, and potentially fatal liver injuries. Lenalidomide is structurally related to thalidomide and there is a risk of peripheral neuropathy and teratogenesis.

The *Scottish Medicines Consortium* (p. 4) has advised (April 2010) that lenalidomide, in combination with dexamethasone, is accepted for restricted use within NHS Scotland for patients with multiple myeloma who have received at least two prior therapies.

NICE guidance

Lenalidomide for the treatment of multiple myeloma (June 2009)

Lenalidomide in combination with dexamethasone is an option for the treatment of multiple myeloma in patients who have received two or more prior therapies. The drug cost of lenalidomide will be met by the manufacturer for patients who remain on treatment for more than 26 cycles.

www.nice.org.uk/TA171

Pomalidomide is structurally related to thalidomide and has immunomodulatory properties and direct anti-myeloma tumoricidal activity. It is licensed for use in combination with dexamethasone for the treatment of relapsed and refractory multiple myeloma in patients who have received at least two prior treatment regimens, including both lenalidomide and bortezomib, and who have had disease progression during the last treatment.

Thalidomide is used in combination with melphalan and prednisolone as first-line treatment for untreated multiple myeloma, in patients aged 65 years and over, or for those not eligible for high-dose chemotherapy (for example, patients with significant co-morbidity such as cardiac risk factors). It has immunomodulatory and anti-inflammatory activity. Thalidomide can cause drowsiness, neutropenia, thrombocytopenia, hepatic disorders, and thromboembolism. Patients should also be monitored for signs and symptoms of peripheral neuropathy.

NICE guidance

Bortezomib and thalidomide for the first-line treatment of multiple myeloma (July 2011)

Thalidomide in combination with an alkylating drug and a corticosteroid is recommended as an option for the first-line treatment of multiple myeloma in people for whom high-dose chemotherapy with stem cell transplantation is considered inappropriate.

For bortezomib, see p. 587

www.nice.org.uk/TA228

Pregnancy For women of child-bearing potential, pregnancy must be excluded before starting treatment with lenalidomide, pomalidomide, or thalidomide (perform pregnancy test on initiation or within 3 days prior to initiation). Women must practise effective contraception at least 1 month before, during, and for at least 1 month after treatment, including during dose interruptions (oral combined hormonal contraceptives and copper-releasing intrauterine devices not recommended) and men should use condoms during treatment, during dose interruption, and for at least 1 week after stopping if their partner is pregnant or is of child-bearing potential and not using effective contraception. Patients, prescribers and pharmacists must comply with pregnancy prevention measures as specified in the manufacturer's Pregnancy Prevention Programme.

LENALIDOMIDE

Indications see notes above

Cautions see notes above; monitor full blood count (including differential white cell count, platelet count, haemoglobin, and haematocrit) and liver function before treatment, then every week for the first 8 weeks, then monthly thereafter (reduce dose or interrupt treatment if neutropenia, thrombocytopenia or impaired liver function develop—consult product literature); monitor for arterial or venous thromboembolism (if thromboembolic event occurs, discontinue lenalidomide and treat with standard anticoagulation therapy; lenalidomide may be restarted with continued anticoagulation therapy once thromboembolic event resolved—consult product literature); use caution with concomitant drugs that increase the risk of thromboembolism—see also Thromboembolism below; high tumour burden—risk

of tumour lysis syndrome, see p. 564; monitor thyroid function; monitor for signs and symptoms of peripheral neuropathy; caution in patients with risk factors for myocardial infarction; discontinue permanently if angioedema, exfoliative or bullous rash, or if Stevens-Johnson syndrome or toxic epidermal necrolysis is suspected; **interactions:** Appendix 1 (lenalidomide)

Thromboembolism Risk factors for thromboembolism (such as smoking, hypertension, hyperlipidaemia) should be minimised and thromboprophylaxis should be considered in patients with multiple risk factors.

Patients and their carers should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness, chest pain, or swelling of a limb

Neutropenia and thrombocytopenia Patients and their carers should be made aware of the symptoms of neutropenia and advised to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat) or of thrombocytopenia (such as bleeding) develop

Second primary malignancy Patients should be carefully evaluated before and during treatment with lenalidomide using routine cancer screening for occurrence of second primary malignancy and treatment should be instituted as indicated

Hepatic disorders Liver function should be monitored (see Cautions above), particularly when there is history of, or concurrent viral liver infection, or when lenalidomide is combined with drugs known to be associated with liver dysfunction (e.g. paracetamol)

Renal impairment reduce dose in renal impairment—consult product literature

Pregnancy **important: teratogenic risk**; see also notes above

Breast-feeding discontinue breast-feeding—no information available

Side-effects constipation, nausea, vomiting, diarrhoea, abdominal pain, dry mouth, dysphagia, dyspepsia, decreased appetite, stomatitis, cerebrovascular events, arrhythmias, bradycardia, tachycardia, myocardial infarction, chest pain, hypertension, hypotension, cardiac failure, oedema, pulmonary embolism, deep vein thrombosis, pneumonia, dyspnoea, respiratory tract infections, respiratory distress, tremor, malaise, mood changes, dizziness, syncope, falls, pyrexia, headache, ataxia, taste disturbance, peripheral neuropathy, sinusitis, sepsis, flu-like illness, hyperglycaemia, hypothyroidism, renal failure, urinary retention, urinary incontinence, haematuria, sexual dysfunction, haematoma, haemorrhagic disorders, iron-overload, neutropenia, thrombocytopenia, anaemia, leucopenia, dehydration, electrolyte disturbances, musculoskeletal disorders, visual disturbances, cataract, hearing disturbances, skin disorders, rash (if rash occurs, treatment should be discontinued and only restarted following appropriate clinical evaluation, see also Cautions above), hyperhidrosis, pruritus; *less commonly* hepatic failure, secondary malignancies; *rarely* Stevens-Johnson syndrome, toxic epidermal necrolysis, tumour lysis syndrome; *also reported* toxic hepatitis, cytolytic hepatitis, cholestatic hepatitis, pancreatitis, interstitial pneumonitis; also consult product literature

Dose

- Multiple myeloma, ADULT over 18 years, 25 mg once daily for 21 consecutive days of repeated 28-day cycles; for doses of dexamethasone, and dose adjustments due to side-effects, consult product literature
- Myelodysplastic syndromes, ADULT over 18 years, 10 mg once daily for 21 consecutive days of repeated 28-day cycles; for dose adjustments due to side-effects, consult product literature

Revlimid® (Celgene) PoM

Capsules, lenalidomide, 5 mg (white), net price 21-cap pack = £3570.00; 10 mg (blue/yellow), 21-cap pack = £3780.00; 15 mg (blue/white), 21-cap pack = £3969.00; 25 mg (white), 21-cap pack = £4368.00. Label: 25, counselling, pregnancy and contraception, symptoms of thromboembolism, neutropenia, and thrombocytopenia

Note Patient, prescriber, and supplying pharmacy must comply with a pregnancy prevention programme. Every prescription must be accompanied by a completed Prescription Authorisation Form

POMALIDOMIDE

Indications see notes above

Cautions monitor full blood count before treatment, then every week for the first 8 weeks, then monthly thereafter (reduce dose or interrupt treatment if neutropenia or thrombocytopenia develop—consult product literature); monitor for arterial or venous thromboembolism; use caution with concomitant drugs that increase the risk of bleeding or thromboembolism; peripheral neuropathy; significant cardiac dysfunction; high tumour burden—risk of tumour lysis syndrome, see p. 564; **interactions:** Appendix 1 (pomalidomide)

Thromboembolism Risk factors for thromboembolism (such as smoking, hypertension, hyperlipidaemia) should be minimised. Thromboprophylaxis should be considered, particularly in patients with additional risk factors. Patients and their carers should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness, chest pain, or swelling of a limb

Neutropenia and thrombocytopenia Patients and their carers should be made aware of the symptoms of neutropenia and advised to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat) or of thrombocytopenia (such as bleeding) develop

Second primary malignancy Patients should be carefully evaluated before and during treatment with pomalidomide using routine cancer screening for occurrence of second primary malignancy and treatment should be instituted as indicated

Hepatic impairment manufacturer advises caution—no information available

Renal impairment manufacturer advises caution—no information available

Pregnancy **important: teratogenic risk**; see also notes above

Breast-feeding avoid—present in milk in *animal* studies

Side-effects decreased appetite, diarrhoea, nausea, vomiting, constipation, thromboembolic events, peripheral oedema, nasopharyngitis, dyspnoea, cough, impaired consciousness, malaise, confusion, peripheral neuropathy, dizziness, vertigo, tremor, pyrexia, pneumonia, respiratory tract infection, pelvic pain, urinary retention, renal failure, leucopenia, neutropenia (including febrile neutropenia and neutropenic sepsis), thrombocytopenia, anaemia, hyperkalaemia, hyponatraemia, bone pain, muscle spasms, rash, pruritus

Dose

- ADULT over 18 years, 4 mg once daily for 21 consecutive days of repeated 28-day cycles; for doses of dexamethasone, and dose adjustments due to side-effects, consult product literature

Imnovid® (Celgene) ▼ PoM

Capsules, pomalidomide, 1 mg (blue/yellow), net price 21-cap pack = £8884.00; 2 mg (blue/orange), 21-cap pack = £8884.00; 3 mg (blue/green), 21-cap pack = £8884.00; 4 mg (blue), 21-cap pack = £8884.00.Label: 3, 25, counselling, pregnancy and contraception, symptoms of thromboembolism, neutropenia, and thrombocytopenia

Note Patient, prescriber, and supplying pharmacy must comply with a pregnancy prevention programme. Every prescription must be accompanied by a completed Prescription Authorisation Form

Excipients include propylene gylcol (see Excipients, p. 2)

THALIDOMIDE

Indications see notes above

Cautions see notes above; monitor white blood cell count (including differential count) and platelet count (reduce dose or interrupt treatment if neutropenia or thrombocytopenia develop - consult product literature); monitor liver function; high tumour burden—risk of tumour lysis syndrome, see p. 564; monitor for arterial or venous thromboembolism and use caution with concomitant drugs that increase the risk of peripheral neuropathy or thromboembolism—see also Thromboembolism, below

Thromboembolism Risk factors for thromboembolism (such as smoking, hypertension, hyperlipidaemia) should be minimised.Thromboprophylaxis is recommended for at least the first 5 months of treatment, especially in patients with additional thrombotic risk factors.

Patients and their carers should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness, chest pain, or swelling of a limb

Neutropenia and thrombocytopenia Patients and their carers should be made aware of the symptoms of neutropenia and advised to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat) or of thrombocytopenia (such as bleeding) develop

Second primary malignancy Patients should be carefully evaluated before and during treatment with thalidomide using routine cancer screening for occurrence of second primary malignancy and treatment should be instituted as indicated

Hepatic disorder Liver function should be monitored, particularly when there is history of, or concurrent viral liver infection, or when thalidomide is combined with drugs known to be associated with liver dysfunction (e.g. paracetamol)

Peripheral neuropathy Monitor patients for signs and symptoms of peripheral neuropathy; patients and their carers should be advised to seek medical advice if symptoms such as paraesthesia, abnormal coordination, or weakness develop. Dose reduction, dose interruption, or treatment discontinuation may be necessary—consult product literature. Patients with pre-existing peripheral neuropathy should not be treated with thalidomide unless the potential clinical benefits outweigh the risk

Hepatic impairment caution in severe impairment—no information available

Renal impairment caution in severe impairment— no information available

Pregnancy **important: teratogenic risk**; see also notes above

Breast-feeding avoid—present in milk in *animal* studies

Side-effects vomiting, dry mouth, dyspepsia, constipation; bradycardia, cardiac failure, deep vein thrombosis; dyspnoea, interstitial lung disease, pulmonary embolism, peripheral oedema; asthenia, confusion, depression, dizziness, drowsiness, peripheral neuropathy, dysaesthesia, paraesthesia, syncope, tremor; pyrexia; pneumonia; anaemia, leucopenia, neutropenia, lymphopenia, thrombocytopenia; skin reactions including Stevens-Johnson syndrome (if rash occurs, treatment should be discontinued and only restarted following appropriate clinical evaluation); *also reported* atrial fibrillation, atrioventricular block, toxic epidermal necrolysis, intestinal obstruction, gastro-intestinal perforation and haemorrhage, worsening of Parkinson's disease symptoms, convulsions, hypothyroidism, sexual dysfunction, menstrual disorders, second primary malignancy, hepatic disorders, renal failure, hearing loss, myocardial infarction, cerebrovascular events

Dose

- ADULT over 18 years, 200 mg once daily at bedtime for 6-week cycle; max. 12 cycles

Thalidomide Celgene® (Celgene) PoM

Capsules, thalidomide 50 mg, net price 28-cap pack = £298.48. Label: 2, counselling, pregnancy and contraception, symptoms of peripheral neuropathy, thromboembolism, neutropenia,, and thrombocytopenia

Note Patient, prescriber, and supplying pharmacy must comply with a pregnancy prevention programme. Every prescription must be accompanied by a complete Prescription Authorisation Form.

Mifamurtide

Mifamurtide is licensed for high-grade, resectable, non-metastatic osteosarcoma after complete surgical resection, in patients 2 to 30 years of age at initial diagnosis. It is used in combination with chemotherapy.

NICE guidance

Mifamurtide for the treatment of osteosarcoma (October 2011)

Mifamurtide in combination with postoperative multi-agent chemotherapy is recommended (within its licensed indication), as an option for the treatment of high-grade resectable non-metastatic osteosarcoma after macroscopically complete surgical resection in children, adolescents and young adults and when mifamurtide is made available at a reduced cost to the NHS under the patient access scheme.

www.nice.org.uk/TA235

MIFAMURTIDE

Indications see notes above

Cautions asthma and chronic obstructive pulmonary disease—consider prophylactic bronchodilator therapy; history of autoimmune, inflammatory, or collagen disease; monitor renal function, hepatic function and clotting parameters; monitor patients with history of venous thrombosis, vasculitis, or unstable cardiovascular disorders for persistent or worsening symptoms during administration—consult product literature; **interactions:** Appendix 1 (mifamurtide)

Hepatic impairment use with caution—no information available

Renal impairment use with caution—no information available

Pregnancy avoid; effective contraception required

Breast-feeding avoid—no information available

Side-effects gastro-intestinal disturbances (including anorexia, nausea, vomiting, diarrhoea, constipation, abdominal pain, dyspepsia); tachycardia, hypertension, palpitations, hypotension, phlebitis, flushing; oedema, respiratory disorders (including dyspnoea, epistaxis, cough, tachypnoea, haemoptysis, pleural effusion); confusion, depression, insomnia, headache, dizziness, paraesthesia, hypoaesthesia, tremor, drowsiness, anxiety; hypokalaemia, anaemia, leucopenia, thrombocytopenia, granulocytopenia; haematuria, dysuria, pollakiuria; musculoskeletal pain; blurred vision; vertigo, tinnitus, hearing loss; sweating, alopecia, rash, dry skin

Dose

- See Doses, p. 563

Mepact® (Takeda) ▼ PoM

Intravenous infusion, powder for reconstitution, mifamurtide encapsulated in liposomes, net price 4-mg vial = £2375.00

Natalizumab

Natalizumab is a monoclonal antibody that inhibits the migration of leucocytes into the central nervous system, hence reducing inflammation and demyelination. It is licensed for use in patients with highly active *relapsing-remitting multiple sclerosis* despite treatment with interferon beta or those with rapidly evolving severe relapsing-remitting multiple sclerosis. Treatment with natalizumab should be initiated and supervised by a specialist.

Natalizumab is associated with an increased risk of opportunistic infection and progressive multifocal leucoencephalopathy (PML). The risk of developing PML increases with previous immunosuppressant therapy and also after 2 years of therapy; the risk beyond 4 years treatment is not known. A magnetic resonance image (MRI) scan is recommended before starting treatment with natalizumab, and annually thereafter. Patients should be monitored for new or worsening neurological symptoms, and for cognitive and psychiatric signs of PML. Treatment should be suspended until PML has been excluded. If a patient develops an opportunistic infection or PML, natalizumab should be permanently discontinued.

Infusion-related side-effects include nausea, vomiting, flushing, headache, dizziness, fatigue, rigors, pyrexia, arthralgia, urticaria, and pruritus. Patients should be observed for hypersensitivity reactions, including anaphylaxis, during the infusion and for 1 hour after completion of the infusion. Natalizumab should be discontinued permanently if hypersensitivity reaction occurs.

The *Scottish Medicines Consortium* (p. 4) has advised (August 2007) that natalizumab is accepted for restricted use as single disease-modifying therapy in highly active relapsing-remitting multiple sclerosis only in patients with rapidly evolving severe relapsing-remitting multiple sclerosis defined by 2 or more disabling relapses in 1 year and with 1 or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI.

NICE guidance

Natalizumab for the treatment of adults with highly active relapsing-remitting multiple sclerosis (August 2007)

Natalizumab is an option for the treatment only of rapidly evolving severe relapsing-remitting multiple sclerosis (RES). RES is defined by 2 or more disabling relapses in 1 year, and 1 or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI.

www.nice.org.uk/TA127

NATALIZUMAB

Indications see notes above

Cautions see notes above and consult product literature; prior treatment with immunosuppressants (increased risk of progressive multifocal leucoencephalopathy); monitor liver function (see below)

Liver toxicity Liver dysfunction reported; advise patients to seek immediate medical attention if symptoms such as jaundice or dark urine develop; discontinue treatment if significant liver injury occurs

Progressive multifocal leucoencephalopathy (PML) Patients should be informed about the risks of PML before starting treatment with natalizumab and again after 2 years; they should be given an alert card which includes information about the symptoms of PML (see also notes above)

Hypersensitivity reactions Patients should be told the importance of uninterrupted dosing, particularly in the early months of treatment (intermittent therapy may increase risk of sensitisation)

Contra-indications progressive multifocal leucoencephalopathy; active infection (see notes above); concurrent use of interferon beta or glatiramer acetate; immunosuppression; active malignancies (except cutaneous basal cell carcinoma)

Pregnancy avoid unless essential—toxicity in *animal* studies

Breast-feeding present in milk in *animal* studies—avoid

Side-effects see notes above; also urinary-tract infection, nasopharyngitis, autoantibodies, and arthralgia; *less commonly* hypersensitivity reactions (see above); liver toxicity also reported

Dose

- By intravenous infusion, ADULT over 18 years, 300 mg once every 4 weeks; discontinue if no response after 6 months

Tysabri® (Biogen) ▼ PoM

Concentrate for intravenous infusion, natalizumab 20 mg/mL, net price 15-mL vial = £1130.00. Counselling, liver toxicity, progressive multifocal leucoencephalopathy, and hypersensitivity, patient alert card

Electrolytes Na^+ 2.3 mmol/vial

Teriflunomide

Teriflunomide is a metabolite of leflunomide which has immunomodulating and anti-inflammatory properties. It is licensed for the treatment of adults with relapsing-remitting multiple sclerosis. Teriflunomide should be

initiated and supervised by a physician experienced in the management of multiple sclerosis.

NICE guidance
Teriflunomide for treating relapsing-remitting multiple sclerosis (January 2014)
Teriflunomide is recommended for the treatment of adults with active relapsing-remitting multiple sclerosis (normally defined as 2 clinically significant relapses in the previous 2 years), in adults who

- do not have highly active or rapidly evolving severe relapsing-remitting multiple sclerosis **and**
- the manufacturer provides teriflunomide with the discount agreed in the patient access scheme

www.nice.org.uk/TA303

TERIFLUNOMIDE

Note Teriflunomide is a metabolite of leflunomide

Indications see notes above

Cautions adult over 65 years; impaired bone-marrow function (avoid if severe) including anaemia, leucopenia or thrombocytopenia; significant alcohol consumption; latent tuberculosis; hypoproteinaemia (avoid if severe); switching between other immunomodulating drugs; persistent cough or dyspnoea—assess for interstitial lung disease and consider suspending treatment; severe infection—delay or suspend treatment until resolved; signs or symptoms of serious skin reactions (including ulcerative stomatitis, Stevens-Johnson syndrome, and toxic epidermal necrolysis)—discontinue treatment; monitor full blood count (including differential white cell count and platelet count) before treatment and as clinically indicated during treatment; monitor blood pressure before treatment and periodically thereafter; an accelerated elimination procedure is recommended following discontinuation due to serious adverse effects (consult product literature and see Accelerated Elimination Procedure below); **interactions:** Appendix 1 (teriflunomide)

Hepatic monitoring Monitor liver function before treatment and every 2 weeks for first 6 months then every 8 weeks thereafter or as clinically indicated (pre-existing liver disease may increase risk). Increase to weekly monitoring if alanine aminotransferase (ALT) is 2–3 times the upper limit of reference range; discontinue treatment if signs or symptoms of hepatic injury, or if liver enzymes exceed 3 times the upper limit of reference range

Accelerated elimination procedure To aid drug elimination in case of serious adverse effect or before conception (see also Pregnancy below), stop treatment and give *either* colestyramine 8 g (reduce to 4 g if not tolerated) 3 times daily for 11 days *or* activated powdered charcoal 50 g every 12 hours for 11 days. After the accelerated elimination procedure a plasma concentration of less than 20 micrograms/litre (measured on 2 occasions at least 14 days apart) and a waiting period of one and a half months are necessary before conception. Use of non-oral contraception is recommended during the accelerated elimination procedure—consult product literature

Contra-indications significantly impaired bone-marrow function (including anaemia, neutropenia, leucopenia, or thrombocytopenia); severe immunodeficiency; severe hypoproteinaemia; serious infection

Hepatic impairment avoid in severe impairment; see also Hepatic Monitoring above

Pregnancy avoid—toxicity in *animal* studies; effective contraception essential for women of child-bearing potential during treatment and for up to 2 years after treatment (see also Accelerated Elimination Procedure above)

Breast-feeding present in milk in *animal* studies—manufacturer advises avoid

Side-effects diarrhoea, nausea, vomiting, gastroenteritis, weight loss, hypertension, respiratory tract infection, laryngitis, anxiety, paraesthesia, peripheral neuropathy, sciatica, carpal tunnel syndrome, hyperaesthesia, neuralgia, menorrhagia, urinary tract infection, cystitis, neutropenia, leucopenia, pollakiuria, elevated liver enzymes, musculoskeletal pain, myalgia, oral infection, alopecia, rash, acne, tinea pedis; *less commonly* anaemia, thrombocytopenia; *very rarely* interstitial lung disease, pancreatitis; **important:** accelerated elimination procedure recommended following discontinuation due to serious adverse effects (consult product literature and see Accelerated Elimination Procedure above)

Dose

- ADULT over 18 years, 14 mg once daily

Aubagio® (Genzyme) ▼ PoM
Tablets, f/c, pale blue, teriflunomide 14 mg, net price 28-tab pack = £1037.84.

8.3 Sex hormones and hormone antagonists in malignant disease

Hormonal manipulation has an important role in the treatment of breast, prostate, and endometrial cancer, and a more marginal role in the treatment of hypernephroma. These treatments are not curative, but may provide excellent palliation of symptoms in selected patients, sometimes for a period of years. Tumour response, and treatment toxicity should be carefully monitored and treatment changed if progression occurs or side-effects exceed benefit.

8.3.1 Oestrogens

Diethylstilbestrol is sometimes used to treat prostate cancer, but it is not usually used first-line because of its side-effects. It is occasionally used in postmenopausal women with breast cancer. Toxicity is common and dose-related side-effects include nausea, fluid retention, and venous and arterial thrombosis. Impotence and gynaecomastia always occur in men, and withdrawal bleeding may be a problem in women. Hypercalcaemia and bone pain may also occur in breast cancer.

Ethinylestradiol is the most potent oestrogen available; unlike other oestrogens it is only slowly metabolised in the liver. Ethinylestradiol is licensed for the palliative treatment of prostate cancer.

DIETHYLSTILBESTROL
(Stilboestrol)

Indications see notes above

Cautions cardiovascular disease

Hepatic impairment avoid; see also Combined Hormonal Contraceptives (section 7.3.1)

Pregnancy in first trimester, high doses associated with vaginal carcinoma, urogenital abnormalities, and reduced fertility in female offspring; increased risk of hypospadias in male offspring

Side-effects sodium retention with oedema, thromboembolism, jaundice, feminising effects in men; see also notes above

Dose

- Breast cancer, 10–20 mg daily
- Prostate cancer, 1–3 mg daily

Diethylstilbestrol (Non-proprietary) PoM

Tablets, diethylstilbestrol 1 mg, net price 28 = £101.32; 5 mg, 28 = £192.67

ETHINYLESTRADIOL

(Ethinyloestradiol)

Indications see notes above; other indications (section 6.4.1.1)

Cautions see section 6.4.1.1; **interactions:** Appendix 1 (oestrogens)

Contra-indications see section 6.4.1.1

Hepatic impairment avoid; see also Combined Hormonal Contraceptives (section 7.3.1)

Side-effects see section 6.4.1.1

Dose

- Prostate cancer (palliative), 0.15–1.5 mg daily

Preparations

Section 6.4.1.1

8.3.2 Progestogens

Progestogens have a role in the treatment of endometrial cancer; their use in breast cancer and renal cell cancer has declined. Progestogens are now rarely used to treat prostate cancer. **Medroxyprogesterone** or **megestrol** are usually chosen and can be given orally; high-dose or parenteral treatment cannot be recommended. Side-effects are mild but may include nausea, fluid retention, and weight gain.

MEDROXYPROGESTERONE ACETATE

Indications see notes above; contraception (section 7.3.2.2); other indications (section 6.4.1.2)

Cautions see section 6.4.1.2; loss of vision during treatment (discontinue treatment if papilloedema or retinal vascular lesions); **interactions:** Appendix 1 (progestogens)

Contra-indications see section 6.4.1.2 and notes above

Hepatic impairment avoid; see also oral Progestogen-only Contraceptives (section 7.3.2.1)

Pregnancy avoid—genital malformations and cardiac defects reported; see also Parenteral Progestogen-only Contraceptives (section 7.3.2.2)

Breast-feeding present in milk—no adverse effects reported; see also Parenteral Progestogen-only Contraceptives (section 7.3.2.2)

Side-effects see section 6.4.1.2 and notes above; glucocorticoid effects at high dose may lead to a cushingoid syndrome; also constipation, diarrhoea, dry mouth, vomiting, indigestion; adrenergic-like effects, congestive heart failure, hypertension, palpitation, tachycardia; confusion, euphoria, loss of concentration, nervousness, hyperpyrexia; hypercalcaemia; cervical erosions, galactorrhoea; raised white blood cell count, raised platelet count; vision disorders, retinal thrombosis

Dose

- See preparations below

Provera® (Pharmacia) PoM

Tablets, medroxyprogesterone acetate 100 mg (scored), net price 60-tab pack = £29.98, 100-tab pack = £49.94; 200 mg (scored), 30-tab pack = £29.65, 400 mg, 30-tab pack = £58.67

Dose endometrial and renal cell cancer, 200–600 mg daily; breast cancer, 0.4–1.5 g daily

Tablets, medroxyprogesterone acetate 2.5 mg, 5 mg and 10 mg, see section 6.4.1.2

MEGESTROL ACETATE

Indications see notes above

Cautions see under Medroxyprogesterone acetate (section 6.4.1.2) and notes above; **interactions:** Appendix 1 (progestogens)

Contra-indications see under Medroxyprogesterone acetate (section 6.4.1.2) and notes above

Hepatic impairment manufacturer advises caution in severe impairment

Pregnancy avoid; reversible feminisation of male fetuses reported in *animal* studies; risk of hypospadias in male fetuses and masculinisation of female fetuses

Breast-feeding discontinue breast-feeding

Side-effects see under Medroxyprogesterone acetate (section 6.4.1.2) and notes above; vomiting, constipation, diarrhoea, carpal tunnel syndrome, adrenal insufficiency. Cushing's syndrome, urinary frequency, tumour flare (with or without hypercalcaemia), and asthenia

Dose

- Breast cancer, 160 mg once daily

Megace® (Bristol-Myers Squibb) PoM

Tablets, scored, megestrol acetate 160 mg (off-white), 30-tab pack = £19.52

NORETHISTERONE

Indications see notes above; other indications (section 6.4.1.2)

Cautions see section 6.4.1.2 and notes above; **interactions:** Appendix 1 (progestogens)

Contra-indications see section 6.4.1.2 and notes above

Hepatic impairment avoid; see also oral Progestogen-only Contraceptives (section 7.3.2.1)

Pregnancy masculinisation of female fetuses and other defects reported; see also oral Progestogen-only Contraceptives (section 7.3.2.1)

Breast-feeding higher doses may suppress lactation and alter milk composition—use lowest effective dose; see also oral Progestogen-only Contraceptives (section 7.3.2.1)

Side-effects see section 6.4.1.2 and notes above

Dose

- Breast cancer, 40 mg daily, increased to 60 mg daily if required

Preparations

Section 6.4.1.2

8.3.3 Androgens

Testosterone esters (section 6.4.2) have largely been superseded by other drugs for breast cancer.

8.3.4 Hormone antagonists

8.3.4.1 Breast cancer

The management of patients with breast cancer involves surgery, radiotherapy, drug therapy, or a combination of these.

For operable breast cancer, treatment before surgery (neoadjuvant therapy) reduces the size of the tumour and facilitates breast-conserving surgery; hormone antagonist therapy (e.g. letrozole) is chosen for steroid hormone-receptor-positive breast cancer and chemotherapy for steroid hormone-receptor-negative tumours or for younger women.

Early breast cancer All women should be considered for adjuvant therapy following surgical removal of the tumour. Adjuvant therapy is used to eradicate the micrometastases that cause relapses. Choice of adjuvant treatment is determined by the risk of recurrence, steroid hormone-receptor status of the primary tumour, and menopausal status.

Adjuvant therapy comprises cytotoxic chemotherapy and hormone-antagonist therapy. Women with steroid hormone-receptor-positive breast cancer are considered for hormone-antagonist therapy (preceded by cytotoxic chemotherapy if necessary) whilst women with steroid hormone-receptor-negative breast cancer should be considered for cytotoxic chemotherapy.

Aromatase inhibitors act predominantly by blocking the conversion of androgens to oestrogens in the peripheral tissues. They do not inhibit ovarian oestrogen synthesis and should not be used in premenopausal women. **Anastrozole** and **letrozole** are non-steroidal aromatase inhibitors; **exemestane** is a steroidal aromatase inhibitor. Aromatase inhibitors are usually prescribed as initial adjuvant therapy in postmenopausal women with oestrogen-receptor-positive tumours; tamoxifen, an oestrogen-receptor antagonist, is used if an aromatase inhibitor is not appropriate. Adjuvant hormone antagonist therapy should generally be continued for 5 years following removal of the tumour. In postmenopausal women considered for extended adjuvant therapy, 5 years of tamoxifen is followed by letrozole for a further 2–3 years.

Trastuzumab (section 8.1.5) is licensed for use in early breast cancer which overexpresses human epidermal growth factor-2 (HER2) in women who have received surgery, chemotherapy and radiotherapy (as appropriate).

Premenopausal women with oestrogen-receptor-positive breast cancer who decline chemotherapy may benefit from treatment with goserelin (section 8.3.4.2) or ovarian ablation.

Advanced breast cancer Treatment of advanced breast cancer depends on the patient's drug history and an assessment of disease severity. Aromatase inhibitors, such as anastrozole or letrozole, are the preferred treatment in postmenopausal women with oestrogen-receptor-positive advanced breast cancer, a long disease-free interval following treatment for early breast cancer, and disease limited to bone or soft tissues; tamoxifen can be used if aromatase inhibitors are not suitable. Progestogens, such as medroxyprogesterone acetate (section 8.3.2), may be used after aromatase inhibitors and tamoxifen in postmenopausal women.

Tamoxifen should be considered for pre- and perimenopausal women with oestrogen-receptor-positive breast cancer not previously treated with tamoxifen. Ovarian suppression is used in pre- and perimenopausal women who have had disease progression despite treatment with tamoxifen. The gonadorelin analogue goserelin (section 8.3.4.2) is licensed for advanced breast cancer in pre- and perimenopausal women suitable for hormone manipulation.

Trastuzumab emtansine can be used alone for treating HER2-positive, unresectable, locally advanced breast cancer previously treated with trastuzumab and a taxane, or when there is disease recurrence during or following adjuvant therapy (section 8.1.5).

Cytotoxic chemotherapy is indicated for advanced steroid hormone-receptor-negative tumours and for aggressive disease, particularly when metastases involve visceral sites (e.g. the liver) or if the disease-free interval following treatment for early breast cancer is short.

Cytotoxic drugs used in breast cancer An anthracycline combined with fluorouracil (section 8.1.3) and cyclophosphamide (section 8.1.1), and sometimes also with methotrexate (section 8.1.3) is effective. Cyclophosphamide, methotrexate, and fluorouracil can be useful if an anthracycline is inappropriate (e.g. in cardiac disease).

Metastatic disease The choice of chemotherapy regimen will be influenced by whether the patient has previously received adjuvant treatment and the presence of any co-morbidity.

For women who have not previously received chemotherapy, an anthracycline (such as doxorubicin or epirubicin) alone or in combination with another cytotoxic drug is the standard initial therapy for metastatic breast disease.

Patients with anthracycline-refractory or resistant disease should be considered for treatment with a taxane (section 8.1.5) either alone or in combination with trastuzumab if they have tumours that overexpress HER2. Other cytotoxic drugs with activity against breast cancer include capecitabine (section 8.1.3), mitoxantrone, mitomycin (both section 8.1.2), and vinorelbine (section 8.1.4). Trastuzumab alone (section 8.1.5) is an option for chemotherapy-resistant cancers that overexpress HER2. Trastuzumab emtansine can be used as monotherapy in HER2-positive metastatic breast cancer previously treated with trastuzumab and a taxane, or when there is disease recurrence during or following adjuvant therapy (section 8.1.5). Trastuzumab and trastuzumab emtansine are **not** interchangeable.

The use of **bisphosphonates** (section 6.6.2) in patients with metastatic breast cancer may reduce pain and prevent skeletal complications of bone metastases.

ANASTROZOLE

Indications adjuvant treatment of oestrogen-receptor-positive early invasive breast cancer in postmenopausal women; adjuvant treatment of oestrogen-receptor-positive early breast cancer in postmenopausal women following 2–3 years of tamoxifen therapy; advanced breast cancer in postmenopausal women which is oestrogen-receptor-positive or responsive to tamoxifen

Cautions laboratory test for menopause if doubt; susceptibility to osteoporosis (assess bone mineral density before treatment and at regular intervals)

Contra-indications not for premenopausal women

Hepatic impairment avoid in moderate to severe impairment

Renal impairment avoid if creatinine clearance less than 20 mL/minute

Pregnancy avoid

Breast-feeding avoid

Side-effects hot flushes, vaginal dryness, vaginal bleeding, hair thinning, anorexia, nausea, vomiting, diarrhoea, headache, arthralgia, arthritis, bone fractures, bone pain, rash (including Stevens-Johnson syndrome), cutaneous vasculitis; asthenia and drowsiness—may initially affect ability to drive or operate machinery; slight increases in total cholesterol levels reported; very rarely allergic reactions including angioedema and anaphylaxis

Dose

- 1 mg daily

Anastrozole (Non-proprietary) PoM

Tablets, anastrozole 1 mg, net price 28-tab pack = £1.80

Brands include *Nastrosa*®

Arimidex® (AstraZeneca) PoM

Tablets, f/c, anastrozole 1 mg, net price 28-tab pack = £68.56

The *Scottish Medicines Consortium* (p. 4) has advised (August 2005 and October 2006) that anastrozole (*Arimidex*®) is accepted for restricted use within NHS Scotland, within the licensed indications, for early breast cancer and early invasive breast cancer.

EXEMESTANE

Indications adjuvant treatment of oestrogen-receptor-positive early breast cancer in postmenopausal women following 2–3 years of tamoxifen therapy; advanced breast cancer in postmenopausal women in whom anti-oestrogen therapy has failed

Cautions **interactions:** Appendix 1 (exemestane)

Contra-indications not indicated for premenopausal women

Hepatic impairment manufacturer advises caution

Renal impairment manufacturer advises caution

Pregnancy avoid

Breast-feeding avoid

Side-effects nausea, vomiting, abdominal pain, dyspepsia, constipation, anorexia; dizziness, fatigue, headache, depression, insomnia; hot flushes, sweating; alopecia, rash; *less commonly* drowsiness, asthenia, and peripheral oedema; *rarely* thrombocytopenia, leucopenia

Dose

- 25 mg daily

Aromasin® (Pharmacia) PoM

Tablets, s/c, exemestane 25 mg, net price 30-tab pack = £88.80, 90-tab pack = £266.40. Label: 21

The *Scottish Medicines Consortium* (p. 4) has advised (October 2005) that exemestane (*Aromasin*®) is accepted for restricted use within NHS Scotland as an adjuvant treatment in postmenopausal women with oestrogen-receptor-positive invasive early breast cancer, following 2–3 years of initial adjuvant tamoxifen therapy.

FULVESTRANT

Indications treatment of oestrogen-receptor-positive metastatic or locally advanced breast cancer in postmenopausal women in whom disease progresses or relapses while on, or after, other anti-oestrogen therapy

Hepatic impairment manufacturer advises caution in mild to moderate impairment; avoid in severe impairment

Renal impairment manufacturer advises caution if creatinine clearance less than 30 mL/minute—no information available

Pregnancy manufacturer advises avoid—increased incidence of fetal abnormalities and death in *animal* studies

Breast-feeding manufacturer advises avoid—present in milk in *animal* studies

Side-effects nausea, vomiting, diarrhoea; venous thromboembolism; anorexia, headache, asthenia; urinary-tract infections; hot flushes; back pain; rash, injection-site reactions, hypersensitivity reactions; *less commonly* vaginal haemorrhage, vaginal candidiasis, and leucorrhoea

Dose

- By deep intramuscular injection into buttock, 500 mg every 2 weeks for the first 3 doses, then 500 mg every month

  Note 500 mg dose should be administered as one 250-mg injection (slowly over 1–2 minutes) into each buttock

Faslodex® (AstraZeneca) PoM

Injection (oily), fulvestrant 50 mg/mL, net price 2 × 5-mL (250-mg) prefilled syringe = £522.41

LETROZOLE

Indications first-line treatment in postmenopausal women with hormone-dependent advanced breast cancer; adjuvant treatment of oestrogen-receptor-positive invasive early breast cancer in postmenopausal women; advanced breast cancer in postmenopausal women (naturally or artificially induced menopause) in whom other anti-oestrogen therapy has failed; extended adjuvant treatment of hormone-dependent invasive breast cancer in postmenopausal women who have received standard adjuvant tamoxifen therapy for 5 years; neo-adjuvant treatment in postmenopausal women with localised hormone-receptor-positive, human epidermal growth factor-2 negative breast cancer where chemotherapy is not suitable and surgery not yet indicated

Cautions susceptibility to osteoporosis (assess bone mineral density before treatment and at regular intervals)

Contra-indications not indicated for premenopausal women

Hepatic impairment manufacturer advises caution in severe impairment

Renal impairment manufacturer advises caution if creatinine clearance less than 10 mL/minute

Pregnancy avoid (isolated cases of birth defects reported); manufacturer advises effective contraception required until postmenopausal status fully established (return of ovarian function reported in postmenopausal women)

Breast-feeding manufacturer advises avoid

Side-effects nausea, vomiting, abdominal pain, hypertension, hot flushes, fatigue, dizziness, headache, dyspepsia, constipation, diarrhoea, depression, anorexia, appetite increase, weight changes, vaginal bleeding, hypercholesterolaemia, alopecia, increased sweating, rash, dry skin, peripheral oedema, arthralgia, musculoskeletal pain, osteoporosis, bone fracture; *less commonly* cerebrovascular events, cardiac events, palpitation, tachycardia, dyspnoea, cough, insomnia, anxiety, memory impairment, dysaesthesia, taste disturbance, pruritus, urticaria, thrombophlebitis, urinary frequency, urinary-tract infection, vaginal discharge, breast pain, pyrexia, mucosal dryness, stomatitis, cataract, eye irritation, blurred vision, tumour pain, arthritis, leucopenia, general oedema; *rarely* pulmonary embolism, arterial thrombosis; *also reported* hepatitis, toxic epidermal necrolysis

Dose

- 2.5 mg daily

Letrozole (Non-proprietary) PoM

Tablets, letrozole 2.5 mg, net price 14-tab pack = £1.63, 28-tab pack = £3.26

Femara® (Novartis) PoM

Tablets, f/c, letrozole 2.5 mg. Net price 14-tab pack = £49.90, 28-tab pack = £84.86

TAMOXIFEN

Indications see under Dose and notes above; mastalgia [unlicensed indication] (section 6.7.2)

Cautions occasional cystic ovarian swellings in premenopausal women; increased risk of thromboembolic events, especially when used with cytotoxics (see also below); endometrial changes (**important:** see below); porphyria, **interactions:** Appendix 1 (tamoxifen)

Endometrial changes Increased endometrial changes, including hyperplasia, polyps, cancer, and uterine sarcoma reported; prompt investigation required if abnormal vaginal bleeding including menstrual irregularities, vaginal discharge, and pelvic pain or pressure in those receiving (or who have received) tamoxifen. Patients should be informed of the risk of endometrial cancer and told to report relevant symptoms promptly

Contra-indications treatment of infertility contra-indicated if personal or family history of idiopathic venous thromboembolism or genetic predisposition to thromboembolism

Pregnancy avoid—possible effects on fetal development; effective contraception must be used during treatment and for 2 months after stopping

Breast-feeding suppresses lactation; avoid unless potential benefit outweighs risk

Side-effects hot flushes, vaginal bleeding and vaginal discharge (**important:** see also Endometrial Changes under Cautions), suppression of menstruation in some premenopausal women, pruritus vulvae, gastrointestinal disturbances, headache, light-headedness, tumour flare, decreased platelet counts; occasionally oedema, rarely hypercalcaemia if bony metastases, alopecia, rashes, uterine fibroids; also visual disturbances (including corneal changes, cataracts, retinopathy); leucopenia (sometimes with anaemia and thrombocytopenia), rarely neutropenia; hypertriglyceridaemia reported rarely (sometimes with pancreatitis); thromboembolic events reported (see below); liver enzyme changes (rarely fatty liver, cholestasis, hepatitis); rarely interstitial pneumonitis, hypersensitivity reactions including angioedema, Stevens-Johnson syndrome, bullous pemphigoid; see also notes above

Risk of thromboembolism Tamoxifen can increase the risk of thromboembolism particularly during and immediately after major surgery or periods of immobility (consider interrupting treatment to initiate anticoagulant measures). Patients should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness and any pain in the calf of one leg

Dose

- Breast cancer, 20 mg daily
- Anovulatory infertility, 20 mg daily on days 2, 3, 4 and 5 of cycle; if necessary the daily dose may be increased to 40 mg then 80 mg for subsequent courses; if cycles irregular, start initial course on any day, with subsequent course starting 45 days later *or* on day 2 of cycle if menstruation occurs

Tamoxifen (Non-proprietary) PoM

Tablets, tamoxifen (as citrate) 10 mg, net price 30-tab pack = £22.89; 20 mg, 30-tab pack = £2.06; 40 mg, 30-tab pack = £16.70

Oral solution, tamoxifen (as citrate) 10 mg/5 mL, net price 150 mL = £29.61

Brands include *Soltamox®*

TOREMIFENE

Indications hormone-dependent metastatic breast cancer in postmenopausal women

Cautions hypercalcaemia may occur (especially if bone metastases and usually at beginning of treatment); avoid in acute porphyria (but see section 9.8.2); history of severe thromboembolic disease; **interactions:** Appendix 1 (toremifene)

Endometrial changes Increased endometrial changes, including hyperplasia, polyps and cancer reported. Abnormal vaginal bleeding including menstrual irregularities, vaginal discharge and symptoms such as pelvic pain or pressure should be promptly investigated

Contra-indications endometrial hyperplasia, QT prolongation (avoid concomitant administration of drugs that prolong QT interval), electrolyte disturbances (particularly uncorrected hypokalaemia), bradycardia, heart failure with reduced left-ventricular ejection fraction, history of arrhythmias

Hepatic impairment elimination decreased in hepatic impairment—avoid if severe

Pregnancy avoid

Breast-feeding avoid

Side-effects nausea, vomiting; oedema; depression, dizziness, fatigue; sweating, hot flushes, vaginal bleeding or discharge (**important:** see Cautions); rash; *less commonly* anorexia, constipation, increased weight, thromboembolic events, dyspnoea, insomnia, headache, endometrial hypertrophy; *very rarely* jaundice, transient corneal opacity, and alopecia

Dose

- 60 mg daily

Fareston® (Orion) PoM

Tablets, toremifene (as citrate) 60 mg. Net price 30-tab pack = £29.08

8.3.4.2 Gonadorelin analogues and gonadotrophin-releasing hormone antagonists

Metastatic cancer of the prostate usually responds to hormonal treatment aimed at androgen depletion. Standard treatments include bilateral subcapsular orchidectomy or use of a gonadorelin analogue (**buserelin**, **goserelin**, **histrelin**, **leuprorelin**, or **triptorelin**). The gonadotrophin-releasing hormone antagonist, **degarelix**, (p. 643) is also available. Response in most patients lasts for 12 to 18 months. No entirely satisfactory therapy exists for disease progression despite this treatment (hormone-refractory prostate cancer), but occasional patients respond to other hormone manipulation e.g. with an anti-androgen. Bone disease can often be palliated with irradiation or, if widespread, with strontium or prednisolone (section 6.3.2).

Gonadorelin analogues

Gonadorelin analogues are as effective as orchidectomy or **diethylstilbestrol** (section 8.3.1) but are expensive and require parenteral administration, at least initially. They cause initial stimulation then depression of luteinising hormone release by the pituitary. During the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour 'flare' may cause spinal cord compression, ureteric obstruction or increased bone pain. When such problems are anticipated, alternative treatments (e.g. orchidectomy) or concomitant use of an anti-androgen such as cyproterone acetate or flutamide (see below) are recommended; anti-androgen treatment should be started before the gonadorelin analogue. Gonadorelin analogues are also used in women for breast cancer (section 8.3.4.1) and other indications (section 6.7.2).

The *Scottish Medicines Consortium* (p. 4) has advised (June 2009) that histrelin (*Vantas*®) is accepted for restricted use within NHS Scotland for the palliative treatment of advanced prostate cancer in patients with an anticipated life expectancy of at least one year in whom annual administration will offer advantages.

Cautions Men at risk of tumour 'flare' (see above) should be monitored closely during the first month of therapy. Caution is required in patients with metabolic bone disease because reduced bone mineral density can occur. The injection site should be rotated.

Side-effects The gonadorelin analogues cause side-effects similar to the menopause in women and orchidectomy in men and include hot flushes and sweating, sexual dysfunction, vaginal dryness or bleeding, and gynaecomastia or changes in breast size. Signs and symptoms of prostate or breast cancer may worsen initially (managed in prostate cancer with anti-androgens, see above). Other side-effects include hypersensitivity reactions (rashes, pruritus, asthma, and rarely anaphylaxis), injection site reactions (see Cautions), headache (rarely migraine), visual disturbances, dizziness, arthralgia and possibly myalgia, hair loss, peripheral oedema, gastro-intestinal disturbances, weight changes, sleep disorders, and mood changes.

BUSERELIN

Indications advanced prostate cancer; other indications (section 6.7.2)

Cautions diabetes, hypertension, depression; see also notes above

Side-effects see notes above; worsening hypertension, palpitation, glucose intolerance, altered blood lipids, thrombocytopenia, leucopenia, nervousness, fatigue, memory and concentration disturbances, anxiety, increased thirst, hearing disorders, musculoskeletal pain; nasal irritation, nose bleeds and altered sense of taste and smell (spray formulation only)

Dose

- By subcutaneous injection, 500 micrograms every 8 hours for 7 days, then intranasally, 1 spray into each nostril 6 times daily (see also notes above)
  Counselling Avoid use of nasal decongestants before and for at least 30 minutes after treatment.

Suprefact® (Sanofi-Aventis) PoM

Injection, buserelin (as acetate) 1 mg/mL. Net price 2 × 5.5-mL vial = £28.64

Nasal spray, buserelin (as acetate) 100 micrograms/metered spray. Net price treatment pack of 4 × 10-g bottle with spray pump = £101.87. Counselling, see above

GOSERELIN

Indications locally advanced prostate cancer as an alternative to surgical castration; adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer; neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer; metastatic prostate cancer; advanced breast cancer; oestrogen-receptor-positive early breast cancer (section 8.3.4.1); endometriosis, endometrial thinning, uterine fibroids, assisted reproduction (section 6.7.2)

Cautions see notes above; diabetes; hypertension; depression; risk of ureteric obstruction and spinal cord compression in men

Contra-indications undiagnosed vaginal bleeding

Pregnancy see Goserelin, section 6.7.2

Breast-feeding see Goserelin, section 6.7.2

Side-effects see notes above; also transient changes in blood pressure, heart failure, myocardial infarction; paraesthesia; *rarely* hypercalcaemia (in patients with metastatic breast cancer)

Dose

- See under preparations below

Zoladex® (AstraZeneca) PoM

Implant, goserelin (as acetate) 3.6 mg in *SafeSystem*® syringe applicator, net price each = £65.00

Dose breast cancer and prostate cancer (see indications above) by subcutaneous injection into anterior abdominal wall, 3.6 mg every 28 days

Zoladex® LA (AstraZeneca) PoM

Implant, goserelin (as acetate) 10.8 mg in *SafeSystem*® syringe applicator, net price each = £235.00

Dose prostate cancer (see indications above), by subcutaneous injection into anterior abdominal wall, 10.8 mg every 12 weeks

HISTRELIN

Indications advanced prostate cancer

Cautions see notes above; monitor patients at high risk of metabolic disease (e.g. bone disease, worsening diabetes) or cardiovascular disease before and during treatment; risk of ureteric obstruction and spinal cord compression

Side-effects see notes above; also hepatic disorder, dyspnoea, depression, asthenia, elevated blood glucose-concentration, increased urinary frequency, hypertrichosis; *less commonly* hypercholesterolaemia, palpitation, ventricular extrasystole, haematoma, tremor, anaemia, renal failure, nephrolithiasis, hypercalcaemia

Dose

- By subcutaneous implantation into upper arm, 1 implant (50 mg) every 12 months; remove after 12 months of treatment

  Counselling Avoid wetting arm containing implant for 24 hours and avoid lifting heavy objects or strenuous physical activity for 7 days after implantation

Vantas® (Orion) PoM

Implant, histrelin (as acetate) 50 mg, net price 1 pack (containing implantation device and implant) = £990.00

LEUPRORELIN ACETATE

Indications locally advanced prostate cancer as an alternative to surgical castration; adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer; metastatic prostate cancer; endometriosis, endometrial thinning, uterine fibroids (section 6.7.2)

Cautions see notes above and section 6.7.2; risk of ureteric obstruction and spinal cord compression in men

Side-effects see notes above and section 6.7.2; also fatigue, muscle weakness, depression, paraesthesia, hypertension, palpitation, alteration of glucose tolerance and of blood lipids; hypotension, jaundice, thrombocytopenia and leucopenia reported

Dose

- See under preparations below

Prostap® SR DCS (Takeda) PoM

Injection, dual-chamber prefilled syringe containing powder for reconstitution, leuprorelin acetate and solvent, net price 3.75-mg prefilled syringe = £75.24

Dose prostate cancer (see indications), by subcutaneous *or* by intramuscular injection, 3.75 mg every month

Prostap® 3 DCS (Takeda) PoM

Injection, dual-chamber prefilled syringe containing powder for reconstitution, leuprorelin acetate and solvent, net price 11.25-mg prefilled syringe = £225.72

Dose prostate cancer (see indications), by subcutaneous injection, 11.25 mg every three months

TRIPTORELIN

Indications prostate cancer; endometriosis, precocious puberty, reduction in size of uterine fibroids; male hypersexuality with severe sexual deviation (section 6.7.2)

Cautions see notes above; risk of ureteric obstruction and spinal cord compression in men; risk factors for osteoporosis

Side-effects see notes above; also dry mouth, transient hypertension, paraesthesia, and increased dysuria

Dose

- See under preparations below

Decapeptyl® SR (Ipsen) PoM

Injection (powder for suspension), triptorelin (as acetate), net price 3-mg vial (with diluent) = £69.00

Dose locally advanced non-metastatic prostate cancer as an alternative to surgical castration, metastatic prostate cancer, as an adjuvant treatment to radiotherapy in high-risk localised or locally advanced prostate cancer, as neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer, as an adjuvant treatment to radical prostatectomy in patients with locally advanced prostate cancer at high risk of disease progression, by intramuscular injection, 3 mg every 4 weeks

Note Each vial includes an overage to allow accurate administration of a 3-mg dose

Injection (powder for suspension), triptorelin (as acetate), net price 11.25-mg vial (with diluent) = £207.00

Dose locally advanced non-metastatic prostate cancer as an alternative to surgical castration, metastatic prostate cancer, as an adjuvant treatment to radiotherapy in high-risk localised or locally advanced prostate cancer, as neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer, as an adjuvant treatment to radical prostatectomy in patients with locally advanced prostate cancer at high risk of disease progression, by intramuscular injection, 11.25 mg every 3 months (see also notes above)

Note Each vial includes an overage to allow accurate administration of an 11.25-mg dose

Injection (powder for suspension), triptorelin (as pamoate), net price 22.5-mg vial (with diluent) = £414.00

Dose locally advanced non-metastatic prostate cancer as an alternative to surgical castration, metastatic prostate cancer, as an adjuvant treatment to radiotherapy in high-risk localised or locally advanced prostate cancer, as neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer, as an adjuvant treatment to radical prostatectomy in patients with locally advanced prostate cancer at high risk of disease progression, by intramuscular injection, 22.5 mg every 6 months (see also notes above)

Note Each vial includes an overage to allow accurate administration of a 22.5-mg dose

Gonapeptyl Depot® (Ferring) PoM

Injection (powder for suspension), triptorelin (as acetate), net price 3.75-mg prefilled syringe (with prefilled syringe of vehicle) = £81.69

Dose advanced prostate cancer, by subcutaneous *or* deep intramuscular injection, 3.75 mg every 4 weeks (see also notes above)

Anti-androgens

Cyproterone acetate, **flutamide** and **bicalutamide** are anti-androgens that inhibit the tumour 'flare' which may occur after commencing gonadorelin analogue administration. Cyproterone acetate and flutamide are also licensed for use alone in patients with metastatic prostate cancer refractory to gonadorelin analogue therapy. Bicalutamide is used for prostate cancer either alone or as an adjunct to other therapy, according to the clinical circumstances.

Abiraterone (in combination with prednisone or prednisolone) and **enzalutamide** are licensed for metastatic castration-resistant prostate cancer in patients whose disease has progressed during or after treatment with a docetaxel-containing chemotherapy regimen. Abirater-

one is also used to treat metastatic castration-resistant prostate cancer in patients who are asymptomatic or mildly symptomatic after failure of androgen deprivation therapy in whom chemotherapy is not yet clinically indicated. Medical castration with a luteinising hormone-releasing hormone analogue should be continued during treatment with abiraterone in patients not surgically castrated.

The *Scottish Medicines Consortium* (p. 4) has advised (July 2012) that abiraterone (*Zytiga*®), in combination with prednisone or prednisolone, is accepted for restricted use within NHS Scotland for the treatment of metastatic castration-resistant prostate cancer in patients whose disease has progressed during or after treatment with docetaxel-containing chemotherapy regimen, and have received only one prior chemotherapy regimen.

NICE guidance

Abiraterone for castration-resistant metastatic prostate cancer previously treated with a docetaxel-containing regimen (June 2012)

Abiraterone in combination with prednisone or prednisolone is recommended as an option for the treatment of castration-resistant metastatic prostate cancer only if:

- their disease has progressed on or after one docetaxel-containing chemotherapy regimen, **and**
- the manufacturer provides abiraterone with the discount agreed in the patient access scheme.

Patients currently receiving abiraterone in combination with prednisone or prednisolone whose disease does not meet the first criteria should be able to continue therapy until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA259

ABIRATERONE ACETATE

Indications see notes above

Cautions monitor blood pressure, serum potassium concentration, and fluid balance before treatment, and at least monthly during treatment—consult product literature for management of hypertension, hypokalaemia and oedema; history of cardiovascular disease—correct hypertension and hypokalaemia before treatment (if significant risk of congestive heart failure, such as history of cardiac failure, uncontrolled hypertension or cardiac events, consult product literature for management and increased monitoring); diabetes (increased risk of hyperglycaemia—monitor blood sugar frequently); concurrent chemotherapy—safety and efficacy not established; increased risk of myopathy and rhabdomyolysis with possible renal failure—caution with concomitant use of drugs known to be associated with myopathy or rhabdomyolysis; monitor liver function before treatment, then every 2 weeks for the first 3 months of treatment, then monthly thereafter—interrupt treatment if serum alanine aminotransferase or aspartate aminotransferase greater than 5 times the upper limit (consult product literature for details of restarting treatment at a lower dose) and discontinue permanently if 20 times the upper limit; **interactions**: Appendix 1 (abiraterone)

Hepatic impairment use with caution in moderate impairment and only if benefit clearly outweighs risk; avoid in severe impairment; see also Cautions

Renal impairment use with caution in severe impairment—no information available

Pregnancy men should use condoms if their partner is pregnant, and use condoms in combination with another effective contraceptive method if their partner is of child-bearing potential—toxicity in *animal* studies

Side-effects diarrhoea, dyspepsia, hepatotoxicity (see under Cautions, above), hypertension, hypertriglyceridaemia, heart failure, angina, arrhythmia, atrial fibrillation, tachycardia, peripheral oedema, urinary tract infection, haematuria, hypokalaemia, fractures, rash; *less commonly* adrenal insufficiency, myopathy, rhabdomyolysis

Dose

- 1 g once daily

Note Consult product literature for dose of concurrent prednisone or prednisolone

Zytiga® (Janssen) ▼ PoM

Tablets, abiraterone actetate 250 mg, net price 120-tab pack = £2930.00. Label: 23

BICALUTAMIDE

Indications locally advanced prostate cancer at high risk of disease progression, either alone or as adjuvant treatment to prostatectomy or radiotherapy; locally advanced, non-metastatic prostate cancer when surgical castration or other medical intervention inappropriate; advanced prostate cancer in combination with gonadorelin analogue or surgical castration

Cautions consider periodic liver function tests; **interactions:** Appendix 1 (bicalutamide)

Hepatic impairment increased accumulation possible in moderate to severe impairment

Side-effects nausea, diarrhoea, cholestasis, jaundice; asthenia, weight gain; gynaecomastia, breast tenderness, hot flushes, impotence, decreased libido; anaemia; alopecia, dry skin, hirsutism, pruritus; *less commonly* vomiting, abdominal pain, dyspepsia, interstitial lung disease, pulmonary fibrosis, depression, haematuria, thrombocytopenia, hypersensitivity reactions including angioneurotic oedema and urticaria; *rarely* cardiovascular disorders (including angina, heart failure, and arrhythmias), and hepatic failure

Dose

- Locally advanced prostate cancer at high risk of disease progression, 150 mg once daily
- Locally advanced, non-metastatic prostate cancer when surgical castration or other medical intervention inappropriate, 150 mg once daily
- Advanced prostate cancer, in combination with gonadorelin analogue or surgical castration, 50 mg once daily (started at the same time as surgical castration or at least 3 days before gonadorelin therapy, see also notes above)

Bicalutamide (Non-proprietary) PoM

Tablets, bicalutamide 50 mg, net price 28-tab pack = £2.31; 150 mg, 28-tab pack = £5.74

Casodex® (AstraZeneca) PoM

Tablets, f/c, bicalutamide 50 mg, net price 28-tab pack = £119.79; 150 mg, 28-tab pack = £240.00

CYPROTERONE ACETATE

Indications prostate cancer, see under Dose and also notes above; other indications, see section 6.4.2

Cautions in prostate cancer, blood counts initially and throughout treatment; monitor hepatic function (liver function tests should be performed before treatment, see also under Side-effects below); monitor adrenocortical function regularly; risk of recurrence of thromboembolic disease; diabetes mellitus, sickle-cell anaemia, severe depression (in other indications some of these are contra-indicated, see section 6.4.2)
Driving Fatigue and lassitude may impair performance of skilled tasks (e.g. driving)

Contra-indications patients with meningioma or history of meningioma; for contra-indications relating to other indications see section 6.4.2

Hepatic impairment dose-related toxicity; see also under cautions (above) and side-effects (below)

Side-effects see section 6.4.2
Hepatotoxicity Direct hepatic toxicity including jaundice, hepatitis and hepatic failure have been reported (fatalities reported at dosages of 100 mg and above, usually in men treated for advanced prostate cancer). Liver function tests should be performed before and regularly during treatment and whenever symptoms suggestive of hepatotoxicity occur—if confirmed cyproterone should normally be withdrawn unless the hepatotoxicity can be explained by another cause such as metastatic disease (in which case cyproterone should be continued only if the perceived benefit exceeds the risk)

Dose

- Prevention of flare with initial gonadorelin analogue therapy, 200 mg daily in 2–3 divided doses for 5–7 days before initiation of gonadorelin analogue, followed by 200 mg daily in 2–3 divided doses for 3–4 weeks after initiation of gonadorelin analogue; max. 300 mg daily
- Long-term palliative therapy where gonadorelin analogues or orchidectomy contra-indicated, not tolerated, or where oral therapy preferred, 200–300 mg daily in 2–3 divided doses
- Hot flushes with gonadorelin analogue therapy or after orchidectomy, initially 50 mg daily, adjusted according to response to 50–150 mg daily in 1–3 divided doses

Cyproterone Acetate (Non-proprietary) PoM
Tablets, cyproterone acetate 50 mg, net price 56-tab pack = £29.00; 100 mg, 84-tab pack = £55.19. Label: 21, counselling, driving

Cyprostat® (Bayer) PoM
Tablets, scored, cyproterone acetate 50 mg, net price 168-tab pack = £87.00; 100 mg, 84-tab pack = £87.00. Label: 21, counselling, driving

ENZALUTAMIDE

Indications metastatic castration-resistant prostate cancer in patients whose disease has progressed during or after docetaxel therapy

Cautions history or risk of seizure (including brain injury, stroke, brain tumours, brain metastases, alcoholism, concurrent use of medication which may lower seizure threshold); recent cardiovascular disease; bradycardia; uncontrolled hypertension; concurrent chemotherapy—safety and efficacy not established; **interactions:** Appendix 1 (enzalutamide)

Hepatic impairment manufacturer advises caution in moderate impairment, avoid in severe impairment

Renal impairment caution in severe impairment—no information available

Pregnancy men should use condoms during treatment and for 3 months after stopping treatment if their partner is pregnant, and use condoms in combination with another effective contraceptive method if their partner is of child-bearing potential—toxicity in *animal* studies

Side-effects hot flush, hypertension, headache, visual hallucinations, anxiety, cognitive disorder, memory impairment, falls, neutropenia, fractures, dry skin, pruritus; *less commonly* seizure, leucopenia

Dose

- 160 mg once daily

Xtandi® (Astellas) ▼ PoM
Capsules, enzalutamide 40 mg, net price 112-cap pack = £2734.67. Label: 25

FLUTAMIDE

Indications advanced prostate cancer, see also notes above

Cautions cardiac disease (oedema reported); also liver function tests, monthly for first 4 months, periodically thereafter and at the first sign or symptom of liver disorder (e.g. pruritus, dark urine, persistent anorexia, jaundice, abdominal pain, unexplained influenza-like symptoms); avoid excessive alcohol consumption; avoid in acute porphyria (section 9.8.2); **interactions:** Appendix 1 (flutamide)

Hepatic impairment use with caution (hepatotoxic)

Side-effects gynaecomastia (sometimes with galactorrhoea); nausea, vomiting, diarrhoea, increased appetite, insomnia, tiredness; other side-effects reported include decreased libido, reduced sperm count, gastric and chest pain, hypertension, headache, dizziness, oedema, blurred vision, thirst, rash, pruritus, haemolytic anaemia, systemic lupus erythematosus-like syndrome, and lymphoedema; hepatic injury (with transaminase abnormalities, cholestatic jaundice, hepatic necrosis, hepatic encephalopathy and occasional fatality) reported

Dose

- 250 mg 3 times daily (see also notes above)

Flutamide (Non-proprietary) PoM
Tablets, flutamide 250 mg. Net price 84-tab pack = £49.38

Gonadotrophin-releasing hormone antagonists

Degarelix is a gonadotrophin-releasing hormone antagonist used to treat advanced hormone-dependent prostate cancer. It does not induce a testosterone surge or tumour 'flare', therefore anti-androgen therapy is not required.

DEGARELIX

Indications see notes above

Cautions susceptibility to QT-interval prolongation (avoid concomitant use of drugs that prolong QT interval); monitor bone density; diabetes

Hepatic impairment manufacturer advises caution in severe impairment—no information available

Renal impairment manufacturer advises caution in severe impairment—no information available

Side-effects nausea; dizziness, headache, drowsiness, insomnia, asthenia; influenza-like symptoms; hot flushes, sweating (including night sweats), weight gain; injection-site reactions; *less commonly* diarrhoea, vomiting, abdominal discomfort, dry mouth, constipation, anorexia, atrio-ventricular block, QT-interval prolongation, fainting, hypertension, hypersensitivity reactions, depression, anxiety, oedema, gynaecomastia, micturition urgency, renal impairment, sexual dysfunction, pelvic pain, prostatitis, testicular pain, anaemia, musculoskeletal pain, tinnitus, urticaria, alopecia, and rash

Dose

- By subcutaneous injection into the abdominal region, ADULT over 18 years, initially 240 mg (administered as 2 injections of 120 mg), then 80 mg every 28 days

Firmagon® (Ferring) PoM

Injection, powder for reconstitution, degarelix (as acetate), net price 80-mg vial (with diluent) = £129.37; 2 × 120-mg vials (with diluent) = £260.00

8.3.4.3 Somatostatin analogues

Lanreotide, **octreotide** and **pasireotide** are analogues of the hypothalamic release-inhibiting hormone somatostatin. Lanreotide and octreotide are indicated for the relief of symptoms associated with neuroendocrine (particularly carcinoid) tumours and acromegaly. Additionally, lanreotide is licensed for the treatment of thyroid tumours and octreotide is also licensed for the prevention of complications following pancreatic surgery. Octreotide long-acting depot injection is licensed for treatment of advanced neuroendocrine tumours of the midgut, or treatment where primary origin is not known but non-midgut sites of origin have been excluded. Octreotide may also be valuable in reducing vomiting in palliative care (see p. 23) and in stopping variceal bleeding [unlicensed indication]—see also vasopressin and terlipressin (section 6.5.2). Pasireotide is licensed for the treatment of Cushing's disease when surgery has failed or is inappropriate.

Cautions Growth hormone-secreting pituitary tumours can expand causing serious complications; during treatment with somatostatin analogues patients should be monitored for signs of tumour expansion (e.g. visual field defects). Ultrasound examination of the gallbladder is recommended before treatment and at intervals of 6–12 months during treatment (avoid abrupt withdrawal of short-acting octreotide—see Side-effects below). In insulinoma an increase in the depth and duration of hypoglycaemia may occur (observe patients when initiating treatment and changing doses); in diabetes mellitus, insulin or oral antidiabetic requirements may be reduced. Patients with carcinoid tumours must only receive lanreotide after excluding the presence of an obstructive intestinal tumour.

Side-effects Gastro-intestinal disturbances including anorexia, nausea, vomiting, abdominal pain and bloating, flatulence, diarrhoea, and steatorrhoea may occur (administering non-depot injections of octreotide between meals and at bedtime may reduce gastro-intestinal side-effects). Postprandial glucose tolerance may be impaired and rarely persistent hyperglycaemia occurs with chronic administration; hypoglycaemia has also been reported. Gallstones have been reported after long-term treatment (abrupt withdrawal of subcutaneous octreotide is associated with biliary colic and pancreatitis). Pain and irritation may occur at the injection site and sites should be rotated. Rarely, pancreatitis has been reported shortly after administration.

LANREOTIDE

Indications see notes above

Cautions see notes above; cardiac disorders (including bradycardia); **interactions:** Appendix 1 (lanreotide)

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Breast-feeding manufacturer advises caution—no information available

Side-effects see notes above; also reported constipation, dyspepsia, bradycardia, asthenia, dizziness, fatigue, raised bilirubin, biliary dilatation, alopecia; *less commonly* skin nodule, hot flushes, leg pain, malaise, headache, insomnia, tenesmus, decreased libido, drowsiness, pruritus, increased sweating; *rarely* hypothyroidism (monitor as necessary)

Dose

- See under preparations

Somatuline® LA (Ipsen) PoM

Injection (copolymer microparticles for aqueous suspension), lanreotide (as acetate) 30-mg vial (with vehicle) = £323.00

Dose by intramuscular injection, acromegaly and neuroendocrine (particularly carcinoid) tumours, initially 30 mg every 14 days, frequency increased to every 7–10 days according to response

Thyroid tumours, 30 mg every 14 days, frequency increased to every 10 days according to response

Somatuline Autogel® (Ipsen)

Injection, prefilled syringe, lanreotide (as acetate) 60 mg = £551.00; 90 mg = £736.00; 120 mg = £937.00

Dose by deep subcutaneous injection into the gluteal region, acromegaly (if somatostatin analogue not given previously), initially 60 mg every 28 days, adjusted according to response; for patients treated previously with somatostatin analogue, consult product literature for initial dose

Neuroendocrine (particularly carcinoid) tumours, initially 60–120 mg every 28 days, adjusted according to response

OCTREOTIDE

Indications see under Dose

Cautions see notes above; monitor thyroid function on long-term therapy; monitor liver function; **interactions:** Appendix 1 (octreotide)

Hepatic impairment adjustment of maintenance dose of non-depot preparations may be necessary in patients with liver cirrhosis

Pregnancy possible effect on fetal growth; manufacturer advises use only if potential benefit outweighs risk and effective contraception required during treatment

Breast-feeding manufacturer advises avoid—present in milk in *animal* studies

Side-effects see notes above; also arrhythmias, bradycardia, dyspnoea, headache, dizziness, dehydration, alopecia, rash; hepatitis also reported

Dose

- Symptoms associated with carcinoid tumours with features of carcinoid syndrome, VIPomas, glucagonomas, by subcutaneous injection, initially 50 micrograms once or twice daily, gradually increased

according to response to 200 micrograms 3 times daily (higher doses required exceptionally); maintenance doses variable; in carcinoid tumours discontinue after 1 week if no effect; if rapid response required, initial dose by intravenous injection (with ECG monitoring and after dilution to a concentration of 10–50% with sodium chloride 0.9% injection)

- Acromegaly, short-term treatment before pituitary surgery *or* long-term treatment in those inadequately controlled by other treatment *or* until radiotherapy becomes fully effective by subcutaneous injection, 100–200 micrograms 3 times daily; discontinue if no improvement within 3 months
- Prevention of complications following pancreatic surgery, consult product literature

Octreotide (Non-proprietary) PoM

Injection, octreotide (as acetate) 50 micrograms/mL, net price 1-mL amp = £3.72; 100 micrograms/mL, 1-mL amp = £6.53; 200 micrograms/mL, 5-mL vial = £65.10; 500 micrograms/mL, 1-mL amp = £33.87

Sandostatin® (Novartis) PoM

Injection, octreotide (as acetate) 50 micrograms/mL, net price 1-mL amp = £2.97; 100 micrograms/mL, 1-mL amp = £5.59; 200 micrograms/mL 5-mL vial = £55.73; 500 micrograms/mL, 1-mL amp = £27.09

Depot preparation

Sandostatin Lar® (Novartis) PoM

Injection (microsphere powder for aqueous suspension), octreotide (as acetate) 10-mg vial = £469.84; 20-mg vial = £776.05; 30-mg vial = £993.44 (all supplied with 2.5-mL diluent-filled syringe)

Dose acromegaly (test dose by subcutaneous injection 50–100 micrograms if subcutaneous octreotide not previously given), neuroendocrine (particularly carcinoid) tumour adequately controlled by subcutaneous octreotide, by deep intramuscular injection into gluteal muscle, initially 20 mg every 4 weeks for 3 months then adjusted according to response; max. 30 mg every 4 weeks

For acromegaly, start depot octreotide 1 day after the last dose of subcutaneous octreotide (for pituitary surgery give last dose of depot octreotide at least 3 weeks before surgery); for neuroendocrine tumours, continue subcutaneous octreotide for 2 weeks after first dose of depot octreotide

Advanced neuroendocrine tumours of the midgut, or tumours of unknown primary origin where non-midgut sites of origin have been excluded, 30 mg every 4 weeks

PASIREOTIDE

Indications see notes above

Cautions see notes above; diabetes mellitus (assess glycaemic status before treatment, weekly for the first 2–3 months of treatment, periodically thereafter, and 3 months after treatment is complete); monitor liver function before treatment and after 1, 2, 4, 8, and 12 weeks of treatment; cardiac disorders (including bradycardia); susceptibility to QT-interval prolongation (including concomitant use of drugs that prolong QT interval and electrolyte disturbances)—monitor ECG and electrolytes before treatment, after one week, and periodically thereafter; **interactions:** Appendix 1 (pasireotide)

Hepatic impairment reduce initial dose to 300 micrograms twice daily (increased if necessary after 2 months to max. 600 micrograms twice daily) in moderate impairment; avoid in severe impairment

Pregnancy avoid—toxicity in *animal* studies

Breast-feeding avoid—present in milk in *animal* studies

Side-effects see notes above; also bradycardia, QT-interval prolongation, hypotension, headache, fatigue, adrenal insufficiency, hyperglycaemia, decreased appetite, anaemia, alopecia, pruritus, myalgia, arthralgia

Dose

- By subcutaneous injection, ADULT over 18 years, initially 600 micrograms twice daily, increased if necessary after 2 months (according to response) to 900 micrograms twice daily; consider discontinuation if no response within 2 months; for dose adjustment due to side-effects, consult product literature

Signifor® (Novartis) ▼ PoM

Injection, pasireotide (as diaspartate) 300 micrograms/mL, net price 1-mL amp = £46.67; 600 micrograms/mL, 1-mL amp = £54.00; 900 micrograms/mL, 1-mL amp = £54.00

9 Nutrition and blood

9.1 Anaemias and some other blood disorders

Before initiating treatment for anaemia it is essential to determine which type is present. Iron salts may be harmful and result in iron overload if given alone to patients with anaemias other than those due to iron deficiency.

9.1.1 Iron-deficiency anaemias

Treatment with an iron preparation is justified only in the presence of a demonstrable iron-deficiency state. Before starting treatment, it is important to exclude any serious underlying cause of the anaemia (e.g. gastric erosion, gastro-intestinal cancer).

Prophylaxis with an iron preparation may be appropriate in malabsorption, menorrhagia, pregnancy, after subtotal or total gastrectomy, in haemodialysis patients, and in the management of low birth-weight infants such as preterm neonates.

9.1.1.1 Oral iron

Iron salts should be given by mouth unless there are good reasons for using another route.

Ferrous salts show only marginal differences between one another in efficiency of absorption of iron. Haemoglobin regeneration rate is little affected by the type of salt used provided sufficient iron is given, and in most patients the speed of response is not critical. Choice of

preparation is thus usually decided by the incidence of side-effects and cost.

The oral dose of **elemental iron** for iron-deficiency anaemia should be 100 to 200 mg daily. It is customary to give this as **dried ferrous sulfate**, 200 mg (≡ 65 mg elemental iron) three times daily; for prophylaxis of iron-deficiency anaemia, a dose of ferrous sulfate 200 mg once or twice daily may be effective. For treatment of iron-deficiency anaemia in children and for prophylaxis of iron-deficiency anaemia in babies of low birth weight, see *BNF for Children*.

Iron content of different iron salts

Iron salt	Amount	Content of ferrous iron
Ferrous fumarate	200 mg	65 mg
Ferrous gluconate	300 mg	35 mg
Ferrous sulfate	300 mg	60 mg
Ferrous sulfate, dried	200 mg	65 mg

Therapeutic response The haemoglobin concentration should rise by about 100–200 mg/100 mL (1–2 g/litre) per day *or* 2 g/100 mL (20 g/litre) over 3–4 weeks. When the haemoglobin is in the reference range, treatment should be continued for a further 3 months to replenish the iron stores. Epithelial tissue changes such as atrophic glossitis and koilonychia are usually improved, but the response is often slow.

Side-effects Gastro-intestinal irritation can occur with iron salts. Nausea and epigastric pain are dose-related, but the relationship between dose and altered bowel habit (constipation or diarrhoea) is less clear. Oral iron, particularly modified-release preparations, can exacerbate diarrhoea in patients with inflammatory bowel disease; care is also needed in patients with intestinal strictures and diverticular disease.

Iron preparations taken orally can be constipating, particularly in older patients and occasionally lead to faecal impaction.

If side-effects occur, the dose may be reduced; alternatively, another iron salt may be used, but an improvement in tolerance may simply be a result of a lower content of elemental iron. The incidence of side-effects due to ferrous sulfate is no greater than with other iron salts when compared on the basis of equivalent amounts of elemental iron.

Iron preparations are a common cause of accidental overdose in children. For the treatment of **iron overdose**, see Emergency Treatment of Poisoning, p. 39.

Counselling Although iron preparations are best absorbed on an empty stomach they can be taken after food to reduce gastro-intestinal side-effects; they may discolour stools.

Compound preparations Preparations containing iron and **folic acid** are used during pregnancy in women who are at high risk of developing iron and folic acid deficiency; they should be distinguished from those used for the prevention of neural tube defects in women planning a pregnancy (see p. 651).

It is important to note that the small doses of folic acid contained in these preparations are inadequate for the treatment of megaloblastic anaemias.

Some oral preparations contain **ascorbic acid** to aid absorption of the iron but the therapeutic advantage of such preparations is minimal and cost may be increased.

There is no justification for the inclusion of other ingredients, such as the **B group of vitamins** (except folic acid for pregnant women, see notes above and on p. 651).

Modified-release preparations Modified-release preparations of iron are licensed for once-daily dosage, but have no therapeutic advantage and should not be used. These preparations are formulated to release iron gradually; the low incidence of side-effects may reflect the small amounts of iron available for absorption as the iron is carried past the first part of the duodenum into an area of the gut where absorption may be poor.

FERROUS SULFATE

Indications iron-deficiency anaemia

Cautions **interactions:** Appendix 1 (iron)

Side-effects see notes above

Dose

- See under preparations below and notes above

Ferrous Sulfate (Non-proprietary)

Tablets, coated, dried ferrous sulfate 200 mg (65 mg iron), net price 28-tab pack = 97p

Dose prophylactic, 1 tablet daily; therapeutic, 1 tablet 2–3 times daily; CHILD, see *BNF for Children*

Ironorm® Drops (Wallace Mfg)

Oral drops, ferrous sulfate 125 mg (25 mg iron)/mL, net price 15-mL = £28.00

Dose ADULT and CHILD over 6 years, prophylactic, 0.6 mL daily; CHILD under 6 years, see *BNF for Children*

Modified-release preparations

Feospan® (Intrapharm) NHS

Spansule® (= capsules m/r), clear/red, enclosing green and brown pellets, dried ferrous sulfate 150 mg (47 mg iron), net price 30-cap pack = £3.45. Label: 25

Dose 1–2 capsules daily; CHILD over 1 year, 1 capsule daily; can be opened and sprinkled on food

Ferrograd® (Teofarma)

Tablets, f/c, m/r, red, dried ferrous sulfate 325 mg (105 mg iron), net price 30-tab pack = £2.58. Label: 25

Dose ADULT and CHILD over 12 years, prophylactic and therapeutic, 1 tablet daily before food

With folic acid

For prescribing information on folic acid, see section 9.1.2

Fefol® (Intrapharm) NHS

Spansule® (= capsules m/r), clear/green, enclosing brown, yellow, and white pellets, dried ferrous sulfate 150 mg (47 mg iron), folic acid 500 micrograms, net price 30-cap pack = £1.69. Label: 25

Dose 1 capsule daily

Ferrograd Folic® (Teofarma)

Tablets, f/c, red/yellow, dried ferrous sulfate 325 mg (105 mg iron) for sustained release, folic acid 350 micrograms, net price 30-tab pack = £2.64. Label: 25

Dose ADULT and CHILD over 12 years, 1 tablet daily before food

With ascorbic acid

For prescribing information on ascorbic acid, see section 9.6.3

Ferrograd C® (Teofarma)

Tablets, f/c, red, dried ferrous sulfate 325 mg (105 mg iron) for sustained release, ascorbic acid 500 mg (as sodium salt), net price 30-tab pack = £3.20. Label: 25

Dose ADULT and CHILD over 12 years, 1 tablet daily before food

FERROUS FUMARATE

Indications iron-deficiency anaemia

Cautions **interactions:** Appendix 1 (iron)

Side-effects see notes above

Dose

- See under preparations below and notes above

Fersaday® (AMCo)

Tablets, brown, f/c, ferrous fumarate 322 mg (100 mg iron), net price 28-tab pack = 95p

Dose prophylactic, 1 tablet daily; therapeutic, 1 tablet twice daily

Ferrous Fumarate (Non-proprietary)

Tablets, ferrous fumarate 210 mg (68 mg iron), net price 84 = £2.30

Dose ADULT and CHILD over 12 years, prophylactic, 1 tablet 1–2 times daily; therapeutic, 1 tablet 2–3 times daily

Syrup, ferrous fumarate approx. 140 mg (45 mg iron)/5 mL, net price 200 mL = £3.73

Dose prophylactic, 5 mL twice daily; therapeutic, 10 mL twice daily; CHILD see *BNF for Children*

Galfer® (Thornton & Ross)

Capsules, red/green, ferrous fumarate 305 mg (100 mg iron), net price 100 = £2.00

Dose ADULT and CHILD over 12 years, prophylactic, 1 capsule daily; therapeutic, 1 capsule twice daily

Syrup, brown, sugar-free ferrous fumarate 140 mg (45 mg iron)/5 mL, net price 300 mL = £5.33

Dose ADULT and CHILD over 12 years, prophylactic, 10 mL once daily; therapeutic, 10 mL 1–2 times daily; PRETERM NEONATE and NEONATE, see *BNF for Children*; CHILD 1 month–12 years, prophylactic and therapeutic, 0.5 mL/kg daily in 2–3 divided doses; max. 20 mL daily

With folic acid

For prescribing information on folic acid, see section 9.1.2

Galfer FA® (Thornton & Ross)

Capsules, red/yellow, ferrous fumarate 305 mg (100 mg iron), folic acid 350 micrograms, net price 100 = £2.17

Dose 1 capsule daily before food

Pregaday® (RPH)

Tablets, brown, f/c, ferrous fumarate equivalent to 100 mg iron, folic acid 350 micrograms, net price 28-tab pack =£1.25

Dose 1 tablet daily

FERROUS GLUCONATE

Indications iron-deficiency anaemia

Cautions **interactions:** Appendix 1 (iron)

Side-effects see notes above

Dose

- See under preparation below and notes above

Ferrous Gluconate (Non-proprietary)

Tablets, red, coated, ferrous gluconate 300 mg (35 mg iron), net price 28 = £1.95

Dose prophylactic, 2 tablets daily before food; therapeutic, 4–6 tablets daily in divided doses before food; CHILD 6–12 years, prophylactic and therapeutic, 1–3 tablets daily

POLYSACCHARIDE–IRON COMPLEX

Indications iron-deficiency anaemia

Cautions **interactions:** Appendix 1 (iron)

Side-effects see notes above

Dose

- See under preparation below and notes above

Niferex® (Tillomed)

Elixir, brown, sugar-free, polysaccharide–iron complex equivalent to 100 mg of iron/5 mL, net price 240-mL pack = £6.06; [1] 30-mL dropper bottle for paediatric use = £2.16. Counselling, use of dropper

Dose prophylactic, 2.5 mL daily; therapeutic, 5 mL 1–2 times daily (once daily if required during second and third trimester of pregnancy); PRETERM NEONATE, NEONATE, and INFANT (from dropper bottle) 1 drop (approx. 500 micrograms iron) per 450 g body-weight 3 times daily; CHILD 2–6 years 2.5 mL daily, 6–12 years 5 mL daily

SODIUM FEREDETATE

(Sodium ironedetate)

Indications iron-deficiency anaemia

Cautions **interactions:** Appendix 1 (iron)

Side-effects see notes above

Dose

- See under preparation below and notes above

Sytron® (Forum)

Elixir, sugar-free, sodium feredetate 190 mg equivalent to 27.5 mg of iron/5 mL, net price 100 mL = £1.07

Dose therapeutic, 5 mL increasing gradually to 10 mL 3 times daily; CHILD under 1 year, see *BNF for Children*; CHILD 1–5 years, therapeutic, 2.5 mL 3 times daily, 6–12 years, therapeutic, 5 mL 3 times daily

9.1.1.2 Parenteral iron

Iron can be administered parenterally as **iron dextran**, **iron sucrose**, **ferric carboxymaltose**, **iron isomaltoside 1000**, or **ferumoxytol**. Parenteral iron is generally reserved for use when oral therapy is unsuccessful because the patient cannot tolerate oral iron, or does not take it reliably, or if there is continuing blood loss, or in malabsorption. Parenteral iron may also have a role in the management of chemotherapy-induced anaemia, when given with erythropoietins, in specific patient groups (see NICE guidance, p. 653).

The *Scottish Medicines Consortium* (p. 4) has advised (January 2013) that ferumoxytol (*Rienso®*) is accepted for restricted use within NHS Scotland for the treatment of iron deficiency anaemia in non-haemodialysis dependent adults with chronic kidney disease when oral iron preparations are ineffective or cannot be used.

Many patients with chronic renal failure who are receiving haemodialysis (and some who are receiving peritoneal dialysis) also require iron by the intravenous route

1. except 30-mL paediatric dropper bottle for prophylaxis and treatment of iron deficiency in infants born prematurely; endorse prescription 'SLS'

on a regular basis (see also Erythropoietins, section 9.1.3).

With the exception of patients with severe renal failure receiving haemodialysis, parenteral iron does not produce a faster haemoglobin response than oral iron provided that the oral iron preparation is taken reliably and is absorbed adequately. If parenteral iron is necessary, the dose should be calculated according to the patient's body-weight and total iron deficit. Depending on the preparation used, parenteral iron is given as a total dose or in divided doses. Further treatment should be guided by monitoring haemoglobin and serum iron concentrations.

Anaphylactic reactions can occur with parenteral administration of iron complexes and facilities for cardiopulmonary resuscitation must be available—see MHRA/CHM advice, below.

MHRA/CHM advice

Serious hypersensitivity reactions with intravenous iron (August 2013)

Serious hypersensitivity reactions, including life-threatening and fatal anaphylactic reactions, have been reported in patients receiving intravenous iron. These reactions can occur even when a previous administration has been tolerated (including a negative test dose). Test doses are no longer recommended and caution is needed with *every* dose of intravenous iron.

Intravenous iron products should only be administered when appropriately trained staff and resuscitation facilities are immediately available; patients should be closely monitored for signs of hypersensitivity during and for at least 30 minutes after every administration. In the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated.

The risk of hypersensitivity is increased in patients with known allergies, immune or inflammatory conditions, or those with a history of severe asthma, eczema, or other atopic allergy; in these patients, intravenous iron should only be used if the benefits outweigh the risks.

Intravenous iron should be avoided in the first trimester of pregnancy and used in the second or third trimesters only if the benefit outweighs the potential risks for both mother and fetus.

FERRIC CARBOXYMALTOSE

A ferric carboxymaltose complex containing 5% (50 mg/mL) of iron

Indications iron-deficiency anaemia, see notes above

Cautions hypersensitivity can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available (see MHRA/CHM advice, p. 648); oral iron should not be given until 5 days after last injection; allergic disorders including asthma and eczema; infection (discontinue if ongoing bacteraemia)

Hepatic impairment use with caution; avoid in conditions where iron overload increases risk of impairment

Pregnancy avoid in first trimester; crosses the placenta in *animal* studies; may influence skeletal development

Side-effects gastro-intestinal disturbances; headache, dizziness; rash, injection-site reactions; *less commonly* hypertension, hypotension, flushing, chest pain, peripheral oedema, hypersensitivity reactions (including anaphylaxis), fatigue, paraesthesia, malaise, pyrexia, rigors, myalgia, arthralgia, back pain, pruritus, and urticaria; *rarely* dyspnoea

Dose

- By slow intravenous injection or by intravenous infusion, ADULT and CHILD over 14 years, calculated according to body-weight and iron deficit, consult product literature

Ferinject® (Vifor) ▼ PoM

Injection, iron (as ferric carboxymaltose) 50 mg/mL, net price 2-mL vial = £19.10, 10-mL vial = £95.50, 20-mL vial = £181.45

Electrolytes Na^+ 0.24 mmol/mL

FERUMOXYTOL

A complex of iron oxide with polyglucose sorbitol-carboxymethylether containing 3% (30 mg/mL) of iron

Indications iron-deficiency anaemia in chronic renal failure, see notes above

Cautions hypersensitivity can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available (see MHRA/CHM advice, p. 648); oral iron should not be given until 5 days after last injection; allergic or immune conditions; infection (discontinue if ongoing bacteraemia)

Hepatic impairment use with caution

Pregnancy avoid—toxicity in *animal* studies

Breast-feeding avoid—present in milk in *animal* studies

Side-effects injection-site reactions; *less commonly* nausea, vomiting, constipation, diarrhoea, abdominal pain, appetite disorders, hypotension, hypertension, flushing, dyspnoea, dizziness, taste disturbances, headache, drowsiness, malaise, myalgia, arthralgia, back pain, pruritus, rash, hypersensitivity reactions (including anaphylaxis); *rarely* dry mouth, dyspepsia, epistaxis, blurred vision, paraesthesia, dehydration, hyperkalaemia, eosinophilia, gout; *also reported* arrhythmias, tachycardia, myocardial infarction, congestive heart failure, cough, syncope

Dose

- By intravenous injection, ADULT over 18 years, calculated according to body-weight and iron deficit, consult product literature

Rienso® (Takeda) ▼ PoM

Injection, iron (as ferumoxytol) 30 mg/mL, net price 17-mL vial = £65.00

IRON DEXTRAN

A complex of ferric hydroxide with dextran containing 5% (50 mg/mL) of iron

Indications iron-deficiency anaemia, see notes above

Cautions hypersensitivity can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available (see MHRA/CHM advice, p. 648); oral iron should not be given until 5 days after last injection

Contra-indications history of allergic disorders including asthma and eczema; infection; active rheumatoid arthritis

Hepatic impairment avoid in severe impairment

Renal impairment avoid in acute renal failure

Pregnancy avoid in first trimester

Side-effects *less commonly* nausea, vomiting, abdominal pain, flushing, dyspnoea, hypersensitivity reactions (including anaphylaxis), numbness, cramps, blurred vision, pruritus, and rash; *rarely* diarrhoea, chest pain, hypotension, angioedema, arrhythmias, tachycardia, dizziness, restlessness, fatigue, seizures, tremor, impaired consciousness, myalgia, arthralgia, sweating, and injection-site reactions; *very rarely* hypertension, palpitation, headache, paraesthesia, haemolysis, and transient deafness

Dose

- By deep intramuscular injection into the gluteal muscle *or* by slow intravenous injection *or* by intravenous infusion, calculated according to body-weight and iron deficit, consult product literature

  CHILD under 14 years, not recommended

CosmoFer® (Pharmacosmos) ▼ PoM

Injection, iron (as iron dextran) 50 mg/mL, net price 2-mL amp = £7.97, 10-mL amp = £39.85

IRON ISOMALTOSIDE 1000

A complex of ferric iron and isomaltosides containing 10% (100 mg/mL) of iron

Indications iron deficiency anaemia, see notes above

Cautions hypersensitivity can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available (see MHRA/CHM advice, p. 648); oral iron should not be given until 5 days after last injection; infection (discontinue if ongoing bacteraemia)

Contra-indications history of allergic disorders including asthma and eczema; active rheumatoid arthritis

Hepatic impairment avoid in decompensated liver disease and hepatitis

Pregnancy avoid in first trimester

Side-effects *less commonly* nausea, vomiting, constipation, abdominal pain, dyspnoea, dysphonia, flushing, numbness, fever, cramps, blurred vision, pruritus, rash, hypersensitivity reactions (including anaphylaxis), injection-site reactions; *rarely* diarrhoea, angioedema, tachycardia, arrhythmias, hypotension, chest pain, malaise, seizures, tremor, dizziness, restlessness, loss of consciousness, altered mental status, myalgia, arthralgia, sweating; *very rarely* hypertension, foetal bradycardia, palpitation, headache, paraesthesia, haemolysis, transient deafness

Dose

- By slow intravenous injection or by intravenous infusion, ADULT over 18 years, calculated according to body-weight and iron deficit, consult product literature

Monofer® (Pharmacosmos) ▼ PoM

Injection, iron (as iron isomaltoside 1000) 100 mg/mL, net price 1-mL vial = £16.95, 5-mL vial = £84.75, 10-mL vial = £169.50

IRON SUCROSE

A complex of ferric hydroxide with sucrose containing 2% (20 mg/mL) of iron

Indications iron-deficiency anaemia, see notes above

Cautions hypersensitivity reactions can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available (see MHRA/CHM advice, p. 648); oral iron should not be given until 5 days after last injection; infection (discontinue if ongoing bacteraemia)

Contra-indications history of allergic disorders including asthma, eczema, and anaphylaxis

Hepatic impairment use with caution; avoid in conditions where iron overload increases risk of impairment

Pregnancy avoid in first trimester

Side-effects taste disturbances; *less commonly* nausea, vomiting, abdominal pain, diarrhoea, hypotension, tachycardia, flushing, palpitation, chest pain, bronchospasm, dyspnoea, headache, dizziness, fever, myalgia, pruritus, rash, and injection-site reactions; *rarely* peripheral oedema, hypertension, hypersensitivity reactions (including anaphylaxis), fatigue, asthenia, and paraesthesia; bradycardia, confusion, arthralgia, and increased sweating also reported

Dose

- By slow intravenous injection *or* by intravenous infusion, calculated according to body-weight and iron deficit, consult product literature; CHILD not recommended but see *BNF for Children*

Venofer® (Vifor) ▼ PoM

Injection, iron (as iron sucrose) 20 mg/mL, net price 5-mL vial = £10.24

9.1.2 Drugs used in megaloblastic anaemias

Most megaloblastic anaemias result from a lack of either vitamin B_{12} or folate, and it is essential to establish in every case which deficiency is present and the underlying cause. In emergencies, when delay might be dangerous, it is sometimes necessary to administer both substances after the bone marrow test while plasma assay results are awaited. Normally, however, appropriate treatment should not be instituted until the results of tests are available.

One cause of megaloblastic anaemia in the UK is *pernicious anaemia* in which lack of gastric intrinsic factor resulting from an autoimmune gastritis causes malabsorption of vitamin B_{12}.

Vitamin B_{12} is also needed in the treatment of megaloblastosis caused by *prolonged nitrous oxide anaesthesia*, which inactivates the vitamin, and in the rare syndrome of *congenital transcobalamin II deficiency*.

Vitamin B_{12} should be given prophylactically after *total gastrectomy* or *total ileal resection* (or after *partial gastrectomy* if a vitamin B_{12} absorption test shows vitamin B_{12} malabsorption).

Apart from dietary deficiency, all other causes of vitamin B_{12} deficiency are attributable to malabsorption. There is little place for the use of low-dose vitamin B_{12} orally and none for vitamin B_{12} intrinsic factor com-

plexes given by mouth. Vitamin B_{12} in larger oral doses of 1–2 mg daily [unlicensed] may be effective.

Hydroxocobalamin has completely replaced cyanocobalamin as the form of vitamin B_{12} of choice for therapy; it is retained in the body longer than cyanocobalamin and thus for maintenance therapy can be given at intervals of up to 3 months. Treatment is generally initiated with frequent administration of intramuscular injections to replenish the depleted body stores. Thereafter, maintenance treatment, which is usually for life, can be instituted. There is no evidence that doses larger than those recommended provide any additional benefit in vitamin B_{12} neuropathy.

Folic acid has few indications for long-term therapy since most causes of folate deficiency are self-limiting or will yield to a short course of treatment. It should not be used in undiagnosed megaloblastic anaemia unless vitamin B_{12} is administered concurrently otherwise neuropathy may be precipitated (see above).

In *folate-deficient megaloblastic anaemia* (e.g. because of poor nutrition, pregnancy, or antiepileptic drugs), daily folic acid supplementation for 4 months brings about haematological remission and replenishes body stores.

For prophylaxis in *chronic haemolytic states, malabsorption*, or *in renal dialysis*, folic acid is given daily or sometimes weekly, depending on the diet and the rate of haemolysis.

For *prophylaxis in pregnancy*, see Prevention of Neural Tube Defects below.

Folic acid is also used for the prevention of methotrexate-induced side-effects in severe Crohn's disease (see section 1.5.3, p. 66), rheumatic disease (see section 10.1.3, p. 716), and severe psoriasis (see section 13.5.3, p. 801).

Folinic acid is also effective in the treatment of folate-deficient megaloblastic anaemia but it is generally used in association with cytotoxic drugs (see section 8.1); it is given as calcium folinate.

Prevention of neural tube defects Folic acid supplements taken before and during pregnancy can reduce the occurrence of neural tube defects. The risk of a neural tube defect occurring in a child should be assessed and folic acid given as follows:

Women at a low risk of conceiving a child with a neural tube defect should be advised to take folic acid as a medicinal or food supplement at a dose of 400 micrograms daily before conception and until week 12 of pregnancy. Women who have not been taking folic acid and who suspect they are pregnant should start at once and continue until week 12 of pregnancy.

Couples are at a high risk of conceiving a child with a neural tube defect if either partner has a neural tube defect (or either partner has a family history of neural tube defects), if they have had a previous pregnancy affected by a neural tube defect, or if the woman has coeliac disease (or other malabsorption state), diabetes mellitus, sickle-cell anaemia, or is taking antiepileptic medicines (see also section 4.8.1).

Women in the high-risk group who wish to become pregnant (or who are at risk of becoming pregnant) should be advised to take folic acid 5 mg daily and continue until week 12 of pregnancy (women with sickle-cell disease should continue taking their normal dose of folic acid 5 mg daily (or to increase the dose to 5 mg daily) and continue this throughout pregnancy).

There is **no** justification for prescribing multiple-ingredient vitamin preparations containing vitamin B_{12} or folic acid.

HYDROXOCOBALAMIN

Indications see under dose below; cyanide poisoning (see Emergency Treatment of Poisoning, p. 41)

Cautions should not be given before diagnosis fully established but see also notes above; **interactions:** Appendix 1 (hydroxocobalamin)

Breast-feeding present in milk but not known to be harmful

Side-effects nausea, headache, dizziness; fever, hypersensitivity reactions (including rash and pruritus); injection-site reactions; hypokalaemia and thrombocytosis during initial treatment; chromaturia

Dose

- By intramuscular injection, pernicious anaemia and other macrocytic anaemias without neurological involvement, initially 1 mg 3 times a week for 2 weeks then 1 mg every 3 months

  Pernicious anaemia and other macrocytic anaemias with neurological involvement, initially 1 mg on alternate days until no further improvement, then 1 mg every 2 months

  Prophylaxis of macrocytic anaemias associated with vitamin B_{12} deficiency, 1 mg every 2–3 months

  Tobacco amblyopia and Leber's optic atrophy, initially 1 mg daily for 2 weeks, then 1 mg twice weekly until no further improvement, thereafter 1 mg every 1–3 months

  CHILD see *BNF for Children*

Hydroxocobalamin (Non-proprietary) PoM

Injection, hydroxocobalamin 1 mg/mL. Net price 1-mL amp = 73p

Note The BP directs that when vitamin B_{12} injection is prescribed or demanded hydroxocobalamin injection shall be dispensed or supplied

Brands include *Cobalin-H*® NHS, *Neo-Cytamen*® NHS

CYANOCOBALAMIN

Indications see notes above

Dose

- By mouth, vitamin B_{12} deficiency of dietary origin, 50–150 micrograms daily taken between meals; CHILD 50–105 micrograms daily in 1–3 divided doses
- By intramuscular injection, initially 1 mg repeated 10 times at intervals of 2–3 days, maintenance 1 mg every month, but see notes above

Cyanocobalamin (Non-proprietary)

Tablets, cyanocobalamin 50 micrograms. Net price 50-tab pack = £6.24

Brands include *Cytacon*® NHS

Note Currently available brands may not be suitable for vegans

Liquid NHS, cyanocobalamin 35 micrograms/5 mL. Net price 200 mL = £2.77

Brands include *Cytacon*® NHS

Injection PoM, cyanocobalamin 1 mg/mL. Net price 1-mL amp = £2.90

Brands include *Cytamen*® NHS

Note The BP directs that when vitamin B_{12} injection is prescribed or demanded hydroxocobalamin injection shall be dispensed or supplied

FOLIC ACID

Indications see notes above and under dose

Cautions should never be given alone for pernicious anaemia and other vitamin B_{12} deficiency states (may precipitate subacute combined degeneration of the spinal cord); **interactions:** Appendix 1 (folates)

Side-effects *rarely* gastro-intestinal disturbances

Dose

- Folate-deficient megaloblastic anaemia, by mouth, ADULT and CHILD over 1 year, 5 mg daily for 4 months (until term in pregnant women); up to 15 mg daily may be required in malabsorption states; CHILD under 1 year, 500 micrograms/kg daily (max. 5 mg) for up to 4 months; up to 10 mg daily may be required in malabsorption states
- Prevention of neural tube defects, by mouth, see notes above
- Prevention of methotrexate-induced side-effects in severe Crohn's disease [unlicensed], by mouth, see section 1.5.3
- Prevention of methotrexate-induced side-effects in rheumatic disease [unlicensed], by mouth, ADULT over 18 years 5 mg once weekly; CHILD 2–18 years see *BNF for Children*
- Prevention of methotrexate-induced side-effects in severe psoriasis [unlicensed], by mouth, see section 13.5.3
- Prophylaxis in chronic haemolytic states, by mouth, ADULT 5 mg every 1–7 days depending on underlying disease
- Prophylaxis of folate deficiency in dialysis, by mouth, ADULT 5 mg every 1–7 days; CHILD 1–12 years 250 micrograms/kg (max. 10 mg) once daily, CHILD 12–18 years 5–10 mg once daily

[1]**Folic Acid** (Non-proprietary) PoM

Tablets, folic acid 400 micrograms, net price 90-tab pack = £2.71; 5 mg, 28-tab pack = 91p

Syrup, folic acid 2.5 mg/5 mL, net price 150 mL = £9.16

Brands include *Lexpec*® (sugar-free)

Injection, folic acid 15 mg, net price 1-mL amp = £1.34

Available from 'special-order' manufacturers or specialist importing companies, see p. 1104

9.1.3 Drugs used in hypoplastic, haemolytic, and renal anaemias

Anabolic steroids (section 6.4.3), pyridoxine, antilymphocyte immunoglobulin, and various corticosteroids are used in hypoplastic and haemolytic anaemias.

Antilymphocyte immunoglobulin given intravenously through a central line over 12–18 hours each day for 5 days produces a response in about 50% of cases of acquired *aplastic anaemia*; the response rate may be increased when ciclosporin is given as well. Severe reactions are common in the first 2 days and profound immunosuppression can occur; antilymphocyte immunoglobulin should be given under specialist supervision with appropriate resuscitation facilities. Alternatively, oxymetholone tablets (available from 'special-order' manufacturers or specialist importing companies, see p. 1104) can be used in aplastic anaemia at a dose of 1–5 mg/kg daily for 3 to 6 months.

It is unlikely that dietary deprivation of **pyridoxine** (section 9.6.2) produces clinically relevant haematological effects. However, certain forms of *sideroblastic anaemia* respond to pharmacological doses, possibly reflecting its role as a co-enzyme during haemoglobin synthesis. Pyridoxine is indicated in both *idiopathic acquired* and *hereditary sideroblastic anaemias*. Although complete cures have not been reported, some increase in haemoglobin can occur; the dose required is usually high, up to 400 mg daily. *Reversible sideroblastic anaemias* respond to treatment of the underlying cause but in pregnancy, haemolytic anaemias, and alcohol dependence, or during isoniazid treatment, pyridoxine is also indicated.

Corticosteroids (see section 6.3) have an important place in the management of a wide variety of haematological disorders. They include conditions with an immune basis such as *autoimmune haemolytic anaemia*, *immune thrombocytopenias* and *neutropenias*, and *major transfusion reactions*. They are also used in chemotherapy schedules for many types of *lymphoma*, *lymphoid leukaemias*, and *paraproteinaemias*, including *multiple myeloma*.

Erythropoietins

Epoetins (recombinant human erythropoietins) are used to treat symptomatic anaemia associated with erythropoietin deficiency in chronic renal failure, to increase the yield of autologous blood in normal individuals and to shorten the period of symptomatic anaemia in patients receiving cytotoxic chemotherapy. Epoetin beta is also used for the prevention of anaemia in preterm neonates of low birth-weight; only unpreserved formulations should be used in neonates because other preparations may contain benzyl alcohol (see Excipients, p. 2).

Darbepoetin is a hyperglycosylated derivative of epoetin; it has a longer half-life and can be administered less frequently than epoetin.

Methoxy polyethylene glycol-epoetin beta is a continuous erythropoietin receptor activator that is licensed for the treatment of symptomatic anaemia associated with chronic kidney disease. It has a longer duration of action than epoetin.

Other factors, such as iron or folate deficiency, that contribute to the anaemia of chronic renal failure should be corrected before treatment and monitored during therapy. Supplemental iron may improve the response in resistant patients. Aluminium toxicity, concurrent infection, or other inflammatory disease can impair the response to erythropoietin.

1. Can be sold to the public provided daily doses do not exceed 500 micrograms

MHRA/CHM advice (December 2007) Erythropoietins—haemoglobin concentration

Overcorrection of haemoglobin concentration in patients with chronic kidney disease may increase the risk of death and serious cardiovascular events, and in patients with cancer may increase the risk of thrombosis and related complications:

- patients should not be treated with erythropoietins for the licensed indications in chronic kidney disease or cancer in patients receiving chemotherapy *unless* symptoms of anaemia are present;
- the haemoglobin concentration should be maintained within the range 10–12 g/100 mL;
- haemoglobin concentrations higher than 12 g/100 mL should be avoided;
- the aim of treatment is to relieve symptoms of anaemia, and in patients with chronic kidney disease to avoid the need for blood transfusion; the haemoglobin concentration should not be increased beyond that which provides adequate control of symptoms of anaemia (in some patients, this may be achieved at concentrations lower than the recommended range).

See also MHRA/CHM advice below.

MHRA/CHM advice (December 2007 and July 2008) Erythropoietins—tumour progression and survival in patients with cancer

Clinical trial data show an unexplained excess mortality and increased risk of tumour progression in patients with anaemia associated with cancer who have been treated with erythropoietins. Many of these trials used erythropoietins *outside* of the licensed indications (i.e. overcorrected haemoglobin concentration or given to patients who have *not* received chemotherapy):

- erythropoietins licensed for the treatment of *symptomatic* anaemia associated with cancer, are licensed only for patients who are receiving chemotherapy;
- the decision to use erythropoietins should be based on an assessment of the benefits and risks for individual patients; blood transfusion may be the preferred treatment for anaemia associated with cancer chemotherapy, particularly in those with a good cancer prognosis.

See also MHRA/CHM advice above.

Pure red cell aplasia

There have been very rare reports of pure red cell aplasia in patients treated with erythropoietins. In patients who develop a lack of efficacy with erythropoietin therapy and with a diagnosis of pure red cell aplasia, treatment with erythropoietins must be discontinued and testing for erythropoietin antibodies considered. Patients who develop pure red cell aplasia should **not** be switched to another form of erythropoietin.

NICE guidance
Epoetin alfa, beta and darbepoetin alfa for cancer treatment-induced anaemia (May 2008)

Erythropoietin analogues are **not** recommended for routine use in the management of cancer treatment-induced anaemia, but may be considered, in combination with intravenous iron, for:

- women receiving platinum-based chemotherapy for ovarian cancer who have symptomatic anaemia with a haemoglobin concentration of 8 g/100 mL or lower (the use of erythropoietin analogues does not preclude the use of existing approaches to the management of anaemia, including blood transfusion when necessary);
- patients who cannot be given blood transfusions and who have profound cancer treatment-related anaemia that is likely to have an impact on survival.

Patients currently treated with erythropoietin analogues for the management of cancer treatment-related anaemia who do not fulfil the criteria outlined above can continue therapy until they and their specialists consider it appropriate to stop.

www.nice.org.uk/TA142

DARBEPOETIN ALFA

Indications see under Dose below

Cautions see Epoetin

Contra-indications see Epoetin

Hepatic impairment manufacturer advises caution

Pregnancy no evidence of harm in *animal* studies—manufacturer advises caution

Breast-feeding manufacturer advises avoid—no information available

Side-effects see Epoetin; also, oedema, injection-site pain; isolated reports of pure red cell aplasia, particularly following subcutaneous administration in patients with chronic renal failure (discontinue therapy)—see also notes above

Dose

- Symptomatic anaemia associated with chronic renal failure in patients on dialysis (see also MHRA/CHM advice, above), ADULT and CHILD over 11 years, by subcutaneous *or* intravenous injection, initially 450 nanograms/kg once weekly, adjusted according to response by approx. 25% at intervals of at least 4 weeks; maintenance dose, given once weekly *or* once every 2 weeks
- Symptomatic anaemia associated with chronic renal failure in patients not on dialysis (see also MHRA/CHM advice, above), ADULT and CHILD over 11 years, by subcutaneous *or* intravenous injection, initially 450 nanograms/kg once weekly *or* by subcutaneous injection, initially 750 nanograms/kg once every 2 weeks; adjusted according to response by approx. 25% at intervals of at least 4 weeks; maintenance dose, given subcutaneously or intravenously once weekly *or* subcutaneously once every 2 weeks *or* subcutaneously once every month

Note Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. When changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements. Adjust

doses not more frequently than every 2 weeks during maintenance treatment

- Symptomatic anaemia in adults with non-myeloid malignancies receiving chemotherapy (see also MHRA/CHM advice, p. 653), by subcutaneous injection, initially 6.75 micrograms/kg once every 3 weeks *or* 2.25 micrograms/kg once weekly (if response inadequate after 9 weeks further treatment may not be effective); if adequate response obtained, reduce dose by 25–50%

Note Reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy

Aranesp® (Amgen) PoM

Injection, prefilled syringe, darbepoetin alfa, 25 micrograms/mL, net price 0.4 mL (10 micrograms) = £14.68; 40 micrograms/mL, 0.375 mL (15 micrograms) = £22.02, 0.5 mL (20 micrograms) = £29.36; 100 micrograms/mL, 0.3 mL (30 micrograms) = £44.04, 0.4 mL (40 micrograms) = £58.73, 0.5 mL (50 micrograms) = £73.41; 200 micrograms/mL, 0.3 mL (60 micrograms) = £88.09, 0.4 mL (80 micrograms) = £117.45, 0.5 mL (100 micrograms) = £146.81, 0.65 mL (130 micrograms) = £190.86; 500 micrograms/mL, 0.3 mL (150 micrograms) = £220.22, 0.6 mL (300 micrograms) = £440.43, 1 mL (500 micrograms) = £734.05

Injection (*Aranesp® SureClick*), prefilled disposable injection device, darbepoetin alfa, 40 micrograms/mL, net price 0.5 mL (20 micrograms) = £29.36; 100 micrograms/mL, 0.4 mL (40 micrograms) = £58.72; 200 micrograms/mL, 0.3 mL (60 micrograms) = £88.09, 0.4 mL (80 micrograms) = £117.45, 0.5 mL (100 micrograms) = £146.81; 500 micrograms/mL, 0.3 mL (150 micrograms) = £220.22, 0.6 mL (300 micrograms) = £440.43, 1 mL (500 micrograms) = £734.05

EPOETIN ALFA, BETA, THETA, and ZETA

(Recombinant human erythropoietins)

Note The prescriber must specify which epoetin is required, see also Biosimilar medicines, p. 1

Indications see under preparations, below

Cautions see notes above; also inadequately treated or poorly controlled blood pressure (monitor closely blood pressure, reticulocyte counts, haemoglobin, and electrolytes), interrupt treatment if blood pressure uncontrolled; sudden stabbing migraine-like pain is warning of a hypertensive crisis; sickle-cell disease (lower target haemoglobin concentration may be appropriate); ischaemic vascular disease; thrombocytosis (monitor platelet count for first 8 weeks); epilepsy; malignant disease; increase in unfractionated or low molecular weight heparin dose may be needed during dialysis; risk of thrombosis may be increased when used for anaemia in adults receiving cancer chemotherapy; risk of thrombosis may be increased when used for anaemia before orthopaedic surgery—avoid in cardiovascular disease including recent myocardial infarction or cerebrovascular accident

Contra-indications pure red cell aplasia following erythropoietin therapy (see also notes above); uncontrolled hypertension; patients unable to receive thromboprophylaxis; avoid injections containing benzyl alcohol in neonates (see under preparations, below)

Hepatic impairment manufacturers advise caution in chronic hepatic failure

Pregnancy no evidence of harm; benefits probably outweigh risk of anaemia and of transfusion in pregnancy

Breast-feeding unlikely to be present in milk; minimal effect on infant

Side-effects diarrhoea, nausea, vomiting; dose-dependent increase in blood pressure or aggravation of hypertension; in isolated patients with normal or low blood pressure, hypertensive crisis with encephalopathy-like symptoms and generalised tonic-clonic seizures requiring immediate medical attention; headache; dose-dependent increase in platelet count (but thrombocytosis rare) regressing during treatment; influenza-like symptoms (may be reduced if intravenous injection given over 5 minutes); cardiovascular events; shunt thrombosis especially if tendency to hypotension or arteriovenous shunt complications; *very rarely* sudden loss of efficacy because of pure red cell aplasia, particularly following subcutaneous administration in patients with chronic renal failure (discontinue erythropoietin therapy)—see also notes above, hyperkalaemia, hypersensitivity reactions (including anaphylaxis and angioedema), skin reactions, injection-site reactions, and peripheral oedema also reported

Dose

- See under preparations, below

Epoetin alfa

Binocrit® (Sandoz) PoM

Injection, prefilled syringe, epoetin alfa, net price 1000 units = £4.33; 2000 units = £8.65; 3000 units = £12.98; 4000 units = £17.31; 5000 units = £21.64; 6000 units = £25.96; 8000 units = £40.73; 10 000 units = £43.27

Note Biosimilar medicine, p. 1

Dose symptomatic anaemia associated with chronic renal failure in patients on haemodialysis (see also MHRA/CHM advice, p. 653), by intravenous injection over 1–5 minutes, initially 50 units/kg 3 times weekly adjusted according to response in steps of 25 units/kg 3 times weekly at intervals of at least 4 weeks; maintenance dose, usually 25–100 units/kg 3 times weekly; CHILD by intravenous injection initially as for adults; maintenance dose, body-weight under 10 kg usually 75–150 units/kg 3 times weekly, body-weight 10–30 kg usually 60–150 units/kg 3 times weekly, body-weight over 30 kg usually 30–100 units/kg 3 times weekly

Symptomatic anaemia associated with chronic renal failure in adults on peritoneal dialysis (see also MHRA/CHM advice, p. 653), by intravenous injection over 1–5 minutes, initially 50 units/kg twice weekly; maintenance dose 25–50 units/kg twice weekly

Severe symptomatic anaemia of renal origin in adults with renal insufficiency not yet on dialysis (see also MHRA/CHM advice, p. 653), by intravenous injection over 1–5 minutes, initially 50 units/kg 3 times weekly increased according to response in steps of 25 units/kg 3 times weekly at intervals of at least 4 weeks; maintenance dose 17–33 units/kg 3 times weekly; max. 200 units/kg 3 times weekly

Note Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose

reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

Symptomatic anaemia in adults receiving cancer chemotherapy (see also MHRA/CHM advice, p. 653), by subcutaneous injection (max. 1 mL per injection site), initially 150 units/kg 3 times weekly (*or* 450 units/kg once weekly), increased if appropriate rise in haemoglobin (or reticulocyte count) not achieved after 4 weeks to 300 units/kg 3 times weekly; discontinue if inadequate response after 4 weeks at higher dose

Note Reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy

To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia *either* when large volume of blood required *or* when sufficient blood cannot be saved for elective major surgery, by intravenous injection over 1–5 minutes, 600 units/kg twice weekly for 3 weeks before surgery; consult product literature for details and advice on ensuring high iron stores

Moderate anaemia (haemoglobin concentration 10–13 g/100 mL) before elective orthopaedic surgery in adults with expected moderate blood loss to reduce exposure to allogeneic blood transfusion or if autologous transfusion unavailable, by subcutaneous injection (max. 1 mL per injection site), 600 units/kg every week for 3 weeks before surgery and on day of surgery *or* 300 units/kg daily for 15 days starting 10 days before surgery; consult product literature for details

Eprex® (Janssen) PoM

Injection, prefilled syringe, epoetin alfa, net price 1000 units = £5.53; 2000 units = £11.06; 3000 units = £16.59; 4000 units = £22.12; 5000 units = £27.65; 6000 units = £33.19; 8000 units = £44.25; 10 000 units = £55.31; 20 000 units = £110.62; 30 000 units = £199.11; 40 000 units = £265.48. An auto-injector device is available for use with prefilled syringes

Dose symptomatic anaemia associated with chronic renal failure in patients on haemodialysis (see also MHRA/CHM advice, p. 653), by intravenous injection over 1–5 minutes *or* by subcutaneous injection (max. 1 mL per injection site), initially 50 units/kg 3 times weekly adjusted according to response in steps of 25 units/kg 3 times weekly at intervals of at least 4 weeks; maintenance dose, usually a total of 75–300 units/kg weekly (as a single dose or in divided doses); CHILD by intravenous injection initially as for adults; maintenance dose, body-weight under 10 kg usually 75–150 units/kg 3 times weekly, body-weight 10–30 kg usually 60–150 units/kg 3 times weekly, body-weight over 30 kg usually 30–100 units/kg 3 times weekly

Symptomatic anaemia associated with chronic renal failure in adults on peritoneal dialysis (see also MHRA/CHM advice, p. 653), by intravenous injection over 1–5 minutes *or* by subcutaneous injection (max. 1 mL per injection site), initially 50 units/kg twice weekly; maintenance dose 25–50 units/kg twice weekly

Severe symptomatic anaemia of renal origin in adults with renal insufficiency not yet on dialysis (see also MHRA/CHM advice, p. 653), by intravenous injection over 1–5 minutes *or* by subcutaneous injection (max. 1 mL per injection site), initially 50 units/kg 3 times weekly increased according to response in steps of 25 units/kg 3 times weekly at intervals of at least 4 weeks; maintenance dose 17–33 units/kg 3 times weekly; max. 200 units/kg 3 times weekly

Note Intravenous route preferred; reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose.

Symptomatic anaemia in adults receiving cancer chemotherapy (see also MHRA/CHM advice, p. 653), by subcutaneous injection (max. 1 mL per injection site), initially 150 units/kg 3 times weekly (*or* 450 units/kg once weekly), increased if appropriate rise in haemoglobin (or reticulocyte count) not achieved after 4 weeks to 300 units/kg 3 times weekly; discontinue if inadequate response after 4 weeks at higher dose

Note Reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy

To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia *either* when large volume of blood required *or* when sufficient blood cannot be saved for elective major surgery, by intravenous injection over 1–5 minutes, 600 units/kg twice weekly for 3 weeks before surgery; consult product literature for details and advice on ensuring high iron stores

Moderate anaemia (haemoglobin concentration 10–13 g/100 mL) before elective orthopaedic surgery in adults with expected moderate blood loss to reduce exposure to allogeneic blood transfusion or if autologous transfusion unavailable, by subcutaneous injection (max. 1 mL per injection site), 600 units/kg every week for 3 weeks before surgery and on day of surgery *or* 300 units/kg daily for 15 days starting 10 days before surgery; consult product literature for details

Epoetin beta

NeoRecormon® (Roche) PoM

Injection, prefilled syringe, epoetin beta, net price 500 units = £3.51; 2000 units = £14.03; 3000 units = £21.04; 4000 units = £28.06; 5000 units = £35.07; 6000 units = £42.08; 10 000 units = £70.14; 20 000 units = £140.29; 30 000 units = £210.43

Excipients include phenylalanine up to 300 micrograms/syringe (section 9.4.1)

Dose symptomatic anaemia associated with chronic renal failure (see also MHRA/CHM advice, p. 653), by subcutaneous injection, ADULT and CHILD, initially 20 units/kg 3 times weekly for 4 weeks, increased according to response at intervals of 4 weeks in steps of 20 units/kg 3 times weekly; total weekly dose may be divided into daily doses; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks; total weekly maintenance dose may be given as a single dose or in 3 or 7 divided doses; max. 720 units/kg weekly

By intravenous injection over 2 minutes, ADULT and CHILD, initially 40 units/kg 3 times weekly for 4 weeks, increased according to response to 80 units/kg 3 times weekly after 4 weeks, with further increases if needed at intervals of 4 weeks in steps of 20 units/kg 3 times weekly; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks; max. 720 units/kg weekly

Note Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

Prevention of anaemia of prematurity in neonates with birth-weight of 0.75–1.5 kg and corrected gestational age of less than 34 weeks, by subcutaneous injection, 250 units/kg 3 times weekly preferably starting within 3 days of birth and continued for 6 weeks

Symptomatic anaemia in adults with non-myeloid malignancies receiving chemotherapy (see also MHRA/

CHM advice, p. 653), by subcutaneous injection, initially 450 units/kg weekly (as a single dose or in 3–7 divided doses), increased if necessary after 4 weeks (if a rise in haemoglobin of at least 1 g/100 mL not achieved) to 900 units/kg weekly (as a single dose or in 3–7 divided doses); if adequate response obtained reduce dose by 25–50%; max. 60 000 units weekly

Note Discontinue treatment if haemoglobin concentration does not increase by at least 1 g/100 mL after 8 weeks of therapy (response unlikely). Reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy

To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia when blood-conserving procedures are insufficient or unavailable, consult product literature

Multidose injection, powder for reconstitution, epoetin beta, net price 50 000-unit vial = £374.48 (with solvent)

Excipients include phenylalanine up to 5 mg/vial (section 9.4.1), benzyl alcohol (avoid in neonates, see Excipients p. 2)

Note Avoid contact of reconstituted injection with glass; use only plastic materials

Dose symptomatic anaemia associated with chronic renal failure (see also MHRA/CHM advice, p. 653), by subcutaneous injection, ADULT and CHILD over 3 years, initially 20 units/kg 3 times weekly for 4 weeks, increased according to response at intervals of 4 weeks in steps of 20 units/kg 3 times weekly; total weekly dose may be divided into daily doses; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks; total weekly maintenance dose may be given as a single dose or in 3 or 7 divided doses; max. 720 units/kg weekly

By intravenous injection over 2 minutes, ADULT and CHILD over 3 years, initially 40 units/kg 3 times weekly for 4 weeks, increased according to response to 80 units/kg 3 times weekly after 4 weeks, with further increases if needed at intervals of 4 weeks in steps of 20 units/kg 3 times weekly; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks; max. 720 units/kg weekly

Note Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

Symptomatic anaemia in adults with non-myeloid malignancies receiving chemotherapy (see also MHRA/CHM advice, p. 653), by subcutaneous injection, initially 450 units/kg weekly (as a single dose or in 3–7 divided doses), increased if necessary after 4 weeks (if a rise in haemoglobin of at least 1 g/100 mL not achieved) to 900 units/kg weekly (as a single dose or in 3–7 divided doses); if adequate response obtained reduce dose by 25–50%; max. 60 000 units weekly

Note Discontinue treatment if haemoglobin concentration does not increase by at least 1 g/100 mL after 8 weeks of therapy (response unlikely). Reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy

To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia when blood-conserving procedures are insufficient or unavailable, consult product literature

Epoetin theta

Eporatio® (Ratiopharm UK) ▼ PoM

Injection, prefilled syringe, epoetin theta, net price 1000 units = £5.99; 2000 units = £11.98; 3000 units = £17.98; 4000 units = £23.97; 5000 units = £29.96; 10 000 units = £59.92; 20 000 units = £119.84; 30 000 units = £179.75

Note If epoetin theta is substituted for another epoetin the same route of administration should be used

Dose symptomatic anaemia associated with chronic renal failure (see also MHRA/CHM advice, p. 653), by subcutaneous injection, ADULT over 18 years, initially 20 units/kg 3 times weekly, increased after 4 weeks according to response to 40 units/kg 3 times weekly, with further increases if needed at 4-weekly intervals in steps of 25% of the previous dose; maintenance dose, adjusted if necessary in steps of 25%; weekly maintenance dose may be given as a single dose or in 3 divided doses; max. 700 units/kg weekly

By intravenous injection, ADULT over 18 years, initially 40 units/kg 3 times weekly, increased according to response to 80 units/kg 3 times weekly after 4 weeks, with further increases if needed at intervals of 4 weeks in steps of 25% of the previous dose; maintenance dose, adjusted if necessary in steps of 25%; weekly maintenance dose may be given in 2 divided doses in stable patients; max. 700 units/kg weekly

Note Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

Symptomatic anaemia in adults with non-myeloid malignancies receiving cancer chemotherapy (see also MHRA/CHM advice, p. 653), by subcutaneous injection, initially 20 000 units once weekly, increased if necessary after 4 weeks (if a rise in haemoglobin of at least 1 g/100 mL not achieved) to 40 000 units once weekly, with further increase if needed after 4 weeks to max. 60 000 units once weekly

Note Discontinue treatment if haemoglobin concentration does not increase by at least 1 g/100 mL after 12 weeks of therapy (response unlikely). Reduce dose by 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy

Epoetin zeta

Retacrit® (Hospira) PoM

Injection, prefilled syringe, epoetin zeta, net price 1000 units = £5.66; 2000 units = £11.31; 3000 units = £16.97; 4000 units = £22.63; 5000 units = £28.28; 6000 units = £33.94; 8000 units = £45.25; 10 000 units = £56.57; 20 000 units = £113.13; 30 000 units = £169.70; 40 000 units = £226.26

Excipients include phenylalanine up to 500 micrograms/syringe (section 9.4.1)

Note Biosimilar medicine, p. 1

Dose symptomatic anaemia associated with chronic renal failure in patients on haemodialysis (see also MHRA/CHM advice, p. 653), by intravenous injection over 1–5 minutes *or* by subcutaneous injection (max. 1 mL per injection site), initially 50 units/kg 3 times weekly adjusted according to response in steps of 25 units/kg 3 times weekly at intervals of at least 4 weeks; maintenance dose, usually 25–100 units/kg 3 times weekly; CHILD by intravenous injection initially as for adults; maintenance dose, body-weight under 10 kg usually 75–150 units/kg 3 times weekly, body-weight 10–30 kg usually 60–150 units/kg 3 times weekly, body-weight over 30 kg usually 30–100 units/kg 3 times weekly

Symptomatic anaemia associated with chronic renal failure in adults on peritoneal dialysis (see also MHRA/CHM

advice, p. 653), by intravenous injection over 1–5 minutes *or* by subcutaneous injection (max. 1 mL per injection site), initially 50 units/kg twice weekly; maintenance dose 25–50 units/kg twice weekly

Severe symptomatic anaemia of renal origin in adults with renal insufficiency not yet on dialysis (see also MHRA/CHM advice, p. 653), by intravenous injection over 1–5 minutes *or* by subcutaneous injection (max. 1 mL per injection site), initially 50 units/kg 3 times weekly increased according to response in steps of 25 units/kg 3 times weekly at intervals of at least 4 weeks; maintenance dose 17–33 units/kg 3 times weekly; max. 200 units/kg 3 times weekly

Note Avoid increasing haemoglobin concentration at a rate exceeding 2 g/100 mL over 4 weeks

Symptomatic anaemia in adults receiving cancer chemotherapy (see also MHRA/CHM advice, p. 653), by subcutaneous injection (max. 1 mL per injection site), initially 150 units/kg 3 times weekly (*or* 450 units/kg once weekly), increased if appropriate rise in haemoglobin (or reticulocyte count) not achieved after 4 weeks to 300 units/kg 3 times weekly; discontinue if inadequate response after 4 weeks at higher dose

Note Reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy

To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia *either* when large volume of blood required *or* when sufficient blood cannot be saved for elective major surgery, by intravenous injection over 1–5 minutes, 600 units/kg twice weekly for 3 weeks before surgery; consult product literature for details and advice on ensuring high iron stores

Moderate anaemia (haemoglobin concentration 10–13 g/100 mL) before elective orthopaedic surgery in adults with expected moderate blood loss to reduce exposure to allogeneic blood transfusion or if autologous transfusion unavailable, by subcutaneous injection (max. 1 mL per injection site), 600 units/kg every week for 3 weeks before surgery and on day of surgery *or* 300 units/kg daily for 15 days starting 10 days before surgery; consult product literature for details

METHOXY POLYETHYLENE GLYCOL-EPOETIN BETA

Indications see under Dose below

Cautions see Epoetin

Contra-indications see Epoetin

Pregnancy no evidence of harm in *animal* studies—manufacturer advises caution

Breast-feeding manufacturer advises use only if potential benefit outweighs risk—present in milk in *animal* studies

Side-effects see Epoetin; also hot flushes reported

Dose

- Symptomatic anaemia associated with chronic kidney disease in patients on dialysis and *not* currently treated with erythropoietins (see also MHRA/CHM advice, p. 653), ADULT over 18 years, by subcutaneous *or* intravenous injection, initially 600 nanograms/kg once every 2 weeks, adjusted according to response at intervals of at least 4 weeks; maintenance dose of double the previous fortnightly dose may be given every 4 weeks
- Symptomatic anaemia associated with chronic kidney disease in patients *not* on dialysis and *not* currently treated with erythropoietins (see also MHRA/CHM advice, p. 653), ADULT over 18 years, by subcutaneous injection, initially 1.2 micrograms/kg once every 4 weeks, *alternatively* by subcutaneous *or* intravenous injection, initially 600 nanograms/kg once every 2 weeks; dose adjusted according to response at intervals of at least 4 weeks; patients treated once every 2 weeks may be given a maintenance dose of double the previous fortnightly dose every 4 weeks
- Symptomatic anaemia associated with chronic kidney disease in patients currently treated with erythropoietins (see also MHRA/CHM advice, p. 653), ADULT over 18 years, by subcutaneous *or* intravenous injection, consult product literature

Note Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks, or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

Mircera® (Roche) ▼ PoM

Injection, prefilled syringe, methoxy polyethylene glycol-epoetin beta, net price 30 micrograms/0.3 mL = £44.05; 50 micrograms/0.3 mL = £73.41; 75 micrograms/0.3 mL = £110.11; 100 micrograms/0.3 mL = £146.81; 120 micrograms/0.3 mL = £176.18; 150 micrograms/0.3 mL = £220.22; 200 micrograms/0.3 mL = £293.62; 250 micrograms/0.3 mL = £367.03; 360 micrograms/0.6 mL = £528.56

Sickle-cell disease

Sickle-cell disease is caused by a structural abnormality of haemoglobin resulting in deformed, less flexible red blood cells. Acute complications in the more severe forms include *sickle-cell crisis*, where infarction of the microvasculature and blood supply to organs results in severe pain. Sickle-cell crisis requires hospitalisation, intravenous fluids, analgesia (section 4.7), and treatment of any concurrent infection. Chronic complications include skin ulceration, renal failure, and increased susceptibility to infection. Pneumococcal vaccine (section 14.4), haemophilus influenzae type b vaccine (section 14.4), an annual influenza vaccine (section 14.4) and prophylactic penicillin (Table 2, section 5.1) reduce the risk of infection. Hepatitis B vaccine (section 14.4) should be considered if the patient is not immune.

In most forms of sickle-cell disease, varying degrees of haemolytic anaemia are present accompanied by increased erythropoiesis; this may increase folate requirements and folate supplementation may be necessary (section 9.1.2).

Hydroxycarbamide can reduce the frequency of crises and the need for blood transfusions in sickle-cell disease; it should be considered in consultation with a specialist centre. The beneficial effects of hydroxycarbamide may not become evident for several months. Myelosuppression and skin reactions are the most common side-effects.

HYDROXYCARBAMIDE

(Hydroxyurea)

Indications sickle-cell disease (see notes above); chronic myeloid leukaemia, cancer of the cervix (section 8.1.5)

Cautions see section 8.1 and notes above; also monitor renal and hepatic function before and during

treatment; monitor full blood count before treatment, then every 2 weeks for the first 2 months and then every 2 months thereafter (or every 2 weeks if on max. dose); leg ulcers (review treatment if cutaneous vasculitic ulcerations develop); **interactions:** Appendix 1 (hydroxycarbamide)

Hepatic impairment manufacturer advises caution in mild to moderate impairment; avoid in severe impairment

Renal impairment reduce initial dose by 50% if eGFR less than 60 mL/minute/1.73 m^2; avoid if eGFR less than 30 mL/minute/1.73 m^2

Pregnancy section 8.1.5

Breast-feeding section 8.1.5

Side-effects see section 8.1 and notes above; also headache; *less commonly* dizziness and rash; *rarely* reduced sperm count and activity; fever, amenorrhoea, skin cancers (in elderly patients), bleeding and hypomagnesaemia also reported

Dose

- By mouth, initially 15 mg/kg daily, increased every 12 weeks in steps of 2.5–5 mg/kg daily according to response; usual dose 15–30 mg/kg daily (max. 35 mg/kg daily); CHILD under 18 years, see *BNF for Children*

Siklos® (Nordic) PoM

Tablets, scored, f/c, hydroxycarbamide 100 mg, net price 60-tab pack = £100.00; 1 g, 30-tab pack = £500.00

Iron overload

Severe tissue iron overload can occur in aplastic and other refractory anaemias, mainly as the result of repeated blood transfusions. It is a particular problem in refractory anaemias with hyperplastic bone marrow, especially *thalassaemia major*, where excessive iron absorption from the gut and inappropriate iron therapy can add to the tissue siderosis.

Iron overload associated with haemochromatosis can be treated with repeated venesection. Venesection may also be used for patients who have received multiple transfusions and whose bone marrow has recovered. Where venesection is contra-indicated, the long-term administration of the iron chelating compound **desferrioxamine mesilate** is useful. Subcutaneous infusions of desferrioxamine are given over 8–12 hours, 3–7 times a week. The dose should reflect the degree of iron overload. For children starting therapy (and who have low iron overload) the dose should not exceed 30 mg/kg. For established overload the dose is usually between 20 and 50 mg/kg daily. Desferrioxamine (up to 2 g per unit of blood) may also be given at the time of blood transfusion, provided that the desferrioxamine is **not** added to the blood and is **not** given through the same line as the blood (but the two may be given through the same cannula).

Iron excretion induced by desferrioxamine is enhanced by administration of ascorbic acid (vitamin C, section 9.6.3) 200 mg daily by mouth (100 mg in infants); it should be given separately from food since it also enhances iron absorption. Ascorbic acid should not be given to patients with cardiac dysfunction; in patients with normal cardiac function ascorbic acid should be introduced 1 month after starting desferrioxamine.

Desferrioxamine infusion can be used to treat *aluminium overload* in dialysis patients; theoretically 100 mg of desferrioxamine binds with 4.1 mg of aluminium.

Deferasirox, an oral iron chelator, is licensed for the treatment of chronic iron overload in adults and children over 6 years with thalassaemia major who receive frequent blood transfusions (more than 7 mL/kg/month of packed red blood cells). It is also licensed for transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in children aged 2–5 years with thalassaemia major who receive frequent blood transfusions, adults and children over 2 years with thalassaemia major who receive infrequent blood transfusions (less than 7 mL/kg/month of packed red blood cells), and in adults and children over 2 years with other anaemias. Deferasirox is also licensed for the treatment of chronic iron overload when desferrioxamine is contra-indicated or inadequate in adults and children over 10 years with non-transfusion-dependent thalassaemia syndromes.

The *Scottish Medicines Consortium* (p. 4) has advised (January 2007) that deferasirox is accepted for restricted use within NHS Scotland for the treatment of chronic iron overload associated with the treatment of rare acquired or inherited anaemias requiring recurrent blood transfusions. It is not recommended for patients with myelodysplastic syndromes.

Deferiprone, an oral iron chelator, is licensed for the treatment of iron overload in patients with thalassaemia major in whom desferrioxamine is contra-indicated or is inadequate. Blood dyscrasias, particularly agranulocytosis, have been reported with deferiprone.

DEFERASIROX

Indications see notes above

Cautions eye and ear examinations required before treatment and annually during treatment; monitor body-weight, height, and sexual development in children annually; monitor serum-ferritin concentration monthly; elderly (increased risk of side-effects); risk of gastro-intestinal ulceration and haemorrhage; platelet count less than 50 × 10^9/litre; consider treatment interruption if unexplained cytopenia occurs; not recommended in conditions which may reduce life expectancy (e.g. high-risk myelodysplastic syndromes); history of liver cirrhosis; test liver function before treatment, then every 2 weeks during the first month, and then monthly; measure baseline serum creatinine and monitor renal function weekly during the first month of treatment and monthly thereafter; test for proteinuria monthly; **interactions:** Appendix 1 (deferasirox)

Hepatic impairment use with caution in moderate impairment, reduce dose considerably then gradually increase to max. 50% of normal dose; avoid in severe impairment

Renal impairment reduce dose by 10 mg/kg if eGFR 60–90 mL/minute/1.73 m^2 and if serum creatinine increased by more than 33% of baseline measurement on 2 consecutive occasions—interrupt treatment if deterioration in renal function persists after dose reduction; avoid if eGFR less than 60 mL/minute/1.73 m^2

Pregnancy manufacturer advises avoid unless essential—toxicity in *animal* studies

Breast-feeding manufacturer advises avoid—present in milk in *animal* studies

Side-effects gastro-intestinal disturbances (including ulceration and fatal haemorrhage); headache; proteinuria; pruritus, rash; *less commonly* hepatitis, cholelithiasis, oedema, fatigue, anxiety, sleep disorder, dizziness, pyrexia, pharyngitis, glucosuria, renal tubulopathy, disturbances of hearing and vision (including lens opacity and maculopathy), and skin pigmentation; hepatic failure, acute renal failure, tubulointerstitial nephritis, blood disorders (including anaemia, agranulocytosis, neutropenia, pancytopenia, and thrombocytopenia), hypersensitivity reactions (including anaphylaxis and angioedema), alopecia also reported

Dose

- Transfusion-related chronic iron overload, ADULT and CHILD over 2 years initially 10–30 mg/kg once daily according to serum-ferritin concentration and amount of transfused blood (consult product literature); maintenance, adjust dose every 3–6 months in steps of 5–10 mg/kg according to serum-ferritin concentration; usual max. 30 mg/kg daily, but may be increased to max. 40 mg/kg daily and reduced in steps of 5–10 mg/kg once control achieved
- Chronic iron overload in non-transfusion-dependent thalassaemia syndromes, ADULT over 18 years initially 10 mg/kg once daily; maintenance, adjust dose every 3–6 months in steps of 5–10 mg/kg according to serum-ferritin concentration and liver-iron concentration (consult product literature); max. 20 mg/kg daily; CHILD under 18 years see *BNF for Children*

Exjade® (Novartis) ▼ PoM

Dispersible tablets, deferasirox 125 mg, net price 28-tab pack = £117.60; 250 mg, 28-tab pack = £235.20; 500 mg, 28-tab pack = £470.40. Label: 13, 22, counselling, administration

Counselling Tablets should be dispersed in water, orange juice, or apple juice; if necessary resuspend residue

DEFERIPRONE

Indications see notes above

Cautions monitor neutrophil count weekly and discontinue treatment if neutropenia develops; monitor plasma-zinc concentration; **interactions:** Appendix 1 (deferiprone)

Blood disorders Patients or their carers should be told how to recognise signs of neutropenia and advised to seek immediate medical attention if symptoms such as fever or sore throat develop

Contra-indications history of agranulocytosis or recurrent neutropenia

Hepatic impairment manufacturer advises monitor liver function—interrupt treatment if persistent elevation in serum alanine aminotransferase

Renal impairment manufacturer advises caution—no information available

Pregnancy manufacturer advises avoid before intended conception and during pregnancy—teratogenic and embryotoxic in *animal* studies; contraception advised in women of child-bearing potential

Breast-feeding manufacturer advises avoid—no information available

Side-effects gastro-intestinal disturbances (reducing dose and increasing gradually may improve tolerance), increased appetite; headache; red-brown urine discoloration; neutropenia, agranulocytosis; zinc deficiency; arthropathy

Dose

- ADULT and CHILD over 6 years 25 mg/kg 3 times daily (max. 100 mg/kg daily)

Ferriprox® (Swedish Orphan) PoM

Tablets, f/c, scored, deferiprone 500 mg, net price 100-tab pack = £152.39; 1 g, 50-tab pack = £175.25. Label: 14, counselling, blood disorders

Oral solution, red, deferiprone 100 mg/mL, net price 500 mL = £152.39. Label: 14, counselling, blood disorders

DESFERRIOXAMINE MESILATE

(Deferoxamine Mesilate)

Indications see notes above; iron poisoning, see Emergency Treatment of Poisoning, p. 39

Cautions eye and ear examinations before treatment and at 3-month intervals during treatment; monitor body-weight and height in children at 3-month intervals—risk of growth retardation with excessive doses; aluminium-related encephalopathy (may exacerbate neurological dysfunction); **interactions:** Appendix 1 (desferrioxamine)

Renal impairment use with caution

Pregnancy teratogenic in *animal* studies; manufacturer advises use only if potential benefit outweighs risk

Breast-feeding manufacturer advises use only if potential benefit outweighs risk—no information available

Side-effects nausea, vomiting, abdominal pain; headache; pyrexia; growth retardation and bone disorders (see Cautions); arthralgia, myalgia; hearing disturbances; injection-site reactions; *rarely* diarrhoea, hepatic impairment, hypotension (especially when given too rapidly by intravenous injection), anaphylaxis, Yersinia and mucormycosis infections, blood dyscrasias (including thrombocytopenia and leucopenia), leg cramps, bone pain, visual disturbances (including lens opacity and retinopathy), rash; *very rarely* acute respiratory distress, neurological disturbances (including dizziness, neuropathy, convulsions, and paraesthesia), renal impairment; muscle spasms also reported

Dose

- See notes above; iron poisoning, see Emergency Treatment of Poisoning, p. 39

Note For full details and warnings relating to administration, consult product literature

Desferrioxamine mesilate (Non-proprietary) PoM

Injection, powder for reconstitution, desferrioxamine mesilate, net price 500-mg vial = £4.26; 2-g vial = £17.65

Desferal® (Novartis) PoM

Injection, powder for reconstitution, desferrioxamine mesilate, net price 500-mg vial = £4.67, 2-g vial = £18.66

Paroxysmal nocturnal haemoglobinuria and atypical haemolytic uraemic syndrome

Eculizumab, a recombinant monoclonal antibody, inhibits terminal complement activation at the C5 protein

and thereby reduces haemolysis and thrombotic microangiopathy. It is used to reduce haemolysis in paroxysmal nocturnal haemoglobinuria (PNH), a severe and disabling form of haemolytic anaemia. Eculizumab is also used to reduce thrombotic microangiopathy in atypical haemolytic uraemic syndrome (aHUS).

ECULIZUMAB

Indications paroxysmal nocturnal haemoglobinuria, in those with a history of blood transfusions (under specialist supervision); atypical haemolytic uraemic syndrome (under specialist supervision)

Cautions active systemic infection; monitor for 1 hour after infusion; for *paroxysmal nocturnal haemoglobinuria*, monitor for intravascular haemolysis (including serum-lactate dehydrogenase concentration) during treatment and for at least 8 weeks after discontinuation; for *atypical haemolytic uraemic syndrome*, monitor for thrombotic microangiopathy (measure platelet count, serum-lactate dehydrogenase concentration, and serum creatinine) during treatment and for at least 12 weeks after discontinuation

Meningococcal infection Vaccinate against *Neisseria meningitidis* at least 2 weeks before treatment (tetravalent vaccine against serotypes A, C, W135 and Y recommended); revaccinate according to current medical guidelines. Patients receiving eculizumab less than 2 weeks after receiving meningococcal vaccine must be given prophylactic antibiotics until 2 weeks after vaccination. Advise patient to report promptly any signs of meningococcal infection. Other immunisations should also be up to date (section 14.1)

Contra-indications unresolved *Neisseria meningitidis* infection; patients unvaccinated against *Neisseria meningitidis* (see also Cautions above)

Pregnancy no information available—use only if potential benefit outweighs risk; human IgG antibodies known to cross placenta; manufacturer advises effective contraception during and for 5 months after treatment

Breast-feeding no information available—manufacturer advises avoid breast-feeding during and for 5 months after treatment

Side-effects gastro-intestinal disturbances; oedema; cough, nasopharyngitis; headache, dizziness, vertigo, fatigue, dysgeusia, paraesthesia; infection (including meningococcal infection); spontaneous erection, dysuria; arthralgia, myalgia; blood disorders (including thrombocytopenia, leucopenia); alopecia, pruritus, rash; influenza-like symptoms; infusion-related reactions; *less commonly* anorexia, gingival pain, jaundice, palpitation, haematoma, hypotension, chest pain, syncope, tremor, hot flushing, epistaxis, anxiety, depression, mood changes, sleep disturbances, Graves' disease, menstrual disorders, renal impairment, malignant melanoma, muscle spasms, myelodysplastic syndrome, visual disturbances, tinnitus, hyperhidrosis, petechiae, and skin depigmentation

Dose

- Paroxysmal nocturnal haemoglobinuria, by intravenous infusion, ADULT over 18 years, initially 600 mg once a week for 4 weeks, then 900 mg on week 5; maintenance, 900 mg once every 12–16 days; CHILD see *BNF for Children*
- Atypical haemolytic uraemic syndrome, by intravenous infusion, ADULT over 18 years, initially 900 mg once a week for 4 weeks, then 1200 mg on week 5; maintenance, 1200 mg once every 12–16 days; CHILD see *BNF for Children*

Note Consult product literature for details of supplemental doses with concomitant plasmapheresis, plasma exchange, or plasma infusion

Soliris® (Alexion) PoM

Concentrate for intravenous infusion, eculizumab 10 mg/mL, net price 30-mL vial = £3150.00. Counselling, meningococcal infection, patient information card

Electrolytes Na^+ 5 mmol/vial

9.1.4 Drugs used in platelet disorders

Idiopathic thrombocytopenic purpura

Acute idiopathic thrombocytopenic purpura is usually self-limiting in children. In adults, idiopathic thrombocytopenic purpura can be treated with a **corticosteroid**, e.g. prednisolone 1 mg/kg daily, gradually reducing the dose over several weeks. Splenectomy is considered if a satisfactory platelet count is not achieved or if there is a relapse on reducing the dose of corticosteroid or withdrawing it.

Immunoglobulin preparations (section 14.5.1), are also used in idiopathic thrombocytopenic purpura or where a temporary rapid rise in platelets is needed, as in pregnancy or pre-operatively; they are also used for children often in preference to a corticosteroid. **Anti-D (Rh_0) immunoglobulin** (section 14.5.3) is effective in raising the platelet count in about 80% of unsplenectomised rhesus-positive individuals; its effects may last longer than normal immunoglobulin for intravenous use, but further doses are usually required.

Other therapy that has been tried in refractory idiopathic thrombocytopenic purpura includes azathioprine (section 8.2.1), cyclophosphamide (section 8.1.1), vincristine (section 8.1.4), ciclosporin (section 8.2.2), and danazol (section 6.7.2). Rituximab (section 8.2.3) may also be effective and in some cases induces prolonged remission. For patients with chronic severe thrombocytopenia refractory to other therapy, tranexamic acid (section 2.11) may be given to reduce the severity of haemorrhage.

Eltrombopag and **romiplostim** are thrombopoietin receptor agonists licensed for the treatment of chronic idiopathic thrombocytopenic purpura in splenectomised patients refractory to other treatments, such as corticosteroids or immunoglobulins, or as a second-line treatment in non-splenectomised patients when surgery is contra-indicated (see also NICE guidance below). Eltrombopag is an oral preparation and romiplostim is an injection which is made biosynthetically by recombinant DNA technology; they should both be used under the supervision of a specialist.

The *Scottish Medicines Consortium* (p. 4) has advised (July 2010) that eltrombopag (*Revolade®*) is accepted for restricted use within NHS Scotland for the treatment of both splenectomised and non-splenectomised patients with severe symptomatic immune (idiopathic) thrombocytopenic purpura or a high risk of bleeding.

NICE guidance

Eltrombopag for treating chronic immune (idiopathic) thrombocytopenic purpura (July 2013)

Eltrombopag is recommended for the treatment of chronic immune (idiopathic) thrombocytopenic purpura in splenectomised adults refractory to other treatments, or as a second-line treatment in non-splenectomised adults when surgery is contra-indicated, only if:

- the manufacturer provides eltrombopag at the agreed discount as part of the patient access scheme *and*
- their condition is refractory to standard active treatments and rescue therapies *or*
- they have severe disease and a high risk of bleeding that needs frequent courses of rescue therapies.

Patients currently receiving eltrombopag whose disease does not meet these criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA293

The *Scottish Medicines Consortium* (p. 4) has advised (September 2009) that romiplostim (*Nplate*®) is accepted for restricted use within NHS Scotland for patients with severe symptomatic idiopathic thrombocytopenic purpura or those at high risk of bleeding.

NICE guidance

Romiplostim for the treatment of chronic immune (idiopathic) thrombocytopenic purpura (April 2011)

Romiplostim is recommended for the treatment of chronic immune (idiopathic) thrombocytopenic purpura in adults:

- if the manufacturer provides romiplostin at the agreed discount as part of the patient access scheme *and*
- whose condition is refractory to standard active treatments and rescue therapies *or*
- who have severe disease and a high risk of bleeding that needs frequent courses of rescue therapies.

www.nice.org.uk/TA221

Eltrombopag is also used, under specialist supervision, to treat thrombocytopenia in patients with chronic hepatitis C infection, where the degree of thrombocytopenia is the main factor preventing the initiation or limiting the ability to maintain optimal interferon-based therapy. For the treatment of chronic hepatitis C, see section 5.3.3.2, p. 429.

ELTROMBOPAG

Indications see notes above

Cautions patients of East Asian origin (see under Dose for *idiopathic thrombocytopenic purpura*); risk factors for thromboembolism; monitor liver function before treatment, every two weeks when adjusting the dose, and monthly thereafter; regular ophthalmological examinations for cataract formation recommended; for *idiopathic thrombocytopenic purpura*, monitor full blood count including platelet count and peripheral blood smears every week during treatment until a stable platelet count is reached (50 × 10^9/litre or more for at least 4 weeks), then monthly thereafter; for *thrombocytopenia associated with chronic hepatitis C infection*, monitor platelet count every week before and during antiviral treatment until a stable platelet count is reached (50–75 × 10^9/litre), then monitor full blood count including platelet count and peripheral blood smears monthly thereafter; **interactions:** Appendix 1 (eltrombopag)

Hepatic impairment for *idiopathic thrombocytopenic purpura*, avoid unless potential benefit outweighs risk—reduce initial dose to 25 mg once daily; for *thrombocytopenia associated with chronic hepatitis C infection*, in severe hepatic impairment use only if potential benefit outweighs risk and monitor closely—increased risk of hepatic decompensation and thromboembolic events

Renal impairment use with caution

Pregnancy avoid—toxicity in *animal* studies; ensure effective contraception during treatment

Breast-feeding manufacturer advises avoid

Side-effects gastro-intestinal disturbances (including nausea, diarrhoea, abdominal pain, and constipation), peripheral oedema, headache, insomnia, paraesthesia, fatigue, arthralgia, bone pain, myalgia, cataract, dry eye, pruritus, rash, alopecia; *less commonly* dry mouth, gingival bleeding, haemorrhoids, taste disturbances, cholestasis, hepatitis, anorexia, changes in appetite, weight gain, flushing, palpitation, QT-interval prolongation, hypertension, tachycardia, thromboembolic events (including deep vein thrombosis, pulmonary embolism, and acute myocardial infarction), cough, sleep disorders, mood changes, depression, anxiety, dizziness, migraine, hemiparesis, tremor, peripheral neuropathy, respiratory and urinary tract infections, renal failure, nocturia, rectosigmoid cancer, blood disorders (including anaemia, haemolysis, eosinophilia, myelocytosis), gout, eye disorders, vertigo, epistaxis, skin reactions including ecchymosis, sweating

Dose

- Idiopathic thrombocytopenic purpura, ADULT over 18 years, initially 50 mg once daily (patients of EAST ASIAN origin such as Chinese, Japanese, Taiwanese, or Korean, initially 25 mg once daily), adjusted to achieve a platelet count of 50 × 10^9/litre or more (consult product literature for dose adjustments); max. 75 mg once daily; discontinue if inadequate response after 4 weeks at maximum dose
- Thrombocytopenia associated with chronic hepatitis C infection (see also notes above), ADULT over 18 years, initially 25 mg once daily, adjusted to achieve a platelet count sufficient to initiate antiviral therapy then a platelet count of 50–75 × 10^9/litre during antiviral therapy (consult product literature for dose adjustments); max. 100 mg once daily; discontinue if inadequate response after 2 weeks at maximum dose

Counselling Each dose should be taken at least 4 hours before or after any dairy products (or foods containing calcium), indigestion remedies, or medicines containing aluminium, calcium, iron, magnesium, zinc, or selenium to reduce possible interference with absorption

Revolade® (GSK) ▼ PoM

Tablets, f/c, eltrombopag (as olamine) 25 mg (white), net price 28-tab pack = £770.00; 50 mg (brown), 28-tab pack = £1540.00. Counselling, see above

ROMIPLOSTIM

Indications see notes above

Cautions monitor full blood count and peripheral blood smears for morphological abnormalities before

and during treatment; monitor platelet count weekly until 50 × 10^9/litre or more for at least 4 weeks without dose adjustment, then monthly thereafter
Driving Dizziness may affect performance of skilled tasks (e.g. driving)

Hepatic impairment avoid in moderate or severe impairment unless potential benefit outweighs risk (e.g. of portal vein thrombosis)

Renal impairment manufacturer advises caution—no information available

Pregnancy manufacturer advises use only if essential—toxicity in *animal* studies

Breast-feeding manufacturer advises avoid—no information available

Side-effects gastro-intestinal disturbances; flushing, oedema; dizziness, migraine, insomnia, fatigue, asthenia, paraesthesia; influenza-like symptoms; arthralgia, myalgia, bone pain, muscle spasm; increased bone marrow reticulin; ecchymosis, rash; injection-site reactions

Dose

- By subcutaneous injection, ADULT over 18 years, initially 1 microgram/kg once weekly, adjusted in steps of 1 microgram/kg at weekly intervals until a stable platelet count of 50 × 10^9/litre or more is reached (consult product literature for dose adjustments); max. 10 micrograms/kg once weekly; discontinue if inadequate response after 4 weeks at maximum dose

Nplate® (Amgen) PoM
Injection, powder for reconstitution, romiplostim, net price 250-microgram vial (with solvent) = £482.00

Essential thrombocythaemia

Anagrelide inhibits platelet formation. It is licensed for essential thrombocythaemia in patients at risk of thrombo-haemorrhagic events who have not responded adequately to other drugs or who cannot tolerate other drugs. Anagrelide should be initiated under specialist supervision.

ANAGRELIDE

Indications see notes above

Cautions cardiovascular disease—assess cardiac function before and during treatment; concomitant aspirin in patients at risk of haemorrhage; monitor full blood count (monitor platelet count every 2 days for 1 week, then weekly until maintenance dose established), liver function, serum creatinine and urea; **interactions:** Appendix 1 (anagrelide)
Driving Dizziness may affect performance of skilled tasks (e.g. driving)

Hepatic impairment manufacturer advises caution in mild impairment; avoid in moderate to severe impairment

Renal impairment manufacturer advises avoid if eGFR less than 50 mL/minute/1.73 m^2

Pregnancy manufacturer advises avoid (toxicity in *animal* studies)

Breast-feeding manufacturer advises avoid—no information available

Side-effects gastro-intestinal disturbances, palpitation, tachycardia, fluid retention, headache, dizziness, fatigue, anaemia, rash; *less commonly* pancreatitis, gastro-intestinal haemorrhage, congestive heart failure, hypertension, arrhythmias, syncope, chest pain, dyspnoea, sleep disturbances, paraesthesia, hypoaesthesia, depression, nervousness, confusion, amnesia, fever, weight changes, impotence, blood disorders, myalgia, arthralgia, epistaxis, dry mouth, alopecia, skin discoloration, pruritus; *rarely* gastritis, colitis, postural hypotension, angina, myocardial infarction, vasodilatation, pulmonary hypertension, pulmonary infiltrates, migraine, drowsiness, impaired coordination, dysarthria, asthenia, tinnitus, renal failure, nocturia, visual disturbances, gingival bleeding; *also reported* allergic alveolitis, interstitial lung disease, pneumonitis, hepatitis, tubulointerstitial nephritis

Dose

- Initially 500 micrograms twice daily adjusted according to response in steps of 500 micrograms daily at weekly intervals to max. 10 mg daily (max. single dose 2.5 mg); usual dose range 1–3 mg daily in divided doses; CHILD under 18 years see *BNF for Children*

Xagrid® (Shire) ▼ PoM
Capsules, anagrelide (as hydrochloride), 500 micrograms, net price 100-cap pack = £404.57. Counselling, driving, see above

9.1.5 G6PD deficiency

Glucose 6-phosphate dehydrogenase (G6PD) deficiency is highly prevalent in individuals originating from most parts of Africa, from most parts of Asia, from Oceania, and from Southern Europe; it can also occur, rarely, in any other individuals. G6PD deficiency is more common in males than it is in females.

Individuals with G6PD deficiency are susceptible to developing acute haemolytic anaemia when they take a number of common drugs. They are also susceptible to developing acute haemolytic anaemia when they eat fava beans (broad beans, *Vicia faba*); this is termed *favism* and can be more severe in children or when the fresh fava beans are eaten raw.

When prescribing drugs for patients with G6PD deficiency, the following three points should be kept in mind:

- G6PD deficiency is genetically heterogeneous; susceptibility to the haemolytic risk from drugs varies; thus, a drug found to be safe in some G6PD-deficient individuals may not be equally safe in others;
- manufacturers do not routinely test drugs for their effects in G6PD-deficient individuals;
- the risk and severity of haemolysis is almost always dose-related.

The lists below should be read with these points in mind. Ideally, information about G6PD deficiency should be available before prescribing a drug listed below. However, in the absence of this information, the possibility of haemolysis should be considered, especially if the patient belongs to a group in which G6PD deficiency is common.

A very few G6PD-deficient individuals with chronic non-spherocytic haemolytic anaemia have haemolysis even in the absence of an exogenous trigger. These patients must be regarded as being at high risk of severe exacerbation of haemolysis following administration of any of the drugs listed below.

Drugs with definite risk of haemolysis in most G6PD-deficient individuals

Dapsone and other sulfones (higher doses for dermatitis herpetiformis more likely to cause problems)

Methylthioninium chloride

Niridazole [not on UK market]

Nitrofurantoin

Pamaquin [not on UK market]

Primaquine (30 mg weekly for 8 weeks has been found to be without undue harmful effects in African and Asian people, see section 5.4.1)

Quinolones (including ciprofloxacin, moxifloxacin, nalidixic acid, norfloxacin, and ofloxacin)

Rasburicase

Sulfonamides (including co-trimoxazole; some sulfonamides, e.g. sulfadiazine, have been tested and found not to be haemolytic in many G6PD-deficient individuals)

Drugs with possible risk of haemolysis in some G6PD-deficient individuals

Aspirin (acceptable up to a dose of at least 1 g daily in most G6PD-deficient individuals)

Chloroquine (acceptable in acute malaria and malaria chemoprophylaxis)

Menadione, water-soluble derivatives (e.g. menadiol sodium phosphate)

Probenecid [not on UK market]

Quinidine (acceptable in acute malaria) [not on UK market]

Quinine (acceptable in acute malaria)

Sulfonylureas

Note Naphthalene in mothballs also causes haemolysis in individuals with G6PD deficiency

9.1.6 Drugs used in neutropenia

Recombinant human granulocyte-colony stimulating factor (rhG-CSF) stimulates the production of neutrophils and may reduce the duration of chemotherapy-induced neutropenia and thereby reduce the incidence of associated sepsis; there is as yet no evidence that it improves overall survival. **Filgrastim** (unglycosylated rhG-CSF) and **lenograstim** (glycosylated rhG-CSF) have similar effects; both have been used in a variety of clinical settings, but they do not have any clear-cut routine indications. In congenital neutropenia filgrastim usually increases the neutrophil count with an appropriate clinical response. Prolonged use may be associated with an increased risk of myeloid malignancy. **Pegfilgrastim** is a polyethylene glycol-conjugated ('pegylated') derivative of filgrastim; pegylation increases the duration of filgrastim activity.

Granulocyte-colony stimulating factors should only be prescribed by those experienced in their use.

Cautions Granulocyte-colony stimulating factors should be used with caution in patients with pre-malignant or malignant myeloid conditions. Full blood counts including differential white cell and platelet counts should be monitored. Treatment should be withdrawn in patients who develop signs of pulmonary infiltration. There have been reports of pulmonary infiltrates leading to acute respiratory distress syndrome—patients with a recent history of pulmonary infiltrates or pneumonia may be at higher risk. Granulocyte-colony stimulating factors should be used with caution in patients with sickle-cell disease. Spleen size should be monitored during treatment because there is a risk of splenomegaly and rupture.

Pregnancy There have been reports of toxicity in *animal* studies and manufacturers advise not to use granulocyte-colony stimulating factors during pregnancy unless the potential benefit outweighs the risk.

Breast-feeding There is no evidence for the use of granulocyte-colony stimulating factors during breast-feeding and manufacturers advise avoiding their use.

Side-effects Side-effects of granulocyte-colony stimulating factors include gastro-intestinal disturbances, anorexia, headache, asthenia, fever, musculoskeletal pain, bone pain, rash, alopecia, injection-site reactions, thrombocytopenia, and leucocytosis. *Less commonly* chest pain can occur. Pulmonary side-effects, particularly interstitial pneumonia (see Cautions above), cutaneous vasculitis and acute febrile neutrophilic dermatosis have *rarely* been reported.

FILGRASTIM

(Recombinant human granulocyte-colony stimulating factor, G-CSF)

Indications (specialist use only) reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes); reduction in duration of neutropenia (and associated sequelae) in myeloablative therapy followed by bone-marrow transplantation; mobilisation of peripheral blood progenitor cells for harvesting and subsequent autologous or allogeneic infusion; severe congenital neutropenia, cyclic neutropenia, or idiopathic neutropenia and history of severe or recurrent infections (distinguish carefully from other haematological disorders, consult product literature); persistent neutropenia in advanced HIV infection

Cautions see notes above; also regular morphological and cytogenetic bone-marrow examinations recommended in severe congenital neutropenia (possible risk of myelodysplastic syndromes or leukaemia); secondary acute myeloid leukaemia; osteoporotic bone disease (monitor bone density if given for more than 6 months); **interactions:** Appendix 1 (filgrastim)

Contra-indications severe congenital neutropenia (Kostmann's syndrome) with abnormal cytogenetics

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above; also mucositis, splenic enlargement, hepatomegaly, transient hypotension, epistaxis, urinary abnormalities (including dysuria, proteinuria, and haematuria), osteoporosis, exacerbation of rheumatoid arthritis, anaemia, transient decrease in blood glucose, pseudogout, and raised uric acid; *less commonly* capillary leak syndrome (including fatal cases); *very rarely* splenic rupture

Dose

- Cytotoxic-induced neutropenia, preferably by subcutaneous injection *or* by intravenous infusion (over 30 minutes), ADULT and CHILD, 500 000 units/kg daily started at least 24 hours after cytotoxic chemother-

apy, continued until neutrophil count in normal range, usually for up to 14 days (up to 38 days in acute myeloid leukaemia)

- Myeloablative therapy followed by bone-marrow transplantation, by intravenous infusion over 30 minutes or over 24 hours *or* by subcutaneous infusion over 24 hours, 1 million units/kg daily, started at least 24 hours following cytotoxic chemotherapy (and within 24 hours of bone-marrow infusion), then adjusted according to neutrophil count (consult product literature)
- Mobilisation of peripheral blood progenitor cells for autologous infusion, used alone, by subcutaneous injection *or* by subcutaneous infusion over 24 hours, 1 million units/kg daily for 5–7 days; used following adjunctive myelosuppressive chemotherapy (to improve yield), by subcutaneous injection, 500 000 units/kg daily, started the day after completing chemotherapy and continued until neutrophil count in normal range; for timing of leucopheresis consult product literature
- Mobilisation of peripheral blood progenitor cells in normal donors for allogeneic infusion, by subcutaneous injection, ADULT under 60 years and CHILD over 16 years, 1 million units/kg daily for 4–5 days; for timing of leucopheresis consult product literature
- Severe chronic neutropenia, by subcutaneous injection, ADULT and CHILD, in severe congenital neutropenia, initially 1.2 million units/kg daily in single or divided doses (initially 500 000 units/kg daily in idiopathic or cyclic neutropenia), adjusted according to response (consult product literature)
- Persistent neutropenia in HIV infection, by subcutaneous injection, initially 100 000 units/kg daily, increased as necessary until neutrophil count in normal range (usual max. 400 000 units/kg daily), then adjusted to maintain neutrophil count in normal range (consult product literature)

Neupogen® (Amgen) PoM

Injection, filgrastim 30 million-units (300 micrograms)/mL, net price 1-mL vial = £52.70

Injection (Singleject®), filgrastim 60 million-units (600 micrograms)/mL, net price 0.5-mL prefilled syringe = £52.70; 96 million-units (960 micrograms)/mL, 0.5-mL prefilled syringe = £84.06

Nivestim® (Hospira) ▼ PoM

Injection, prefilled syringe, filgrastim, net price 12 million-units (120 micrograms)/0.2 mL = £36.00; 30 million-units (300 micrograms)/0.5 mL = £58.00; 48 million-units (480 micrograms)/0.5 mL = £93.00

Note Biosimilar medicine, p. 1

Ratiograstim® (Ratiopharm UK) ▼ PoM

Injection, prefilled syringe, filgrastim, net price 30 million-units (300 micrograms)/0.5 mL = £62.25; 48 million-units (480 micrograms)/0.8 mL = £99.29

Note Biosimilar medicine, p. 1

Zarzio® (Sandoz) PoM

Injection, prefilled syringe, filgrastim, net price 30 million-units (300 micrograms)/0.5 mL = £50.15; 48 million-units (480 micrograms)/0.5 mL = £79.90

Note Biosimilar medicine, p. 1

LENOGRASTIM

(Recombinant human granulocyte-colony stimulating factor, rHuG-CSF)

Indications (specialist use only) reduction in the duration of neutropenia and associated complications following peripheral stem cells or bone-marrow transplantation for non-myeloid malignancy, or following treatment with cytotoxic chemotherapy associated with a significant incidence of febrile neutropenia; mobilisation of peripheral blood progenitor cells for harvesting and subsequent infusion

Cautions see notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above; also mucositis, splenic rupture, and toxic epidermal necrolysis

Dose

- Following bone-marrow transplantation, by intravenous infusion or subcutaneous injection, ADULT and CHILD over 2 years 19.2 million units/m^2 daily started the day after transplantation, continued until neutrophil count stable in acceptable range (max. 28 days)
- Following peripheral stem cells transplantation, by intravenous infusion or subcutaneous injection, ADULT 19.2 million units/m^2 daily started the day after transplantation, continued until neutrophil count stable in acceptable range (max. 28 days); CHILD see *BNF for Children*
- Cytotoxic-induced neutropenia, by subcutaneous injection, ADULT 19.2 million units/m^2 daily started the day after completion of chemotherapy, continued until neutrophil count stable in acceptable range (max. 28 days); CHILD see *BNF for Children*
- Mobilisation of peripheral blood progenitor cells, used alone, by subcutaneous injection, ADULT 1.28 million units/kg daily for 4–6 days (5–6 days in healthy donors); used following adjunctive myelosuppressive chemotherapy (to improve yield), by subcutaneous injection, 19.2 million units/m^2 daily, started 1–5 days after completion of chemotherapy and continued until neutrophil count in acceptable range; for timing of leucopheresis consult product literature; CHILD see *BNF for Children*

Granocyte® (Chugai) PoM

Injection, powder for reconstitution, lenograstim, net price 13.4 million-unit (105-microgram) vial = £40.11; 33.6 million-unit (263-microgram) vial = £62.54 (both with 1-mL prefilled syringe water for injections)

Excipients include phenylalanine (section 9.4.1)

PEGFILGRASTIM

(Pegylated recombinant methionyl human granulocyte-colony stimulating factor)

Indications (specialist use only) reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes)

Cautions see notes above; also acute leukaemia and myelosuppressive chemotherapy; **interactions:** Appendix 1 (filgrastim)

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above; also *rarely* capillary leak syndrome (including fatal cases); *very rarely* splenic rupture

Dose

Note Dose expressed as filgrastim

- By subcutaneous injection, ADULT over 18 years, 6 mg (0.6 mL) for each chemotherapy cycle, starting 24 hours after chemotherapy

Neulasta® (Amgen) PoM

Injection, pegfilgrastim (expressed as filgrastim) 10 mg/mL, net price 0.6-mL (6-mg) prefilled syringe = £686.38

9.1.7 Drugs used to mobilise stem cells

Plerixafor is a chemokine receptor antagonist licensed to mobilise haematopoietic stem cells to peripheral blood for collection and subsequent autologous transplantation in patients with lymphoma or multiple myeloma. Plerixafor should be given under specialist supervision following 4 days treatment with a granulocyte-colony stimulating factor (section 9.1.6)

PLERIXAFOR

Indications see notes above

Cautions monitor platelet and white blood cell count

Renal impairment reduce dose to 160 micrograms/kg daily if creatinine clearance 20–50 mL/minute; no information available if creatinine clearance less than 20 mL/minute

Pregnancy manufacturer advises avoid unless essential and use effective contraception during treatment—teratogenic in *animal* studies

Breast-feeding manufacturer advises avoid—no information available

Side-effects gastro-intestinal disturbances, dry mouth, oral hypoaesthesia; dizziness, headache, insomnia, fatigue; arthralgia, musculoskeletal pain; erythema, sweating; injection-site reactions; *less commonly* hypersensitivity reactions including dyspnoea and periorbital swelling

Dose

- By subcutaneous injection, ADULT over 18 years, 240 micrograms/kg daily 6–11 hours before initiation of apheresis; usual duration 2–4 days (max. 7 days)

Mozobil® (Genzyme) ▼ PoM

Injection, plerixafor 20 mg/mL, net price 1.2 mL-vial = £4882.77

Faeces, vomit, or aspiration should be saved and analysed where possible if abnormal losses are suspected; where this is impracticable the approximations above may be helpful in planning replacement therapy

9.2 Fluids and electrolytes

The following tables give a selection of useful electrolyte values:

9.2.1 Oral preparations for fluid and electrolyte imbalance

Sodium and potassium salts, which may be given by mouth to prevent deficiencies or to treat established deficiencies of mild or moderate degree, are discussed in this section. Oral preparations for removing excess potassium and preparations for oral rehydration therapy are also included here. Oral bicarbonate, for metabolic acidosis, is also described in this section.

For reference to calcium, magnesium, and phosphate, see section 9.5.

9.2.1.1 Oral potassium

Compensation for potassium loss is especially necessary:

- in those taking digoxin or anti-arrhythmic drugs, where potassium depletion may induce arrhythmias;
- in patients in whom secondary hyperaldosteronism occurs, e.g. renal artery stenosis, cirrhosis of the liver, the nephrotic syndrome, and severe heart failure;
- in patients with excessive losses of potassium in the faeces, e.g. chronic diarrhoea associated with intestinal malabsorption or laxative abuse.

Measures to compensate for potassium loss may also be required in the elderly since they frequently take inadequate amounts of potassium in the diet (but see below for **warning** on **renal insufficiency**). Measures may also be required during long-term administration of drugs known to induce potassium loss (e.g. corticosteroids). Potassium supplements are **seldom required** with the small doses of diuretics given to treat hypertension; **potassium-sparing diuretics** (rather than potassium supplements) are recommended for prevention of hypokalaemia due to diuretics such as furosemide or the thiazides when these are given to eliminate oedema.

Dosage If potassium salts are used for the *prevention of hypokalaemia*, then doses of potassium chloride 2 to 4 g (approx. 25 to 50 mmol) daily (in divided doses) by mouth are suitable in patients taking a normal diet. *Smaller doses* must be used if there is *renal insufficiency (common in the elderly)* to reduce the **risk** of **hyperkalaemia**. Potassium salts cause nausea and vomiting and poor compliance is a major limitation to their effectiveness; when appropriate, potassium-sparing diuretics are preferable (see also above). Regular monitoring of plasma-potassium concentration is essential in those taking potassium supplements. When there is *established potassium depletion* larger doses may be necessary, the quantity depending on the severity of any continuing potassium loss (monitoring of plasma-potassium concentration and specialist advice would be required). Potassium depletion is frequently associated with chloride depletion and with metabolic alkalosis, and these disorders require correction.

Administration Potassium salts are preferably given as a liquid (or effervescent) preparation, rather than modified-release tablets; they should be given as the chloride (the use of effervescent potassium tablets BPC 1968 should be restricted to *hyperchloraemic states*, section 9.2.1.3).

Salt substitutes A number of salt substitutes which contain significant amounts of potassium chloride are readily available as health food products (e.g. *LoSalt*® and *Ruthmol*®). These should not be used by patients with renal failure as potassium intoxication may result.

POTASSIUM CHLORIDE

Indications potassium depletion (see notes above)

Cautions see notes above; cardiac disease; elderly; *with modified-release preparations*, intestinal stricture, history of peptic ulcer, hiatus hernia; **interactions:** Appendix 1 (potassium salts)

Contra-indications plasma-potassium concentration above 5 mmol/litre

Renal impairment close monitoring required—risk of hyperkalaemia; avoid in severe impairment

Side-effects nausea, vomiting, abdominal pain, diarrhoea, flatulence; *with modified-release preparations*, gastro-intestinal obstruction, ulceration and bleeding also reported

Dose

- See notes above

Note Do not confuse Effervescent Potassium Tablets BPC 1968 (section 9.2.1.3) with effervescent potassium chloride tablets. Effervescent Potassium Tablets BPC 1968 do not contain chloride ions and their use should be restricted to hyperchloraemic states (section 9.2.1.3).

Kay-Cee-L® (Geistlich)

Syrup, sugar-free, red, potassium chloride 7.5% (1 mmol/mL each of K^+ and Cl^-), net price 500 mL = £6.80. Label: 21

Sando-K® (HK Pharma)

Tablets, effervescent, potassium bicarbonate and chloride equivalent to potassium 470 mg (12 mmol of K^+) and chloride 285 mg (8 mmol of Cl^-). Net price 20 = £1.53. Label: 13, 21

Modified-release preparations

Avoid unless effervescent tablets or liquid preparations inappropriate

Slow-K® (Alliance)

Tablets, m/r, orange, s/c, potassium chloride 600 mg (8 mmol each of K^+ and Cl^-), net price 100 = £5.95. Label: 25, 27, counselling, swallow whole with fluid during meals while sitting or standing

Note May be difficult to obtain

Management of hyperkalaemia

Acute severe hyperkalaemia (plasma-potassium concentration above 6.5 mmol/litre or in the presence of ECG changes) calls for urgent treatment with 10–20 mL of calcium gluconate 10% by slow intravenous injection, titrated and adjusted to ECG improvement, to temporarily protect against myocardial excitability. An intravenous injection of soluble insulin (5–10 units) with 50 mL glucose 50% given over 5–15 minutes, reduces serum-potassium concentration; this is repeated if necessary or a continuous infusion instituted. Salbutamol [unlicensed indication], by nebulisation or slow intravenous injection may also reduce plasma-potassium concentration; it should be used with caution in patients with cardiovascular disease. The correction of causal or compounding acidosis with sodium bicarbonate infusion (section 9.2.2) should be considered (**important:** preparations of sodium bicarbonate and calcium salts should not be administered in the same line—risk of precipitation). Drugs exacerbating hyperkalaemia should be reviewed and stopped as appropriate; occasionally haemodialysis is needed.

Ion-exchange resins may be used to remove excess potassium in *mild hyperkalaemia* or in *moderate hyperkalaemia* when there are no ECG changes.

POLYSTYRENE SULFONATE RESINS

Indications hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients

Cautions children (impaction of resin with excessive dosage or inadequate dilution); monitor for electrolyte disturbances (stop if plasma-potassium concentration

below 5 mmol/litre); *sodium-containing resin* in congestive heart failure, hypertension, and oedema; **interactions:** Appendix 1 (polystyrene sulfonate resins)

Contra-indications obstructive bowel disease; neonates with reduced gut motility; *calcium-containing resin* in hyperparathyroidism, multiple myeloma, sarcoidosis, or metastatic carcinoma

Renal impairment use *sodium-containing resin* with caution

Pregnancy manufacturers advise use only if potential benefit outweighs risk—no information available

Breast-feeding manufacturers advise use only if potential benefit outweighs risk—no information available

Side-effects faecal impaction following rectal administration, gastro-intestinal concretions following oral administration, intestinal necrosis reported with concomitant use of sorbitol, gastric irritation, anorexia, nausea, vomiting, constipation (discontinue treatment—avoid magnesium-containing laxatives), diarrhoea, hypomagnesaemia; gastro-intestinal obstruction, ulceration, necrosis, and ischaemic colitis also reported; with *calcium-containing resin*, hypercalcaemia (including in dialysed patients and occasionally in those with renal impairment); with *sodium-containing resin*, sodium retention, hypocalcaemia

Dose

- See under preparations

Calcium Resonium® (Sanofi-Aventis)

Powder, buff, calcium polystyrene sulfonate. Net price 300 g = £68.47. Label: 13

Dose By mouth, 15 g 3–4 times daily in a small amount of water or syrup (not fruit juice which has a high potassium content); CHILD under 18 years see *BNF for Children*

By rectum, as an enema, 30 g in 150 mL of water or 10% glucose, retained for 9 hours followed by irrigation to remove resin from colon; NEONATE and CHILD under 18 years see *BNF for Children*

Resonium A® (Sanofi-Aventis)

Powder, buff, sodium polystyrene sulfonate. Net price 454 g = £67.50. Label: 13

Dose By mouth, 15 g 3–4 times daily in a small amount of water or syrup (not fruit juice which has a high potassium content); CHILD under 18 years see *BNF for Children*

By rectum, as an enema, 30 g in 150 mL of water or 10% glucose, retained for 9 hours followed by irrigation to remove resin from colon; NEONATE and CHILD under 18 years see *BNF for Children*

Sorbisterit® (Stanningley) PoM

Powder, buff, calcium polystyrene sulfonate 759–949 mg/g, net price 500 g = £49.95. Label: 13, 21

Excipients include sucrose 51–241 mg per 1 g of powder

Dose By mouth, 20 g 1–3 times daily in 150 mL of water or soft drink (not fruit juice which has a high potassium content); CHILD under 18 years see *BNF for Children*

By rectum, as an enema, 40 g in 150 mL of 5% glucose 1–3 times daily, retained for 6 hours followed by irrigation to remove resin from colon; NEONATE and CHILD under 18 years see *BNF for Children*

9.2.1.2 Oral sodium and water

Sodium chloride is indicated in states of sodium depletion and usually needs to be given intravenously (section 9.2.2). In chronic conditions associated with mild or moderate degrees of sodium depletion, e.g. in salt-losing bowel or renal disease, oral supplements of sodium chloride or sodium bicarbonate (section 9.2.1.3), according to the acid-base status of the patient, may be sufficient.

SODIUM CHLORIDE

Indications sodium depletion—see also 9.2.2.1; nebuliser diluent (section 3.1.5); eye (section 11.8.1); oral hygiene (section 12.3.4); wound irrigation (section 13.11.1)

Slow Sodium® (HK Pharma)

Tablets, m/r, sodium chloride 600 mg (approx. 10 mmol each of Na^+ and Cl^-). Net price 100-tab pack = £6.05. Label: 25

Dose prophylaxis of sodium chloride deficiency 4–8 tablets daily with water (in severe depletion up to max. 20 tablets daily)

Chronic renal salt wasting, up to 20 tablets daily with appropriate fluid intake

CHILD see *BNF for Children*

Oral rehydration therapy (ORT)

As a worldwide problem *diarrhoea* is by far the most important indication for fluid and electrolyte replacement. Intestinal absorption of sodium and water is enhanced by glucose (and other carbohydrates). Replacement of fluid and electrolytes lost through diarrhoea can therefore be achieved by giving solutions containing sodium, potassium, and glucose or another carbohydrate such as rice starch.

Oral rehydration solutions should:

- enhance the absorption of water and electrolytes;
- replace the electrolyte deficit adequately and safely;
- contain an alkalinising agent to counter acidosis;
- be slightly hypo-osmolar (about 250 mmol/litre) to prevent the possible induction of osmotic diarrhoea;
- be simple to use in hospital and at home;
- be palatable and acceptable, especially to children;
- be readily available.

It is the policy of the World Health Organization (WHO) to promote a single oral rehydration solution but to use it flexibly (e.g. by giving extra water between drinks of oral rehydration solution to moderately dehydrated infants).

Oral rehydration solutions used in the UK are lower in sodium (50–60 mmol/litre) than the WHO formulation since, in general, patients suffer less severe sodium loss.

Rehydration should be rapid over 3 to 4 hours (except in hypernatraemic dehydration in which case rehydration should occur more slowly over 12 hours). The patient should be reassessed after initial rehydration and if still dehydrated rapid fluid replacement should continue.

Once rehydration is complete further dehydration is prevented by encouraging the patient to drink normal volumes of an appropriate fluid and by replacing continuing losses with an oral rehydration solution; in infants, breast-feeding or formula feeds should be offered between oral rehydration drinks.

For intravenous rehydration see section 9.2.2.

ORAL REHYDRATION SALTS (ORS)

Indications fluid and electrolyte loss in diarrhoea, see notes above

Dose

- According to fluid loss, usually 200–400 mL solution after every loose motion; INFANT 1–1½ times usual feed volume; CHILD 200 mL after every loose motion

UK formulations

Note After reconstitution any unused solution should be discarded no later than 1 hour after preparation unless stored in a refrigerator when it may be kept for up to 24 hours

Dioralyte® (Sanofi-Aventis)

Oral powder, sodium chloride 470 mg, potassium chloride 300 mg, disodium hydrogen citrate 530 mg, glucose 3.56 g/sachet, net price 6-sachet pack = £2.25, 20-sachet pack (black currant- or citrus-flavoured or natural) = £6.72

Note Reconstitute 1 sachet with 200 mL of water (freshly boiled and cooled for infants); 5 sachets reconstituted with 1 litre of water provide Na^+ 60 mmol, K^+ 20 mmol, Cl^- 60 mmol, citrate 10 mmol, and glucose 90 mmol

Dioralyte® Relief (Sanofi-Aventis)

Oral powder, sodium chloride 350 mg, potassium chloride 300 mg, sodium citrate 580 mg, cooked rice powder 6 g/sachet, net price 6-sachet pack (apricot-, black currant- or raspberry-flavoured) = £2.50, 20-sachet pack (apricot-flavoured) = £7.13

Note Reconstitute 1 sachet with 200 mL of water (freshly boiled and cooled for infants); 5 sachets when reconstituted with 1 litre of water provide Na^+ 60 mmol, K^+ 20 mmol, Cl^- 50 mmol and citrate 10 mmol; contains aspartame (section 9.4.1)

Electrolade® (Actavis)

Oral powder, sodium chloride 236 mg, potassium chloride 300 mg, sodium bicarbonate 500 mg, anhydrous glucose 4 g/sachet (banana-, black currant-, lemon and lime-, or orange-flavoured). Net price 6-sachet (plain or multiflavoured) pack = £1.33, 20-sachet (single- or multiflavoured) pack = £4.99

Note Reconstitute 1 sachet with 200 mL of water (freshly boiled and cooled for infants); 5 sachets when reconstituted with 1 litre of water provide Na^+ 50 mmol, K^+ 20 mmol, Cl^- 40 mmol, HCO_3^- 30 mmol, and glucose 111 mmol

WHO formulation

Oral Rehydration Salts (Non-proprietary)

Oral powder, sodium chloride 2.6 g, potassium chloride 1.5 g, sodium citrate 2.9 g, anhydrous glucose 13.5 g. To be dissolved in sufficient water to produce 1 litre (providing Na^+ 75 mmol, K^+ 20 mmol, Cl^- 65 mmol, citrate 10 mmol, glucose 75 mmol/litre)

Note Recommended by the WHO and the United Nations Children's Fund but not commonly used in the UK.

9.2.1.3 Oral bicarbonate

Sodium bicarbonate is given by mouth for *chronic acidotic states* such as uraemic acidosis or renal tubular acidosis. The dose for correction of metabolic acidosis is not predictable and the response must be assessed; sodium bicarbonate 4.8 g daily (57 mmol each of Na^+ and HCO_3^-) or more may be required. For severe *metabolic acidosis*, sodium bicarbonate can be given intravenously (section 9.2.2).

Sodium bicarbonate may also be used to increase the pH of the urine (see section 7.4.3); for use in dyspepsia see section 1.1.1.

Sodium supplements may increase blood pressure or cause fluid retention and pulmonary oedema in those at risk; hypokalaemia may be exacerbated.

Where *hyperchloraemic acidosis* is associated with potassium deficiency, as in some renal tubular and gastrointestinal disorders it may be appropriate to give oral **potassium bicarbonate**, although acute or severe deficiency should be managed by intravenous therapy.

SODIUM BICARBONATE

Indications see notes above

Cautions see notes above; respiratory acidosis; **interactions:** Appendix 1 (antacids)

Dose

- See notes above

Sodium Bicarbonate (Non-proprietary)

Capsules, sodium bicarbonate 500 mg (approx. 6 mmol each of Na^+ and HCO_3^-), net price 56-cap pack = £2.66

Tablets, sodium bicarbonate 600 mg, net price 100 = £27.14

Important Oral solutions of sodium bicarbonate are required occasionally; these are available from 'special-order' manufacturers or specialist importing companies, see p. 1104; the strength of sodium bicarbonate should be stated on the prescription

POTASSIUM BICARBONATE

Indications see notes above

Cautions elderly; cardiac disease; **interactions:** Appendix 1 (potassium salts)

Contra-indications hypochloraemia; plasma-potassium concentration above 5 mmol/litre

Renal impairment close monitoring required—high risk of hyperkalaemia; avoid in severe impairment

Side-effects nausea, vomiting, abdominal pain, diarrhoea, and flatulence

Dose

- See notes above

Potassium Tablets, Effervescent (Non-proprietary)

Effervescent tablets, potassium bicarbonate 500 mg, potassium acid tartrate 300 mg, each tablet providing 6.5 mmol of K^+. To be dissolved in water before administration. Net price 56 = £85.64 Label: 13, 21

Note These tablets do not contain chloride; for effervescent tablets containing potassium and chloride, see under Potassium Chloride, section 9.2.1.1

9.2.2 Parenteral preparations for fluid and electrolyte imbalance

9.2.2.1 Electrolytes and water

Solutions of electrolytes are given intravenously, to meet normal fluid and electrolyte requirements or to replenish substantial deficits or continuing losses, when the patient is nauseated or vomiting and is unable to take adequate amounts by mouth. When intravenous administration is not possible, fluid (as sodium chloride

0.9% or glucose 5%) can also be given by subcutaneous infusion (hypodermoclysis).

The nature and severity of the electrolyte imbalance must be assessed from the history and clinical and biochemical investigations. Sodium, potassium, chloride, magnesium, phosphate, and water depletion can occur singly and in combination with or without disturbances of acid-base balance; for reference to the use of magnesium and phosphates, see section 9.5.

Isotonic solutions may be infused safely into a peripheral vein. Solutions more concentrated than plasma, e.g. 20% glucose, are best given through an indwelling catheter positioned in a large vein.

Intravenous sodium

Sodium chloride in isotonic solution provides the most important extracellular ions in near physiological concentrations and is indicated in *sodium depletion*, which can arise from such conditions as gastro-enteritis, diabetic ketoacidosis, ileus, and ascites. In a severe deficit of 4 to 8 litres, 2 to 3 litres of isotonic sodium chloride may be given over 2 to 3 hours; thereafter the infusion can usually be at a slower rate. Excessive administration should be avoided; the jugular venous pressure should be assessed, the bases of the lungs should be examined for crepitations, and in elderly or seriously ill patients it is often helpful to monitor the right atrial (central) venous pressure.

Chronic hyponatraemia arising from inappropriate secretion of antidiuretic hormone should ideally be corrected by fluid restriction. However, if sodium chloride is required for acute or chronic hyponatraemia, regardless of the cause, the deficit should be corrected slowly to avoid the risk of osmotic demyelination syndrome and the rise in plasma-sodium concentration should not exceed 10 mmol/litre in 24 hours. In severe hyponatraemia, sodium chloride 1.8% may be used cautiously.

Compound sodium lactate (Hartmann's solution) can be used instead of isotonic sodium chloride solution during or after surgery, or in the initial management of the injured or wounded; it may reduce the risk of hyperchloraemic acidosis.

Sodium chloride and glucose solutions are indicated when there is combined *water and sodium depletion*. A 1:1 mixture of isotonic sodium chloride and 5% glucose allows some of the water (free of sodium) to enter body cells which suffer most from dehydration while the sodium salt with a volume of water determined by the normal plasma Na^+ remains extracellular. Maintenance fluid should accurately reflect daily requirements and close monitoring is required to avoid fluid and electrolyte imbalance. Illness or injury increase the secretion of anti-diuretic hormone and therefore the ability to excrete excess water may be impaired. Inappropriate use of hypotonic solutions such as sodium chloride 0.18% and glucose 4% may also cause dilutional hyponatraemia especially in children (see *BNF for Children*) and the elderly; if necessary, guidance should be sought from a clinician experienced in the management of fluid and electrolytes.

Combined sodium, potassium, chloride, and water depletion may occur, for example, with severe diarrhoea or persistent vomiting; replacement is carried out with sodium chloride intravenous infusion 0.9% and glucose intravenous infusion 5% with potassium as appropriate.

SODIUM CHLORIDE

Indications electrolyte imbalance—see also section 9.2.1.2; nebuliser diluent (section 3.1.5); eye (section 11.8.1); oral hygiene (section 12.3.4); wound irrigation (section 13.11.1)

Cautions restrict intake in impaired renal function, cardiac failure, hypertension, peripheral and pulmonary oedema, toxaemia of pregnancy

Side-effects administration of large doses may give rise to sodium accumulation, oedema, and hyperchloraemic acidosis

Dose

- See notes above

Sodium Chloride Intravenous Infusion (Non-proprietary) PoM

Intravenous infusion, usual strength sodium chloride 0.9% (9 g, 150 mmol each of Na^+ and Cl^-/litre), this strength being supplied when normal saline for injection is requested. Net price 2-mL amp = 21p; 5-mL amp = 28p; 10-mL amp = 34p; 20-mL amp = £1.04; 50-mL amp = £4.27

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

Note The term 'normal saline' should **not** be used to describe sodium chloride intravenous infusion 0.9%; the term 'physiological saline' is acceptable but it is preferable to give the composition (i.e. sodium chloride intravenous infusion 0.9%).

With other ingredients

Sodium Chloride and Glucose Intravenous Infusion (Non-proprietary) PoM

Intravenous infusion, sodium chloride 0.18% (Na^+ and Cl^- each 30 mmol/litre), glucose 4%

In hospitals, usually 500-mL packs and sometimes other sizes are available

Intravenous infusion, sodium chloride 0.45% (Na^+ and Cl^- each 75 mmol/litre), glucose 2.5%

In hospitals, usually 500-mL packs and sometimes other sizes are available

Intravenous infusion, sodium chloride 0.45% (Na^+ and Cl^- each 75 mmol/litre), glucose 5%

In hospitals, usually 500-mL packs and sometimes other sizes are available

Intravenous infusion, sodium chloride 0.9% (Na^+ and Cl^- each 150 mmol/litre), glucose 5%

In hospitals, usually 500-mL packs and sometimes other sizes are available

Note See above for warning on hyponatraemia especially in children and elderly

Ringer's Solution for Injection PoM

Calcium chloride (dihydrate) 322 micrograms, potassium chloride 300 micrograms, sodium chloride 8.6 mg/mL, providing the following ions (in mmol/litre), Ca^{2+} 2.2, K^+ 4, Na^+ 147, Cl^- 156

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

Sodium Lactate Intravenous Infusion, Compound (Non-proprietary) PoM

(Hartmann's Solution for Injection; Ringer-Lactate Solution for Injection)

Intravenous infusion, sodium chloride 0.6%, sodium lactate 0.32%, potassium chloride 0.04%, calcium chloride 0.027% (containing Na^+ 131 mmol, K^+ 5 mmol, Ca^{2+} 2 mmol, HCO_3^- (as lactate) 29 mmol, Cl^- 111 mmol/litre)

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

Intravenous glucose

Glucose solutions (5%) are used mainly to replace water deficit and should not be given alone except when there is no significant loss of electrolytes; prolonged administration of glucose solutions without electrolytes can lead to hyponatraemia and other electrolyte disturbances. Average water requirements in a healthy adult are 1.5 to 2.5 litres daily and this is needed to balance unavoidable losses of water through the skin and lungs and to provide sufficient for urinary excretion. Water depletion (dehydration) tends to occur when these losses are not matched by a comparable intake, as may occur in coma or dysphagia or in the elderly or apathetic who may not drink enough water on their own initiative.

Excessive loss of water without loss of electrolytes is uncommon, occurring in fevers, hyperthyroidism, and in uncommon water-losing renal states such as diabetes insipidus or hypercalcaemia. The volume of glucose solution needed to replace deficits varies with the severity of the disorder, but usually lies within the range of 2 to 6 litres.

Glucose solutions are also used to correct and prevent hypoglycaemia and to provide a source of energy in those too ill to be fed adequately by mouth; glucose solutions are a key component of parenteral nutrition (section 9.3).

Glucose solutions are given in regimens with calcium and insulin for the emergency management of *hyperkalaemia* (see p. 666). They are also given, after correction of hyperglycaemia, during treatment of diabetic ketoacidosis, when they must be accompanied by continuing insulin infusion.

GLUCOSE

(Dextrose Monohydrate)

Note Glucose BP is the monohydrate but Glucose Intravenous Infusion BP is a sterile solution of anhydrous glucose or glucose monohydrate, potency being expressed in terms of anhydrous glucose

Indications fluid replacement (see notes above), provision of energy (section 9.3); hypoglycaemia (section 6.1.4)

Side-effects glucose injections especially if hypertonic may have a low pH and may cause venous irritation and thrombophlebitis

Dose

- Water replacement, see notes above; energy source, 1–3 litres daily of 20–50% solution

Glucose Intravenous Infusion (Non-proprietary) PoM

Intravenous infusion, glucose or anhydrous glucose (potency expressed in terms of anhydrous glucose), usual strength 5% (50 mg/mL), 10% (100 mg/mL), and 20% (200 mg/mL); 20% solution, net price 20-mL amp = £2.04; 50% solution,[1] 20-mL amp = £1.00, 50-mL vial = £2.01

In hospitals, 500- and 1000-mL packs, and sometimes other sizes and strengths, are available; also available as *Minijet® Glucose*, 50% in 50-mL disposable syringe[1]

1. PoM restriction does not apply where administration is for saving life in emergency

Intravenous potassium

Potassium chloride and sodium chloride intravenous infusion is the initial treatment for the correction of *severe hypokalaemia* and when sufficient potassium cannot be taken by mouth. Ready-mixed infusion solutions should be used when possible; alternatively, potassium chloride concentrate, as ampoules containing 1.5 g (K^+ 20 mmol) in 10 mL, is **thoroughly mixed** with 500 mL of sodium chloride 0.9% intravenous infusion and given slowly over 2 to 3 hours, with specialist advice and ECG monitoring in difficult cases. Higher concentrations of potassium chloride may be given in very severe depletion, but require specialist advice.

Repeated measurement of plasma-potassium concentration is necessary to determine whether further infusions are required and to avoid the development of hyperkalaemia, which is especially likely in renal impairment.

Initial potassium replacement therapy should **not** involve glucose infusions, because glucose may cause a further decrease in the plasma-potassium concentration.

POTASSIUM CHLORIDE

Indications electrolyte imbalance; see also oral potassium supplements, section 9.2.1.1

Cautions for intravenous infusion the concentration of solution should not usually exceed 3 g (40 mmol)/litre; specialist advice and ECG monitoring (see notes above); **interactions:** Appendix 1 (potassium salts)

Contra-indications plasma-potassium concentration above 5 mmol/litre

Renal impairment close monitoring required—high risk of hyperkalaemia; avoid in severe impairment

Side-effects rapid infusion toxic to heart

Dose

- By slow intravenous infusion, depending on the deficit or the daily maintenance requirements, see also notes above

Potassium Chloride and Glucose Intravenous Infusion (Non-proprietary) PoM

Intravenous infusion, usual strength potassium chloride 0.3% (3 g, 40 mmol each of K^+ and Cl^-/litre) or 0.15% (1.5 g, 20 mmol each of K^+ and Cl^-/litre) with 5% of anhydrous glucose

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

Potassium Chloride and Sodium Chloride Intravenous Infusion (Non-proprietary) PoM

Intravenous infusion, usual strength potassium chloride 0.15% (1.5 g/litre) with sodium chloride 0.9% (9 g/litre), containing K^+ 20 mmol, Na^+ 150 mmol, and Cl^- 170 mmol/litre *or* potassium chloride 0.3% (3 g/litre) with sodium chloride 0.9% (9 g/litre), containing K^+ 40 mmol, Na^+ 150 mmol, and Cl^- 190 mmol/litre

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

Potassium Chloride, Sodium Chloride, and Glucose Intravenous Infusion (Non-proprietary) PoM

Intravenous infusion, sodium chloride 0.45% (4.5 g, Na^+ 75 mmol/litre) with 5% of anhydrous glucose and usually sufficient potassium chloride to provide K^+ 10–40 mmol/litre (to be specified by the prescriber)

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

Intravenous infusion, sodium chloride 0.18% (1.8 g, Na^+ 30 mmol/litre) with 4% of anhydrous glucose and usually sufficient potassium chloride to provide K^+ 10–40 mmol/litre (to be specified by the prescriber)

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

Potassium Chloride Concentrate, Sterile (Non-proprietary) PoM

Sterile concentrate, potassium chloride 15% (150 mg, approximately 2 mmol each of K^+ and Cl^-/mL). Net price 10-mL amp = 48p

Important Must be diluted with **not less** than 50 times its volume of sodium chloride intravenous infusion 0.9% or other suitable diluent and **mixed well**

Solutions containing 10 and 20% of potassium chloride are also available in both 5- and 10-mL ampoules

Bicarbonate and lactate

Sodium bicarbonate is used to control severe *metabolic acidosis* (pH < 7.1) particularly that caused by loss of bicarbonate (as in renal tubular acidosis or from excessive gastro-intestinal losses). Mild metabolic acidosis associated with volume depletion should first be managed by appropriate fluid replacement because acidosis usually resolves as tissue and renal perfusion are restored. In more severe metabolic acidosis or when the acidosis remains unresponsive to correction of anoxia or hypovolaemia, sodium bicarbonate (1.26%) can be infused over 3–4 hours with plasma-pH and electrolyte monitoring. In severe shock (section 2.7.1), for example in cardiac arrest, metabolic acidosis can develop without sodium or volume depletion; in these circumstances sodium bicarbonate is best given as a small volume of hypertonic solution, such as 50 mL of 8.4% solution intravenously; plasma-pH and electrolytes should be monitored.

Sodium lactate intravenous infusion is no longer used in metabolic acidosis because of the risk of producing lactic acidosis, particularly in seriously ill patients with poor tissue perfusion or impaired hepatic function.

For *chronic acidotic states*, sodium bicarbonate can be given by mouth (section 9.2.1.3).

SODIUM BICARBONATE

Indications metabolic acidosis, see also notes above

Dose

- By slow intravenous injection, a strong solution (up to 8.4%), or by continuous intravenous infusion, a weaker solution (usually 1.26%), an amount appropriate to the body base deficit (see notes above)

Sodium Bicarbonate Intravenous Infusion PoM

Usual strength sodium bicarbonate 1.26% (12.6 g, 150 mmol each of Na^+ and HCO_3^-/litre); various other strengths available

In hospitals, 500- and 1000-mL packs, and sometimes other sizes, are available

Minijet® Sodium Bicarbonate (UCB Pharma) PoM

Intravenous injection, sodium bicarbonate in disposable syringe, net price 4.2%, 10 mL = £11.03; 8.4%, 10 mL = £11.10, 50 mL = £12.15

SODIUM LACTATE

Indications see notes above

Sodium Lactate (Non-proprietary) PoM

Intravenous infusion, sodium lactate M/6, contains the following ions (in mmol/litre), Na^+ 167, HCO_3^- (as lactate) 167

Water

Water for Injections PoM

Net price 1-mL amp = 18p; 2-mL amp = 13p; 5-mL amp = 24p; 10-mL amp = 25p, 10-mL vial = £1.40; 20-mL amp = 39p; 50-mL amp = £1.91; 100-mL vial = £2.96

Note Water for Injections can be sold or supplied by a pharmacist for a purpose other than parenteral administration, or when dry powder for parenteral administration has been prescribed without the Water for Injections that is needed as a diluent

9.2.2.2 Plasma and plasma substitutes

Plasma and plasma substitutes ('colloids') contain large molecules that do not readily leave the intravascular space where they exert osmotic pressure to maintain circulatory volume. Compared to fluids containing electrolytes such as sodium chloride and glucose ('crystalloids'), a smaller volume of colloid is required to produce the same expansion of blood volume, thereby shifting salt and water from the extravascular space. If resuscitation requires a volume of fluid that exceeds the maximum dose of the colloid then crystalloids can be given; packed red cells may also be required.

Albumin solutions, prepared from whole blood, contain soluble proteins and electrolytes but no clotting factors, blood group antibodies, or plasma cholinesterases; they may be given without regard to the recipient's blood group.

Albumin is usually used after the acute phase of illness, to correct a plasma-volume deficit; hypoalbuminaemia itself is not an appropriate indication. The use of albumin solutions in acute plasma or blood loss may be wasteful; plasma substitutes are more appropriate. Concentrated albumin solutions (20%) can be used under specialist supervision in patients with an intravascular fluid deficit and oedema because of interstitial fluid overload, to restore intravascular plasma volume with less exacerbation of the salt and water overload than isotonic solutions. Concentrated albumin solutions may also be used to obtain a diuresis in hypoalbuminaemic patients (e.g. in hepatic cirrhosis).

Recent evidence does not support the previous view that the use of albumin increases mortality.

Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient's condition at all times.

ALBUMIN SOLUTION

(Human Albumin Solution)

A solution containing protein derived from plasma, serum, or normal placentas; at least 95% of the protein is albumin. The solution may be isotonic (containing 3.5–5% protein) or concentrated (containing 15–25% protein).

Indications see under preparations, and also notes above

Cautions history of cardiac or circulatory disease (administer slowly to avoid rapid rise in blood pressure and cardiac failure, and monitor cardiovascular and respiratory function); increased capillary permeability; correct dehydration when administering concentrated solution

Contra-indications cardiac failure; severe anaemia

Side-effects hypersensitivity reactions (including anaphylaxis) with nausea, vomiting, increased salivation, fever, tachycardia, hypotension and chills reported

Isotonic solutions

Indications: acute or sub-acute loss of plasma volume e.g. in burns, pancreatitis, trauma, and complications of surgery; plasma exchange

Available as: *Human Albumin Solution 4.5%* (50-, 100-, 250- and 400-mL bottles—Baxter); *Human Albumin Solution 5%* (250- and 500-mL bottles—Baxter); *Albunorm® 5%* (100-, 250-, and 500-mL bottles—Octapharm); *Zenalb® 4.5%* (50-, 100-, 250-, and 500-mL bottles—BPL)

Concentrated solutions (20%)

Indications: severe hypoalbuminaemia associated with low plasma volume and generalised oedema where salt and water restriction with plasma volume expansion are required; adjunct in the treatment of hyperbilirubinaemia by exchange transfusion in the newborn; paracentesis of large volume ascites associated with portal hypertension

Available as: *Human Albumin Solution 20%* (50- and 100-mL vials—Baxter); *Albunorm® 20%* (50- and 100-mL bottles—Octapharm); *Flexbumin®* 20% (50- and 100-mL bags—Baxter); *Zenalb® 20%* (50- and 100-mL bottles—BPL)

Plasma substitutes

Dextran, **gelatin**, and the **etherified starches** (hetastarch and pentastarch) are macromolecular substances which are metabolised slowly; they may be used at the outset to expand and maintain blood volume in shock arising from conditions such as burns or septicaemia. Plasma substitutes may be used as an immediate short-term measure to treat haemorrhage until blood is available. They are rarely needed when shock is due to sodium and water depletion because, in these circumstances, the shock responds to water and electrolyte repletion; see also section 2.7.1 for the management of shock.

MHRA/CHM advice

MHRA suspends use of hydroxyethyl starch (HES) infusions (June 2013)

The use of hydroxyethyl starch infusions to treat critically ill patients and those undergoing surgery has been suspended in the UK because their benefits no longer outweigh the risk of using them. Studies have suggested an increased risk of renal injury and death in patients treated with these products compared with crystalloids (simple salt solutions). *Tetraspan®*, *Venofundin®*, *Volulyte®*, and *Voluven®* have all been withdrawn by the manufacturers.

Plasma substitutes should **not** be used to maintain plasma volume in conditions such as burns or peritonitis where there is loss of plasma protein, water, and electrolytes over periods of several days or weeks. In these situations, plasma or plasma protein fractions containing large amounts of albumin should be given.

Large volumes of *some* plasma substitutes can increase the risk of bleeding through depletion of coagulation factors.

Dextran 70 by intravenous infusion is used for volume expansion. Dextran may interfere with blood group cross-matching or biochemical measurements, and these should be carried out before infusion is begun.

Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient's condition at all times.

Cautions Plasma substitutes should be used with caution in patients with cardiac disease, severe liver disease, or renal impairment; urine output should be monitored. Care should be taken to avoid haematocrit concentration from falling below 25–30% and the patient should be monitored for hypersensitivity reactions.

Side-effects Hypersensitivity reactions may occur including, rarely, severe anaphylactic reactions. Transient increase in bleeding time may occur.

DEXTRAN 70

Dextrans of weight average molecular weight about '70 000'

Indications short-term blood volume expansion

Cautions see notes above; can interfere with some laboratory tests (see also above); where possible, monitor central venous pressure

Hepatic impairment use with caution in severe impairment

Pregnancy avoid—reports of anaphylaxis in mother causing fetal anoxia, neurological damage and death

Side-effects see notes above

Dose

- See under preparation below

Hypertonic solution

RescueFlow® (Pharmacosmos) PoM

Intravenous infusion, dextran 70 intravenous infusion 6% in sodium chloride intravenous infusion 7.5%. Net price 250-mL bag = £28.50

Cautions see notes above; severe hyperglycaemia and hyperosmolality

Dose initial treatment of hypovolaemia with hypotension induced by traumatic injury, by intravenous infusion over 2–5 minutes, 250 mL, followed immediately by administration of isotonic fluids

GELATIN

Note The gelatin is partially degraded

Indications low blood volume (but see notes above)

Cautions see notes above

Hepatic impairment use with caution in severe impairment

Pregnancy manufacturer of *Geloplasma*® advises avoid at the end of pregnancy

Side-effects see notes above

Dose

- By intravenous infusion, initially 500–1000 mL of a 3.5–4% solution (see notes above)

Gelaspan (B. Braun) PoM

Intravenous infusion, succinylated gelatin (modified fluid gelatin, average molecular weight 26 500) 40 g, Na^+ 151 mmol, K^+ 4 mmol, Mg^{2+} 1 mmol, Cl^- 103 mmol, Ca^{2+} 1 mmol, acetate 24 mmol/litre, net price 500-mL bag = £6.80, 1-litre bag = £13.60

Gelofusine® (B. Braun) PoM

Intravenous infusion, succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na^+ 154 mmol, Cl^- 120 mmol/litre, net price 500-mL *Ecobag*® = £4.83, 1-litre *Ecobag*® = £9.04

Geloplasma® (Fresenius Kabi) PoM

Intravenous infusion, partially hydrolysed and succinylated gelatin (modified liquid gelatin) (as anhydrous gelatin) 30 g (3%), Na^+ 150 mmol, K^+ 5 mmol, Mg^{2+} 1.5 mmol, Cl^- 100 mmol, lactate 30 mmol/litre, net price 500-mL bag = £5.05

Isoplex® (Beacon) PoM

Intravenous infusion, succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na^+ 145 mmol, K^+ 4 mmol, Mg^{2+} 0.9 mmol, Cl^- 105 mmol, lactate 25 mmol/litre, net price 500-mL bag = £7.53, 1-litre bag = £14.54

Volplex® (Beacon) PoM

Intravenous infusion, succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na^+ 154 mmol, Cl^- 125 mmol/litre, net price 500-mL bag = £4.70, 1-litre bag = £9.09

ETHERIFIED STARCH

A starch composed of more than 90% of amylopectin that has been etherified with hydroxyethyl groups; the terms pentastarch and hetastarch reflect the degree of etherification

Indications low blood volume

Cautions see notes above; children

Hepatic impairment use with caution in severe impairment

Renal impairment use with caution in mild to moderate impairment; avoid in severe impairment

Side-effects see notes above; also pruritus, raised serum amylase

Dose

- See under preparations below

Hetastarch

Hetastarch (Non-proprietary) PoM

Intravenous infusion, hetastarch (weight average molecular weight 450 000) 6% in sodium chloride intravenous infusion 0.9%, net price 500-mL bag = £8.00

Dose by intravenous infusion, 500–1000 mL; usual daily max. 1500 mL (see notes above)

Pentastarch

Pentastarch (Non-proprietary) PoM

Intravenous infusion, pentastarch (weight average molecular weight 200 000), net price (in sodium chloride intravenous infusion 0.9%) 10%, 500-mL bag = £9.24

Dose by intravenous infusion, pentastarch 10%, 500–1000 mL; max. 1500 mL daily (see notes above)

HAES-steril® (Fresenius Kabi) PoM

Intravenous infusion, pentastarch (weight average molecular weight 200 000) 10% in sodium chloride intravenous infusion 0.9%, net price 500 mL = £16.50

Dose by intravenous infusion, up to 1500 mL daily (see notes above)

Hemohes® (B. Braun) PoM

Intravenous infusion, pentastarch (weight average molecular weight 200 000), net price (both in sodium chloride intravenous infusion 0.9%) 6%, 500 mL = £12.50; 10%, 500 mL = £16.50

Cautions see notes above

Dose by intravenous infusion, pentastarch 6%, up to 2500 mL daily; pentastarch 10%, up to 1500 mL daily (see notes above)

9.3 Intravenous nutrition

When adequate feeding through the alimentary tract is not possible, nutrients may be given by intravenous infusion. This may be in addition to ordinary oral or tube feeding—**supplemental parenteral nutrition**, or may be the sole source of nutrition—**total parenteral nutrition** (TPN). Indications for this method include preparation of undernourished patients for surgery, chemotherapy, or radiation therapy; severe or prolonged disorders of the gastro-intestinal tract; major surgery, trauma, or burns; prolonged coma or refusal to eat; and some patients with renal or hepatic failure. The composition of proprietary preparations available is given under Proprietary Infusion Fluids for Parenteral Feeding, p. 675.

Parenteral nutrition requires the use of a solution containing amino acids, glucose, fat, electrolytes, trace elements, and vitamins. This is now commonly provided by the pharmacy in the form of a 3-litre bag. A single dose of vitamin B_{12}, as hydroxocobalamin, is given by intramuscular injection; regular vitamin B_{12} injections are not usually required unless total parenteral nutrition continues for many months. Folic acid is given in a dose of 15 mg once or twice each week, usually in the nutrition solution. Other vitamins are usually given daily; they are generally introduced in the parenteral nutrition solution. Alternatively, if the

patient is able to take small amounts by mouth, vitamins may be given orally.

The nutrition solution is infused through a central venous catheter inserted under full surgical precautions. Alternatively, infusion through a peripheral vein may be used for supplementary as well as total parenteral nutrition for periods of up to a month, depending on the availability of peripheral veins; factors prolonging cannula life and preventing thrombophlebitis include the use of soft polyurethane paediatric cannulas and use of feeds of low osmolality and neutral pH. Only nutritional fluids should be given by the dedicated intravenous line.

Before starting, the patient should be well oxygenated with a near normal circulating blood volume and attention should be given to renal function and acid-base status. Appropriate biochemical tests should have been carried out beforehand and serious deficits corrected. Nutritional and electrolyte status must be monitored throughout treatment.

Complications of long-term parenteral nutrition include gall bladder sludging, gall stones, cholestasis and abnormal liver function tests. For details of the prevention and management of parenteral nutrition complications, specialist literature should be consulted.

Protein is given as mixtures of essential and non-essential synthetic L-amino acids. Ideally, all essential amino acids should be included with a wide variety of non-essential ones to provide sufficient nitrogen together with electrolytes (see also section 9.2.2). Solutions vary in their composition of amino acids; they often contain an energy source (usually glucose) and electrolytes.

Energy is provided in a ratio of 0.6 to 1.1 megajoules (150–250 kcals) per gram of protein nitrogen. Energy requirements must be met if amino acids are to be utilised for tissue maintenance. A mixture of carbohydrate and fat energy sources (usually 30–50% as fat) gives better utilisation of amino acids than glucose alone.

Glucose is the preferred source of carbohydrate, but if more than 180 g is given per day frequent monitoring of blood glucose is required, and insulin may be necessary. Glucose in various strengths from 10 to 50% must be infused through a central venous catheter to avoid thrombosis.

In parenteral nutrition regimens, it is necessary to provide adequate **phosphate** in order to allow phosphorylation of glucose and to prevent hypophosphataemia; between 20 and 30 mmol of phosphate is required daily.

Fructose and sorbitol have been used in an attempt to avoid the problem of hyperosmolar hyperglycaemic non-ketotic acidosis but other metabolic problems may occur, as with xylitol and ethanol which are now rarely used.

Fat emulsions have the advantages of a high energy to fluid volume ratio, neutral pH, and iso-osmolarity with plasma, and provide essential fatty acids. Several days of adaptation may be required to attain maximal utilisation. Reactions include occasional febrile episodes (usually only with 20% emulsions) and rare anaphylactic responses. Interference with biochemical measurements such as those for blood gases and calcium may occur if samples are taken before fat has been cleared. Daily checks are necessary to ensure complete clearance from the plasma in conditions where fat metabolism may be disturbed. **Additives should not be mixed with fat emulsions unless compatibility is known.**

Administration

Because of the complex requirements relating to parenteral nutrition full details relating to administration have been omitted. In all cases *product literature and other specialist literature should be consulted.*

Supplementary preparations

Compatibility with the infusion solution must be ascertained before adding supplementary preparations.

Addiphos® (Fresenius Kabi) PoM
Solution, sterile, phosphate 40 mmol, K^+ 30 mmol, Na^+ 30 mmol/20 mL. For addition to *Vamin®* solutions and glucose intravenous infusions. Net price 20-mL vial = £1.30

Additrace® (Fresenius Kabi) PoM
Solution, trace elements for addition to *Vamin®* solutions and glucose intravenous infusions, traces of Fe^{3+}, Zn^{2+}, Mn^{2+}, Cu^{2+}, Cr^{3+}, Se^{4+}, Mo^{6+}, F^-, I^-. For adults and children over 40 kg. Net price 10-mL amp = £1.96

Cernevit® (Baxter) PoM
Solution, *dl*-alpha tocopherol 11.2 units, ascorbic acid 125 mg, biotin 69 micrograms, colecalciferol 220 units, cyanocobalamin 6 micrograms, folic acid 414 micrograms, glycine 250 mg, nicotinamide 46 mg, pantothenic acid (as dexpanthenol) 17.25 mg, pyridoxine hydrochloride 5.5 mg, retinol (as palmitate) 3500 units, riboflavin (as dihydrated sodium phosphate) 4.14 mg, thiamine (as cocarboxylase tetrahydrate) 3.51 mg. Dissolve in 5 mL water for injections. Net price per vial = £4.64

Decan® (Baxter) PoM
Solution, trace elements for addition to infusion solutions, Fe^{2+}, Zn^{2+}, Cu^{2+}, Mn^{2+}, F^-, Co^{2+}, I^-, Se^{4+}, Mo^{6+}, Cr^{3+}. For adults over 40 kg. Net price 40-mL vial = £2.00

Dipeptiven® (Fresenius Kabi) PoM
Solution, *N*(2)-L-alanyl-L-glutamine 200 mg/mL (providing L-alanine 82 mg, L-glutamine 134.6 mg). For addition to infusion solutions containing amino acids. Net price 50 mL = £13.94, 100 mL = £25.93
Dose amino acid supplement for hypercatabolic or hypermetabolic states, 300–400 mg/kg daily; max. 400 mg/kg daily, dose not to exceed 20% of total amino acid intake

Glycophos® Sterile Concentrate (Fresenius Kabi) PoM
Solution, sterile, phosphate 20 mmol, Na^+ 40 mmol/20 mL. For addition to *Vamin®* and *Vaminolact®* solutions, and glucose intravenous infusions. Net price 20-mL vial = £3.91

Peditrace® (Fresenius Kabi) PoM

Solution, trace elements for addition to *Vaminolact®*, *Vamin® 14 Electrolyte-Free* solutions and glucose intravenous infusions, traces of Zn^{2+}, Cu^{2+}, Mn^{2+}, Se^{4+}, F^-, I^-. For use in neonates (when kidney function established, usually second day of life), infants, and children. Net price 10-mL vial = £3.55

Cautions reduced biliary excretion especially in cholestatic liver disease or in markedly reduced urinary excretion (careful biochemical monitoring required); total parenteral nutrition exceeding 1 month (measure serum manganese concentration and check liver function before commencing treatment and regularly during treatment)—discontinue if manganese concentration raised or if cholestasis develops

Solivito N® (Fresenius Kabi) PoM

Solution, powder for reconstitution, biotin 60 micrograms, cyanocobalamin 5 micrograms, folic acid 400 micrograms, glycine 300 mg, nicotinamide 40 mg, pyridoxine hydrochloride 4.9 mg, riboflavin sodium phosphate 4.9 mg, sodium ascorbate 113 mg, sodium pantothenate 16.5 mg, thiamine mononitrate 3.1 mg. Dissolve in water for injections or glucose intravenous infusion for adding to glucose intravenous infusion or *Intralipid®*; dissolve in *Vitlipid N®* or *Intralipid®* for adding to *Intralipid®* only. Net price per vial = £1.97

Tracutil® (B. Braun) PoM

Solution, trace elements for addition to infusion solutions, Fe^{2+}, Zn^{2+}, Mn^{2+}, Cu^{2+}, Cr^{3+}, Se^{4+}, Mo^{6+}, I^-, F^-. For adults. Net price 10-mL amp = 80p

Vitlipid N® (Fresenius Kabi) PoM

Emulsion, adult, vitamin A 330 units, ergocalciferol 20 units, *dl*-alpha tocopherol 1 unit, phytomenadione 15 micrograms/mL. For addition to *Intralipid®*. For adults and children over 11 years. Net price 10-mL amp = £1.97

Emulsion, infant, vitamin A 230 units, ergocalciferol 40 units, *dl*-alpha tocopherol 0.7 unit, phytomenadione 20 micrograms/mL. For addition to *Intralipid®*. Net price 10-mL amp = £1.97

9.4 Oral nutrition

9.4.1 Foods for special diets

These are preparations that have been modified to eliminate a particular constituent from a food or that are nutrient mixtures formulated as food substitutes for patients who either cannot tolerate or cannot metabolise certain common constituents of food. In certain clinical conditions, some food preparations are regarded as drugs and can be prescribed within the NHS if they have been approved by the Advisory Committee on Borderline Substances (ACBS)—see Appendix 2.

Phenylketonuria Phenylketonuria (hyperphenylalaninaemia, PKU), which results from the inability to metabolise phenylalanine, is managed by restricting dietary intake of phenylalanine to a small amount sufficient for tissue building and repair.

Sapropterin, a synthetic form of tetrahydrobiopterin, is licensed as an adjunct to dietary restriction of phenylalanine in the management of patients with phenylketonuria and tetrahydrobiopterin deficiency.

Aspartame (used as a sweetener in some foods and medicines) contributes to the phenylalanine intake and may affect control of phenylketonuria. Where the presence of aspartame is specified in the product literature this is indicated in the BNF against the preparation; the patient should be informed of this.

Coeliac disease Intolerance to gluten in coeliac disease is managed by completely eliminating gluten from the diet. A range of gluten-free products is available for prescription—see Appendix 2, p. 1022.

SAPROPTERIN DIHYDROCHLORIDE

Note Sapropterin is a synthetic form of tetrahydrobiopterin

Indications see under Dose below

Cautions monitor blood-phenylalanine concentration before and after first week of treatment—if unsatisfactory response increase dose at weekly intervals to max. dose and monitor blood-phenylalanine concentration weekly; discontinue treatment if unsatisfactory response after 1 month; monitor blood-phenylalanine

and tyrosine concentrations 1–2 weeks after dose adjustment and during treatment; history of convulsions

Hepatic impairment manufacturer advises caution—no information available

Renal impairment manufacturer advises caution—no information available

Pregnancy manufacturer advises caution—consider only if strict dietary management inadequate

Breast-feeding manufacturer advises avoid—no information available

Side-effects diarrhoea, vomiting, abdominal pain, nasal congestion, cough, pharyngolaryngeal pain, headache; *also reported* hypersensitivity reactions

Dose

- Phenylketonuria (specialist use only), by mouth, ADULT and CHILD over 4 years, initially 10 mg/kg once daily, preferably in the morning, adjusted according to response; usual dose 5–20 mg/kg daily

- Tetrahydrobiopterin deficiency (specialist use only), by mouth, ADULT and CHILD initially 2–5 mg/kg once daily, preferably in the morning, adjusted according to response; max. 20 mg/kg daily; total daily dose may alternatively be given in 2–3 divided doses

Kuvan® (Merck Serono) PoM

Dispersible tablets, sapropterin dihydrochloride 100 mg, net price 30-tab pack = £597.22, 120-tab pack = £2388.88. Label: 13, 21

Counselling Tablets should be dissolved in water and taken within 20 minutes

9.4.2 Enteral nutrition

The body's reserves of protein rapidly become exhausted in severely ill patients, especially during chronic illness or in those with severe burns, extensive trauma, pancreatitis, or intestinal fistula. Much can be achieved by frequent meals and by persuading the patient to take supplementary snacks of ordinary food between the meals.

However, extra calories, protein, other nutrients, and vitamins are often best given by supplementing ordinary meals with enteral sip or tube feeds (preparations, see Appendix 2).

When patients cannot feed normally, for example, patients with severe facial injury, oesophageal obstruction, or coma, a nutritionally complete diet of enteral feeds must be given. The advice of a dietitian should be sought to determine the protein and total energy requirement of the patient and the form and relative contribution of carbohydrate and fat to the energy requirements.

Most enteral feeds contain protein derived from cows' milk or soya. Elemental feeds containing protein hydrolysates or free amino acids can be used for patients who have diminished ability to break down protein, for example in inflammatory bowel disease or pancreatic insufficiency.

Even when nutritionally complete feeds are given, water and electrolyte balance should be monitored. Haematological and biochemical parameters should also be monitored, particularly in clinically unstable patients. Extra minerals (e.g. magnesium and zinc) may be needed in patients where gastro-intestinal secretions are being lost. Additional vitamins may also be needed. Feeds containing vitamin K may affect the INR in patients receiving warfarin—see **interactions:** Appendix 1 (vitamins).

Children Children have special requirements and in most situations liquid feeds prepared for adults are totally unsuitable—the advice of a paediatric dietitian should be sought; see also *BNF for Children*, section 9.4.2

Preparations

See Borderline Substances, Appendix 2.

9.5 Minerals

See section 9.1.1 for iron salts.

9.5.1 Calcium and magnesium

9.5.1.1 Calcium supplements

Calcium supplements are usually only required where dietary calcium intake is deficient. This dietary requirement varies with age and is relatively greater in childhood, pregnancy, and lactation, due to an increased demand, and in old age, due to impaired absorption. In osteoporosis, a calcium intake which is double the recommended amount reduces the rate of bone loss. If the actual dietary intake is less than the recommended amount, a supplement of as much as 40 mmol is appropriate, see also Osteoporosis, p. 510 and Vitamin D, p. 689.

In severe acute hypocalcaemia or hypocalcaemic tetany, an initial slow intravenous injection of 10–20 mL of calcium gluconate injection 10% (providing approximately 2.25–4.5 mmol of calcium) should be given, with plasma-calcium and ECG monitoring (risk of arrhythmias if given too rapidly), and either repeated as required or, if only temporary improvement, followed by a continuous intravenous infusion to prevent recurrence. For infusion, dilute 100 mL of calcium gluconate 10% in 1 litre of glucose 5% or sodium chloride 0.9% and give at an initial rate of 50 mL/hour adjusted according to response. Calcium chloride injection is also available, but is more irritant; care should be taken to prevent extravasation. Oral supplements of calcium and vitamin D may also be required in persistent hypocalcaemia (see also section 9.6.4). Concurrent hypomagnesaemia should be corrected with **magnesium sulphate** (section 9.5.1.3).

For the role of calcium gluconate in temporarily reducing the toxic effects of hyperkalaemia, see p. 666.

CALCIUM SALTS

Indications see notes above; calcium deficiency

Cautions sarcoidosis; history of nephrolithiasis; avoid calcium chloride in respiratory acidosis or respiratory failure; **interactions:** Appendix 1 (antacids, calcium salts)

Contra-indications conditions associated with hypercalcaemia and hypercalciuria (e.g. some forms of malignant disease)

Renal impairment use with caution (but see also Calcium Gluconate injection, below)

Side-effects *rarely* gastro-intestinal disturbances; *with injection*, bradycardia, arrhythmias, peripheral vasodilatation, fall in blood pressure, sweating, injection-site reactions, severe tissue damage with extravasation

Dose

- By mouth, daily in divided doses, see notes above
- By slow intravenous injection, acute hypocalcaemia, see notes above; CHILD see *BNF for Children*
- By continuous intravenous infusion, acute hypocalcaemia, see notes above

Oral preparations

Calcium Gluconate (Non-proprietary)

Effervescent tablets, calcium gluconate 1 g (calcium 89 mg or Ca^{2+} 2.23 mmol), net price 28-tab pack = £14.82. Label: 13

Note Each tablet usually contains 4.46 mmol Na^+

Calcium Lactate (Non-proprietary)

Tablets, calcium lactate 300 mg (calcium 39 mg or Ca^{2+} 1 mmol), net price 84 = £4.57

Adcal® (ProStrakan)

Chewable tablets, fruit flavour, calcium carbonate 1.5 g (calcium 600 mg or Ca^{2+} 15 mmol), net price 100-tab pack = £8.70. Label: 24

Cacit® (Warner Chilcott)

Tablets, effervescent, pink, calcium carbonate 1.25 g, providing calcium citrate when dispersed in water (calcium 500 mg or Ca^{2+} 12.5 mmol), net price 76-tab pack = £11.81. Label: 13

Calcichew® (Takeda)

Tablets (chewable), orange flavour, calcium carbonate 1.25 g (calcium 500 mg or Ca^{2+} 12.5 mmol), net price 100-tab pack = £9.33. Label: 24

Forte tablets (chewable), orange flavour, scored, calcium carbonate 2.5 g (calcium 1 g or Ca^{2+} 25 mmol), net price 60-tab pack = £13.16. Label: 24

Excipients include aspartame (section 9.4.1)

Calcium-500 (Martindale)

Tablets, pink, f/c, calcium carbonate 1.25 g (calcium 500 mg or Ca^{2+} 12.5 mmol), net price 100-tab pack = £9.46. Label: 25

Calcium-Sandoz® (Alliance)

Syrup, orange flavour, calcium glubionate 1.09 g, calcium lactobionate 727 mg (calcium 108.3 mg or Ca^{2+} 2.7 mmol)/5 mL, net price 300 mL = £4.07

Sandocal® (Novartis Consumer Health)

Sandocal 1000 tablets, effervescent, orange flavour, calcium lactate gluconate 2.263 g, calcium carbonate 1.75 g, providing 1 g calcium (Ca^{2+} 25 mmol), net price 3 × 10-tab pack = £6.91. Label: 13

Excipients include aspartame (section 9.4.1)

Parenteral preparations

Calcium Gluconate (Non-proprietary) PoM

Injection, calcium gluconate 10% (Ca^{2+} approx. 225 micromol/mL), net price 10-mL amp = 65p

Note The MHRA has advised that repeated or prolonged administration of calcium gluconate injection packaged in 10 mL *glass* containers is contra-indicated in children under 18 years and in patients with renal impairment owing to the risk of aluminium accumulation; in these patients the use of calcium gluconate injection packaged in *plastic* containers is recommended

Calcium Chloride (Non-proprietary) PoM

Injection, calcium chloride dihydrate 10% (calcium 27.3 mg or Ca^{2+} 680 micromol/mL), net price 10-mL disposable syringe = £6.94

Brands include *Minijet® Calcium Chloride 10%*

Injection, calcium chloride dihydrate 13.4% (calcium 36 mg or Ca^{2+} 910 micromol/mL), net price 10-mL amp = £14.94

With vitamin D

Section 9.6.4

With risedronate sodium and colecalciferol

Section 6.6.2

9.5.1.2 Hypercalcaemia and hypercalciuria

Severe hypercalcaemia Severe hypercalcaemia calls for urgent treatment before detailed investigation of the cause. Dehydration should be corrected first with intravenous infusion of **sodium chloride 0.9%**. Drugs (such as thiazides and vitamin D compounds) which promote hypercalcaemia, should be discontinued and dietary calcium should be restricted.

If *severe hypercalcaemia persists* drugs which inhibit mobilisation of calcium from the skeleton may be required. The **bisphosphonates** are useful and pamidronate disodium (section 6.6.2) is probably the most effective.

Corticosteroids (section 6.3) are widely given, but may only be useful where hypercalcaemia is due to sarcoidosis or vitamin D intoxication; they often take several days to achieve the desired effect.

Calcitonin (section 6.6.1) can be used for the treatment of hypercalcaemia associated with malignancy; it is rarely effective where bisphosphonates have failed to reduce serum calcium adequately.

After treatment of severe hypercalcaemia the underlying cause must be established. *Further treatment* is governed by the same principles as for initial therapy. Salt and water depletion and drugs promoting hypercalcaemia should be avoided; oral administration of a bisphosphonate may be useful.

Hyperparathyroidism **Cinacalcet** is licensed for the treatment of secondary hyperparathyroidism in dialysis patients with end-stage renal disease (but see NICE guidance below), for primary hyperparathyroidism in patients where parathyroidectomy is inappropriate, and for the treatment of hypercalcaemia in parathyroid carcinoma. Cinacalcet reduces parathyroid hormone which leads to a decrease in serum calcium concentrations.

Paricalcitol (section 9.6.4) is also licensed for the prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure.

Parathyroidectomy may be indicated for hyperparathyroidism.

NICE guidance

Cinacalcet for the treatment of secondary hyperparathyroidism in patients with end-stage renal disease on maintenance dialysis therapy (January 2007)

Cinacalcet is not recommended for the routine treatment of secondary hyperparathyroidism in patients with end-stage renal disease on maintenance dialysis therapy.

Cinacalcet is recommended for the treatment of refractory secondary hyperparathyroidism in patients with end-stage renal disease (including those with calciphylaxis) **only** in those:

- who have 'very uncontrolled' plasma concentration of intact parathyroid hormone (defined as greater than 85 picomol/litre) refractory to standard therapy, and a normal or high adjusted serum calcium concentration, **and**
- in whom surgical parathyroidectomy is contraindicated, in that the risks of surgery outweigh the benefits.

Response to treatment should be monitored regularly and treatment should be continued only if a reduction in the plasma concentration of intact parathyroid hormone of 30% or greater is seen within 4 months of treatment.

www.nice.org.uk/TA117

Hypercalciuria Hypercalciuria should be investigated for an underlying cause, which should be treated. Where a cause is not identified (idiopathic hypercalciuria), the condition is managed by increasing fluid intake and giving bendroflumethiazide in a dose of 2.5 mg daily (a higher dose is not usually necessary). Reducing dietary calcium intake may be beneficial but severe restriction of calcium intake has not proved beneficial and may even be harmful.

CINACALCET

Indications see under Dose and notes above

Cautions measure serum-calcium concentration before initiation of treatment and within 1 week after starting treatment or adjusting dose, then monthly for secondary hyperparathyroidism and every 2–3 months for primary hyperparathyroidism and parathyroid carcinoma; treatment should not be initiated in patients with hypocalcaemia; in secondary hyperparathyroidism measure parathyroid hormone concentration 1–4 weeks after starting treatment or adjusting dose, then every 1–3 months; dose adjustment may be necessary if smoking started or stopped during treatment; **interactions:** Appendix 1 (cinacalcet)

Hepatic impairment manufacturer advises caution in moderate to severe impairment—monitor closely especially when increasing dose

Pregnancy manufacturer advises use only if potential benefit outweighs risk—no information available

Breast-feeding manufacturer advises avoid—present in milk in *animal* studies

Side-effects nausea, vomiting, anorexia; dizziness, paraesthesia, asthenia; reduced testosterone concentrations; myalgia; rash; *less commonly* dyspepsia, diarrhoea, and seizures; hypotension, heart failure, and allergic reactions (including angioedema) also reported

Dose

- Secondary hyperparathyroidism in patients with end-stage renal disease on dialysis (but see notes above), ADULT over 18 years, initially 30 mg once daily, adjusted every 2–4 weeks to max. 180 mg daily
- Hypercalcaemia of primary hyperparathyroidism or parathyroid carcinoma, ADULT over 18 years, initially 30 mg twice daily, adjusted every 2–4 weeks according to response up to max. 90 mg 4 times daily

Mimpara® (Amgen) PoM

Tablets, green, f/c, cinacalcet (as hydrochloride) 30 mg, net price 28-tab pack = £125.75; 60 mg, 28-tab pack = £231.97; 90 mg, 28-tab pack = £347.96. Label: 21

9.5.1.3 Magnesium

Magnesium is an essential constituent of many enzyme systems, particularly those involved in energy generation; the largest stores are in the skeleton.

Magnesium salts are not well absorbed from the gastrointestinal tract, which explains the use of magnesium sulfate (section 1.6.4) as an osmotic laxative.

Magnesium is excreted mainly by the kidneys and is therefore retained in renal failure, but significant *hypermagnesaemia* (causing muscle weakness and arrhythmias) is rare.

Hypomagnesaemia Since magnesium is secreted in large amounts in the gastro-intestinal fluid, excessive losses in diarrhoea, stoma or fistula are the most common causes of *hypomagnesaemia*; deficiency may also occur in alcoholism or as a result of treatment with certain drugs. Hypomagnesaemia often causes secondary hypocalcaemia, and also hypokalaemia and hyponatraemia.

Symptomatic *hypomagnesaemia* is associated with a deficit of 0.5–1 mmol/kg; up to 160 mmol Mg^{2+} over up to 5 days may be required to replace the deficit (allowing for urinary losses). Magnesium is given initially by intravenous infusion or by intramuscular injection of **magnesium sulfate**; the intramuscular injection is painful. Plasma magnesium concentration should be measured to determine the rate and duration of infusion and the dose should be reduced in renal impairment. To prevent *recurrence of the deficit*, magnesium may be given by mouth in a dose of 24 mmol Mg^{2+} daily in divided doses, but there is limited evidence of benefit; magnesium glycerophosphate tablets and liquid [unlicensed] are available from 'special-order' manufacturers or specialist importing companies, see p. 1104. For maintenance (e.g. in intravenous nutrition), parenteral doses of magnesium are of the order of 10–20 mmol Mg^{2+} daily (often about 12 mmol Mg^{2+} daily).

Arrhythmias Magnesium sulfate injection has also been recommended for the emergency treatment of *serious arrhythmias*, especially in the presence of hypokalaemia (when hypomagnesaemia may also be present) and when salvos of rapid ventricular tachycardia show the characteristic twisting wave front known as *torsade de pointes* (see also section 2.3.1). The usual intravenous dose of magnesium sulfate injection is 8 mmol Mg^{2+} (2 g) over 10–15 minutes (repeated once if necessary).

Myocardial infarction Limited evidence that magnesium sulfate prevents arrhythmias and reperfusion injury in patients with suspected myocardial infarction has not been confirmed by large studies. Routine

use of magnesium sulfate for this purpose is not recommended. For the management of myocardial infarction, see section 2.10.1.

Eclampsia and pre-eclampsia Magnesium sulfate injection is the drug of choice for the treatment of seizures and the prevention of recurrent seizures in women with *eclampsia*. Regimens may vary between hospitals. Calcium gluconate injection is used for the management of magnesium toxicity.

Magnesium sulfate injection is also of benefit in women with *pre-eclampsia* in whom there is concern about developing eclampsia. The patient should be monitored carefully (see under Magnesium Sulfate).

MAGNESIUM SULFATE

Note Magnesium Sulfate Injection BP is a sterile solution of Magnesium Sulfate Heptahydrate

Indications see notes above; constipation (section 1.6.4); severe acute asthma (section 3.1); paste for boils (section 13.10.5)

Cautions see notes above; in severe hypomagnesaemia administer initially via controlled infusion device (preferably syringe pump); monitor blood pressure, respiratory rate, urinary output and for signs of overdosage (loss of patellar reflexes, weakness, nausea, sensation of warmth, flushing, drowsiness, double vision, and slurred speech); **interactions:** Appendix 1 (magnesium, parenteral)

Hepatic impairment avoid in hepatic coma if risk of renal failure

Renal impairment avoid or reduce dose; increased risk of toxicity

Pregnancy not known to be harmful for short-term intravenous administration in eclampsia, but excessive doses in third trimester cause neonatal respiratory depression

Side-effects generally associated with hypermagnesaemia, nausea, vomiting, thirst, flushing of skin, hypotension, arrhythmias, coma, respiratory depression, drowsiness, confusion, loss of tendon reflexes, muscle weakness; colic and diarrhoea following oral administration

Dose

- Hypomagnesaemia, see notes above
- Arrhythmias, see notes above
- Prevention of seizures in pre-eclampsia [unlicensed indication], initially by intravenous injection over 5–15 minutes, 4 g (16 mmol Mg^{2+}) followed by intravenous infusion, 1 g/hour (4 mmol/hour Mg^{2+}) for 24 hours; if seizure occurs, additional dose by intravenous injection, 2 g (8 mmol Mg^{2+})
- Treatment of seizures and prevention of seizure recurrence in eclampsia, initially by intravenous injection over 5–15 minutes, 4 g (16 mmol Mg^{2+}), followed by intravenous infusion, 1 g/hour (4 mmol/hour Mg^{2+}) for 24 hours after seizure or delivery, whichever is later; if seizure recurs, increase the infusion rate to 1.5–2 g/hour (6–8 mmol/hour Mg^{2+}) or give an additional dose by intravenous injection, 2 g (8 mmol Mg^{2+})

Intravenous administration For intravenous injection, concentration of magnesium sulfate heptahydrate should not exceed 20% (200 mg/mL or 0.8 mmol/mL Mg^{2+}); dilute 1 part of magnesium sulfate injection 50% with at least 1.5 parts of water for injections

Note Magnesium sulfate heptahydrate 1 g equivalent to Mg^{2+} approx. 4 mmol

Magnesium Sulfate Injection, BP (Non-proprietary) PoM

Injection, magnesium sulfate heptahydrate 20% (Mg^{2+} approx. 0.8 mmol/mL), net price 20-mL (4-g) amp = £16.98; 50% (Mg^{2+} approx. 2 mmol/mL), 2-mL (1-g) amp = £1.09, 4-mL (2-g) prefilled syringe = £10.23, 5-mL (2.5-g) amp = £5.56, 10-mL (5-g) amp = £1.46; 10-mL (5-g) prefilled syringe = £4.95

Brands include *Minijet® Magnesium Sulfate Injection BP 50%*

Note The BP directs that the label states the strength as the % w/v of magnesium sulfate heptahydrate and as the approximate concentration of magnesium ions (Mg^{2+}) in mmol/mL

9.5.2 Phosphorus

9.5.2.1 Phosphate supplements

Oral phosphate supplements may be required in addition to vitamin D in a small minority of patients with hypophosphataemic vitamin D-resistant rickets. Diarrhoea is a common side-effect and should prompt a reduction in dosage.

Phosphate infusion is occasionally needed in alcohol dependence or in phosphate deficiency arising from use of parenteral nutrition deficient in phosphate supplements; phosphate depletion also occurs in severe diabetic ketoacidosis. For *established hypophosphataemia*, monobasic potassium phosphate may be infused at a rate of 9 mmol every 12 hours. In critically ill patients, the dose of phosphate can be increased up to 500 micromol/kg (approx. 30 mmol in adults, max. 50 mmol), infused over 6–12 hours, according to severity. Excessive doses of phosphates may cause hypocalcaemia and metastatic calcification; it is **essential** to monitor closely plasma concentrations of calcium, phosphate, potassium, and other electrolytes.

For phosphate requirements in *total parenteral nutrition* regimens, see section 9.3.

Phosphates (Fresenius Kabi) PoM

Intravenous infusion, phosphates (providing PO_4^{3-} 100 mmol, K^+ 19 mmol, and Na^+ 162 mmol/litre), net price 500 mL (*Polyfusor®*) = £53.40.

For the treatment of moderate to severe hypophosphatemia

Phosphate-Sandoz® (HK Pharma)

Tablets, effervescent, anhydrous sodium acid phosphate 1.936 g, sodium bicarbonate 350 mg, potassium bicarbonate 315 mg, equivalent to phosphorus 500 mg (phosphate 16.1 mmol), sodium 468.8 mg (Na^+ 20.4 mmol), potassium 123 mg (K^+ 3.1 mmol). Net price 20 = £3.29. Label: 13

Dose vitamin D-resistant hypophosphataemic osteomalacia, 4–6 tablets daily; CHILD under 5 years 2–3 tablets daily

9.5.2.2 Phosphate-binding agents

Calcium-containing preparations are used as phosphate-binding agents in the management of hyperphosphataemia complicating renal failure. Aluminium-

containing preparations are rarely used as phosphate-binding agents and can cause aluminium accumulation.

Sevelamer hydrochloride and **sevelamer carbonate** are both licensed for the treatment of hyperphosphataemia in patients on haemodialysis or peritoneal dialysis. Sevelamer carbonate is also licensed for the treatment of patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more.

Lanthanum is licensed for the control of hyperphosphataemia in patients with chronic renal failure on haemodialysis or continuous ambulatory peritoneal dialysis (CAPD), and in patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more that cannot be controlled by a low-phosphate diet.

The *Scottish Medicines Consortium* (p. 4) has advised (March 2007) that lanthanum (*Fosrenol*®) is accepted for restricted use within NHS Scotland for the control of hyperphosphataemia in patients with chronic renal failure on haemodialysis or continuous ambulatory peritoneal dialysis, as a second-line agent, where a non-aluminium, non-calcium phosphate binder is required.

Colestilan is licensed for the treatment of hyperphosphataemia in patients with chronic kidney disease receiving haemodialysis or peritoneal dialysis.

The *Scottish Medicines Consortium* (p. 4) has advised (January 2014) that colestilan (*BindRen*®) is **not** recommended for use within NHS Scotland.

ALUMINIUM HYDROXIDE

Indications hyperphosphataemia; dyspepsia (section 1.1)

Cautions see notes above; **interactions:** Appendix 1 (antacids)

Side-effects constipation; hyperaluminaemia

Alu-Cap® (Meda)
Capsules, green/red, dried aluminium hydroxide 475 mg (low Na^+), net price 120-cap pack = £13.71
Dose phosphate-binding agent in renal failure, 4–20 capsules daily in divided doses with meals

CALCIUM SALTS

Indications hyperphosphataemia

Cautions sarcoidosis; history of nephrolithiasis; **interactions:** Appendix 1 (antacids, calcium salts)

Contra-indications hypercalcaemia, hypercalciuria

Side-effects hypercalcaemia

Adcal® section 9.5.1.1

Calcichew® section 9.5.1.1

Calcium-500 section 9.5.1.1

Phosex® (Pharmacosmos) PoM
Tablets, yellow, scored, calcium acetate 1 g (calcium 250 mg or Ca^{2+} 6.2 mmol), net price 180-tab pack = £19.79. Label: 25, counselling, with meals
Dose initially 1 tablet 3 times daily with meals, adjusted according to serum-phosphate concentration (usual dose 4–6 tablets daily (1 or 2 tablets with each meal)); max. 12 tablets daily

PhosLo® (Fresenius Medical Care) PoM
Capsules, calcium acetate (anhydrous) 667 mg (calcium 169 mg or Ca^{2+} 4.2 mmol), net price 200-cap pack = £14.40. Counselling, with meals
Excipients include propylene glycol (see Excipients, p. 2)
Dose initially 2 capsules with each meal, adjusted according to serum-phosphate concentration (usual dose 3 or 4 capsules with each meal)

Renacet® (KoRa) PoM
Tablets, f/c, calcium acetate 475 mg (calcium 120.25 mg or Ca^{2+} 3 mmol), net price 100-tab pack = £5.38, 200-tab pack = £9.71; 950 mg (calcium 240.5 mg or Ca^{2+} 6 mmol), scored, net price 100-tab pack = £10.25, 200-tab pack = £18.45. Label: 25, counselling, with meals, avoid other drugs at same time (see below)
Dose ADULT over 18 years, 475–950 mg with breakfast and with snacks, 0.95–2.85 g with main meals, 0.95–1.9 g with supper; adjusted according to serum-phosphate concentration; max. 6.65 g daily
Counselling Manufacturer advises that other drugs should be taken 1 to 2 hours before or after *Renacet*® to reduce possible interference with absorption of other drugs

With magnesium carbonate

Osvaren® (Fresenius Medical Care) PoM
Tablets, f/c, scored, calcium acetate 435 mg (calcium 110 mg or Ca^{2+} 2.7 mmol), heavy magnesium carbonate 235 mg (magnesium 60 mg), net price 180-tab pack = £24.00. Label: 25, counselling, with meals, avoid other drugs at same time (see below)
Contra-indications hypercalcaemia, hypermagnesaemia; third-degree AV block; myasthenia gravis
Dose ADULT over 18 years, initially 1 tablet 3 times daily with meals, adjusted according to serum-phosphate concentration (usual dose 3–10 tablets daily); max. 12 tablets daily
Counselling Manufacturer advises that other drugs should be taken at least 2 hours before or 3 hours after *Osvaren*® to reduce possible interference with absorption of other drugs

COLESTILAN

Indications hyperphosphataemia in patients with chronic kidney disease on haemodialysis or peritoneal dialysis

Cautions constipation; predisposition to gastrointestinal haemorrhage; malabsorption syndromes; **interactions**: Appendix 1 (colestilan)

Contra-indications bowel obstruction; dysphagia; severe gastrointestinal disorders; biliary obstruction; seizure disorders; recent history of peritonitis in peritoneal dialysis patients; serum albumin less than 30 g/L

Hepatic impairment manufacturer advises avoid in severe impairment—no information available

Pregnancy no information available; not absorbed but supplements of fat-soluble vitamins and folic acid may be required

Breast-feeding no information available; not absorbed but supplements of fat-soluble vitamins and folic acid may be required

Side-effects constipation, diarrhoea, flatulence, nausea, vomiting, dyspepsia, gastritis, abdominal pain, decreased appetite; *less commonly* oesophagitis, gastrointestinal haemorrhage, taste disturbances; *rarely* intestinal obstruction

Dose

- ADULT over 18 years, initially 2–3 g 3 times daily with or immediately after meals, increased according to serum-phosphate concentration in steps of 3 g daily (in divided doses) every 2–3 weeks; max. 5 g 3 times daily

BindRen® (Mitsubishi) ▼ PoM

Tablets, f/c, colestilan 1 g, net price 198-tab pack = £143.00. Label: 21, 25, counselling, avoid other drugs at same time (see below)

Granules, f/c, colestilan 2 g/sachet, net price 90-sachet pack = £130.00; 3 g/sachet, net price 90-sachet pack = £195.00. Label: 21, counselling, avoid other drugs at same time (see below)

Counselling Manufacturer advises that other drugs should be taken at least 1 hour before or 3 hours after *BindRen®* to reduce possible interference with absorption of other drugs

LANTHANUM

Indications see notes above

Cautions acute peptic ulcer; ulcerative colitis; Crohn's disease; bowel obstruction; **interactions**: Appendix 1 (lanthanum)

Hepatic impairment lanthanum excreted in bile—possible accumulation in obstructive jaundice

Pregnancy manufacturer advises avoid—toxicity in *animal* studies

Breast-feeding manufacturer advises caution—no information available

Side-effects gastro-intestinal disturbances, headache, hypocalcaemia; *less commonly* anorexia, increased appetite, taste disturbances, dry mouth, thirst, stomatitis, chest pain, peripheral oedema, dizziness, vertigo, asthenia, malaise, hyperglycaemia, hyperparathyroidism, hypercalcaemia, hypophosphataemia, eosinophilia, arthralgia, myalgia, osteoporosis, sweating, alopecia; accumulation of lanthanum in bone, and transient changes in QT interval also reported

Dose

- ADULT over 18 years, usual dose range 1.5–3 g daily in divided doses with or immediately after meals, adjusted according to serum-phosphate concentration every 2–3 weeks

Fosrenol® (Shire) PoM

Tablets (chewable), lanthanum (as carbonate hydrate) 500 mg, net price 90-tab pack = £124.06; 750 mg, 90-tab pack = £182.60; 1 g, 90-tab pack = £193.59. Label: 21, counselling, to be chewed

Powder, lanthanum (as carbonate hydrate) 750 mg, net price 90 sachets = £182.60; 1 g, 90 sachets = £193.59. Label: 21, counselling, administration

Counselling Each sachet to be mixed with soft food and consumed within 15 minutes

SEVELAMER HYDROCHLORIDE

Indications hyperphosphataemia in patients on haemodialysis or peritoneal dialysis

Cautions gastro-intestinal disorders; **interactions**: Appendix 1 (sevelamer)

Contra-indications bowel obstruction

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Breast-feeding manufacturer advises use only if potential benefit outweighs risk

Side-effects nausea, vomiting, abdominal pain, constipation, diarrhoea, dyspepsia, flatulence; *very rarely* intestinal obstruction; *also reported* intestinal perforation, ileus, diverticulitis, pruritus, rash

Dose

- ADULT over 18 years, initially 2.4–4.8 g daily in 3 divided doses with meals, adjusted according to serum-phosphate concentration (usual dose range 2.4–12 g daily in 3 divided doses); CHILD see *BNF for Children*

Renagel® (Genzyme) PoM

Tablets, f/c, sevelamer hydrochloride 800 mg, net price 180-tab pack = £167.04. Label: 25, counselling, with meals

Excipients include propylene glycol (see Excipients, p. 2)

SEVELAMER CARBONATE

Indications hyperphosphataemia in patients on haemodialysis or peritoneal dialysis, and patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more

Cautions gastro-intestinal disorders; **interactions:** Appendix 1 (sevelamer)

Contra-indications bowel obstruction

Pregnancy manufacturer advises use only if potential benefit outweighs risk

Breast-feeding unlikely to be present in milk (however, manufacturer advises avoid)

Side-effects nausea, vomiting, abdominal pain, constipation, diarrhoea, dyspepsia, flatulence; *also reported* intestinal obstruction and perforation, ileus, pruritus, rash

Dose

- ADULT over 18 years, initially 2.4–4.8 g daily in 3 divided doses with meals, adjusted according to serum-phosphate concentration every 2–4 weeks (usual dose approx. 6 g daily in 3 divided doses)

Renvela® (Genzyme) PoM

Tablets, f/c, sevelamer carbonate 800 mg, net price 180-tab pack = £167.04. Label: 25, counselling, with meals

Excipients include propylene glycol (see Excipients, p. 2)

Powder for oral suspension, pale yellow, sevelamer carbonate 2.4 g, net price 60-sachet pack (citrus-flavoured) = £167.04. Label: 13, counselling, with meals

Note Each sachet to be dispersed in 60 mL water

9.5.3 Fluoride

Availability of adequate fluoride confers significant resistance to dental caries. It is now considered that the topical action of fluoride on enamel and plaque is more important than the systemic effect.

When the fluoride content of drinking water is less than 700 micrograms per litre (0.7 parts per million), daily administration of fluoride tablets or drops provides suitable supplementation. Systemic fluoride supplements should not be prescribed without reference to the fluoride content of the local water supply. Infants need not receive fluoride supplements until the age of 6 months.

Dentifrices which incorporate sodium fluoride or monofluorophosphate are also a convenient source of fluoride.

Individuals who are either particularly caries prone or medically compromised may be given additional protection by use of fluoride rinses or by application of fluoride gels. Rinses may be used daily or weekly; daily use of a less concentrated rinse is more effective than

weekly use of a more concentrated one. High-strength gels must be applied regularly under professional supervision; extreme caution is necessary to prevent children from swallowing any excess. Less concentrated gels are available for home use. Varnishes are also available and are particularly valuable for young or disabled children since they adhere to the teeth and set in the presence of moisture.

Fluoride mouthwash, oral drops, tablets and toothpaste are prescribable on form FP10D (GP14 in Scotland, WP10D in Wales; for details see preparations, below).

There are also arrangements for health authorities to supply fluoride tablets in the course of pre-school dental schemes, and they may also be supplied in school dental schemes.

Fluoride gels are not prescribable on form FP10D (GP14 in Scotland, WP10D in Wales).

FLUORIDES

Note Sodium fluoride 2.2 mg provides approx. 1 mg fluoride ion

Indications prophylaxis of dental caries—see notes above

Contra-indications not for areas where drinking water is fluoridated

Side-effects occasional white flecks on teeth with recommended doses; *rarely* yellowish-brown discoloration if recommended doses are exceeded

Dose

Note Dose expressed as fluoride ion (F^-)

- Water content less than F^- 300 micrograms/litre (0.3 parts per million), CHILD up to 6 months none; 6 months–3 years F^- 250 micrograms daily, 3–6 years F^- 500 micrograms daily, over 6 years F^- 1 mg daily
- Water content between F^- 300 and 700 micrograms/litre (0.3–0.7 parts per million), CHILD up to 3 years none, 3–6 years F^- 250 micrograms daily, over 6 years F^- 500 micrograms daily
- Water content above F^- 700 micrograms/litre (0.7 parts per million), supplements not advised

Note These doses reflect the recommendations of the British Dental Association, the British Society of Paediatric Dentistry and the British Association for the Study of Community Dentistry (*Br Dent J* 1997; **182:** 6–7)

Tablets

Counselling Tablets should be sucked or dissolved in the mouth and taken preferably in the evening

En-De-Kay® (Manx)

Fluotabs 3–6 years, orange-flavoured, scored, sodium fluoride 1.1 mg (F^- 500 micrograms), net price 200-tab pack = £2.38

Dental prescribing on NHS May be prescribed as Sodium Fluoride Tablets

Fluotabs 6+ years, orange-flavoured, scored, sodium fluoride 2.2 mg (F^- 1 mg), net price 200-tab pack = £2.38

Dental prescribing on NHS May be prescribed as Sodium Fluoride Tablets

Fluor-a-day® (Dental Health)

Tablets, buff, sodium fluoride 1.1 mg (F^- 500 micrograms), net price 200-tab pack = £2.79; 2.2 mg (F^- 1 mg), 200-tab pack = £2.79

Dental prescribing on NHS May be prescribed as Sodium Fluoride Tablets

Oral drops

Note Fluoride supplements not considered necessary below 6 months of age (see notes above)

En-De-Kay® (Manx)

Fluodrops® (= paediatric drops), sugar-free, sodium fluoride 550 micrograms (F^- 250 micrograms)/0.15 mL. Net price 60 mL = £2.38

Dental prescribing on NHS May be prescribed as Sodium Fluoride Oral Drops

Mouthwashes

Rinse mouth for 1 minute and spit out

Counselling Avoid eating, drinking, or rinsing mouth for 15 minutes after use

En-De-Kay® (Manx)

Daily fluoride mouthrinse (= mouthwash), blue, sodium fluoride 0.05%. Net price 250 mL = £1.50

Dose CHILD 6 years and over, for *daily* use, rinse with 10 mL

Dental prescribing on NHS May be prescribed as Sodium Fluoride Mouthwash 0.05%

Fluorinse (= mouthwash), red, sodium fluoride 2%. Net price 100 mL = £4.97. Counselling, see above

Dose CHILD 8 years and over, for *daily* use, dilute 5 drops to 10 mL of water; for *weekly* use, dilute 20 drops to 10 mL

Dental prescribing on NHS May be prescribed as Sodium Fluoride Mouthwash 2%

FluoriGard® (Colgate-Palmolive)

Daily dental rinse (= mouthwash), blue, sodium fluoride 0.05%. Net price 400 mL = £2.99. Counselling, see above

Dose CHILD 6 years and over, for *daily* use, rinse with 10 mL

Dental prescribing on NHS May be prescribed as Sodium Fluoride Mouthwash 0.05%

Toothpastes

Duraphat® (Colgate-Palmolive) PoM

Duraphat® '2800 ppm' toothpaste, sodium fluoride 0.619%. Net price 75 mL = £3.26, dual pack (2 × 75 mL) = £5.54. Counselling, see below

Dose ADULT and CHILD over 10 years, apply 1 cm twice daily using a toothbrush

Counselling Brush teeth for 1 minute before spitting out. Avoid drinking or rinsing mouth for 30 minutes after use

Dental prescribing on NHS May be prescribed as Sodium Fluoride Toothpaste 0.619%

Duraphat® '5000 ppm' toothpaste, sodium fluoride 1.1%. Net price 51 g = £6.50. Counselling, see below

Dose ADULT and ADOLESCENT over 16 years, apply 2 cm 3 times daily after meals using a toothbrush

Counselling Brush teeth for 3 minutes before spitting out

Dental prescribing on NHS May be prescribed as Sodium Fluoride Toothpaste 1.1%

9.5.4 Zinc

Zinc supplements should not be given unless there is good evidence of deficiency (hypoproteinaemia spuriously lowers plasma-zinc concentration) or in zinc-losing conditions. Zinc deficiency can occur as a result of inadequate diet or malabsorption; excessive loss of zinc can occur in trauma, burns, and protein-losing conditions. A zinc supplement is given until clinical improvement occurs, but it may need to be continued in severe malabsorption, metabolic disease (section 9.8.1), or in zinc-losing states.

Parenteral nutrition regimens usually include trace amounts of zinc (section 9.3). If necessary, further zinc can be added to intravenous feeding regimens. A sug-

gested dose for intravenous nutrition is elemental zinc 6.5 mg (Zn^{2+} 100 micromol) daily.

ZINC SULFATE

Indications zinc deficiency or supplementation in zinc-losing conditions

Cautions **interactions:** Appendix 1 (zinc)

Renal impairment accumulation may occur in acute renal failure

Pregnancy crosses placenta; risk theoretically minimal, but no information available

Breast-feeding present in milk; risk theoretically minimal, but no information available

Side-effects abdominal pain, dyspepsia, nausea, vomiting, diarrhoea, gastric irritation; irritability, headache, lethargy

Dose

- See preparation below and notes above

Zinc Sulfate (Non-proprietary) PoM

Injection, zinc sulfate 14.6 mg/mL (zinc 50 micromol/mL), net price 10 mL vial = £2.50

Solvazinc® (Galen)

Effervescent tablets, zinc sulfate monohydrate 125 mg (45 mg zinc), net price 30 = £4.32. Label: 13, 21

Dose ADULT and CHILD over 30 kg, 1 tablet in water 1–3 times daily after food; CHILD under 10 kg, ½ tablet daily; 10–30 kg, ½ tablet 1–3 times daily

9.5.5 Selenium

Selenium deficiency can occur as a result of inadequate diet or prolonged parenteral nutrition. A selenium supplement should not be given unless there is good evidence of deficiency.

SELENIUM

Indications selenium deficiency

Cautions **interactions:** Appendix 1 (selenium)

Dose

- By mouth *or* by intramuscular injection *or* by intravenous injection, 100–500 micrograms daily

Selenase® PoM

Oral solution, selenium (as sodium selenite pentahydrate) 50 micrograms/mL, net price 2-mL amp = £1.03, 10-mL bottle = £4.05

Injection, selenium (as sodium selenite pentahydrate) 50 micrograms/mL, net price 2-mL amp = £1.50, 10-mL vial = £4.25

Note May be difficult to obtain

9.6 Vitamins

Vitamins are used for the prevention and treatment of specific deficiency states or where the diet is known to be inadequate; they may be prescribed in the NHS to prevent or treat deficiency but not as dietary supplements.

Their use as general 'pick-me-ups' is of unproven value and, in the case of preparations containing vitamin A or D, may actually be harmful if patients take more than the prescribed dose. The 'fad' for mega-vitamin therapy with water-soluble vitamins, such as ascorbic acid and pyridoxine, is unscientific and can be harmful.

Dietary reference values for vitamins are available in the Department of Health publication:

Dietary Reference Values for Food Energy and Nutrients for the United Kingdom: Report of the Panel on Dietary Reference Values of the Committee on Medical Aspects of Food Policy. *Report on Health and Social Subjects 41*. London: HMSO, 1991

Dental patients It is unjustifiable to treat stomatitis or glossitis with mixtures of vitamin preparations; this delays diagnosis and correct treatment.

Most patients who develop a nutritional deficiency despite an adequate intake of vitamins have malabsorption and if this is suspected the patient should be referred to a medical practitioner.

9.6.1 Vitamin A

Deficiency of vitamin A (retinol) is associated with ocular defects (particularly xerophthalmia) and an increased susceptibility to infections, but deficiency is rare in the UK (even in disorders of fat absorption).

Massive overdose can cause rough skin, dry hair, an enlarged liver, and a raised erythrocyte sedimentation rate and raised serum calcium and serum alkaline phosphatase concentrations.

Pregnancy In view of evidence suggesting that high levels of vitamin A may cause birth defects, women who are (or may become) pregnant are advised not to take vitamin A supplements (including tablets and fish-liver oil drops), except on the advice of a doctor or an antenatal clinic; nor should they eat liver or products such as liver paté or liver sausage.

VITAMIN A

(Retinol)

Indications see notes above

Cautions see notes above; **interactions:** Appendix 1 (vitamins)

Pregnancy excessive doses may be teratogenic; see also notes above

Breast-feeding theoretical risk of toxicity in infants of mothers taking large doses

Side-effects see notes above

Dose

- See notes above and under preparations

Vitamins A and D

Halibut-liver Oil (Non-proprietary)

Capsules, vitamin A 4000 units [also contains vitamin D], net price 100-cap pack = £1.05

Vitamins A and D (Non-proprietary)

Capsules, vitamin A 4000 units, vitamin D 400 units (10 micrograms), net price 84-cap pack = £8.42

Note May be difficult to obtain

Vitamins A, C and D

Healthy Start Children's Vitamin Drops (Non-proprietary)

Oral drops, vitamin A 5000 units, vitamin D 2000 units (50 micrograms), ascorbic acid 150 mg/mL

Available free of charge to children under 4 years in families on the Healthy Start Scheme, or alternatively may be available direct to the public—further information for healthcare professionals can be accessed at www.healthystart.nhs.uk. Beneficiaries can contact their midwife or health visitor for further information on where to obtain supplies.

Dose prevention of vitamin deficiency, CHILD 1 month–5 years, 5 drops daily (5 drops contain vitamin A approx. 700 units, vitamin D approx. 300 units (7.5 micrograms), ascorbic acid approx. 20 mg)

Note *Healthy Start Vitamins for women* (containing ascorbic acid, vitamin D, and folic acid) are also available free of charge to women on the Healthy Start Scheme during pregnancy and until their baby is one year old, or alternatively may be available direct to the public—further information for healthcare professionals can be accessed at www.healthystart.nhs.uk. Beneficiaries can contact their midwife or health visitor for further information on where to obtain supplies.

9.6.2 Vitamin B group

Deficiency of the B vitamins, other than vitamin B_{12} (section 9.1.2), is rare in the UK and is usually treated by preparations containing thiamine (B_1), riboflavin (B_2), and nicotinamide, which is used in preference to nicotinic acid, as it does not cause vasodilatation. Other members (or substances traditionally classified as members) of the vitamin B complex such as aminobenzoic acid, biotin, choline, inositol, and pantothenic acid or panthenol may be included in vitamin B preparations but there is no evidence of their value.

The severe deficiency states Wernicke's encephalopathy and Korsakoff's psychosis, especially as seen in chronic alcoholism (section 4.10.1), are best treated initially by the parenteral administration of B vitamins (*Pabrinex*®), followed by oral administration of **thiamine** in the longer term. Anaphylaxis has been reported with parenteral B vitamins (see MHRA/CHM advice, below).

As with other vitamins of the B group, **pyridoxine** (B_6) deficiency is rare, but it may occur during isoniazid therapy (section 5.1.9) or penicillamine treatment in Wilson's disease (section 9.8.1) and is characterised by peripheral neuritis. High doses of pyridoxine are given in some metabolic disorders, such as hyperoxaluria, and it is also used in sideroblastic anaemia (section 9.1.3). There is evidence to suggest that pyridoxine in a dose not exceeding 100 mg daily may provide some benefit in premenstrual syndrome. It has been tried for a wide variety of other disorders, but there is little sound evidence to support the claims of efficacy, and overdosage induces toxic effects.

Nicotinic acid inhibits the synthesis of cholesterol and triglyceride (see section 2.12). Folic acid and vitamin B_{12} are used in the treatment of megaloblastic anaemia (section 9.1.2). Folinic acid (available as calcium folinate) is used in association with cytotoxic therapy (section 8.1).

RIBOFLAVIN

(Riboflavine, vitamin B_2)

Indications see notes above

Preparations

Injections of vitamins B and C, see under Thiamine

Oral vitamin B complex preparations

See p. 689

THIAMINE

(Vitamin B_1)

Indications see notes above

Cautions anaphylaxis may occasionally follow injection (see MHRA/CHM advice below)

MHRA/CHM advice (September 2007)

Although potentially serious allergic adverse reactions may rarely occur during, or shortly after, parenteral administration, the CHM has recommended that:

1. This should not preclude the use of parenteral thiamine in patients where this route of administration is required, particularly in patients at risk of Wernicke-Korsakoff syndrome where treatment with thiamine is essential;
2. Intravenous administration should be by infusion over 30 minutes;
3. Facilities for treating anaphylaxis (including resuscitation facilities) should be available when parenteral thiamine is administered.

Breast-feeding severely thiamine-deficient mothers should avoid breast-feeding as toxic methyl-glyoxal present in milk

Dose

- Mild deficiency, by mouth, 25–100 mg daily; severe deficiency, 200–300 mg daily in divided doses

Thiamine (Non-proprietary)

Tablets, thiamine hydrochloride 50 mg, net price 100 = £3.49; 100 mg, 100 = £5.38

Brands include *Benerva*® MHS

Pabrinex® (Archimedes) PoM

I/M High Potency injection, for intramuscular use only, ascorbic acid 500 mg, nicotinamide 160 mg, pyridoxine hydrochloride 50 mg, riboflavin 4 mg, thiamine hydrochloride 250 mg/7 mL. Net price 7 mL (in 2 amps) = £2.25

Excipients include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

I/V High Potency injection, for intravenous use only, ascorbic acid 500 mg, anhydrous glucose 1 g, nicotinamide 160 mg, pyridoxine hydrochloride 50 mg, riboflavin 4 mg, thiamine hydrochloride 250 mg/10 mL. Net price 10 mL (in 2 × 5 mL amps) = £2.25

Parenteral vitamins B and C for rapid correction of severe depletion or malabsorption (e.g. in alcoholism, after acute infections, postoperatively, or in psychiatric states), maintenance of vitamins B and C in chronic intermittent haemodialysis

Dose see MHRA/CHM advice above

Treatment of Wernicke's encephalopathy, by intravenous infusion of *I/V High Potency*, 2–3 pairs 3 times daily for 2 days; if no response, discontinue; if symptoms respond after 2 days, give by intravenous infusion of *I/V High Potency* or by deep intramuscular injection into the gluteal muscle of *IM High Potency*, 1 pair once daily for 5 days or for as long as improvement continues

Prophylaxis of Wernicke's encephalopathy in alcohol

dependence, by intravenous infusion of *I/V High Potency* or by deep intramuscular injection into the gluteal muscle of *I/M High Potency*, 1 pair once daily for at least 3–5 days

Psychosis following narcosis or electroconvulsive therapy, toxicity from acute infections, by intravenous infusion of *I/V High Potency* or by deep intramuscular injection into the gluteal muscle of *I/M High Potency*, 1 pair twice daily for up to 7 days

Haemodialysis, by intravenous infusion of *I/V High Potency* (in sodium chloride intravenous infusion 0.9%), 1 pair every 2 weeks

Note *Pabrinex*® doses in BNF may differ from those in product literature

Oral vitamin B complex preparations

See below

PYRIDOXINE HYDROCHLORIDE

(Vitamin B_6)

Indications see under Dose

Cautions **interactions:** Appendix 1 (vitamins)

Side-effects sensory neuropathy reported with high doses given for extended periods

Dose

- Deficiency states, 20–50 mg up to 3 times daily
- Isoniazid-induced neuropathy, prophylaxis 10 mg daily [or 20 mg daily if suitable product not available]; treatment, 50 mg three times daily; CHILD under 18 years see *BNF for Children*
- Idiopathic sideroblastic anaemia, 100–400 mg daily in divided doses
- Penicillamine-induced neuropathy, prophylaxis in Wilson's disease [unlicensed use] (see also notes above), 20 mg daily; CHILD under 18 years see *BNF for Children*
- Premenstrual syndrome [unlicensed use], 50–100 mg daily (see notes above)

Prolonged use of pyridoxine in a dose of 10 mg daily is considered safe but the long-term use of pyridoxine in a dose of 200 mg or more daily has been associated with neuropathy. The safety of long-term pyridoxine supplementation with doses above 10 mg daily has not been established.

Pyridoxine (Non-proprietary)

Tablets, pyridoxine hydrochloride 10 mg, net price 500 = £8.48; 20 mg, 500 = £8.53; 50 mg, 28 = £3.19

Injections of vitamins B and C

See under Thiamine

NICOTINAMIDE

Indications see notes above; acne vulgaris, see section 13.6.1

Injections of vitamins B and C

See under Thiamine

Oral vitamin B complex preparations

Note Other multivitamin preparations are in section 9.6.7.

Vitamin B Tablets, Compound

Tablets, nicotinamide 15 mg, riboflavin 1 mg, thiamine hydrochloride 1 mg, net price 28 = £22.12

Dose prophylactic, 1–2 tablets daily

Vitamin B Tablets, Compound, Strong

Tablets, brown, f/c or s/c, nicotinamide 20 mg, pyridoxine hydrochloride 2 mg, riboflavin 2 mg, thiamine hydrochloride 5 mg. Net price 28-tab pack = £2.03

Dose treatment of vitamin-B deficiency, 1–2 tablets 3 times daily

Vigranon B® (Wallace Mfg) NHS

Syrup, thiamine hydrochloride 5 mg, riboflavin 2 mg, nicotinamide 20 mg, pyridoxine hydrochloride 2 mg, panthenol 3 mg/5 mL. Net price 150 mL = £2.41

Other compounds

Potassium aminobenzoate has been used in the treatment of various disorders associated with excessive fibrosis such as scleroderma and Peyronie's disease. In Peyronie's disease there is some evidence to support efficacy in reducing progression when given early in the disease; however, there is no evidence for reversal of the condition. The therapeutic value of potassium aminobenzoate in scleroderma is doubtful.

Potaba® (Glenwood)

Capsules, potassium aminobenzoate 500 mg, net price 240 = £44.75. Label: 21

Envules® (= powder in sachets), potassium aminobenzoate 3 g, net price 40 sachets = £34.31. Label: 13, 21

Dose Peyronie's disease, scleroderma, 12 g daily in divided doses after food

9.6.3 Vitamin C

(Ascorbic acid)

Vitamin C therapy is essential in scurvy, but less florid manifestations of vitamin C deficiency are commonly found, especially in the elderly. It is rarely necessary to prescribe more than 100 mg daily except early in the treatment of scurvy.

Severe scurvy causes gingival swelling and bleeding margins as well as petechiae on the skin. This is, however, exceedingly rare and a patient with these signs is more likely to have leukaemia. Investigation should not be delayed by a trial period of vitamin treatment.

Claims that vitamin C ameliorates colds or promotes wound healing have not been proved.

ASCORBIC ACID

Indications prevention and treatment of scurvy

Cautions **interactions:** Appendix 1 (vitamins)

Dose

- Prophylactic, 25–75 mg daily; therapeutic, not less than 250 mg daily in divided doses

Ascorbic Acid (Non-proprietary)

Tablets, ascorbic acid 50 mg, net price 28 = £2.11; 100 mg, 28 = £2.39; 200 mg, 28 = £3.10; 500 mg (label: 24), 28 = £4.50

Brands include *Redoxon*® NHS

Injection, ascorbic acid 100 mg/mL. Net price 5-mL amp = £4.39

Available from UCB Pharma

9.6.4 Vitamin D

Note The term Vitamin D is used for a range of compounds which possess the property of preventing or curing rickets.

They include ergocalciferol (calciferol, vitamin D_2), colecalciferol (vitamin D_3), dihydrotachysterol, alfacalcidol (1α-hydroxycholecalciferol), and calcitriol (1,25-dihydroxycholecalciferol).

Simple vitamin D deficiency can be prevented by taking an oral supplement of only 10 micrograms (400 units) of **ergocalciferol** (calciferol, vitamin D_2) or **colecalciferol** (vitamin D_3) daily. Vitamin D deficiency can occur in people whose exposure to sunlight is limited and in those whose diet is deficient in vitamin D. In these individuals, ergocalciferol or colecalciferol in a dose of 20 micrograms (800 units) daily by mouth may be given to treat vitamin D deficiency; higher doses may be necessary for *severe* deficiency. Patients who do not respond should be referred to a specialist.

Preparations containing **calcium with colecalciferol** are available for the management of combined calcium and vitamin D deficiency, or for those at high risk of deficiency (see also Osteoporosis, p. 510 and Calcium Supplements, p. 680).

Vitamin D deficiency caused by *intestinal malabsorption* or *chronic liver disease* usually requires vitamin D in pharmacological doses, such as ergocalciferol tablets up to 1 mg (40 000 units) daily; the hypocalcaemia of *hypoparathyroidism* often requires doses of up to 2.5 mg (100 000 units) daily in order to achieve normocalcaemia.

Vitamin D requires hydroxylation by the kidney to its active form, therefore the hydroxylated derivatives **alfacalcidol** or **calcitriol** should be prescribed if patients with *severe renal impairment* require vitamin D therapy. Calcitriol is also licensed for the management of postmenopausal osteoporosis.

Paricalcitol, a synthetic vitamin D analogue, is licensed for the prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure (section 9.5.1.2).

Important. All patients receiving pharmacological doses of vitamin D should have their plasma-calcium concentration checked at intervals (initially once or twice weekly) and whenever nausea or vomiting occur.

ERGOCALCIFEROL

(Calciferol, Vitamin D_2)

Indications see notes above

Cautions take care to ensure correct dose in infants; monitor plasma-calcium concentration in patients receiving high doses and in renal impairment (see notes above); **interactions**: Appendix 1 (vitamins)

Contra-indications hypercalcaemia; metastatic calcification

Pregnancy high doses teratogenic in *animals* but therapeutic doses unlikely to be harmful

Breast-feeding caution with high doses; may cause hypercalcaemia in infant—monitor serum-calcium concentration

Side-effects symptoms of overdosage include anorexia, lassitude, nausea and vomiting, diarrhoea, constipation, weight loss, polyuria, sweating, headache, thirst, vertigo, and raised concentrations of calcium and phosphate in plasma and urine

Dose

- See notes above

Daily supplements

Note There is no plain vitamin D tablet available for treating simple deficiency (see notes above). Alternatives include vitamins capsules (section 9.6.7), preparations of vitamins A and D (section 9.6.1), and calcium and ergocalciferol tablets (see below) (although the calcium and other vitamins in supplements are unnecessary).
For prescribing information on calcium, see section 9.5.1.1

Calcium and Ergocalciferol (Non-proprietary)
(Calcium and Vitamin D)
Tablets, calcium lactate 300 mg, calcium phosphate 150 mg (calcium 97 mg or Ca^{2+} 2.4 mmol), ergocalciferol 10 micrograms (400 units). Net price 28-tab pack = £10.81. Counselling, crush before administration or may be chewed

Pharmacological strengths

Note The BP directs that when calciferol is prescribed or demanded, colecalciferol or ergocalciferol should be dispensed or supplied

Ergocalciferol (Non-proprietary)
Tablets, ergocalciferol 250 micrograms (10 000 units), net price 100 = £21.99; 1.25 mg (50 000 units), 100 = £30.34
Note May be difficult to obtain
Important When the strength of the tablets ordered or prescribed is not clear, the intention of the prescriber with respect to the strength (expressed in micrograms or milligrams per tablet) should be ascertained.
Injection, for intramuscular use only, ergocalciferol, 7.5 mg (300 000 units)/mL in oil, net price 1-mL amp = £9.35, 2-mL amp = £10.84
Note Other formulations of ergocalciferol are available from 'special-order' manufacturers or specialist importing companies, see p. 1104

ALFACALCIDOL

(1α-Hydroxycholecalciferol)

Indications see notes above

Cautions see under Ergocalciferol; also nephrolithiasis

Contra-indications see under Ergocalciferol

Pregnancy see under Ergocalciferol

Breast-feeding see under Ergocalciferol

Side-effects see under Ergocalciferol; also *rarely* nephrocalcinosis, pruritus, rash, and urticaria

Dose

- By mouth *or* by intravenous injection over 30 seconds, ADULT and CHILD over 20 kg, initially 1 microgram daily (elderly 500 nanograms), adjusted to avoid hypercalcaemia; maintenance, usually 0.25–1 microgram daily; NEONATE and PREMATURE NEONATE initially 50–100 nanograms/kg daily, CHILD under 20 kg initially 50 nanograms/kg daily

Alfacalcidol (Non-proprietary) PoM
Capsules, alfacalcidol 250 nanograms, net price 30-cap pack = £2.62; 500 nanograms 30-cap pack = £5.77; 1 microgram 30-cap pack = £5.89

One-Alpha® (LEO) PoM
Capsules, alfacalcidol 250 nanograms (white), net price 30-cap pack = £3.37; 500 nanograms (red), 30-cap pack = £6.27; 1 microgram (brown), 30-cap pack = £8.75
Excipients include sesame oil
Oral drops, sugar-free, alfacalcidol 2 micrograms/mL (1 drop contains approx. 100 nanograms), net price 10 mL = £21.30
Excipients include alcohol
Note The concentration of alfacalcidol in *One-Alpha® drops* is **10 times greater** than that of the former preparation *One-Alpha® solution.*

Injection, alfacalcidol 2 micrograms/mL, net price 0.5-mL amp = £2.16, 1-mL amp = £4.11
Excipients include alcohol, propylene glycol (caution in neonates, see Excipients, p. 2)
Note Shake ampoule for at least 5 seconds before use

CALCITRIOL

(1,25-Dihydroxycholecalciferol)

Indications see notes above
Cautions see under Ergocalciferol; monitor plasma calcium, phosphate, and creatinine during dosage titration
Contra-indications see under Ergocalciferol
Pregnancy see under Ergocalciferol
Breast-feeding see under Ergocalciferol
Side-effects see under Ergocalciferol
Dose

- By mouth, renal osteodystrophy, initially 250 nanograms daily, or on alternate days (in patients with normal or only slightly reduced plasma-calcium concentration), increased if necessary in steps of 250 nanograms at intervals of 2–4 weeks; usual dose 0.5–1 microgram daily; CHILD not established
  Established postmenopausal osteoporosis, 250 nanograms twice daily (monitor plasma-calcium concentration and creatinine, consult product literature)

Calcitriol (Non-proprietary) PoM
Capsules, calcitriol 250 nanograms, net price 30-cap pack = £5.41, 100-cap pack = £19.15; 500 nanograms, 30-cap pack = £9.68, 100-cap pack = £25.76

Rocaltrol® (Roche) PoM
Capsules, calcitriol 250 nanograms (red/white), net price 100 = £18.04; 500 nanograms (red), 100 = £32.25

COLECALCIFEROL

(Cholecalciferol, vitamin D_3)

Indications see notes above
Cautions see under Ergocalciferol
Contra-indications see under Ergocalciferol
Pregnancy see under Ergocalciferol
Breast-feeding see under Ergocalciferol
Side-effects see under Ergocalciferol
Dose

- See notes above

Desunin® (Meda) PoM
Tablets, colecalciferol 20 micrograms (800 units), net price 30-tab pack = £3.60

Fultium-D_3® (Internis) PoM
Capsules, colecalciferol 20 micrograms (800 units) (blue), net price 30-cap pack = £3.60, 90-cap pack = £10.80; 80 micrograms (3200 units) (green), 30-cap pack = £13.32. Label: 25
Excipients include arachis (peanut) oil

Colecalciferol
Various formulations available from 'special-order' manufacturers or specialist importing companies, see p. 1104

With calcium

For prescribing information on calcium, see section 9.5.1.1

Accrete D3® (Internis)
Tablets, f/c, calcium carbonate 1.5 g (calcium 600 mg or Ca^{2+} 15 mmol), colecalciferol 10 micrograms (400 units), net price 60-tab pack = £2.95

Adcal-D_3® (ProStrakan)
Tablets (chewable) (lemon or tutti-frutti flavour), calcium carbonate 1.5 g (calcium 600 mg or Ca^{2+} 15 mmol), colecalciferol 10 micrograms (400 units), net price 56-tab pack = £3.65, 112-tab pack = £7.49. Label: 24
Dissolve (effervescent tablets), lemon flavour, calcium carbonate 1.5 g (calcium 600 mg or Ca^{2+} 15 mmol), colecalciferol 10 micrograms (400 units), net price 56-tab pack = £5.99. Label: 13
Caplets (= tablets), f/c, calcium carbonate 750 mg (calcium 300 mg or Ca^{2+} 7.5 mmol), colecalciferol 5 micrograms (200 units), net price 112-tab pack = £3.65

Cacit® D3 (Warner Chilcott)
Granules, effervescent, lemon flavour, calcium carbonate 1.25 g (calcium 500 mg or Ca^{2+} 12.5 mmol), colecalciferol 11 micrograms (440 units)/sachet, net price 30-sachet pack = £4.06. Label: 13

Calceos® (Galen)
Tablets (chewable), lemon flavour, calcium carbonate 1.25 g (calcium 500 mg or Ca^{2+} 12.5 mmol), colecalciferol 10 micrograms (400 units), net price 60-tab pack = £3.58. Label: 24

Calcichew-D_3® (Takeda)
Calcichew-D_3® Tablets (chewable), orange flavour, calcium carbonate 1.25 g (calcium 500 mg or Ca^{2+} 12.5 mmol), colecalciferol 5 micrograms (200 units), net price 100-tab pack = £7.68. Label: 24
Excipients include aspartame (section 9.4.1)
Calcichew-D_3® Forte Tablets (chewable), lemon flavour, calcium carbonate 1.25 g (calcium 500 mg or Ca^{2+} 12.5 mmol), colecalciferol 10 micrograms (400 units), net price 60-tab pack = £4.24, 100-tab pack = £7.08. Label: 24
Excipients include aspartame (section 9.4.1)
Calcichew-D_3® 500 mg/400 unit caplets, f/c, lemon flavour, calcium carbonate providing calcium 500 mg (Ca^{2+} 12.5 mmol), colecalciferol 10 micrograms (400 units), net price 100-tab pack = £7.43
Excipients include propylene glycol, see Excipients, p. 2

Calfovit D3® (Menarini)
Powder, lemon flavour, calcium phosphate 3.1 g (calcium 1.2 g or Ca^{2+} 30 mmol), colecalciferol 20 micrograms (800 units), net price 30-sachet pack = £4.32. Label: 13, 21

Kalcipos-D® (Meda) PoM
Tablets (chewable), calcium carbonate providing calcium 500 mg (Ca^{2+} 12.5 mmol), colecalciferol 20 micrograms (800 units), net price 30-tab pack = £4.21. Label: 24

Natecal D3® (Chiesi)
Tablets (chewable), (aniseed, peppermint, and molasses flavour), calcium carbonate 1.5 g (calcium 600 mg or Ca^{2+} 15 mmol), colecalciferol 10 micrograms (400 units), net price 60-tab pack = £3.63. Label: 24
Excipients include aspartame (section 9.4.1)

With alendronic acid

Section 6.6.2

With risedronate sodium and calcium

Section 6.6.2

DIHYDROTACHYSTEROL

Indications see notes above
Cautions see under Ergocalciferol
Contra-indications see under Ergocalciferol

Pregnancy see under Ergocalciferol

Breast-feeding see under Ergocalciferol

Side-effects see under Ergocalciferol

AT 10® (Intrapharm)

Oral solution, dihydrotachysterol 250 micrograms/mL. Net price 15-mL dropper bottle = £22.87

Excipients include arachis (peanut) oil

Dose acute, chronic, and latent forms of hypocalcaemic tetany due to hypoparathyroidism, consult product literature

PARICALCITOL

Indications see under preparations below

Cautions monitor plasma calcium and phosphate during dose titration and at least monthly when stabilised; monitor parathyroid hormone concentration; **interactions:** Appendix 1 (vitamins)

Contra-indications see under Ergocalciferol

Pregnancy toxicity in *animal* studies—manufacturer advises avoid unless potential benefit outweighs risk; see also under Ergocalciferol

Breast-feeding manufacturer advises caution—no information available; see also under Ergocalciferol

Side-effects see under Ergocalciferol; also dyspepsia, taste disturbance, breast tenderness, acne, pruritus, and rash

Dose

- Consult product literature

Zemplar® (AbbVie) PoM

Capsules, paricalcitol 1 microgram (grey), net price 28-cap pack = £69.44; 2 micrograms (orange-brown), 28-cap pack = £138.88; 4 micrograms (gold), 28-cap pack = £277.76

For prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure

Injection, paricalcitol 5 micrograms/mL, net price 1-mL amp = £12.40, 2-mL amp = £24.80. For injection via haemodialysis access

Excipients include propylene glycol, see Excipients, p. 2

For prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure in patients on haemodialysis

9.6.5 Vitamin E (Tocopherols)

The daily requirement of vitamin E has not been well defined but is probably about 3 to 15 mg daily. There is little evidence that oral supplements of vitamin E are essential in adults, even where there is fat malabsorption secondary to cholestasis. In young children with congenital cholestasis, abnormally low vitamin E concentrations may be found in association with neuromuscular abnormalities, which usually respond only to the parenteral administration of vitamin E.

Vitamin E has been tried for various other conditions but there is little scientific evidence of its value.

ALPHA TOCOPHERYL ACETATE

Indications see notes above

Cautions predisposition to thrombosis; increased risk of necrotising enterocolitis in neonate weighing less than 1.5 kg; **interactions**: Appendix 1 (vitamins)

Pregnancy no evidence of safety of high doses

Breast-feeding excreted in milk; minimal risk, although caution with large doses

Side-effects diarrhoea and abdominal pain with doses more than 1 g daily

Vitamin E Suspension (Non-proprietary)

Suspension, alpha tocopheryl acetate 500 mg/5 mL. Net price 100 mL = £42.12

Dose malabsorption in cystic fibrosis, 100–200 mg daily; CHILD 1 month–1 year 50 mg daily; 1–12 years, 100 mg daily

Malabsorption in abetalipoproteinaemia, ADULT and CHILD 50–100 mg/kg daily

Malabsorption in chronic cholestasis and severe liver disease, CHILD see *BNF for Children*

Note Tablets containing tocopheryl acetate are available from 'special-order' manufacturers or specialist importing companies, see p. 1104

ALPHA TOCOPHEROL

Indications vitamin E deficiency because of malabsorption in congenital or hereditary chronic cholestasis

Cautions predisposition to thrombosis; **interactions:** Appendix 1 (Vitamin E)

Contra-indications preterm neonates

Hepatic impairment manufacturer advises caution and monitor closely—no information available

Renal impairment manufacturer advises caution and monitor closely; risk of renal toxicity due to polyethylene glycol content

Pregnancy manufacturer advises caution, no evidence of harm in *animal* studies

Breast-feeding manufacturer advises use only if potential benefit outweighs risk—no information available

Side-effects diarrhoea; *less commonly* asthenia, headache, disturbances in serum-potassium and serum-sodium concentrations, alopecia, pruritus, and rash

Vedrop® (Orphan Europe) ▼ PoM

Oral solution, yellow, D-alpha tocopherol (as tocofersolan) 50 mg/mL, net price 20 mL = £54.55, 60 mL = £163.65 (all with oral syringe)

Note Tocofersolan is a water-soluble form of D-alpha tocopherol

Dose CHILD under 18 years, 17 mg/kg daily, adjusted as necessary

9.6.6 Vitamin K

Vitamin K is necessary for the production of blood clotting factors and proteins necessary for the normal calcification of bone.

Because vitamin K is fat soluble, patients with fat malabsorption, especially in biliary obstruction or hepatic disease, may become deficient. **Menadiol sodium phosphate** is a water-soluble synthetic vitamin K derivative that can be given orally to prevent vitamin K deficiency in malabsorption syndromes.

Oral coumarin anticoagulants act by interfering with vitamin K metabolism in the hepatic cells and their effects can be antagonised by giving vitamin K; for advice on the use of vitamin K in haemorrhage, see section 2.8.2.

Vitamin K deficiency bleeding Neonates are relatively deficient in vitamin K and those who do not receive supplements of vitamin K are at risk of serious bleeding including intracranial bleeding. The Chief Medical Officer and the Chief Nursing Officer have recommended that all newborn babies should receive vitamin

K to prevent vitamin K deficiency bleeding (previously termed haemorrhagic disease of the newborn). An appropriate regimen should be selected after discussion with parents in the antenatal period.

Vitamin K (as **phytomenadione**) 1 mg may be given by a single intramuscular injection at birth; this prevents vitamin K deficiency bleeding in virtually all babies. For preterm neonates, see *BNF for Children*.

Alternatively, in healthy babies who are not at particular risk of bleeding disorders, vitamin K may be given by mouth, and arrangements must be in place to ensure the appropriate regimen is followed. Two doses of a colloidal (mixed micelle) preparation of phytomenadione 2 mg should be given by mouth in the first week, the first dose being given at birth and the second dose at 4–7 days. For exclusively breast-fed babies, a third dose of colloidal phytomenadione 2 mg is given by mouth at 1 month of age; the third dose is omitted in formula-fed babies because formula feeds contain adequate vitamin K. An alternative regimen is to give one dose of phytomenadione 1 mg by mouth at birth (using the contents of a phytomenadione capsule, see preparation below) to protect from the risk of vitamin K deficiency bleeding in the first week; for exclusively breast-fed babies, further doses of phytomenadione 1 mg are given by mouth (using the contents of a phytomenadione capsule) at weekly intervals for 12 weeks.

MENADIOL SODIUM PHOSPHATE

Indications see notes above

Cautions G6PD deficiency (section 9.1.5) and vitamin E deficiency (risk of haemolysis); **interactions:** Appendix 1 (vitamins)

Contra-indications neonates and infants

Pregnancy avoid in late pregnancy and labour unless benefit outweighs risk of neonatal haemolytic anaemia, hyperbilirubinaemia, and kernicterus in neonate

Dose

- 10–40 mg daily, adjusted as necessary; CHILD under 18 years see *BNF for Children*

Menadiol Phosphate (Non-proprietary)

Tablets, menadiol sodium phosphate equivalent to 10 mg of menadiol phosphate, net price 100-tab pack = £122.48

PHYTOMENADIONE

(Vitamin K_1)

Indications see notes above

Cautions intravenous injections should be given very slowly (see also below); **interactions:** Appendix 1 (vitamins)

Pregnancy use if potential benefit outweighs risk

Breast-feeding present in milk, but see notes above

Dose

- See notes above and section 2.8.2

Neokay® (Neoceuticals) PoM

Capsules, brown, phytomenadione 1 mg in an oily basis, net price 12-cap pack = £3.95; 100-cap pack = £34.00

Note The contents of one capsule should be administered by cutting the narrow tubular tip off and squeezing the liquid contents into the mouth; if the baby spits out the dose or is sick within three hours of administration a replacement dose should be given

Colloidal formulation

Konakion® MM (Roche) PoM

Injection, phytomenadione 10 mg/mL in a mixed micelles vehicle, net price 1-mL amp = 38p

Excipients include glycocholic acid 54.6 mg/amp, lecithin

Cautions reduce dose in elderly; liver impairment (glycocholic acid may displace bilirubin); reports of anaphylactoid reactions

Note *Konakion® MM* may be administered by slow intravenous injection or by intravenous infusion in glucose 5% (see Appendix 4); **not** for intramuscular injection

Konakion® MM Paediatric (Roche) ▼ PoM

Injection, phytomenadione 10 mg/mL in a mixed micelles vehicle, net price 0.2-mL amp = 94p

Excipients include glycocholic acid 10.9 mg/amp, lecithin

Cautions parenteral administration in neonate of less than 2.5 kg (increased risk of kernicterus)

Note *Konakion® MM Paediatric* may be administered *by mouth* or *by intramuscular injection* or *by intravenous injection*

9.6.7 Multivitamin preparations

Vitamins

Capsules, ascorbic acid 15 mg, nicotinamide 7.5 mg, riboflavin 500 micrograms, thiamine hydrochloride 1 mg, vitamin A 2500 units, vitamin D 300 units, net price 28-cap pack = £1.50

Abidec® (Chefaro UK)

Drops, vitamins A, B group, C, and D, net price 25 mL (with dropper) = £3.33

Excipients include arachis (peanut) oil

Note Contains 1333 units of vitamin A (as palmitate) per 0.6-mL dose

Dalivit® (LPC)

Oral drops, vitamins A, B group, C, and D, net price 25 mL = £3.28, 50 mL = £5.58

Note Contains 5000 units of vitamin A (as palmitate) per 0.6-mL dose

Vitamin and mineral supplements and adjuncts to synthetic diets

Forceval® (Alliance)

Capsules, brown/red, vitamins (ascorbic acid 60 mg, biotin 100 micrograms, cyanocobalamin 3 micrograms, folic acid 400 micrograms, nicotinamide 18 mg, pantothenic acid 4 mg, pyridoxine 2 mg, riboflavin 1.6 mg, thiamine 1.2 mg, vitamin A 2500 units, vitamin D_2 400 units, vitamin E 10 mg, minerals and trace elements (calcium 100 mg, chromium 200 micrograms, copper 2 mg, iodine 140 micrograms, iron 12 mg, magnesium 30 mg, manganese 3 mg, molybdenum 250 micrograms, phosphorus 77 mg, potassium 4 mg, selenium 50 micrograms, zinc 15 mg), net price 15-cap pack = £3.40, 30-cap pack = £5.93, 90-cap pack = £14.32. Label: 25

Dose vitamin and mineral deficiency and as adjunct in synthetic diets, ADULT 1 capsule daily one hour after a meal

Ketovite® (Essential)

Tablets PoM, yellow, ascorbic acid 16.6 mg, riboflavin 1 mg, thiamine hydrochloride 1 mg, pyridoxine hydrochloride 330 micrograms, nicotinamide 3.3 mg, calcium pantothenate 1.16 mg, alpha tocopheryl acetate 5 mg, inositol 50 mg, biotin 170 micrograms, folic acid 250 micrograms, acetomenaphthone 500 micrograms, net price 100-tab pack = £9.21

Dose prevention of vitamin deficiency in disorders of carbohydrate or amino-acid metabolism and adjunct in restricted, specialised, or synthetic diets, 1 tablet 3 times daily; use with *Ketovite® Liquid* for complete vitamin supplementation

Liquid, pink, sugar-free, vitamin A 2500 units, ergocalciferol 400 units, choline chloride 150 mg, cyanocobalamin 12.5 micrograms/5 mL, net price 150-mL pack = £19.10

Dose prevention of vitamin deficiency in disorders of carbohydrate or amino-acid metabolism and adjunct in restricted, specialised, or synthetic diets, 5 mL daily; use with *Ketovite® Tablets* for complete vitamin supplementation

9.7 Bitters and tonics

Mixtures containing simple and aromatic bitters are traditional remedies for loss of appetite; there is no evidence to support their use.

9.8 Metabolic disorders

This section covers drugs used in metabolic disorders and not readily classified elsewhere.

9.8.1 Drugs used in metabolic disorders

Wilson's disease

Penicillamine (see also section 10.1.3) is used in Wilson's disease (hepatolenticular degeneration) to aid the elimination of copper ions. See below for other indications.

Trientine is used for the treatment of Wilson's disease only in patients intolerant of penicillamine; it is **not** an alternative to penicillamine for rheumatoid arthritis or cystinuria. Penicillamine-induced systemic lupus erythematosus may not resolve on transfer to trientine.

Zinc prevents the absorption of copper in Wilson's disease. Symptomatic patients should be treated initially with a chelating agent because zinc has a slow onset of action. When transferring from chelating treatment to zinc maintenance therapy, chelating treatment should be co-administered for 2–3 weeks until zinc produces its maximal effect.

PENICILLAMINE

Indications see under Dose below

Cautions section 10.1.3; also neurological involvement in Wilson's disease

Contra-indications section 10.1.3

Renal impairment section 10.1.3

Pregnancy section 10.1.3

Breast-feeding section 10.1.3

Side-effects section 10.1.3; also neuropathy (especially if previous neurological involvement in Wilson's disease—prophylactic pyridoxine recommended, see section 9.6.2)

Dose

- Wilson's disease, 1.5–2 g daily in divided doses before food; max. 2 g daily for 1 year; maintenance 0.75–1 g daily; ELDERLY 20 mg/kg daily in divided doses, adjusted according to response; CHILD see *BNF for Children*
- Autoimmune hepatitis (used rarely; after disease controlled with corticosteroids), initially 500 mg daily in divided doses increased slowly over 3 months; usual maintenance dose 1.25 g daily; ELDERLY not recommended
- Cystinuria, therapeutic, 1–3 g daily in divided doses before food, adjusted to maintain urinary cystine below 200 mg/litre; prophylactic (maintain urinary cystine below 300 mg/litre) 0.5–1 g at bedtime; maintain adequate fluid intake (at least 3 litres daily); ELDERLY minimum dose to maintain urinary cystine below 200 mg/litre; CHILD see *BNF for Children*
- Severe active rheumatoid arthritis, section 10.1.3

Preparations

Section 10.1.3

TRIENTINE DIHYDROCHLORIDE

Indications Wilson's disease in patients intolerant of penicillamine

Cautions see notes above; **interactions:** Appendix 1 (trientine)

Pregnancy manufacturer advises use only if potential benefit outweighs risk; monitor maternal and neonatal serum-copper concentration; teratogenic in *animal* studies

Side-effects nausea, rash; *very rarely* anaemia; duodenitis and colitis also reported

Dose

- ADULT and CHILD over 12 years, 1.2–2.4 g daily in 2–4 divided doses before food; CHILD 2–12 years, initially 0.6–1.5 g daily in 2–4 divided doses before food, adjusted according to response

Trientine Dihydrochloride (Univar) PoM

Capsules, trientine dihydrochloride 300 mg. Label: 6, 22

ZINC ACETATE

Indications Wilson's disease (initiated under specialist supervision)

Cautions portal hypertension (risk of hepatic decompensation when switching from chelating agent); monitor full blood count and serum cholesterol; **interactions:** Appendix 1 (zinc)

Pregnancy reduce dose to 25 mg 3 times daily adjusted according to plasma-copper concentration and urinary copper excretion

Breast-feeding manufacturer advises avoid; present in milk—may cause zinc-induced copper deficiency in infant

Side-effects gastric irritation (usually transient; may be reduced if first dose taken mid-morning or with a little protein); *less commonly* sideroblastic anaemia and leucopenia

Dose

Note Dose expressed as elemental zinc

- Wilson's disease, 50 mg 3 times daily (max. 50 mg 5 times daily), adjusted according to response; CHILD 1–6 years, 25 mg twice daily; 6–16 years, body-weight under 57 kg, 25 mg 3 times daily, body-weight over 57 kg, 50 mg 3 times daily; ADOLESCENT 16–18 years, 50 mg 3 times daily

Wilzin® (Orphan Europe) PoM

Capsules, zinc (as acetate) 25 mg (blue), net price 250-cap pack = £132.00; 50 mg (orange), 250-cap pack = £242.00. Label: 23

Carnitine deficiency

Levocarnitine is available for the management of primary carnitine deficiency due to inborn errors of metabolism or of secondary deficiency in haemodialysis patients.

LEVOCARNITINE

(Carnitine)

Indications primary and secondary carnitine deficiency

Cautions diabetes mellitus; monitoring of free and acyl carnitine in blood and urine recommended

Renal impairment accumulation of metabolites may occur with chronic oral administration in severe impairment

Pregnancy appropriate to use; no evidence of teratogenicity in *animal* studies

Side-effects nausea, vomiting, abdominal pain, diarrhoea, body odour; side-effects may be dose-related—monitor tolerance during first week and after any dose increase

Dose

- Primary deficiency, by mouth, up to 200 mg/kg daily in 2–4 divided doses; usual max. 3 g daily; by intravenous injection over 2–3 minutes, up to 100 mg/kg daily in 2–4 divided doses
- Secondary deficiency, by intravenous injection over 2–3 minutes, 20 mg/kg after each dialysis session (dosage adjusted according to plasma-carnitine concentration); maintenance (if benefit gained from first intravenous course), by mouth, 1 g daily

Levocarnitine (Non-proprietary) PoM

Paediatric oral solution, levocarnitine 300 mg/mL (30%), net price 20 mL = £55.55

Carnitor® (Sigma-Tau) PoM

Tablets, levocarnitine 330 mg, net price 90-tab pack = £103.95

Chewable tablets, levocarnitine 1 g, net price 10-tab pack = £35.00

Oral liquid, levocarnitine 100 mg/mL (10%), net price 10 × 10-mL (1-g) single-dose bottle = £35.00

Injection, levocarnitine 200 mg/mL, net price 5-mL amp = £11.90

Fabry's disease

Agalsidase alfa and **agalsidase beta**, enzymes produced by recombinant DNA technology, are licensed for long-term enzyme replacement therapy in Fabry's disease (a lysosomal storage disorder caused by deficiency of alpha-galactosidase A).

AGALSIDASE ALFA and BETA

Indications Fabry's disease (specialist use only)

Cautions **interactions:** Appendix 1 (agalsidase alfa and beta)

Infusion-related reactions Infusion-related reactions very common; manage by slowing the infusion rate or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature

Pregnancy use with caution

Breast-feeding use with caution—no information available

Side-effects gastro-intestinal disturbances, taste disturbances; tachycardia, bradycardia, palpitation, hypertension, hypotension, chest pain, oedema, flushing; dyspnoea, cough, rhinorrhoea; headache, fatigue, dizziness, asthenia, paraesthesia, syncope, neuropathic pain, tremor, sleep disturbances; influenza-like symptoms, nasopharyngitis; muscle spasms, myalgia, arthralgia; eye irritation; tinnitus; hypersensitivity reactions, angioedema, pruritus, urticaria, rash, acne; *less commonly* cold extremities, parosmia, ear pain and swelling, skin discoloration, and injection-site reactions

Fabrazyme® (Genzyme) PoM

Intravenous infusion, powder for reconstitution, agalsidase beta, net price 5-mg vial = £315.08; 35-mg vial = £2196.59

Dose By intravenous infusion, ADULT and CHILD over 8 years 1 mg/kg every 2 weeks

Replagal® (Shire HGT) PoM

Concentrate for intravenous infusion, agalsidase alfa 1 mg/mL, net price 3.5-mL vial = £1068.64

Dose By intravenous infusion, ADULT and CHILD over 7 years 200 micrograms/kg every 2 weeks

Gaucher's disease

Imiglucerase, an enzyme produced by recombinant DNA technology, is administered as enzyme replacement therapy for non-neurological manifestations of type I or type III Gaucher's disease, a familial disorder affecting principally the liver, spleen, bone marrow, and lymph nodes.

Velaglucerase alfa, an enzyme produced by recombinant DNA technology, is administered as enzyme replacement therapy for the treatment of type I Gaucher's disease.

Miglustat, an inhibitor of glucosylceramide synthase, is licensed for the treatment of mild to moderate type I Gaucher's disease in patients for whom enzyme replacement therapy is unsuitable; it is given by mouth; see p. 698.

IMIGLUCERASE

Indications (specialist use only) non-neurological manifestations of type I or type III Gaucher's disease

Cautions monitor immunoglobulin G (IgG) antibody concentration; when stabilised, monitor all parameters and response to treatment at intervals of 6–12 months

Pregnancy manufacturer advises use with caution—limited information available

Breast-feeding no information available

Side-effects hypersensitivity reactions (including urticaria, angioedema, cyanosis, hypotension, flushing, tachycardia, paraesthesia, backache); *less commonly* nausea, vomiting, diarrhoea, abdominal cramps, headache, dizziness, fatigue, fever, arthralgia, and injection-site reactions

Dose

- By intravenous infusion, initially 60 units/kg once every 2 weeks (doses as low as 15 units/kg once every 2 weeks may improve haematological parameters and organomegaly); maintenance, adjust dose according to response; CHILD under 18 years see *BNF for Children*

Cerezyme® (Genzyme) PoM
Intravenous infusion, powder for reconstitution, imiglucerase, net price 200-unit vial = £535.65; 400-unit vial = £1071.29
Electrolytes Na^+ 0.62 mmol/200-unit vial, 1.24 mmol/400-unit vial

VELAGLUCERASE ALFA

Indications (specialist use only) type I Gaucher's disease

Cautions monitor immunoglobulin G (IgG) antibody concentration in severe infusion-related reactions or if there is a lack or loss of effect with velaglucerase alfa
Infusion-related reactions Infusion-related reactions very common; manage by slowing the infusion rate, or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature

Pregnancy manufacturer advises use with caution—limited information available

Breast-feeding manufacturer advises use with caution—no information available

Side-effects nausea, abdominal pain, tachycardia, hypertension, hypotension, flushing, headache, dizziness, malaise, pyrexia, arthralgia, bone pain, back pain, hypersensitivity reactions, rash, urticaria

Dose
- By intravenous infusion, 60 units/kg once every 2 weeks; adjusted according to response to 15–60 units/kg once every 2 weeks; CHILD under 18 years see *BNF for Children*

VPRIV® (Shire HGT) ▼ PoM
Intravenous infusion, powder for reconstitution, velaglucerase alfa, net price 400-unit vial = £1410.20
Electrolytes Na^+ 0.53 mmol/400-unit vial

Mucopolysaccharidosis

Laronidase, an enzyme produced by recombinant DNA technology, is licensed for long-term replacement therapy in the treatment of non-neurological manifestations of mucopolysaccharidosis I, a lysosomal storage disorder caused by deficiency of alpha-L-iduronidase.

Idursulfase, an enzyme produced by recombinant DNA technology, is licensed for long-term replacement therapy in mucopolysaccharidosis II (Hunter syndrome), a lysosomal storage disorder caused by deficiency of iduronate-2-sulfatase.

Galsulfase, a recombinant form of human N-acetylgalactosamine-4-sulfatase, is licensed for long-term replacement therapy in mucopolysaccharidosis VI (Maroteaux-Lamy syndrome).

Infusion-related reactions Infusion-related reactions often occur with administration of laronidase, idursulfase, and galsulfase; they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details.

GALSULFASE

Indications (specialist use only) mucopolysaccharidosis VI

Cautions respiratory disease; acute febrile or respiratory illness (consider delaying treatment)
Infusion-related reactions See notes above

Pregnancy manufacturer advises avoid unless essential

Breast-feeding manufacturer advises avoid—no information available

Side-effects abdominal pain, umbilical hernia, gastroenteritis; chest pain, hypertension; dyspnoea, apnoea, nasal congestion; rigors, malaise, areflexia; pharyngitis; conjunctivitis, corneal opacity; ear pain; facial oedema

Dose
- By intravenous infusion, ADULT and CHILD over 5 years, 1 mg/kg once weekly

Naglazyme® (BioMarin) PoM
Concentrate for intravenous infusion, galsulfase 1 mg/mL, net price 5-mL vial = £982.00

IDURSULFASE

Indications (specialist use only) mucopolysaccharidosis II

Cautions severe respiratory disease; acute febrile respiratory illness (consider delaying treatment)
Infusion-related reactions See notes above

Contra-indications women of child-bearing potential

Pregnancy manufacturer advises avoid

Breast-feeding manufacturer advises avoid—present in milk in *animal* studies

Side-effects gastro-intestinal disturbances, swollen tongue; arrhythmia, tachycardia, chest pain, cyanosis, peripheral oedema, hypertension, hypotension, flushing; bronchospasm, hypoxia, cough, wheezing, tachypnoea, dyspnoea; headache, dizziness, tremor; pyrexia; arthralgia; facial oedema, urticaria, pruritus, rash, infusion-site swelling, erythema; pulmonary embolism and anaphylaxis also reported

Dose
- By intravenous infusion, ADULT and CHILD over 5 years, 500 micrograms/kg once weekly

Elaprase® (Shire HGT) ▼ PoM
Concentrate for intravenous infusion, idursulfase 2 mg/mL, net price 3-mL vial = £1985.00

LARONIDASE

Indications (specialist use only) non-neurological manifestations of mucopolysaccharidosis I

Cautions monitor immunoglobulin G (IgG) antibody concentration; **interactions:** Appendix 1 (laronidase)
Infusion-related reactions See notes above

Pregnancy manufacturer advises avoid unless essential—no information available

Breast-feeding manufacturer advises avoid—no information available

Side-effects nausea, vomiting, diarrhoea, abdominal pain; cold extremities, pallor, flushing, tachycardia, blood pressure changes; dyspnoea, cough, angioedema, anaphylaxis; headache, paraesthesia, dizziness, fatigue, restlessness; influenza-like symptoms; musculoskeletal pain, pain in extremities; rash, pruritus, urticaria, alopecia, infusion-site reactions; bronchospasm and respiratory arrest also reported

Dose
- By intravenous infusion, 100 units/kg once weekly; CHILD see *BNF for Children*

Aldurazyme® (Genzyme) PoM
Concentrate for intravenous infusion, laronidase 100 units/mL, net price 5-mL vial = £444.70
Electrolytes Na^+ 1.29 mmol/5-mL vial

Nephropathic cystinosis

Mercaptamine is available for the treatment of nephropathic cystinosis.

MERCAPTAMINE
(Cysteamine)

Indications (specialist use only) nephropathic cystinosis

Cautions leucocyte-cystine concentration and haematological monitoring required—consult product literature; dose of phosphate supplement may need to be adjusted if transferring from phosphocysteamine to mercaptamine

Contra-indications hypersensitivity to penicillamine

Pregnancy avoid—teratogenic and toxic in *animal* studies

Breast-feeding avoid

Side-effects breath and body odour, nausea, vomiting, diarrhoea, anorexia, abdominal pain, gastroenteritis, dyspepsia, encephalopathy, headache, malaise, fever, rash; *less commonly* gastro-intestinal ulcer, seizures, hallucinations, drowsiness, nervousness, leucopenia, nephrotic syndrome

Dose

- Initial doses should be one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks
- Maintenance, ADULT and CHILD over 50 kg bodyweight, 2 g daily in 4 divided doses
  CHILD up to 12 years, 1.3 g/m^2 (approx. 50 mg/kg) daily in 4 divided doses

Cystagon® (Orphan Europe) PoM
Capsules, mercaptamine (as bitartrate) 50 mg, net price 100-cap pack = £70.00; 150 mg, 100-cap pack = £190.00. Label: 21
Note CHILD under 6 years at risk of aspiration, capsules can be opened and contents sprinkled on food (at a temperature suitable for eating); avoid adding to acidic drinks (e.g. orange juice)

Pompe disease

Alglucosidase alfa, an enzyme produced by recombinant DNA technology, is licensed for long-term replacement therapy in Pompe disease, a lysosomal storage disorder caused by deficiency of acid alpha-glucosidase.

ALGLUCOSIDASE ALFA

Indications (specialist use only) Pompe disease

Cautions cardiac and respiratory dysfunction—monitor closely; monitor immunoglobulin G (IgG) antibody concentration
Infusion-related reactions Infusion-related reactions very common, calling for use of antihistamine, antipyretic, or corticosteroid; consult product literature for details

Pregnancy toxicity in *animal* studies, but treatment should not be withheld

Breast-feeding manufacturer advises avoid—no information available

Side-effects nausea, vomiting, diarrhoea; flushing, tachycardia, blood pressure changes, cold extremities, cyanosis, facial oedema, chest discomfort; cough, tachypnoea, bronchospasm; headache, agitation, tremor, irritability, restlessness, paraesthesia, dizziness, fatigue; pyrexia; antibody formation; myalgia, muscle spasm; sweating, rash, pruritus, urticaria, injection-site reactions; hypersensitivity reactions (including anaphylaxis); severe skin reactions (including ulcerative and necrotising skin lesions) also reported

Dose

- By intravenous infusion, ADULT and CHILD 20 mg/kg every 2 weeks

Myozyme® (Genzyme) PoM
Intravenous infusion, powder for reconstitution, alglucosidase alfa, net price 50-mg vial = £356.06

Tyrosinaemia type I

Nitisinone is licensed for the treatment of hereditary tyrosinaemia type I in combination with dietary restriction of tyrosine and phenylalanine.

NITISINONE
(NTBC)

Indications hereditary tyrosinaemia type I (specialist use only)

Cautions slit-lamp examination of eyes recommended before treatment; monitor liver function regularly; monitor platelet and white blood cell count every 6 months

Pregnancy manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies

Breast-feeding manufacturer advises avoid—adverse effects in *animal* studies

Side-effects thrombocytopenia, leucopenia, granulocytopenia; conjunctivitis, photophobia, corneal opacity, keratitis, eye pain; *less commonly* leucocytosis, blepharitis, pruritus, exfoliative dermatitis, and erythematous rash

Dose

- ADULT and CHILD initially 500 micrograms/kg twice daily, adjusted according to response; max. 2 mg/kg daily
  Note Capsules can be opened and the contents suspended in a small amount of water or formula diet and taken immediately

Orfadin® (Swedish Orphan) PoM
Capsules, nitisinone 2 mg, net price 60-cap pack = £564.00; 5 mg, 60-cap pack = £1127.00; 10 mg, 60-cap pack = £2062.00

Urea cycle disorders

Sodium phenylbutyrate is used in the management of urea cycle disorders. It is indicated as adjunctive therapy in all patients with neonatal-onset disease and in those with late-onset disease who have a history of hyperammonaemic encephalopathy.

Carglumic acid is licensed for the treatment of hyperammonaemia due to *N*-acetylglutamate synthase deficiency and organic acidaemia.

Emergency management

For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at www.bimdg.org.uk.

CARGLUMIC ACID

Indications hyperammonaemia due to *N*-acetylglutamate synthase deficiency and organic acidaemia under specialist supervision; see also notes above

Pregnancy manufacturer advises avoid unless essential—no information available

Breast-feeding manufacturer advises avoid—present in milk in *animal* studies

Side-effects sweating; *less commonly* diarrhoea, vomiting, bradycardia, pyrexia

Dose

- Hyperammonaemia due to *N*-acetylglutamate synthase deficiency, ADULT and CHILD initially 100–250 mg/kg daily in 2–4 divided doses immediately before food, adjusted according to plasma–ammonia concentration; maintenance 10–100 mg/kg daily in 2–4 divided doses
- Hyperammonaemia due to organic acidaemia, ADULT and CHILD initially 100–250 mg/kg daily in 2–4 divided doses immediately before food, adjusted according to plasma-ammonia concentration

Carbaglu® (Orphan Europe) PoM

Dispersible tablets, carglumic acid 200 mg, net price 5-tab pack = £299.00, 60-tab pack = £3499.00. Label: 13

Note Must be dispersed in at least 5–10 mL of water and taken orally immediately, *or* administered via a nasogastric tube

SODIUM PHENYLBUTYRATE

Indications adjunct in long-term treatment of urea cycle disorders (under specialist supervision); see also notes above

Cautions congestive heart failure; **interactions:** Appendix 1 (sodium phenylbutyrate)

Hepatic impairment manufacturer advises caution

Renal impairment manufacturer advises caution

Pregnancy avoid—toxicity in *animal* studies; manufacturer advises adequate contraception during administration

Breast-feeding manufacturer advises avoid—no information available

Side-effects gastro-intestinal disturbances, weight gain, taste disturbance, decreased appetite; syncope, oedema; headache, depression, irritability; renal tubular acidosis, menstrual disorders; blood disorders, metabolic acidosis, alkalosis; rash, body odour; *less commonly* rectal bleeding, peptic ulcer, pancreatitis, and arrhythmias

Dose

- ADULT 9.9–13 g/m^2 daily in divided doses with meals (max. 20 g daily); CHILD see *BNF* for *Children*

Ammonaps® (Swedish Orphan) PoM

Tablets, sodium phenylbutyrate 500 mg. Contains Na^+ 2.7 mmol/tablet. Net price 250-tab pack = £493.00

Granules, sodium phenylbutyrate 940 mg/g. Contains Na^+ 5.4 mmol/g of sodium phenylbutyrate. Net price 266-g pack = £860.00

Note Granules should be mixed with food before taking

Pheburane® (Lucane) PoM

Granules, sodium phenylbutyrate 483 mg/g. Contains Na^+ 5.4 mmol/g of sodium phenylbutyrate, net price 174-g pack = £331.00

Note Granules should be mixed with food before taking orally and must not be administered by nasogastric or gastrostomy tubes

Homocystinuria

Betaine is licensed for the adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism. Betaine should be used in conjunction with dietary restrictions and may be given with supplements of Vitamin B_{12}, pyridoxine, and folate under specialist advice.

The *Scottish Medicines Consortium* (p. 4) has advised (July 2010) that betaine anhydrous (*Cystadane®*) is accepted for restricted use within NHS Scotland for the adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism in patients who are not responsive to pyridoxine treatment.

BETAINE

Indications (specialist use only) adjunctive treatment of homocystinuria

Cautions monitor plasma-methionine concentration before and during treatment—interrupt treatment if symptoms of cerebral oedema occur

Pregnancy manufacturer advises avoid unless essential—limited information available

Breast-feeding manufacturer advises caution—no information available

Side-effects *less commonly* gastro-intestinal disorders, anorexia, reversible cerebral oedema (see Cautions), agitation, depression, personality disorder, sleep disturbances, urinary incontinence, alopecia, and urticaria

Dose

- ADULT and CHILD over 10 years, 3 g twice daily, adjusted according to response; max. 20 g/day; CHILD under 10 years 50 mg/kg twice daily, dose and frequency adjusted according to response; max. 75 mg/kg twice daily

Cystadane® (Orphan Europe) PoM

Powder, betaine (anhydrous), net price 180 g = £347.00

Note Powder should be mixed with water, juice, milk, formula, or food until completely dissolved and taken immediately; measuring spoons are provided to measure 1 g, 150 mg, and 100 mg of powder

Other metabolic disorders

Miglustat is available for the treatment of progressive neurological manifestations of Niemann-Pick type C disease, a neurodegenerative disorder characterised by impaired intracellular lipid trafficking; it is also licensed for the treatment of mild to moderate type 1 Gaucher's disease for whom imiglucerase is unsuitable, see also p. 695.

MIGLUSTAT

Indications mild to moderate type I Gaucher's disease (specialist supervision only); Niemann-Pick type C disease (specialist supervision only)

Cautions monitor cognitive and neurological function; monitor growth and platelet count in Niemann-Pick type C disease

Hepatic impairment no information available—manufacturer advises caution

Renal impairment for Gaucher's disease initially 100 mg twice daily if eGFR 50–70 mL/minute/1.73 m^2; initially 100 mg once daily if eGFR 30–50 mL/minute/1.73 m^2; for Niemann-Pick type C disease, initially 200 mg twice daily if eGFR 50–70 mL/minute/1.73 m^2; initially 100 mg twice daily if eGFR 30–50 mL/minute/1.73 m^2; child under 12 years—consult product literature; avoid if eGFR less than 30 mL/minute/1.73 m^2

Pregnancy manufacturer advises avoid (toxicity in *animal* studies)—effective contraception must be used during treatment; also men should avoid fathering a child during and for 3 months after treatment

Breast-feeding manufacturer advises avoid—no information available

Side-effects diarrhoea, flatulence, abdominal pain, dyspepsia, constipation, nausea, vomiting, anorexia, weight changes, tremor, dizziness, headache, peripheral neuropathy, ataxia, amnesia, hypoaesthesia, paraesthesia, insomnia, depression, chills, malaise, decreased libido, thrombocytopenia, muscle spasm and weakness

Dose

- Gaucher's disease, ADULT over 18 years, 100 mg 3 times daily; reduced if not tolerated to 100 mg 1–2 times daily
- Niemann-Pick type C disease, ADULT and CHILD over 12 years, 200 mg 3 times daily; CHILD 4–12 years, body surface area less than 0.47 m^2, 100 mg once daily; body surface area 0.47–0.73 m^2, 100 mg twice daily; body surface area 0.73–0.88 m^2, 100 mg three times daily; body surface area 0.88–1.25 m^2, 200 mg twice daily; body surface area greater than 1.25 m^2, adult dose

Zavesca® (Actelion) PoM
Capsules, miglustat 100 mg, net price 84-cap pack = £3934.17 (hospital only)

9.8.2 Acute porphyrias

The acute porphyrias (acute intermittent porphyria, variegate porphyria, hereditary coproporphyria, and 5-aminolaevulinic acid dehydratase deficiency porphyria) are hereditary disorders of haem biosynthesis; they have a prevalence of about 1 in 10 000 of the population.

Great care must be taken when prescribing for patients with acute porphyria, since certain drugs can induce acute porphyric crises. Since acute porphyrias are hereditary, relatives of affected individuals should be screened and advised about the potential danger of certain drugs.

Treatment of serious or life-threatening conditions should not be withheld from patients with acute porphyria. When there is no safe alternative, treatment should be started and urinary porphobilinogen excretion should be measured regularly; if it increases or symptoms occur, the drug can be withdrawn and the acute attack treated. If an acute attack of porphyria occurs during pregnancy, contact an expert porphyria service for further advice.

Haem arginate is administered by short intravenous infusion as haem replacement in moderate, severe, or unremitting acute porphyria crises.

The National Acute Porphyria Service (NAPS) provides clinical support and treatment with haem arginate from three centres (University Hospital of Wales, Addenbrooke's Hospital, and King's College Hospital). To access the service telephone (029) 2074 7747 and ask for the Acute Porphyria Service.

HAEM ARGINATE

(Human hemin)

Indications acute porphyrias (acute intermittent porphyria, porphyria variegata, hereditary coproporphyria)

Pregnancy manufacturer advises avoid unless essential

Breast-feeding manufacturer advises avoid unless essential—no information available

Side-effects pain and thrombophlebitis at injection site; *rarely* hypersensitivity reactions and fever; *also reported* headache

Dose

- By intravenous infusion, ADULT and CHILD 3 mg/kg once daily (max. 250 mg daily) for 4 days; if response inadequate, repeat 4-day course with close biochemical monitoring

Normosang® (Orphan Europe) ▼ PoM
Concentrate for intravenous infusion, haem arginate 25 mg/mL, net price 10-mL amp = £434.25

Drugs unsafe for use in acute porphyrias

The following list contains drugs on the UK market that have been classified as 'unsafe' in porphyria because they have been shown to be porphyrinogenic in animals or *in vitro*, or have been associated with acute attacks in patients. Absence of a drug from the following lists does not necessarily imply that the drug is safe. For many drugs no information about porphyria is available.

An up-to-date list of drugs considered **safe** in acute porphyrias is available at www.wmic.wales.nhs.uk/porphyria_info.php

Further information may be obtained from:
www.porphyria-europe.org

and also from:

Welsh Medicines Information Centre
University Hospital of Wales
Cardiff, CF14 4XW
Tel: (029) 2074 2979/3877

Note Quite modest changes in chemical structure can lead to changes in porphyrinogenicity but where possible general statements have been made about groups of drugs; these should be checked first.

Unsafe Drug Groups (check first)

- Alkylating drugs[1]
- Amfetamines
- Anabolic steroids
- Antidepressants[2]
- Antihistamines[3]
- Barbiturates[4]
- Calcium channel blockers[5]
- Contraceptives, hormonal[6]
- Ergot derivatives[7]
- Hormone replacement therapy[6]
- Imidazole antifungals[8]
- Non-nucleoside reverse transcriptase inhibitors[1]
- Progestogens[6]
- Protease inhibitors[1]
- Sulfonamides[9]
- Sulfonylureas[10]
- Taxanes[1]
- Thiazolidinediones[1]
- Triazole antifungals[8]

Unsafe Drugs (check groups above first)

- Aceclofenac
- Alcohol
- Amiodarone
- Aprepitant[1]
- Artemether with lumefantrine
- Bexarotene
- Bosentan
- Bromocriptine
- Buspirone
- Cabergoline
- Carbamazepine
- Chloral hydrate[11]
- Chloramphenicol
- Chloroform[12]
- Clindamycin
- Cocaine
- Colistimethate sodium
- Danazol
- Dapsone
- Dexfenfluramine
- Disopyramide
- Disulfiram
- Erythromycin
- Etamsylate
- Ethosuximide
- Etomidate
- Fenfluramine
- Flupentixol
- Flutamide
- Fosaprepitant[1]
- Fosphenytoin
- Griseofulvin
- Hydralazine
- Indapamide
- Isometheptene mucate
- Isoniazid[13]
- Ketamine
- Mefenamic acid[14]
- Meprobamate
- Methyldopa
- Metolazone
- Metyrapone
- Mifepristone
- Minoxidil[14]
- Mitotane
- Nalidixic acid
- Nitrazepam
- Nitrofurantoin
- Orphenadrine
- Oxcarbazepine
- Oxybutynin
- Pentazocine[15]
- Pentoxifylline
- Phenoxybenzamine
- Phenytoin
- Pivmecillinam
- Porfimer
- Raloxifene
- Rifabutin[13]
- Rifampicin
- Riluzole
- Risperidone
- Selegiline
- Spironolactone
- Sulfinpyrazone
- Tamoxifen
- Telithromycin
- Temoporfin
- Tiagabine
- Tinidazole
- Topiramate
- Toremifene
- Trimethoprim
- Valproate
- Xipamide
- Zidovudine[1]
- Zuclopenthixol

1. Contact Welsh Medicines Information Centre for further advice.
2. Includes tricyclic (and related) antidepressants and MAOIs; fluoxetine, duloxetine, venlafaxine, and trazodone thought to be safe.
3. Alimemazine, chlorphenamine, desloratadine, fexofenadine, ketotifen, loratadine, and promethazine thought to be safe.
4. Includes primidone and thiopental.
5. Amlodipine, felodipine, and nifedipine thought to be safe.
6. Progestogens are more porphyrinogenic than oestrogens; oestrogens may be safe at least in replacement doses. Progestogens should be avoided whenever possible by all women susceptible to acute porphyria; however, when non-hormonal contraception is inappropriate, progestogens may be used with extreme caution if the potential benefit outweighs risk. The risk of an acute attack is greatest in women who have had a previous attack or are aged under 30 years. Long-acting progestogen preparations should **never** be used in those at risk of acute porphyria.
7. Includes ergometrine (oxytocin probably safe) and pergolide.
8. Applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure.
9. Includes co-trimoxazole and sulfasalazine.
10. Glipizide and glimepiride are thought to be safe.
11. Although evidence of hazard is uncertain, manufacturer advises avoid.
12. Small amounts in medicines probably safe.
13. Safety uncertain, contact Welsh Medicines Information Centre for further advice.
14. May be used with caution if safer alternative not available.
15. Buprenorphine, codeine, diamorphine, dihydrocodeine, fentanyl, methadone, morphine, oxycodone, pethidine, and tramadol are thought to be safe.

10 Musculoskeletal and joint diseases

This chapter also includes advice on the drug management of the following:

- dental and orofacial pain, p. 703
- extravasation, p. 736
- gout, p. 728
- myasthenia gravis, p. 731
- osteoarthritis and soft-tissue disorders, below
- rheumatoid arthritis and other inflammatory disorders, below

For treatment of septic arthritis see Table 1, section 5.1.

10.1 Drugs used in rheumatic diseases and gout

Rheumatoid arthritis and other inflammatory disorders

A **non-steroidal anti-inflammatory drug** (NSAID) is indicated for pain and stiffness resulting from inflammatory rheumatic disease; analgesics such as **paracetamol** or **codeine** can also be used. For advice on the prophylaxis and treatment of NSAID-associated gastrointestinal ulcers, see p. 51.

Drugs are also used to influence the rheumatic disease process itself (section 10.1.3). For *rheumatoid arthritis* these **disease-modifying antirheumatic drugs** (DMARDs) include methotrexate, cytokine modulators, azathioprine, ciclosporin, cyclophosphamide, leflunomide, penicillamine, gold, antimalarials (chloroquine and hydroxychloroquine), and sulfasalazine. **Corticosteroids** also have a significant role in the management of rheumatoid arthritis (section 10.1.2.1).

Drugs which may affect the disease process in *psoriatic arthritis* include sulfasalazine, gold, azathioprine, methotrexate, leflunomide, and cytokine modulators (section 10.1.3).

For long-term control of *gout*, xanthine-oxidase inhibitors or uricosuric drugs (section 10.1.4) can be used.

Osteoarthritis and soft-tissue disorders

For pain relief in osteoarthritis and soft-tissue disorders, **paracetamol** (section 4.7.1) should be used first and may need to be taken regularly. A **topical NSAID** (section 10.3.2) or topical **capsaicin** 0.025% (section 10.3.2) should also be considered, particularly in knee or hand osteoarthritis. An **oral NSAID** (section 10.1.1) can be substituted for, or used in addition to, paracetamol. If further pain relief is required in osteoarthritis, then the addition of an **opioid** analgesic (section 4.7.2) may be considered, but with a substantial risk of adverse effects; however, an opioid analgesic should be considered

before a NSAID in patients taking low-dose aspirin. For advice on the prophylaxis and treatment of NSAID-associated gastro-intestinal ulcers, see p. 51.

Intra-articular **corticosteroid** injections (section 10.1.2.2) may produce temporary benefit in osteoarthritis, especially if associated with soft-tissue inflammation.

Non-drug measures, such as weight reduction and exercise, should also be encouraged.

Glucosamine (section 10.1.5) and **rubefacients** (section 10.3.2) are not recommended for the treatment of osteoarthritis.

Hyaluronic acid and its derivatives are available for osteoarthritis of the knee, but are not recommended. Sodium hyaluronate (*Durolane*®, *Euflexxa*®, *Fermathron*®, *Hyalgan*® NHS, *Orthovisc*®, *Ostenil*®, *Ostenil Plus*®, *RenehaVis*®, *Suplasyn*®, *Synocrom*®, *Synopsis*®) or hylan G-F 20 (*Synvisc*®) is injected intra-articularly to supplement natural hyaluronic acid in the synovial fluid. These injections may reduce pain over 1–6 months, but are associated with a short-term increase in knee inflammation. Sodium hyaluronate (*SportVis*®) is also licensed for the relief of pain and optimisation of recovery following ankle sprain, and for the relief of chronic pain and disability associated with tennis elbow.

10.1.1 Non-steroidal anti-inflammatory drugs

In *single doses* non-steroidal anti-inflammatory drugs (NSAIDs) have analgesic activity comparable to that of paracetamol (section 4.7.1), but paracetamol is preferred, particularly in the elderly (see also Prescribing for the Elderly, p. 25).

In regular *full dosage* NSAIDs have both a lasting analgesic and an anti-inflammatory effect which makes them particularly useful for the treatment of continuous or regular pain associated with inflammation. Therefore, although paracetamol often gives adequate pain control in osteoarthritis, NSAIDs are more appropriate than paracetamol or the opioid analgesics in the *inflammatory arthritides* (e.g. rheumatoid arthritis) and in some cases of *advanced osteoarthritis*. NSAIDs can also be of benefit in the less well defined conditions of *back pain* and *soft-tissue disorders*.

Choice Differences in anti-inflammatory activity between NSAIDs are small, but there is considerable variation in individual response and tolerance to these drugs. About 60% of patients will respond to any NSAID; of the others, those who do not respond to one may well respond to another. Pain relief starts soon after taking the first dose and a full analgesic effect should normally be obtained within a week, whereas an anti-inflammatory effect may not be achieved (or may not be clinically assessable) for up to 3 weeks. If appropriate responses are not obtained within these times, another NSAID should be tried.

NSAIDs reduce the production of prostaglandins by inhibiting the enzyme cyclo-oxygenase. They vary in their selectivity for inhibiting different types of cyclo-oxygenase; selective inhibition of cyclo-oxygenase-2 is associated with less gastro-intestinal intolerance. Several other factors also influence susceptibility to gastro-intestinal effects, and a NSAID should be chosen on the basis of the incidence of gastro-intestinal and other side-effects.

Ibuprofen is a propionic acid derivative with anti-inflammatory, analgesic, and antipyretic properties. It has fewer side-effects than other non-selective NSAIDs but its anti-inflammatory properties are weaker. Doses of 1.6 to 2.4 g daily are needed for rheumatoid arthritis and it is unsuitable for conditions where inflammation is prominent, such as acute gout. **Dexibuprofen** is the active enantiomer of ibuprofen. It has similar properties to ibuprofen and is licensed for the relief of mild to moderate pain and inflammation.

Other propionic acid derivatives:

Naproxen is one of the first choices because it combines good efficacy with a low incidence of side-effects (but more than ibuprofen, see NSAIDs and Gastro-intestinal Events, below).

Fenoprofen is as effective as naproxen, and **flurbiprofen** may be slightly more effective. Both are associated with slightly more gastro-intestinal side-effects than ibuprofen.

Ketoprofen has anti-inflammatory properties similar to ibuprofen and has more side-effects (see also NSAIDs and Gastro-intestinal Events, below). **Dexketoprofen**, an isomer of ketoprofen, has been introduced for the short-term relief of mild to moderate pain.

Tiaprofenic acid is as effective as naproxen; it has more side-effects than ibuprofen (**important:** reports of severe cystitis, see CSM advice on p. 712).

Drugs with properties similar to those of propionic acid derivatives:

Diclofenac and **aceclofenac** are similar in efficacy to naproxen.

Etodolac is comparable in efficacy to naproxen; it is licensed for symptomatic relief of osteoarthritis and rheumatoid arthritis.

Indometacin has an action equal to or superior to that of naproxen, but with a high incidence of side-effects including headache, dizziness, and gastro-intestinal disturbances (see also NSAIDs and Gastro-intestinal Events, below).

Mefenamic acid has minor anti-inflammatory properties. It has occasionally been associated with diarrhoea and haemolytic anaemia which require discontinuation of treatment.

Meloxicam is licensed for the short-term relief of pain in osteoarthritis and for long-term treatment of rheumatoid arthritis and ankylosing spondylitis.

Nabumetone is comparable in effect to naproxen.

Phenylbutazone is licensed for ankylosing spondylitis, but is not recommended because it is associated with serious side-effects, in particular haematological reactions; it should be used only by a specialist in severe cases where other treatments have been found unsuitable.

Piroxicam is as effective as naproxen and has a long duration of action which permits once-daily administration. However, it has more gastro-intestinal side-effects than most other NSAIDs, and is associated with more frequent serious skin reactions (**important:** see CHMP advice, p. 711).

Sulindac is similar in tolerance to naproxen.

Tenoxicam is similar in activity and tolerance to naproxen. Its long duration of action allows once-daily administration.

Tolfenamic acid is licensed for the treatment of migraine (section 4.7.4.1).

Ketorolac and the selective inhibitor of cyclo-oxygenase-2, **parecoxib**, are licensed for the short-term management of postoperative pain (section 15.1.4.2).

The selective inhibitors of cyclo-oxygenase-2, **etoricoxib** and **celecoxib**, are as effective as non-selective NSAIDs such as diclofenac and naproxen. Although selective inhibitors can cause serious gastro-intestinal events, available evidence appears to indicate that the risk of serious upper gastro-intestinal events is lower with selective inhibitors compared to non-selective NSAIDs; this advantage may be lost in patients who require concomitant low-dose aspirin.

Celecoxib and **etoricoxib** are licensed for the relief of pain in osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis; etoricoxib is also licensed for the relief of pain from acute gout.

Dental and orofacial pain Most mild to moderate dental pain and inflammation is effectively relieved by NSAIDs. Those used for dental pain include **ibuprofen** and **diclofenac**.

For information on the risks of serious gastro-intestinal side-effects of NSAIDs, see p. 704.

For further information on the management of dental and orofacial pain, see p. 274.

Cautions and contra-indications NSAIDs should be used with caution in the elderly (risk of serious side-effects and fatalities, see also Prescribing for the Elderly p. 25), in allergic disorders (they are **contra-indicated** in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID), and in coagulation defects. Long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment. Caution is also required in patients with connective-tissue disorders, see Side-effects below.

In patients with cardiac impairment, caution is required since NSAIDs may impair renal function (see also Side-effects, below). All NSAIDs are contra-indicated in severe heart failure. **Diclofenac** and the selective inhibitors of cyclo-oxygenase-2 (**celecoxib**, **etoricoxib**, and **parecoxib**) are contra-indicated in ischaemic heart disease, cerebrovascular disease, peripheral arterial disease, and mild to severe heart failure. They should be used with caution in patients with a history of cardiac failure, left ventricular dysfunction, hypertension, in patients with oedema for any other reason, and in patients with other risk factors for cardiovascular events. Other non-selective NSAIDs should be used with caution in uncontrolled hypertension, heart failure, ischaemic heart disease, peripheral arterial disease, cerebrovascular disease, and when used long term in patients with risk factors for cardiovascular events.

NSAIDs and cardiovascular events

All NSAID use (including cyclo-oxygenase-2 selective inhibitors) can, to varying degrees, be associated with a small increased risk of thrombotic events (e.g. myocardial infarction and stroke) independent of baseline cardiovascular risk factors or duration of NSAID use; however, the greatest risk may be in those receiving high doses long term.

Cyclo-oxygenase-2 selective inhibitors, **diclofenac** (150 mg daily) and **ibuprofen** (2.4 g daily) are associated with an increased risk of thrombotic events. The increased risk for diclofenac is similar to that of licensed doses of **etoricoxib**. **Naproxen** (1 g daily) is associated with a lower thrombotic risk, and low doses of ibuprofen (1.2 g daily or less) have not been associated with an increased risk of myocardial infarction.

The lowest effective dose of NSAID should be prescribed for the shortest period of time to control symptoms and the need for long-term treatment should be reviewed periodically.

All NSAIDs (including cyclo-oxygenase-2 selective inhibitors) are contra-indicated in patients with active gastro-intestinal ulceration or bleeding. Piroxicam, ketoprofen, and ketorolac are contra-indicated in patients with any history of gastro-intestinal bleeding, ulceration, or perforation. Other non-selective NSAIDs are contra-indicated in patients with a history of recurrent gastro-intestinal ulceration or haemorrhage (two or more distinct episodes), and in patients with a history of gastro-intestinal bleeding or perforation related to previous NSAID therapy (see also, p. 704). While it is preferable to avoid NSAIDs in patients with active or previous gastro-intestinal ulceration or bleeding, and to withdraw them if gastro-intestinal lesions develop, nevertheless patients with serious rheumatic diseases (e.g. rheumatoid arthritis) are usually dependent on NSAIDs for effective relief of pain and stiffness. Patients at risk of gastro-intestinal ulceration (including the elderly), who need NSAID treatment should receive gastroprotective treatment; for advice on the prophylaxis and treatment of NSAID-associated gastro-intestinal ulcers, see section 1.3. NSAIDs should also be used with caution in Crohn's disease or ulcerative colitis, as these conditions may be exacerbated.

For **interactions** of NSAIDs, see Appendix 1 (NSAIDs).

Hepatic impairment NSAIDs should be used with caution in patients with hepatic impairment; there is an increased risk of gastro-intestinal bleeding and fluid retention. NSAIDs should be avoided in severe liver disease; see also individual drugs.

Renal impairment NSAIDs should be avoided if possible or used with caution in patients with renal impairment; the **lowest effective dose** should be used for the **shortest possible duration**, and renal function should be **monitored**. Sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure; deterioration in renal function has also been reported after topical use; see also individual drugs.

Pregnancy Most manufacturers advise avoiding the use of NSAIDs during pregnancy or avoiding them unless the potential benefit outweighs the risk. NSAIDs should be avoided during the third trimester because use is associated with a risk of closure of fetal ductus

arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn. In addition, the onset of labour may be delayed and its duration may be increased. See also individual monographs for celecoxib and etoricoxib.

Breast-feeding NSAIDs should be used with caution during breast-feeding; see also individual drugs.

Side-effects Gastro-intestinal disturbances including discomfort, nausea, diarrhoea, and occasionally bleeding and ulceration occur (see also NSAIDs and Gastro-intestinal Events, below and Cautions above). Systemic as well as local effects of NSAIDs contribute to gastro-intestinal damage; taking oral formulations with milk or food, or using enteric-coated formulations, or changing the route of administration may only partially reduce symptoms such as dyspepsia.

NSAIDs and gastro-intestinal events

All NSAIDs are associated with serious gastro-intestinal toxicity; the risk is higher in the elderly. Evidence on the relative safety of non-selective NSAIDs indicates differences in the risks of serious upper gastro-intestinal side-effects—piroxicam (see also CHMP advice, p. 711), ketoprofen, and ketorolac are associated with the highest risk; indometacin, diclofenac, and naproxen are associated with intermediate risk, and ibuprofen with the lowest risk (although high doses of ibuprofen have been associated with intermediate risk). **Selective inhibitors of cyclo-oxygenase-2** are associated with a *lower risk* of serious upper gastro-intestinal side-effects than non-selective NSAIDs.

Recommendations are that NSAIDs associated with a low risk e.g. ibuprofen are *generally preferred*, to start at the *lowest recommended dose* and not to use more than one oral NSAID at a time. See also Cautions and Contra-indications, p. 703.

The combination of a NSAID and low-dose aspirin can increase the risk of gastro-intestinal side-effects; this combination should be used only if absolutely necessary and the patient should be monitored closely.

Other side-effects include hypersensitivity reactions (particularly rashes, angioedema, and bronchospasm—see below), headache, dizziness, nervousness, depression, drowsiness, insomnia, vertigo, hearing disturbances such as tinnitus, photosensitivity, and haematuria. Blood disorders have also occurred. Fluid retention may occur (rarely precipitating congestive heart failure); blood pressure may be raised.

Asthma

Any degree of worsening of asthma may be related to the ingestion of NSAIDs, either prescribed or (in the case of ibuprofen and others) purchased over the counter.

Renal failure may be provoked by NSAIDs, especially in patients with pre-existing renal impairment (**important**, see Renal impairment, above). Rarely, papillary necrosis or interstitial fibrosis associated with NSAIDs can lead to renal failure.

Hepatic damage, alveolitis, pulmonary eosinophilia, pancreatitis, visual disturbances, Stevens-Johnson syndrome, and toxic epidermal necrolysis are other rare side-effects. Induction of or exacerbation of colitis or Crohn's disease has been reported. Aseptic meningitis has been reported rarely with NSAIDs—patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible.

Overdosage: see Emergency Treatment of Poisoning, p. 35.

ACECLOFENAC

Indications pain and inflammation in rheumatoid arthritis, osteoarthritis and ankylosing spondylitis

Cautions see notes above; avoid in acute porphyria (section 9.8.2)

Contra-indications see notes above

Hepatic impairment initially 100 mg daily; see also notes above

Renal impairment avoid in moderate to severe impairment; see also notes above

Pregnancy see notes above

Breast-feeding manufacturer advises avoid; see also notes above

Side-effects see notes above

Dose

- 100 mg twice daily; CHILD not recommended

Aceclofenac (Non-proprietary) PoM

Tablets, aceclofenac 100 mg, net price 60-tab pack = £9.63. Label: 21

Preservex® (Almirall) PoM

Tablets, f/c, aceclofenac 100 mg, net price 60-tab pack = £9.63. Label: 21

ACEMETACIN

(Glycolic acid ester of indometacin)

Indications pain and inflammation in rheumatic disease and other musculoskeletal disorders; postoperative analgesia

Cautions see under Indometacin and notes above

Driving Dizziness may affect performance of skilled tasks (e.g. driving)

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment see notes above

Pregnancy see notes above

Breast-feeding manufacturer advises avoid; see also notes above

Side-effects see under Indometacin and notes above

Dose

- 120 mg daily in divided doses with food, increased if necessary to 180 mg daily; CHILD not recommended

Emflex® (Merck Serono) PoM

Capsules, yellow/orange, acemetacin 60 mg, net price 90-cap pack = £28.20. Label: 21, counselling, driving

CELECOXIB

Indications pain and inflammation in osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis

Cautions see notes above; monitor blood pressure before and during treatment

Contra-indications see notes above; sulfonamide sensitivity; inflammatory bowel disease

Hepatic impairment halve initial dose in moderate impairment; see also notes above

Renal impairment avoid if eGFR less than 30 mL/minute/1.73 m^2; see also notes above

Pregnancy avoid (teratogenic in *animal* studies); see also notes above

Breast-feeding avoid—present in milk in *animal* studies; see also notes above

Side-effects see notes above; dyspnoea, influenza-like symptoms; *less commonly* stomatitis, palpitation, cerebral infarction, fatigue, paraesthesia, muscle cramps; *rarely* taste disturbance, alopecia; *very rarely* seizures; *also reported* chest pain

Dose

- Osteoarthritis, 200 mg daily in 1–2 divided doses, increased if necessary to max. 200 mg twice daily; CHILD not recommended
- Rheumatoid arthritis, 100 mg twice daily, increased if necessary to 200 mg twice daily; CHILD not recommended
- Ankylosing spondylitis, 200 mg daily in 1–2 divided doses, increased if necessary to max. 400 mg daily in 1–2 divided doses; CHILD not recommended

Note Discontinue if no improvement after 2 weeks on max. dose

Celebrex® (Pharmacia) PoM

Capsules, celecoxib 100 mg (white/blue), net price 60-cap pack = £21.55; 200 mg (white/gold), 30-cap pack = £21.55

DEXIBUPROFEN

Indications pain and inflammation associated with osteoarthritis and other musculoskeletal disorders; mild to moderate pain and inflammation including dysmenorrhoea and dental pain

Cautions see notes above

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment reduce initial dose; avoid if eGFR less than 30 mL/minute/1.73m^2; see also notes above

Pregnancy see notes above

Breast-feeding present in milk—but risk to infant minimal; see also notes above

Side-effects see notes above

Dose

- 600–900 mg daily in up to 3 divided doses; increased if necessary to max. 1.2 g daily (900 mg daily for dysmenorrhoea); max. single dose 400 mg (300 mg for dysmenorrhoea); CHILD not recommended

Seractil® (Genus) PoM

Tablets, f/c, dexibuprofen 300 mg, net price 60–tab pack = £9.47; 400 mg (scored) 60–tab pack = £9.97. Label: 21

DEXKETOPROFEN

Indications short-term treatment of mild to moderate pain including dysmenorrhoea

Cautions see notes above

Contra-indications see notes above

Hepatic impairment reduce initial dose to max. 50 mg daily in mild to moderate impairment; see also notes above

Renal impairment reduce initial dose to 50 mg daily; avoid in moderate to severe impairment; see also notes above

Pregnancy see notes above

Breast-feeding manufacturer advises avoid—no information available; see also notes above

Side-effects see notes above

Dose

- 12.5 mg every 4–6 hours *or* 25 mg every 8 hours; max. 75 mg daily; ELDERLY initially max. 50 mg daily; CHILD not recommended

Keral® (Menarini) PoM

Tablets, f/c, scored, dexketoprofen (as trometamol) 25 mg, net price 20-tab pack = £3.67, 50-tab pack = £9.18. Label: 22

DICLOFENAC POTASSIUM

Indications pain and inflammation in rheumatic disease and other musculoskeletal disorders; acute gout; postoperative pain; migraine; fever in ear, nose, or throat infection in children

Cautions see notes above

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment avoid in severe impairment; see also notes above

Pregnancy see notes above

Breast-feeding amount in milk too small to be harmful; see also notes above

Side-effects see notes above

Dose

- Rheumatic disease, musculoskeletal disorders, acute gout, 75–150 mg daily in 2–3 divided doses; CHILD over 14 years, 75–100 mg daily in 2–3 divided doses
- Postoperative pain, 75–150 mg daily in 2–3 divided doses; CHILD 9–14 years (body-weight 35 kg and over), up to 2 mg/kg (max. 100 mg) daily in 3 divided doses; CHILD over 14 years, 75–100 mg daily in 2–3 divided doses
- Migraine, 50 mg at onset, repeated after 2 hours if necessary then after 4–6 hours; max. 200 mg in 24 hours; CHILD not recommended
- Fever in ear, nose, or throat infection, CHILD over 9 years (body-weight 35 kg and over), up to 2 mg/kg (max. 100 mg) daily in 3 divided doses

Diclofenac Potassium (Non-proprietary) PoM

Tablets, diclofenac potassium 25 mg, net price 28-tab pack = £3.23; 50 mg, 28-tab pack = £6.18. Label: 21

[1]**Voltarol® Rapid** (Novartis) PoM

Tablets, s/c, diclofenac potassium 25 mg (red), net price 30-tab pack = £3.46; 50 mg (brown), 30-tab pack = £6.62. Label: 21

DICLOFENAC SODIUM

Indications pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders; acute gout; postoperative pain

Cautions see notes above

1. 12.5 mg tablets can be sold to the public for the treatment of headache, dental pain, period pain, rheumatic and muscular pain, backache and the symptoms of cold and flu (including fever), in patients aged over 14 years subject to max. single dose of 25 mg, max. daily dose of 75 mg for max. 3 days, and max. pack size of 18 × 12.5 mg

Contra-indications see notes above; avoid suppositories in proctitis; avoid injections containing benzyl alcohol in neonates (see preparations below)

Intravenous use Additional contra-indications include concomitant NSAID or anticoagulant use (including low-dose heparins), history of haemorrhagic diathesis, history of confirmed or suspected cerebrovascular bleeding, operations with high risk of haemorrhage, history of asthma, moderate or severe renal impairment (see also Renal impairment below), hypovolaemia, dehydration;

Hepatic impairment see notes above

Renal impairment avoid in severe impairment; avoid intravenous use if serum creatinine greater than 160 micromol/litre; see also notes above

Pregnancy see notes above

Breast-feeding amount in milk too small to be harmful; see also notes above

Side-effects see notes above; suppositories may cause rectal irritation; injection site reactions

Dose

- By mouth, 75–150 mg daily in 2–3 divided doses
- By rectum in suppositories, 75–150 mg daily in divided doses
- Juvenile idiopathic arthritis, CHILD 6 months–18 years, by mouth, see *BNF for Children*
- Postoperative pain, CHILD 6 months–18 years, by rectum, see *BNF for Children*

Diclofenac Sodium (Non-proprietary) PoM

Tablets, e/c, diclofenac sodium 25 mg, net price 84-tab pack = £1.25; 50 mg, 84-tab pack = £1.10. Label: 5, 25

Brands include *Defenac®, Dicloflex®, Diclozip®, Fenactol®, Flamrase®*

Dental prescribing on NHS Diclofenac Sodium Tablets may be prescribed

Suppositories, diclofenac sodium 100 mg, net price 10 = £3.03

Brands include *Econac®*

Dyloject® (Therabel) PoM

Injection, diclofenac sodium 37.5 mg/mL, net price 2-mL vial = £4.80

Note May be difficult to obtain

Dose by deep intramuscular injection into the gluteal muscle, acute exacerbations of pain and postoperative pain, 75 mg once daily (twice daily in severe cases) for max. 2 days

Ureteric colic, 75 mg then a further 75 mg after 30 minutes if necessary

By intravenous injection (in supervised settings), acute postoperative pain, 75 mg repeated after 4–6 hours if necessary; max. 150 mg in 24 hours for 2 days

Prevention of postoperative pain, 25–50 mg after surgery; further doses given after 4–6 hours if necessary; max. 150 mg in 24 hours for 2 days

Note The *Scottish Medicines Consortium* (p. 4) has advised (February 2008) that *Dyloject®* is accepted for restricted use within NHS Scotland for the treatment or prevention of postoperative pain by intravenous injection in supervised healthcare settings

Voltarol® (Novartis) PoM

Tablets, e/c, diclofenac sodium 25 mg (yellow), net price 84-tab pack = £2.94; 50 mg (brown), 84-tab pack = £4.57. Label: 5, 25

Dispersible tablets, sugar-free, pink, diclofenac, equivalent to diclofenac sodium 50 mg, net price 21-tab pack = £6.19. Label: 13, 21

Note Voltarol Dispersible tablets are more suitable for **short-term** use in acute conditions for which treatment required for no more than 3 months (no information on use beyond 3 months)

Injection, diclofenac sodium 25 mg/mL, net price 3-mL amp = 83p

Excipients include benzyl alcohol (avoid in neonates unless there is no safer alternative, see Excipients, p. 2), propylene glycol

Dose by deep intramuscular injection into the gluteal muscle, acute exacerbations of pain and postoperative pain, 75 mg once daily (twice daily in severe cases) for max. 2 days; CHILD 2–18 years, see *BNF for Children*

Ureteric colic, 75 mg then a further 75 mg after 30 minutes if necessary

By intravenous infusion (in hospital setting), acute postoperative pain, 75 mg repeated if necessary after 4–6 hours; max. 150 mg in 24 hours for 2 days; CHILD 2–18 years, see *BNF for Children*

Prevention of postoperative pain, initially after surgery 25–50 mg over 15–60 minutes then 5 mg/hour; max. 150 mg in 24 hours for 2 days

Suppositories, diclofenac sodium 12.5 mg, net price 10 = 58p; 25 mg, 10 = £1.03; 50 mg, 10 = £1.70; 100 mg, 10 = £3.03

Modified release

Diclomax SR® (Galen) PoM

Capsules, m/r, yellow, diclofenac sodium 75 mg, net price 56-cap pack = £9.69. Label: 21, 25

Dose ADULT over 18 years, 1 capsule 1–2 times daily *or* 2 capsules once daily; CHILD 12–18 years see *BNF for Children*

Diclomax Retard® (Galen) PoM

Capsules, m/r, diclofenac sodium 100 mg, net price 28-cap pack = £6.97. Label: 21, 25

Dose ADULT over 18 years, 1 capsule once daily; CHILD 12–18 years see *BNF for Children*

Motifene® 75 mg (Daiichi Sankyo) PoM

Capsules, e/c, m/r, diclofenac sodium 75 mg (enclosing e/c pellets containing diclofenac sodium 25 mg and m/r pellets containing diclofenac sodium 50 mg), net price 56-cap pack = £8.00. Label: 25

Excipients include propylene glycol (see Excipients, p. 2)

Dose ADULT over 18 years, 1 capsule 1–2 times daily; CHILD 12–18 years see *BNF for Children*

Voltarol® 75 mg SR (Novartis) PoM

Tablets, m/r, f/c, pink, diclofenac sodium 75 mg, net price 28-tab pack = £6.46; 56-tab pack = £12.92. Label: 21, 25

Dose ADULT over 18 years, 1 tablet 1–2 times daily; CHILD 12–18 years see *BNF for Children*

Note Other brands of modified-release tablets containing diclofenac sodium 75 mg include *Defenac® SR, Dexomon® 75 SR, Dicloflex® 75 SR, Fenactol® 75 mg SR, Flamatak® 75 MR, Flamrase® SR, Flexotard® MR 75, Rheumatac® Retard 75, Rhumalgan® CR, Slofenac® SR, Volsaid® Retard 75*

Voltarol® Retard (Novartis) PoM

Tablets, m/r, f/c, red, diclofenac sodium 100 mg. Net price 28-tab pack = £9.47. Label: 21, 25

Dose ADULT over 18 years, 1 tablet once daily; CHILD 12–18 years see *BNF for Children*

Note Other brands of modified-release tablets containing diclofenac sodium 100 mg include *Defenac® Retard, Dexomon® Retard 100, Dicloflex® Retard, Fenactol® Retard 100 mg, Flamatak® 100 MR, Slofenac® SR, Volsaid® Retard 100*

With misoprostol

For prescribing information on misoprostol, see section 1.3.4

Arthrotec® (Pharmacia) PoM

Arthrotec® 50 tablets, diclofenac sodium (in e/c core) 50 mg, misoprostol 200 micrograms, net price 60-tab pack = £11.98; Label: 21, 25

Dose prophylaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid

arthritis or osteoarthritis, 1 tablet 2–3 times daily with food; CHILD not recommended

Arthrotec® 75 tablets, diclofenac sodium (in e/c core) 75 mg, misoprostol 200 micrograms, net price 60-tab pack = £15.83. Label: 21, 25

Dose prophylaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis, 1 tablet twice daily with food; CHILD not recommended

Note The BNF recommends a higher starting dose of misoprostol for prophylaxis against NSAID-induced gastroduodenal ulceration than that provided by *Arthrotec*® (see section 1.3.4)

Misofen® (Morningside) PoM

Tablets, diclofenac sodium (in e/c core) 50 mg, misoprostol 200 micrograms, net price 60-tab pack = £11.98. Label: 21, 25

Dose prophylaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis, 1 tablet 2–3 times daily with food; CHILD not recommended

Tablets, diclofenac sodium (in e/c core) 75 mg, misoprostol 200 micrograms, net price 60-tab pack = £15.83. Label: 21, 25

Dose prophylaxis against NSAID-induced gastroduodenal ulceration in patients requiring diclofenac for rheumatoid arthritis or osteoarthritis, 1 tablet twice daily with food; CHILD not recommended

Note The BNF recommends a higher starting dose of misoprostol for prophylaxis against NSAID-induced gastroduodenal ulceration than that provided by *Misofen*® (see section 1.3.4)

Topical preparations

Section 10.3.2

ETODOLAC

Indications pain and inflammation in rheumatoid arthritis and osteoarthritis

Cautions see notes above

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment avoid in severe impairment; see also notes above

Pregnancy see notes above

Breast-feeding manufacturer advises avoid; see also notes above

Side-effects see notes above; also stomatitis, vasculitis, palpitation, dyspnoea, confusion, fatigue, paraesthesia, tremor, urinary frequency, dysuria, pyrexia, and pruritus

Dose

- ADULT over 18 years, 300–600 mg daily in 1–2 divided doses

Etodolac (Non-proprietary) PoM

Capsules, etodolac 300 mg, net price 60-cap pack = £8.14

Brands include *Eccoxolac*®

Modified release

Etopan XL® (Taro) PoM

Tablets, m/r, f/c, grey, etodolac 600 mg, net price 30-tab pack = £14.60. Label: 25

Dose 1 tablet daily; CHILD not recommended

Lodine SR® (Almirall) PoM

Tablets, m/r, f/c, light-grey, etodolac 600 mg, net price 30-tab pack = £15.50. Label: 25

Dose 1 tablet daily; CHILD not recommended

ETORICOXIB

Indications pain and inflammation in osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis; acute gout

Cautions see notes above; also dehydration; monitor blood pressure before treatment, 2 weeks after initiation and periodically during treatment

Contra-indications see notes above; inflammatory bowel disease; uncontrolled hypertension (persistently above 140/90 mmHg)

Hepatic impairment max. 60 mg daily in mild impairment; max. 60 mg on alternate days or 30 mg once daily in moderate impairment; see also notes above

Renal impairment avoid if eGFR less than 30 mL/minute/1.73 m^2; see also notes above

Pregnancy manufacturer advises avoid (teratogenic in *animal* studies); see also notes above

Breast-feeding manufacturer advises avoid—present in milk in *animal* studies; see also notes above

Side-effects see notes above; also palpitation, fatigue, influenza-like symptoms, ecchymosis; *less commonly* dry mouth, taste disturbance, mouth ulcer, appetite and weight change, atrial fibrillation, transient ischaemic attack, chest pain, flushing, cough, dyspnoea, epistaxis, anxiety, mental acuity impaired, paraesthesia, electrolyte disturbance, myalgia and arthralgia; *very rarely* confusion and hallucinations

Dose

- Osteoarthritis, ADULT and CHILD over 16 years, 30 mg once daily, increased if necessary to 60 mg once daily
- Rheumatoid arthritis and ankylosing spondylitis, ADULT and CHILD over 16 years, 90 mg once daily
- Acute gout, ADULT and CHILD over 16 years, 120 mg once daily for max. 8 days

Arcoxia® (MSD) PoM

Tablets, f/c, etoricoxib 30 mg (blue-green), net price 28-tab pack = £13.99; 60 mg (dark green), 28-tab pack = £20.11; 90 mg (white), 28-tab pack = £22.96; 120 mg (pale green), 7-tab pack = £6.03, 28-tab pack = £24.11

FENOPROFEN

Indications pain and inflammation in rheumatic disease and other musculoskeletal disorders; mild to moderate pain

Cautions see notes above

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment see notes above

Pregnancy see notes above

Breast-feeding amount too small to be harmful; see also notes above

Side-effects see notes above; upper respiratory-tract infection, nasopharyngitis, and cystitis also reported

Dose

- 300–600 mg 3–4 times daily; max. 3 g daily; CHILD not recommended

Fenopron® 300 (Typharm) PoM

Tablets, orange, fenoprofen (as calcium salt) 300 mg, net price 100-tab pack = £9.45 Label: 21

FLURBIPROFEN

Indications pain and inflammation in rheumatic disease and other musculoskeletal disorders; mild to moderate pain including dysmenorrhoea; migraine; postoperative analgesia; sore throat (section 12.3.1)

Cautions see notes above

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment avoid in severe impairment; see also notes above

Pregnancy see notes above

Breast-feeding small amount present in milk—manufacturer advises avoid; see also notes above

Side-effects see notes above; also stomatitis; *less commonly* paraesthesia, confusion, hallucinations, and fatigue

Dose

- ADULT and CHILD over 12 years, 150–200 mg daily in 2–4 divided doses, increased in acute conditions to 300 mg daily
- Dysmenorrhoea, ADULT and CHILD over 12 years, initially 100 mg, then 50–100 mg every 4–6 hours; max. 300 mg daily

Flurbiprofen (Non-proprietary) PoM

Tablets, flurbiprofen 50 mg, net price 100 = £10.27; 100 mg, 100 = £19.46. Label: 21

Froben® (Abbott Healthcare) PoM

Tablets, yellow, s/c, flurbiprofen 50 mg, net price 100 = £10.27; 100 mg, 100 = £19.46. Label: 21

IBUPROFEN

Indications pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders; mild to moderate pain including dysmenorrhoea; postoperative analgesia; migraine; dental pain; fever with discomfort and pain in children; post-immunisation pyrexia (section 14.1)

Cautions see notes above

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment avoid in severe impairment; see also notes above

Pregnancy see notes above

Breast-feeding amount too small to be harmful but some manufacturers advise avoid (including topical use); see also notes above

Side-effects see notes above

Dose

- ADULT and CHILD over 12 years, initially 300–400 mg 3–4 times daily; increased if necessary to max. 2.4 g daily; maintenance dose of 0.6–1.2 g daily may be adequate
- Pain and fever in children, CHILD 1–3 months, see *BNF for Children*; CHILD 3–6 months (body-weight over 5 kg), 50 mg 3 times daily (max. 30 mg/kg daily in 3–4 divided doses); CHILD 6 months–1 year, 50 mg 3–4 times daily (max. 30 mg/kg daily in 3–4 divided doses); CHILD 1–4 years, 100 mg 3 times daily (max. 30 mg/kg daily in 3–4 divided doses); CHILD 4–7 years, 150 mg 3 times daily (max. 30 mg/kg daily in 3–4 divided doses); CHILD 7–10 years, 200 mg 3 times daily (up to 30 mg/kg daily (max. 2.4 g) in 3–4 divided doses); CHILD 10–12 years, 300 mg 3 times daily (up to 30 mg/kg daily (max. 2.4 g) in 3–4 divided doses)
- Rheumatic disease in children (including juvenile idiopathic arthritis), CHILD 3 months–18 years (body-weight over 5 kg), 30–40 mg/kg (max. 2.4 g) daily in 3–4 divided doses; in systemic juvenile idiopathic arthritis up to 60 mg/kg (max. 2.4 g) daily [unlicensed] in 4–6 divided doses

[1]**Ibuprofen** (Non-proprietary) PoM

Tablets, coated, ibuprofen 200 mg, net price 84-tab pack = £3.08; 400 mg, 84-tab pack = £3.15; 600 mg, 84-tab pack = £6.93. Label: 21

Brands include *Arthrofen®*, *Ebufac®*, *Rimafen®*

Dental prescribing on NHS Ibuprofen Tablets may be prescribed

Oral suspension, ibuprofen 100 mg/5 mL, net price 100 mL = £1.37, 150 mL = £2.11, 500 mL = £8.88. Label: 21

Note Sugar-free versions are available and can be ordered by specifying 'sugar-free' on the prescription

Brands include *Calprofen®*, *Feverfen®*, *Nurofen® for Children*, *Orbifen® for Children*

Dental prescribing on NHS Ibuprofen Oral Suspension Sugar-free may be prescribed

Brufen® (Abbott Healthcare) PoM

Tablets, f/c, ibuprofen 200 mg, net price 100-tab pack = £3.92; 400 mg, 100-tab pack = £8.16; 600 mg, 100-tab pack = £12.24. Label: 21

Syrup, orange, ibuprofen 100 mg/5 mL, net price 500 mL (orange-flavoured) = £8.88. Label: 21

Granules, effervescent, ibuprofen 600 mg/sachet, net price 20-sachet pack = £6.80. Label: 13, 21

Electrolytes Na^+ approx. 6.5 mmol/sachet

Modified release

Brufen Retard® (Abbott Healthcare) PoM

Tablets, m/r, ibuprofen 800 mg, net price 56-tab pack = £7.74. Label: 25, 27

Dose ADULT and CHILD over 12 years, 2 tablets daily as a single dose, preferably in the early evening, increased in severe cases to 3 tablets daily in 2 divided doses

Topical preparations

Section 10.3.2

INDOMETACIN

(Indomethacin)

Indications pain and moderate to severe inflammation in rheumatic disease and other acute musculoskeletal disorders; acute gout; dysmenorrhoea; premature labour (section 7.1.3)

Cautions see notes above; also epilepsy, parkinsonism, psychiatric disturbances; during prolonged therapy ophthalmic and blood examinations particularly advisable; avoid rectal administration in proctitis and haemorrhoids

Driving Dizziness may affect performance of skilled tasks (e.g. driving)

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment avoid in severe impairment; see also notes above

Pregnancy see notes above

Breast-feeding amount probably too small to be harmful—manufacturers advise avoid; see also notes above

Side-effects see notes above; *rarely* confusion, convulsions, psychiatric disturbances, syncope, blood

1. Can be sold to the public in certain circumstances

disorders (particularly thrombocytopenia), hyperglycaemia, peripheral neuropathy, intestinal strictures; *also reported* hyperkalaemia; suppositories may cause rectal irritation and occasional bleeding

Dose

- By mouth, rheumatic disease, 50–200 mg daily in divided doses; CHILD see *BNF for Children*

  Acute gout, 150–200 mg daily in divided doses

  Dysmenorrhoea, up to 75 mg daily
- By rectum in suppositories, 100 mg at night and in the morning if required; CHILD not recommended

  Combined oral and rectal treatment, max. total daily dose 150–200 mg

Indometacin (Non-proprietary) PoM

Capsules, indometacin 25 mg, net price 28-cap pack = £1.17; 50 mg, 28-cap pack = £1.22. Label: 21, counselling, driving, see above

Suppositories, indometacin 100 mg, net price 10 = £17.61. Counselling, driving, see above

Modified release

Indometacin m/r preparations PoM

Capsules, m/r, indometacin 75 mg. Label: 21, 25, counselling, driving, see above

Brands include *Indolar SR®*, *Pardelprin®*

Dose 75 mg 1–2 times daily (once daily in dysmenorrhoea); CHILD not recommended

KETOPROFEN

Indications pain and mild inflammation in rheumatic disease and other musculoskeletal disorders, and after orthopaedic surgery; acute gout; dysmenorrhoea

Cautions see notes above

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment avoid in severe impairment; see also notes above

Pregnancy see notes above

Breast-feeding amount probably too small to be harmful but manufacturers advise avoid; see also notes above

Side-effects see notes above; suppositories may cause rectal irritation

Dose

- By mouth, rheumatic disease, 100–200 mg daily in 2–4 divided doses; CHILD not recommended

  Pain and dysmenorrhoea, 50 mg up to 3 times daily; CHILD not recommended
- By rectum in suppositories, rheumatic disease, 100 mg at bedtime; CHILD not recommended

  Combined oral and rectal treatment, max. total daily dose 200 mg

Ketoprofen (Non-proprietary) PoM

Capsules, ketoprofen 50 mg, net price 28-cap pack = £9.32; 100 mg, 56-cap pack = £6.66. Label: 21

Orudis® (Sanofi-Aventis) PoM

Capsules, ketoprofen 50 mg (green/purple), net price 112-cap pack = £15.14; 100 mg (pink), 56-cap pack = £15.49. Label: 21

Suppositories, ketoprofen 100 mg. Net price 10 = £6.65

Modified release

Oruvail® (Sanofi-Aventis) PoM

Capsules, m/r, enclosing white pellets, ketoprofen 100 mg (pink/purple), net price 56-cap pack = £23.93; 150 mg (pink), 28-cap pack = £13.66; 200 mg (pink/white), 28-cap pack = £23.85. Label: 21, 25

Dose 100–200 mg once daily with food; CHILD not recommended

Note Other brands of modified-release capsules containing ketoprofen 100 mg and 200 mg include *Ketocid®* 200 mg, *Ketovail®*, *Tiloket® CR*

With omeprazole

For prescribing information on omeprazole, see section 1.3.5

Axorid® (Meda) PoM

Capsules, m/r, ketoprofen 100 mg, omeprazole 20 mg (yellow/white), net price 30-cap pack = £13.80; ketoprofen 200 mg, omeprazole 20 mg (white), 30-cap pack = £13.80. Label: 21, 25

Excipients include propylene glycol (see Excipients, p. 2)

Note Capsules enclose microgranules containing modified-release ketoprofen and gastro-resistant omperazole

Dose (expressed as ketoprofen) patients requiring ketoprofen for osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis, who are at risk of NSAID-associated duodenal or gastric ulcer or gastroduodenal erosions, ADULT and CHILD over 15 years, 100 mg (with omeprazole 20 mg) once daily increased to 200 mg (with omeprazole 20 mg) once daily depending on severity of symptoms

Topical preparations

Section 10.3.2

MEFENAMIC ACID

Indications pain and inflammation in rheumatoid arthritis and osteoarthritis; postoperative pain; mild to moderate pain; dysmenorrhoea and menorrhagia

Cautions see notes above; epilepsy; acute porphyria (section 9.8.2)

Contra-indications see notes above; inflammatory bowel disease

Hepatic impairment see notes above

Renal impairment avoid in severe impairment; see also notes above

Pregnancy see notes above

Breast-feeding amount too small to be harmful but manufacturer advises avoid; see also notes above

Side-effects see notes above; also diarrhoea or rashes (withdraw treatment), stomatitis; *less commonly* paraesthesia and fatigue; *rarely* hypotension, palpitation, glucose intolerance, thrombocytopenia, haemolytic anaemia (positive Coombs' test), and aplastic anaemia

Dose

- ADULT over 18 years, 500 mg 3 times daily
- CHILD 12–18 years, acute pain including dysmenorrhoea, menorrhagia, 500 mg 3 times daily

Mefenamic Acid (Non-proprietary) PoM

Capsules, mefenamic acid 250 mg, net price 100-cap pack = £2.17. Label: 21

Tablets, mefenamic acid 500 mg, net price 28-tab pack = £1.66. Label: 21

Suspension, mefenamic acid 50 mg/5 mL, net price 125 mL = £79.98. Label: 21

Excipients include ethanol

Ponstan® (Chemidex) PoM

Capsules, blue/ivory, mefenamic acid 250 mg, net price 100-cap pack = £8.17. Label: 21

Forte tablets, yellow, mefenamic acid 500 mg, net price 100-tab pack = £15.72. Label: 21

MELOXICAM

Indications pain and inflammation in rheumatic disease; exacerbation of osteoarthritis (short-term); ankylosing spondylitis

Cautions see notes above

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment avoid if eGFR less than 25 mL/minute/1.73m^2; see also notes above

Pregnancy see notes above

Breast-feeding present in milk in *animal* studies—manufacturer advises avoid; see also notes above

Side-effects see notes above

Dose

- By mouth, osteoarthritis, ADULT and CHILD over 16 years, 7.5 mg once daily, increased if necessary to max. 15 mg once daily

  Rheumatoid arthritis, ankylosing spondylitis, ADULT and CHILD over 16 years, 15 mg once daily, may be reduced to 7.5 mg once daily; ELDERLY 7.5 mg daily
- CHILD over 12 years, see *BNF for Children*

Meloxicam (Non-proprietary) PoM

Tablets, meloxicam 7.5 mg, net price 30-tab pack = £1.03; 15 mg, 30-tab pack = £1.13. Label: 21

NABUMETONE

Indications pain and inflammation in osteoarthritis and rheumatoid arthritis

Cautions see notes above

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment avoid in severe impairment; see also notes above

Pregnancy see notes above

Breast-feeding manufacturer advises avoid; see also notes above

Side-effects see notes above

Dose

- 1 g at night; severe or persistent symptoms 0.5–1 g in morning and 1 g at night; ELDERLY 0.5–1 g daily; CHILD not recommended

Nabumetone (Non-proprietary) PoM

Tablets, nabumetone 500 mg, net price 56-tab pack = £8.55. Label: 21

Relifex® (Meda) PoM

Tablets, red, f /c, nabumetone 500 mg. Net price 56-tab pack = £6.18. Label: 21

Suspension, sugar-free, nabumetone 500 mg/5 mL. Net price 300-mL pack = £28.90. Label: 21

NAPROXEN

Indications pain and inflammation in rheumatic disease (including juvenile idiopathic arthritis) and other musculoskeletal disorders; dysmenorrhoea; acute gout

Cautions see notes above

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment avoid if eGFR less than 30 mL/minute/1.73 m^2; see also notes above

Pregnancy see notes above

Breast-feeding amount too small to be harmful but manufacturer advises avoid; see also notes above

Side-effects see notes above

Dose

- Rheumatic disease, 0.5–1 g daily in 1–2 divided doses; CHILD 2–18 years, juvenile idiopathic arthritis, see *BNF for Children*
- Acute musculoskeletal disorders and dysmenorrhoea, 500 mg initially, then 250 mg every 6–8 hours as required; max. dose after first day 1.25 g daily; CHILD under 18 years, see *BNF for Children*
- Acute gout, 750 mg initially, then 250 mg every 8 hours until attack has passed; CHILD under 16 years not recommended

[1]Naproxen (Non-proprietary) PoM

Tablets, naproxen 250 mg, net price 28-tab pack = £1.15; 500 mg, 28-tab pack = £1.82. Label: 21

Brands include *Arthroxen®*

Tablets, e/c, naproxen 250 mg, net price 56-tab pack = £2.71; 375 mg, 56-tab pack = £6.42; 500 mg, 56-tab pack = £5.02. Label: 5, 25

Naprosyn® (Roche) PoM

Tablets, yellow, scored, naproxen 250 mg, net price 56-tab pack = £4.29; 500 mg, 56-tab pack = £8.56. Label: 21

Tablets, e/c, (*Naprosyn EC®*), naproxen 250 mg, net price 56-tab pack = £4.29; 375 mg, 56-tab pack = £6.42; 500 mg, 56-tab pack = £8.56. Label: 5, 25

With esomeprazole

For prescribing information on esomeprazole, see section 1.3.5

Vimovo® (AstraZeneca) PoM

Tablets, f/c, m/r, naproxen 500 mg, esomeprazole (as magnesium trihydrate) 20 mg, net price 60-tab pack = £14.95. Label: 22, 25

Note Naproxen component is gastro-resistant

Dose patients requiring naproxen for osteoarthritis, rheumatoid arthritis, or ankylosing spondylitis, who are at risk of NSAID-associated duodenal or gastric ulcer and when treatment with lower doses of naproxen or other NSAIDs ineffective, ADULT over 18 years, 1 tablet twice daily

With misoprostol

For prescribing information on misoprostol, see section 1.3.4

Napratec® (Pharmacia) PoM

Combination pack, 56 yellow scored tablets, naproxen 500 mg; 56 white scored tablets, misoprostol 200 micrograms. Net price = £23.76. Label: 21

Dose patients requiring naproxen for rheumatoid arthritis, osteoarthritis, or ankylosing spondylitis, with prophylaxis against NSAID-induced gastroduodenal ulceration, 1 naproxen 500-mg tablet and 1 misoprostol 200-microgram tablet taken together twice daily with food; CHILD not recommended

Note The BNF recommends a higher starting dose of misoprostol for prophylaxis against NSAID-induced gastroduodenal ulceration than that provided by *Napratec®* (see section 1.3.4)

1. Can be sold to the public for the treatment of primary dysmenorrhoea in women aged 15–50 years subject to max. single dose of 500 mg, max. daily dose of 750 mg for max. 3 days, and a max. pack size of 9 × 250 mg tablets

PIROXICAM

Indications rheumatoid arthritis, osteoarthritis, and ankylosing spondylitis (see also CHMP advice below)

Cautions see notes above and CHMP advice below

Contra-indications inflammatory bowel disease; see also notes above

Hepatic impairment see notes above

Renal impairment see notes above

Pregnancy see notes above

Breast-feeding amount too small to be harmful; see also notes above

Side-effects see notes above

Dose

- By mouth, max. 20 mg once daily (see also CHMP advice below); CHILD 6–18 years, juvenile idiopathic arthritis, see *BNF for Children*

CHMP advice
Piroxicam (June 2007)

The CHMP has recommended restrictions on the use of piroxicam because of the increased risk of gastro-intestinal side effects and serious skin reactions. The CHMP has advised that:

- piroxicam should be initiated only by physicians experienced in treating inflammatory or degenerative rheumatic diseases
- piroxicam should not be used as first-line treatment
- in adults, use of piroxicam should be limited to the symptomatic relief of osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis
- piroxicam dose should not exceed 20 mg daily
- piroxicam should no longer be used for the treatment of acute painful and inflammatory conditions
- treatment should be reviewed 2 weeks after initiating piroxicam, and periodically thereafter
- concomitant administration of a gastro-protective agent (section 1.3) should be considered

Note

Topical preparations containing piroxicam are not affected by these restrictions

Piroxicam (Non-proprietary) PoM

Capsules, piroxicam 10 mg, net price 56-cap pack = £6.40; 20 mg, 28-cap pack = £7.16. Label: 21

Dispersible tablets, piroxicam 10 mg, net price 56-tab pack = £9.96; 20 mg, 28-tab pack = £32.41. Label: 13, 21

Brexidol® (Chiesi) PoM

Tablets, yellow, scored, piroxicam (as betadex) 20 mg, net price 30-tab pack = £13.82. Label: 21

Dose osteoarthritis, rheumatic disease and acute musculoskeletal disorders, 1 tablet daily (may be halved in elderly); CHILD not recommended

Feldene® (Pfizer) PoM

Capsules, piroxicam 10 mg (red/blue), net price 30-cap pack = £3.86; 20 mg (white), 30-cap pack = £7.71. Label: 21

Tablets, (*Feldene Melt®*), piroxicam 20 mg, net price 30-tab pack = £10.53. Label: 10, patient information leaflet, 21

Excipients include aspartame equivalent to phenylalanine 140 micrograms/tablet (section 9.4.1)

Note *Feldene Melt®* tablets can be taken by placing on tongue or by swallowing

Topical preparations
Section 10.3.2

SULINDAC

Indications pain and inflammation in rheumatic disease and other musculoskeletal disorders; acute gout

Cautions see notes above; also history of renal stones and ensure adequate hydration

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment avoid in severe impairment; see also notes above

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above; jaundice with fever, cholestasis, hepatitis, hepatic failure; also urine discoloration occasionally reported

Dose

- 200 mg twice daily (may be reduced according to response); max. 400 mg daily; acute gout should respond within 7 days; limit treatment of peri-articular disorders to 7–10 days; CHILD not recommended

Sulindac (Non-proprietary) PoM

Tablets, sulindac 100 mg, net price 56-tab pack = £29.78; 200 mg, 56-tab pack = £38.29. Label: 21

TENOXICAM

Indications pain and inflammation in rheumatic disease and other musculoskeletal disorders

Cautions see notes above

Contra-indications see notes above

Hepatic impairment see notes above

Renal impairment avoid in severe impairment; see also notes above

Pregnancy see notes above

Breast-feeding present in milk in *animal* studies; see also notes above

Side-effects see notes above

Dose

- By mouth, rheumatic disease, ADULT over 18 years, 20 mg daily

  Acute musculoskeletal disorders, ADULT over 18 years, 20 mg daily for 7 days; max. duration of treatment 14 days (including treatment by intravenous or intramuscular injection)
- By intravenous *or* intramuscular injection, ADULT over 18 years, initial treatment for 1–2 days if oral administration not possible, 20 mg once daily

Tenoxicam (Non-proprietary) PoM

Tablets, f/c, tenoxicam 20 mg, net price 28-tab pack = £16.16. Label: 21

Injection, powder for reconstitution, tenoxicam, net price 20-mg vial = £3.98

Mobiflex® (Meda) PoM

Tablets, yellow, f/c, tenoxicam 20 mg, net price 30-tab pack = £13.42. Label: 21

TIAPROFENIC ACID

Indications pain and inflammation in rheumatic disease and other musculoskeletal disorders

Cautions see notes above

Contra-indications see notes above; also active bladder or prostate disease (or symptoms) and history of recurrent urinary-tract disorders—if urinary symptoms develop discontinue immediately and perform urine tests and culture; see also CSM advice below

CSM advice

Following reports of **severe cystitis** the CSM has recommended that tiaprofenic acid should not be given to patients with urinary-tract disorders and should be stopped if urinary symptoms develop. Patients should be advised to stop taking tiaprofenic acid and to report to their doctor promptly if they develop urinary-tract symptoms (such as increased frequency, nocturia, urgency, pain on urinating, or blood in urine)

Hepatic impairment reduce dose in mild or moderate impairment; see also notes above

Renal impairment reduce dose in mild or moderate impairment; avoid in severe impairment; see also notes above

Pregnancy see notes above

Breast-feeding amount too small to be harmful; see also notes above

Side-effects see notes above

Dose

- ADULT over 18 years, 300 mg twice daily

Surgam® (Sanofi-Aventis) PoM

Tablets, tiaprofenic acid 300 mg, net price 56-tab pack = £14.95. Label: 21

Aspirin

Aspirin (section 4.7.1) has been used in high doses to treat rheumatoid arthritis, but other NSAIDs are now preferred.

10.1.2 Corticosteroids

10.1.2.1 Systemic corticosteroids

The general actions, uses, and cautions of corticosteroids are described in section 6.3. Short-term treatment with corticosteroids can help to rapidly improve symptoms of rheumatoid arthritis. Long-term treatment in rheumatoid arthritis should be considered only after evaluating the risks and all other treatment options have been considered. Corticosteroids can induce osteoporosis, and prophylaxis should be considered on long-term treatment (section 6.6).

In severe, possibly life-threatening, situations a high initial dose of corticosteroid is given to induce remission and the dose is then reduced gradually and discontinued altogether. Relapse may occur as the dose of corticosteroid is reduced, particularly if the reduction is too rapid. The tendency is therefore to increase the maintenance dose and consequently the patient becomes dependent on corticosteroids. For this reason pulse doses of corticosteroids (e.g. methylprednisolone up to 1 g intravenously on 3 consecutive days) are used to suppress highly active inflammatory disease while longer-term treatment with a disease-modifying drug is commenced.

Prednisolone 7.5 mg daily may reduce the rate of joint destruction in moderate to severe *rheumatoid arthritis* of less than 2 years' duration. The reduction in joint destruction must be distinguished from mere symptomatic improvement (which lasts only 6 to 12 months at this dose) and care should be taken to avoid increasing the dose above 7.5 mg daily. Evidence supports maintenance of this anti-erosive dose for 2–4 years only after which treatment should be tapered off to reduce long-term adverse effects.

A modified-release preparation of **prednisone** (section 6.3.2) is also available for the treatment of moderate to severe rheumatoid arthritis.

Polymyalgia rheumatica and *giant cell (temporal) arteritis* are always treated with corticosteroids. The usual initial dose of prednisolone in polymyalgia rheumatica is 10–15 mg daily and in giant cell arteritis 40–60 mg daily (the higher dose being used if visual symptoms occur). Treatment should be continued until remission of disease activity and doses are then reduced gradually to about 7.5–10 mg daily for maintenance. Relapse is common if therapy is stopped prematurely. Many patients require treatment for at least 2 years and in some patients it may be necessary to continue long-term low-dose corticosteroid treatment.

Polyarteritis nodosa and *polymyositis* are usually treated with corticosteroids. An initial dose of 60 mg of prednisolone daily is often used and reduced to a maintenance dose of 10–15 mg daily.

Systemic lupus erythematosus is treated with corticosteroids when necessary using a similar dosage regimen to that for polyarteritis nodosa and polymyositis (above). Patients with pleurisy, pericarditis, or other systemic manifestations will respond to corticosteroids. It may then be possible to reduce the dosage; alternate-day treatment is sometimes adequate, and the drug may be gradually withdrawn. In some mild cases corticosteroid treatment may be stopped after a few months. Many mild cases of systemic lupus erythematosus do not require corticosteroid treatment. Alternative treatment with anti-inflammatory analgesics, and possibly chloroquine or hydroxychloroquine, should be considered.

Ankylosing spondylitis should not be treated with long-term corticosteroids; rarely, pulse doses may be needed and may be useful in extremely active disease that does not respond to conventional treatment.

10.1.2.2 Local corticosteroid injections

Corticosteroids are injected locally for an anti-inflammatory effect. In inflammatory conditions of the joints, particularly in rheumatoid arthritis, they are given by *intra-articular injection* to relieve pain, increase mobility, and reduce deformity in one or a few joints; they can also provide symptomatic relief while waiting for DMARDs to take effect. Full aseptic precautions are essential; infected areas should be avoided. Occasionally an acute inflammatory reaction develops after an intra-articular or soft-tissue injection of a corticosteroid. This may be a reaction to the microcrystalline suspension of the corticosteroid used, but must be distinguished from sepsis introduced into the injection site.

Smaller amounts of corticosteroids may also be injected directly into soft tissues for the relief of inflammation in conditions such as *tennis* or *golfer's elbow* or *compression neuropathies*. In *tendinitis*, injections should be made into the tendon sheath and not directly into the tendon (due to the absence of a true tendon sheath and a high risk of rupture, the Achilles tendon should not be injected).

Hydrocortisone acetate or one of the synthetic analogues is generally used for local injection. Intra-articular corticosteroid injections can cause flushing and may affect the hyaline cartilage. Each joint should not usually be treated more than 4 times in one year.

Corticosteroid injections are also injected into soft tissues for the treatment of skin lesions (see section 13.4).

LOCAL CORTICOSTEROID INJECTIONS

Indications local inflammation of joints and soft tissues (for details, consult product literature)

Cautions see notes above and consult product literature; see also section 6.3.2

Contra-indications see notes above and consult product literature; avoid injections containing benzyl alcohol in neonates (see preparations below)

Side-effects see notes above and consult product literature

Dose

- See under preparations

Betamethasone

Betnesol® (RPH) PoM

Injection, betamethasone (as sodium phosphate) 4 mg/mL, net price 1-mL amp = £1.22.

Dexamethasone

Dexamethasone (Non-proprietary) PoM

Injection, dexamethasone (as sodium phosphate) 4 mg/mL, net price 1-mL amp = 91p, 2-mL vial = £1.27

Dose by intra-articular injection (for details consult product literature), 0.3–3 mg according to size; where appropriate may be repeated at intervals of 3–21 days according to response

Injection, dexamethasone (as sodium phosphate) 3.3 mg/mL, net price 1-mL amp = £1.14, 2-mL vial = £4.80

Dose by intra-articular injection (for details consult product literature), 0.33–3.3 mg according to size (by soft-tissue infiltration 1.7–5 mg); where appropriate may be repeated at intervals of 3–21 days

Hydrocortisone acetate

Hydrocortistab® (AMCo) PoM

Injection (aqueous suspension), hydrocortisone acetate 25 mg/mL, net price 1-mL amp = £6.87

Dose by intra-articular injection (for details consult product literature), 5–50 mg according to size; where appropriate may be repeated at intervals of 21 days; not more than 3 joints should be treated on any one day; CHILD 5–30 mg (divided)

Methylprednisolone acetate

Depo-Medrone® (Pharmacia) PoM

Injection (aqueous suspension), methylprednisolone acetate 40 mg/mL, net price 1-mL vial = £3.44; 2-mL vial = £6.18; 3-mL vial = £8.96

Dose by intra-articular injection (for details consult product literature), 4–80 mg, according to size; where appropriate may be repeated at intervals of 7–35 days; also for intralesional injection

Depo-Medrone® with Lidocaine (Pharmacia) PoM

Injection (aqueous suspension), methylprednisolone acetate 40 mg, lidocaine hydrochloride 10 mg/mL, net price 1-mL vial = £3.94; 2-mL vial = £7.06

Dose by intra-articular injection (for details consult product literature), 4–80 mg, according to size; where appropriate may be repeated at intervals of 7–35 days

Prednisolone acetate

Deltastab® (AMCo) PoM

Injection (aqueous suspension), prednisolone acetate 25 mg/mL, net price 1-mL amp = £6.87

Dose by intra-articular injection (for details consult product literature), 5–25 mg according to size; not more than 3 joints should be treated on any one day; where appropriate may be repeated when relapse occurs

For intramuscular injection, see section 6.3.2

Triamcinolone acetonide

Adcortyl® Intra-articular/Intradermal (Squibb) PoM

Injection (aqueous suspension), triamcinolone acetonide 10 mg/mL, net price 1-mL amp = 89p; 5-mL vial = £3.63

Excipients include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

Dose by intra-articular injection (for details consult product literature), 2.5–15 mg according to size (for larger doses use *Kenalog®*); where appropriate may be repeated when relapse occurs; CHILD under 18 years see *BNF for Children*

By intradermal injection, (for details consult product literature): 2–3 mg; max. 5 mg at any one site (total max. 30 mg); where appropriate may be repeated at intervals of 1–2 weeks; CHILD under 6 years not recommended

Kenalog® Intra-articular/Intramuscular (Squibb) PoM

Injection (aqueous suspension), triamcinolone acetonide 40 mg/mL, net price 1-mL vial = £1.49

Dose by intra-articular injection (for details consult product literature), 5–40 mg according to size; total max. 80 mg (for doses below 5 mg use *Adcortyl® Intra-articular/Intradermal*); where appropriate may be repeated when relapse occurs; CHILD under 18 years see *BNF for Children*

For intramuscular injection, see section 6.3.2

10.1.3 Drugs that suppress the rheumatic disease process

Certain drugs such as those affecting the immune response can suppress the disease process in *rheumatoid arthritis* and *psoriatic arthritis*; gold, penicillamine, hydroxychloroquine, chloroquine, and sulfasalazine can also suppress the disease process in *rheumatoid arthritis* while sulfasalazine and possibly gold can suppress the disease process in *psoriatic arthritis*. Unlike NSAIDs, which are used only for symptom control, disease-modifying anti-rheumatic drugs (DMARDs) can affect the progression of disease but may require 2–6 months of treatment for a full therapeutic response. Response to DMARDs may allow the NSAID dose to be reduced or withdrawn. All patients with suspected inflammatory joint disease should be referred to a specialist as soon as possible to confirm diagnosis and evaluate disease activity; early initiation of DMARDs is recommended to control the signs and symptoms, and to limit joint damage.

Choice The choice of a disease-modifying anti-rheumatic drug should take into account co-morbidity and patient preference. Methotrexate, sulfasalazine, intramuscular gold, and penicillamine are similar in efficacy. However, **methotrexate** or **sulfasalazine** may be better tolerated.

A combination of **DMARDs** (including methotrexate and at least one other DMARD) and a short-term **corticosteroid** (section 10.1.2), should be given to patients with newly diagnosed active rheumatoid arthritis, ideally within 3 months of the onset of persistent symptoms. If the use of particular DMARDs is contra-

indicated and combination therapy is not possible, monotherapy with a suitable DMARD should be given and the dose rapidly increased until clinically effective. In patients with established and stable rheumatoid arthritis, cautiously reduce drug doses to the lowest that are clinically effective. Response to drug treatment often produces a reduction in requirements of both corticosteroids and other drugs.

Gold and **penicillamine** are effective in *palindromic rheumatism*. *Systemic* and *discoid lupus erythematosus* are sometimes treated with **chloroquine** or **hydroxychloroquine**.

If a disease-modifying anti-rheumatic drug does not lead to an objective benefit within 6 months, it should be replaced by a different one.

Juvenile idiopathic arthritis Many children with *juvenile idiopathic arthritis* (juvenile chronic arthritis) do not require disease-modifying antirheumatic drugs. Methotrexate is effective (see *BNF for Children*); sulfasalazine is an alternative [unlicensed indication] but it should be avoided in *systemic-onset juvenile idiopathic arthritis* (see *BNF for Children*). Gold and penicillamine are no longer used. For the role of cytokine modulators in *juvenile idiopathic arthritis*, see *BNF for Children*.

Gold

Gold can be given as **sodium aurothiomalate** for active progressive rheumatoid arthritis; it must be given by deep intramuscular injection and the area gently massaged. A test dose of 10 mg must be given followed by doses of 50 mg at weekly intervals until there is definite evidence of remission. Benefit is not to be expected until about 300–500 mg has been given; it should be discontinued if there is no remission after 1 g has been given. In patients who do respond, the interval between injections is then gradually increased to 4 weeks and treatment is continued for up to 5 years after complete remission. If relapse occurs the dosage frequency may be immediately increased to 50 mg weekly and only once control has been obtained again should the dosage frequency be decreased; if no response is seen within 2 months, alternative treatment should be sought. It is important to avoid complete relapse since second courses of gold are not usually effective.

Sodium aurothiomalate should be discontinued in the presence of blood disorders, gastro-intestinal bleeding (associated with ulcerative enterocolitis), or unexplained proteinuria (associated with immune complex nephritis) which is repeatedly above 300 mg/litre. Urine tests and full blood counts (including total and differential white cell and platelet counts) must therefore be performed before starting treatment and before each intramuscular injection. Rashes with pruritus often occur after 2 to 6 months of treatment and may necessitate discontinuation.

SODIUM AUROTHIOMALATE

Indications active progressive rheumatoid arthritis

Cautions see notes above; elderly, history of urticaria, eczema, colitis; monitor for pulmonary fibrosis with annual chest X-ray; **interactions:** Appendix 1 (sodium aurothiomalate)

Counselling Patients should be advised to seek prompt medical attention if diarrhoea, sore throat, fever, infection, non-specific illness, unexplained bleeding and bruising, purpura, mouth ulcers, metallic taste, rash, breathlessness, or cough develop

Contra-indications history of blood disorders or bone marrow aplasia, exfoliative dermatitis, systemic lupus erythematosus, necrotising enterocolitis, pulmonary fibrosis

Hepatic impairment caution in mild to moderate impairment, avoid in severe impairment

Renal impairment caution in mild to moderate impairment; avoid in severe impairment

Pregnancy manufacturer advises avoid but limited data suggests usually not necessary to withdraw if condition well controlled—consider reducing dose and frequency

Breast-feeding manufacturer advises avoid—present in milk; theoretical possibility of rashes and idiosyncratic reactions

Side-effects see notes above; also severe anaphylactic reactions; stomatitis, taste disturbances, colitis, hepatotoxicity with cholestatic jaundice, pulmonary fibrosis, peripheral neuropathy, mouth ulcers, proteinuria, blood disorders (sometimes sudden and fatal), nephrotic syndrome, gold deposits in eye, alopecia, and skin reactions (including, on prolonged parenteral treatment, irreversible pigmentation in sun-exposed areas)

Dose

- By deep intramuscular injection, administered on expert advice, see notes above

Myocrisin® (Sanofi-Aventis) PoM

Injection, sodium aurothiomalate 20 mg/mL, net price 0.5-mL (10-mg) amp = £4.56; 100 mg/mL, 0.5-mL (50-mg) amp = £13.48. Label: 11, counselling, blood disorder symptoms

Penicillamine

Penicillamine has a similar action to gold. More patients are able to continue treatment than with gold but side-effects are common.

Patients should be warned not to expect improvement for at least 6 to 12 weeks after treatment is initiated. Penicillamine should be discontinued if there is no improvement within 1 year.

Blood counts, including platelets, and urine examinations should be carried out before starting treatment and then every 1 or 2 weeks for the first 2 months then every 4 weeks to detect blood disorders and proteinuria (they should also be carried out in the week after any dose increase). A reduction in platelet count calls for discontinuation with subsequent re-introduction at a lower dosage and then, if possible, gradual increase. Proteinuria, associated with immune complex nephritis, occurs in up to 30% of patients, but may resolve despite continuation of treatment; treatment may be continued provided that renal function tests remain normal, oedema is absent, and the 24-hour urinary excretion of protein does not exceed 2 g.

Nausea may occur but is not usually a problem provided that penicillamine is taken before food or on retiring and that low initial doses are used and only gradually increased. Loss of taste can occur about 6 weeks after treatment is started but usually returns 6 weeks later irrespective of whether treatment is discontinued; mineral supplements are not recommended. Rashes are a common side-effect. Those that occur in the first few months of treatment disappear when the drug is stopped and treatment may then be re-introduced at a lower dose level and gradually increased.

Patients who are hypersensitive to penicillin may react rarely to penicillamine.

PENICILLAMINE

Indications see notes above and under Dose

Cautions see notes above; concomitant nephrotoxic drugs (increased risk of toxicity); gold treatment (avoid concomitant use if adverse reactions to gold); **interactions:** Appendix 1 (penicillamine)

Blood counts and urine tests See notes above. Longer intervals may be adequate in cystinuria and Wilson's disease. Consider withdrawal if platelet count falls below 120 000/mm^3 or white blood cells below 2500/mm^3 or if 3 successive falls within reference range (can restart at reduced dose when counts return to within reference range but permanent withdrawal necessary if recurrence of leucopenia or thrombocytopenia)

Counselling Warn patient to tell doctor promptly if sore throat, fever, infection, non-specific illness, unexplained bleeding and bruising, purpura, mouth ulcers, or rashes develop

Contra-indications lupus erythematosus

Renal impairment reduce dose and monitor renal function or avoid (consult product literature)

Pregnancy fetal abnormalities reported rarely; avoid if possible

Breast-feeding manufacturer advises avoid unless potential benefit outweighs risk—no information available

Side-effects (see also notes above) initially nausea, anorexia, fever; proteinuria, thrombocytopenia; *rarely* mouth ulceration, stomatitis, male and female breast enlargement, haematuria (withdraw immediately if cause unknown), alopecia, pseudoxanthoma elasticum, elastosis perforans, skin laxity; *also reported* pancreatitis, vomiting, cholestatic jaundice, pulmonary haemorrhage, bronchiolitis, pneumonitis, blood disorders including neutropenia, agranulocytosis, aplastic anaemia, haemolytic anaemia and leucopenia, nephrotic syndrome, glomerulonephritis, Goodpasture's syndrome, septic arthritis in patients with rheumatoid arthritis, lupus erythematosus, myasthenia gravis, polymyositis, rheumatoid arthritis, urticaria, dermatomyositis, pemphigus, Stevens-Johnson syndrome, late rashes (consider dose reduction)

Dose

- Severe active rheumatoid arthritis, administered on expert advice, ADULT over 18 years, initially 125–250 mg daily for 1 month increased by similar amounts at intervals of not less than 4 weeks to usual maintenance of 500–750 mg daily in divided doses; max. 1.5 g daily; if remission sustained for 6 months, reduction of daily dose by 125–250 mg every 12 weeks may be attempted; ELDERLY initially up to 125 mg daily for 1 month increased by similar amounts at intervals of not less than 4 weeks; max. 1 g daily
- Wilson's disease, autoimmune hepatitis, and cystinuria, section 9.8.1

Penicillamine (Non-proprietary) PoM

Tablets, penicillamine 125 mg, net price 56-tab pack = £11.20; 250 mg, 56-tab pack = £21.89. Label: 6, 22, counselling, blood disorder symptoms (see above)

Distamine® (Alliance) PoM

Tablets, f/c, penicillamine 125 mg, net price 100-tab pack = £10.34; 250 mg, 100-tab pack= £17.78. Label: 6, 22, counselling, blood disorder symptoms (see above)

Antimalarials

The antimalarial **hydroxychloroquine** is used to treat rheumatoid arthritis of moderate inflammatory activity; **chloroquine** is also licensed for treating inflammatory disorders but is used much less frequently and is generally reserved for use if other drugs have failed. Chloroquine and hydroxychloroquine are effective for mild systemic lupus erythematosus, particularly involving the skin and joints. These drugs should not be used for psoriatic arthritis.

Chloroquine and hydroxychloroquine are better tolerated than gold or penicillamine. Retinopathy (see below) rarely occurs provided that the recommended doses are not exceeded; in the elderly it is difficult to distinguish drug-induced retinopathy from changes of ageing.

Mepacrine (section 5.4.4) is sometimes used in discoid lupus erythematosus [unlicensed].

Cautions Manufacturers recommend regular ophthalmological examination but the evidence of practical value is unsatisfactory (see advice of the Royal College of Ophthalmologists, below). Chloroquine and hydroxychloroquine should be used with caution in neurological disorders (especially in those with a history of epilepsy), in severe gastro-intestinal disorders, in G6PD deficiency (section 9.1.5), in acute porphyria, and in the elderly (see also above). Chloroquine and hydroxychloroquine may exacerbate psoriasis and aggravate myasthenia gravis. Concurrent use of hepatotoxic drugs should be avoided; other **interactions**: Appendix 1 (chloroquine and hydroxychloroquine).

Screening for ocular toxicity A review group convened by the Royal College of Ophthalmologists has updated guidelines for screening to prevent ocular toxicity on long-term treatment with chloroquine and hydroxychloroquine (*Hydroxychloroquine and Ocular Toxicity: Recommendations on Screening 2009*). Chloroquine should be considered (for treating chronic inflammatory conditions) **only** if other drugs have failed. All patients taking chloroquine should receive ocular examination according to a protocol arranged locally between the prescriber and the ophthalmologist. The following recommendations relate to hydroxychloroquine, which is only rarely associated with toxicity.

Before treatment:

- Assess renal and liver function (adjust dose if impaired)
- Ask patient about visual impairment (not corrected by glasses). If impairment or eye disease present, assessment by an optometrist is advised and any abnormality should be referred to an ophthalmologist
- Record near visual acuity of each eye (with glasses where appropriate) using a standard reading chart
- Initiate hydroxychloroquine treatment if no abnormality detected (at a dose not exceeding hydroxychloroquine sulfate 6.5 mg/kg daily)

During treatment:

- Ask patient about visual symptoms and monitor visual acuity annually using the standard reading chart
- Refer to ophthalmologist if visual acuity changes or if vision blurred and warn patient to seek prescribing doctor's advice about stopping treatment

- A child treated for juvenile idiopathic arthritis should receive slit-lamp examination routinely to check for uveitis
- If long-term treatment is required (more than 5 years), individual arrangement should be agreed with the local ophthalmologist

Important

To avoid excessive dosage in obese patients, the doses of hydroxychloroquine and chloroquine should be calculated on the basis of ideal body-weight. Ocular toxicity is unlikely if the dose of chloroquine phosphate does not exceed 4 mg/kg daily (equivalent to chloroquine base approx. 2.5 mg/kg daily)

Hepatic impairment Chloroquine and hydroxychloroquine should be used with caution in moderate to severe hepatic impairment.

Pregnancy It is not necessary to withdraw an antimalarial drug during pregnancy if the rheumatic disease is well controlled; however, the manufacturer of hydroxychloroquine advises avoiding use.

Breast-feeding Chloroquine and hydroxychloroquine are present in breast milk and breast-feeding should be avoided when they are used to treat rheumatic disease.

Side-effects The side-effects of chloroquine and hydroxychloroquine include gastro-intestinal disturbances, headache and skin reactions (rashes, pruritus); those occurring less frequently include ECG changes, convulsions, visual changes, retinal damage (see above), keratopathy, ototoxicity, hair depigmentation, hair loss, and discoloration of skin, nails, and mucous membranes. Side-effects that occur rarely include blood disorders (including thrombocytopenia, agranulocytosis, and aplastic anaemia), mental changes (including emotional disturbances and psychosis), myopathy (including cardiomyopathy and neuromyopathy), angioedema, acute generalised exanthematous pustulosis, exfoliative dermatitis, Stevens-Johnson syndrome, photosensitivity, and hepatic damage; diffuse parenchymal lung disease, and drug rash with eosinophilia and systemic symptoms have also been reported. **Important**: very toxic in overdosage—immediate advice from poisons centres essential (see also p. 39).

CHLOROQUINE

Indications active rheumatoid arthritis, systemic and discoid lupus erythematosus; malaria (section 5.4.1)

Cautions see notes above

Hepatic impairment see notes above

Renal impairment manufacturer advises caution; reduce dose

Pregnancy see notes above

Breast-feeding see notes above

Side-effects see notes above

Dose

- Administered on expert advice, by mouth, ADULT over 18 years, chloroquine (base) 150 mg daily; max. 2.5 mg/kg daily based on ideal body-weight, see also recommendations above

  Note Chloroquine base 150 mg ≡ chloroquine sulfate 200 mg ≡ chloroquine phosphate 250 mg (approx.).

Preparations

Section 5.4.1

HYDROXYCHLOROQUINE SULFATE

Indications active rheumatoid arthritis (including juvenile idiopathic arthritis), systemic and discoid lupus erythematosus; dermatological conditions caused or aggravated by sunlight

Cautions see notes above

Hepatic impairment see notes above

Renal impairment manufacturer advises caution and monitoring of plasma-hydroxychloroquine concentration in severe impairment

Pregnancy see notes above

Breast-feeding avoid—risk of toxicity in infant; see also notes above

Side-effects see notes above; also reported bronchospasm

Dose

- Administered on expert advice, 200–400 mg daily (but not exceeding 6.5 mg/kg daily based on ideal body-weight, see also recommendations above); CHILD 1 month–18 years see *BNF for Children*

Hydroxychloroquine (Non-proprietary) PoM

Tablets, hydroxychloroquine sulfate 200 mg, net price 60-tab pack = £4.96. Label: 21, counselling, see below

Brands include *Quinoric*®

Counselling Do not take antacids for at least 4 hours before or after hydroxychloroquine to reduce possible interference with hydroxychloroquine absorption

Plaquenil® (Sanofi-Aventis) PoM

Tablets, f/c, hydroxychloroquine sulfate 200 mg, net price 60-tab pack = £5.15. Label: 21, counselling, see below

Counselling Do not take antacids for at least 4 hours before or after hydroxychloroquine to reduce possible interference with hydroxychloroquine absorption

Drugs affecting the immune response

Methotrexate is a disease-modifying antirheumatic drug suitable for moderate to severe rheumatoid arthritis. **Azathioprine**, **ciclosporin**, **cyclophosphamide**, **leflunomide**, and the **cytokine modulators** are considered more toxic and they are used in cases that have not responded to other disease-modifying drugs.

Methotrexate is usually given in an initial dose of 7.5 mg by mouth once a week, adjusted according to response to a maximum of 15 mg once a week (occasionally 20 mg once a week). Regular full blood counts (including differential white cell count and platelet count), renal and liver function tests are required. In patients who experience mucosal or gastro-intestinal side-effects with methotrexate, folic acid 5 mg every week [unlicensed indication], on a different day from the methotrexate, may help to reduce the frequency of such side-effects.

Azathioprine is usually given in a dose of up to 2.5 mg/kg daily in divided doses. Blood counts are needed to detect possible neutropenia or thrombocytopenia (usually resolved by reducing the dose). Nausea, vomiting, and diarrhoea may occur, usually starting early during the course of treatment, and may necessitate withdrawal of the drug; herpes zoster infection may also occur.

Leflunomide acts on the immune system as a disease-modifying antirheumatic drug. Its therapeutic effect starts after 4–6 weeks and improvement may continue for a further 4–6 months. Leflunomide, which is similar

in efficacy to sulfasalazine and methotrexate, may be chosen when these drugs cannot be used. The active metabolite of leflunomide persists for a long period; active procedures to wash the drug out are required in case of serious adverse effects, or before starting treatment with another disease-modifying antirheumatic drug, or, in men or women, before conception. Side-effects of leflunomide include bone-marrow toxicity; its immunosuppressive effects increase the risk of infection and malignancy.

Ciclosporin is licensed for severe active rheumatoid arthritis when conventional second-line therapy is inappropriate or ineffective. There is some evidence that ciclosporin may retard the rate of erosive progression and improve symptom control in those who respond only partially to methotrexate.

Cyclophosphamide (section 8.1.1) may be used at a dose of 1 to 1.5 mg/kg daily by mouth for rheumatoid arthritis with severe systemic manifestations [unlicensed indication]; it is toxic and regular blood counts (including platelet counts) should be carried out. Cyclophosphamide can also be given intravenously in a dose of 0.5 to 1 g (with prophylactic mesna) for *severe systemic rheumatoid arthritis* and for other connective tissue diseases (especially with active vasculitis), repeated initially at fortnightly then at monthly intervals (according to clinical response and haematological monitoring).

Drugs that affect the immune response are also used in the management of severe cases of *systemic lupus erythematosus* and other connective tissue disorders. They are often given in conjunction with corticosteroids for patients with severe or progressive renal disease. They may be used in cases of *polymyositis* that are resistant to corticosteroids. They are used for their corticosteroid-sparing effect in patients whose corticosteroid requirements are excessive. **Azathioprine** is usually used.

In the specialist management of psoriatic arthritis affecting peripheral joints, leflunomide, methotrexate, or azathioprine [unlicensed indication] may be used.

AZATHIOPRINE

Indications see notes above; inflammatory bowel disease (section 1.5.3); autoimmune conditions and prophylaxis of transplantation rejection (section 8.2.1); severe refractory eczema [unlicensed indication] (section 13.5.3)

Cautions section 8.2.1

Contra-indications section 8.2.1

Hepatic impairment section 8.2.1

Renal impairment section 8.2.1

Pregnancy section 8.2.1

Breast-feeding section 8.2.1

Side-effects section 8.2.1

Dose

- By mouth, initially, rarely more than 3 mg/kg daily, reduced according to response; maintenance 1–3 mg/kg daily; consider withdrawal if no improvement within 3 months

Preparations

Section 8.2.1

CICLOSPORIN

(Ciclosporin)

Indications severe active rheumatoid arthritis when conventional second-line therapy inappropriate or ineffective; severe acute ulcerative colitis [unlicensed indication] (section 1.5.3); graft-versus-host disease (section 8.2.2); atopic dermatitis and psoriasis (section 13.5.3)

Cautions section 8.2.2

Additional cautions in rheumatoid arthritis ***Contra-indicated*** in abnormal renal function, uncontrolled hypertension (see also below), uncontrolled infections, and malignancy. Measure serum creatinine at least twice before treatment and monitor every 2 weeks for first 3 months, then every month for a further 3 months, then every 4–8 weeks depending on the stability of the disease, concomitant medication, and concomitant diseases, (or more frequently if dose increased or concomitant NSAIDs introduced or increased (see also ***interactions:*** Appendix 1 (ciclosporin)), reduce dose if serum creatinine increases more than 30% above baseline in more than 1 measurement; if above 50%, reduce dose by 50% (even if within normal range) and discontinue if reduction not successful within 1 month; monitor blood pressure (discontinue if hypertension develops that cannot be controlled by antihypertensive therapy); monitor hepatic function if concomitant NSAIDs given.

Hepatic impairment section 8.2.2

Renal impairment see Cautions above

Pregnancy see section 8.2.2

Breast-feeding section 8.2.2

Side-effects section 8.2.2

Dose

- By mouth, administered in accordance with expert advice, initially 2.5 mg/kg daily in 2 divided doses, if necessary increased gradually after 6 weeks; max. 4 mg/kg daily (discontinue if response insufficient after 3 months); dose adjusted according to response for maintenance and treatment reviewed after 6 months (continue only if benefits outweigh risks); CHILD and under 18 years, not recommended

Important For preparations and counselling and for advice on conversion between the preparations, see section 8.2.2

Preparations

Section 8.2.2

LEFLUNOMIDE

Indications (specialist use only) moderate to severe active rheumatoid arthritis; active psoriatic arthritis

Cautions impaired bone-marrow function including anaemia, leucopenia or thrombocytopenia (avoid if significant and due to causes other than rheumatoid arthritis); recent treatment with other hepatotoxic or myelotoxic disease-modifying antirheumatic drugs; washout procedures recommended for serious adverse effects or before switching to other disease-modifying antirheumatic drugs (consult product literature and see Washout Procedure, below); history of tuberculosis; exclude pregnancy before treatment; effective contraception **essential** during treatment and for at least 2 years after treatment in women and at least 3 months after treatment in men (plasma concentration monitoring required; waiting time before conception may be reduced with washout procedure—consult product literature and see Washout Procedure, below); monitor full blood count (including differential white cell count and platelet count) before treatment and every 2 weeks for 6 months then every 8 weeks; monitor liver function—see Hepatotoxicity, below; monitor blood pressure; **interactions:** Appendix 1 (leflunomide)

Hepatotoxicity Potentially life-threatening hepatotoxicity reported usually in the first 6 months; monitor liver function before treatment and every 2 weeks for first 6 months then

every 8 weeks. Discontinue treatment (and institute washout procedure—consult product literature and see Washout Procedure below) or reduce dose according to liver-function abnormality; if liver-function abnormality persists after dose reduction, discontinue treatment and institute washout procedure

Washout procedure To aid drug elimination in case of serious adverse effect, or before starting another disease-modifying antirheumatic drug, or before conception (see also Pregnancy below), stop treatment and give *either* colestyramine 8 g 3 times daily for 11 days *or* activated charcoal 50 g 4 times daily for 11 days; the concentration of the active metabolite after washout should be less than 20 micrograms/litre (measured on 2 occasions 14 days apart) in men or women before conception—consult product literature. Procedure may be repeated as necessary

Contra-indications severe immunodeficiency; severe hypoproteinaemia; serious infection

Hepatic impairment avoid—active metabolite may accumulate; see also Cautions above

Renal impairment manufacturer advises avoid in moderate or severe impairment—no information available

Pregnancy avoid—active metabolite teratogenic in *animal* studies; effective contraception essential during treatment and for at least 2 years after treatment in women and at least 3 months after treatment in men (see also Cautions above)

Breast-feeding present in milk in *animal* studies—manufacturer advises avoid

Side-effects diarrhoea, nausea, vomiting, anorexia, oral mucosal disorders, abdominal pain; increased blood pressure; headache, dizziness, asthenia, paraesthesia; leucopenia; tenosynovitis; alopecia, rash, dry skin, pruritus; *less commonly* taste disturbance, anxiety, hyperlipidaemia, hypokalaemia, hypophosphataemia, anaemia, thrombocytopenia, and tendon rupture; *rarely* hepatitis, jaundice (see Hepatotoxicity, above), interstitial lung disease, severe infection, eosinophilia, and pancytopenia; *very rarely* pancreatitis, hepatic failure (see Hepatotoxicity, above), peripheral neuropathy, vasculitis, progressive multifocal leucoencephalopathy, Stevens-Johnson syndrome, and toxic epidermal necrolysis; hypouricaemia, reduced sperm count, and renal failure also reported; **important:** discontinue treatment and institute washout procedure (see Washout Procedure under Cautions) in case of serious side-effect

Dose

- Rheumatoid arthritis, ADULT over 18 years, initially 100 mg once daily for 3 days, then 10–20 mg once daily
- Psoriatic arthritis, ADULT over 18 years, initially 100 mg once daily for 3 days, then 20 mg once daily

Leflunomide (Non-proprietary) PoM

Tablets, leflunomide, 10 mg, net price 30-tab pack = £15.82; 20 mg, 30-tab pack = £16.76. Label: 4

Arava® (Sanofi-Aventis) PoM

Tablets, f/c, leflunomide 10 mg (white), net price 30-tab pack = £51.13; 20 mg (yellow), 30-tab pack = £61.36; 100 mg (white), 3-tab pack = £30.67. Label: 4

METHOTREXATE

Indications see under dose; Crohn's disease [unlicensed indication] (section 1.5.3); malignant disease (section 8.1.3); psoriasis (section 13.5.3)

Cautions section 8.1; see Monitoring, Blood Count, Liver Toxicity, and Pulmonary Toxicity below; extreme caution in blood disorders (avoid if severe); peptic ulceration, ulcerative colitis, diarrhoea and ulcerative stomatitis (withdraw if stomatitis develops—may be first sign of gastro-intestinal toxicity); risk of accumulation in pleural effusion or ascites—drain before treatment; acute porphyria (section 9.8.2); **interactions:** see below and Appendix 1 (methotrexate)

Monitoring

In view of reports of blood dyscrasias (including fatalities) and liver cirrhosis with low-dose methotrexate patients should:

- have full blood count and renal and liver function tests before starting treatment and repeated every 1–2 weeks until therapy stabilised, thereafter patients should be monitored every 2–3 months[1]
- be advised to report all symptoms and signs suggestive of infection, especially sore throat

Treatment with folinic acid (as calcium folinate, section 8.1) may be required in acute toxicity

Blood count Bone marrow suppression can occur abruptly; factors likely to increase toxicity include advanced age, renal impairment, and concomitant use with another anti-folate drug (e.g. trimethoprim). A clinically significant drop in white cell count or platelet count calls for immediate withdrawal of methotrexate and introduction of supportive therapy

Liver toxicity Liver cirrhosis reported. Treatment should not be started or should be discontinued if any abnormality of liver function tests or liver biopsy is present or develops during therapy. Abnormalities can return to normal within 2 weeks after which treatment may be recommenced if judged appropriate

Pulmonary toxicity Pulmonary toxicity may be a special problem in rheumatoid arthritis (patient to seek medical attention if dyspnoea, cough or fever); monitor for symptoms at each visit—discontinue if pneumonitis suspected.

Aspirin and other NSAIDs If aspirin or other NSAIDs are given concurrently the dose of methotrexate should be carefully monitored. Patients should be advised to avoid self-medication with over-the-counter aspirin or ibuprofen

Contra-indications see Cautions above; active infection and immunodeficiency syndromes

Hepatic impairment avoid—dose-related toxicity; see also Cautions above

Renal impairment reduce dose; risk of nephrotoxicity at high doses; avoid in severe impairment

Pregnancy avoid (teratogenic; fertility may be reduced during therapy but this may be reversible); effective contraception required during and for at least 3 months after treatment in men or women; see also section 8.1

Breast-feeding discontinue breast-feeding; present in milk

Side-effects section 8.1; also anorexia, abdominal discomfort, dyspepsia, gastro-intestinal ulceration and bleeding, diarrhoea, toxic megacolon, hepatotoxicity (see Cautions above); hypotension, pericarditis, pericardial tamponade; pulmonary oedema, pleuritic pain, pulmonary fibrosis, interstitial pneumonitis (see also Pulmonary Toxicity above); anaphylactic reactions, urticaria; dizziness, chills, fever, drowsiness, insomnia, malaise, headache, mood changes, neurotoxicity, confusion, paraesthesia; precipitation of diabetes; menstrual disturbances, vaginitis, cystitis, reduced libido, impotence; blood disorders; haematuria, dysuria, renal failure; osteoporosis, arthralgia, myalgia, vasculitis; conjunctivitis, visual disturbance; rash, pruritus, Stevens-Johnson syndrome, toxic epidermal necrolysis, photosensitivity, changes in nail and skin pigmentation, telan-

1. Local protocols for frequency of monitoring may vary

giectasia, acne, furuncolosis, ecchymosis; injection-site reactions

Dose

- Moderate to severe active rheumatoid arthritis, by mouth, ADULT over 18 years, 7.5 mg once weekly, adjusted according to response; max. weekly dose 20 mg
- Severe active rheumatoid arthritis, by subcutaneous *or* by intramuscular *or* by intravenous injection, ADULT over 18 years, 7.5 mg once weekly, increased according to response by 2.5 mg weekly; max. weekly dose 25 mg
- CHILD under 18 years see *BNF for Children*

Important

Note that the above dose is a **weekly** dose. To avoid error with low-dose methotrexate, it is recommended that:

- the patient is carefully advised of the **dose** and **frequency** and the reason for taking methotrexate and any other prescribed medicine (e.g. folic acid);
- only one strength of methotrexate tablet (usually 2.5 mg) is prescribed and dispensed;
- the prescription and the dispensing label clearly show the dose and frequency of methotrexate administration;
- the patient is warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort, and dark urine), and respiratory effects (e.g. shortness of breath).

Methotrexate treatment booklets

Methotrexate treatment booklets should be issued where appropriate.

In **England**, **Wales**, and **Northern Ireland**, they are available for purchase from:

3M Security Print and Systems Limited
Gorse Street, Chadderton
Oldham
OL9 9QH
Tel: 0845 610 1112

GP practices can obtain supplies through their Local Area Team stores.

NHS Hospitals can order supplies from www.nhsforms.co.uk or by emailing nhsforms@mmm.com.

In **Scotland**, treatment booklets can be obtained by emailing stockorders.dppas@apsgroup.co.uk.

These booklets include advice for adults taking oral methotrexate for inflammatory conditions, and a section for recording results of blood tests and dosage information.

Methotrexate (Non-proprietary) PoM

Tablets, yellow, methotrexate 2.5 mg, net price 24-tab pack = £2.22, 28-tab pack = £2.60. Counselling, dose, treatment booklet, NSAIDs

Brands include *Maxtrex*®

Tablets, yellow, methotrexate 10 mg, net price 100-tab pack = £37.06. Counselling, dose, treatment booklet, NSAIDs

Parenteral preparations

See also section 8.1.3

Metoject® (Medac) PoM

Injection, prefilled syringe, methotrexate (as disodium salt) 50 mg/mL, net price 0.15 mL (7.5 mg) = £14.85, 0.2 mL (10 mg) = £15.29, 0.25 mL (12.5 mg) = £16.50, 0.3 mL (15 mg) = £16.57, 0.35 mL (17.5 mg) = £17.50), 0.4 mL (20 mg) = £17.84, 0.45 mL (22.5 mg) = £18.45, 0.5 mL (25 mg) = £18.48, 0.55 mL (27.5 mg) = £18.89, 0.6 mL (30 mg) = £18.95

Cytokine modulators

Cytokine modulators should be used under specialist supervision.

Adalimumab, certolizumab pegol, etanercept, golimumab, and infliximab inhibit the activity of tumour necrosis factor alpha (TNF-α).

Adalimumab is licensed for moderate to severe active *rheumatoid arthritis* when response to other disease-modifying antirheumatic drugs (including methotrexate) has been inadequate (see also NICE guidance October 2007, p. 721 and August 2010, p. 721); it is also licensed for severe, active, and progressive disease in adults not previously treated with methotrexate. In the treatment of rheumatoid arthritis, adalimumab should be used in combination with methotrexate, but it can be given alone if methotrexate is inappropriate. Adalimumab is also licensed for the treatment of active and progressive *psoriatic arthritis* (see also NICE guidance, p. 721) and severe active *ankylosing spondylitis* (see also NICE guidance, p. 721) that have not responded adequately to other disease-modifying antirheumatic drugs. It is also licensed for the treatment of severe axial spondyloarthritis without radiographic evidence of ankylosing spondylitis but with objective signs of inflammation, in patients who have had an inadequate response to, or are intolerant of NSAIDs. For the role of adalimumab in inflammatory bowel disease, see section 1.5.3. For the role of adalimumab in plaque psoriasis, see section 13.5.3. For the role of adalimumab in juvenile idiopathic arthritis see *BNF for Children*.

Certolizumab pegol is licensed for use in patients with moderate to severe active *rheumatoid arthritis* when response to disease-modifying antirheumatic drugs (including methotrexate) has been inadequate (see also NICE guidance, below). Certolizumab pegol can be used in combination with methotrexate, or as a monotherapy if methotrexate is not tolerated or is contra-indicated. Certolizumab pegol is also licensed for the treatment of severe active *ankylosing spondylitis* in patients who have had an inadequate response to, or are intolerant of NSAIDs. It is also licensed for the treatment of severe active *axial spondyloarthritis*, without radiographic evidence of ankylosing spondylitis but with objective signs of inflammation, in patients who have had an inadequate response to, or are intolerant of NSAIDs.

NICE guidance
Certolizumab pegol for the treatment of rheumatoid arthritis (February 2010)

Certolizumab pegol is an option for the treatment of patients with rheumatoid arthritis only if:

- certolizumab pegol is used as described in the NICE guidance (October 2007) for other tumour necrosis factor (TNF) inhibitors, (see Adalimumab, Etanercept and Infliximab for the treatment of Rheumatoid Arthritis, below) *and*
- the manufacturer provides the first 12 weeks of certolizumab pegol (10 prefilled 200-mg syringes) free of charge to all patients starting treatment.

www.nice.org.uk/TA186

Etanercept is licensed for the treatment of moderate to severe active *rheumatoid arthritis* either alone or in

combination with methotrexate when the response to other disease-modifying antirheumatic drugs is inadequate and in severe, active and progressive *rheumatoid arthritis* in patients not previously treated with methotrexate (see also NICE guidance October 2007, p. 721 and August 2010, p. 721). It is also licensed for the treatment of active and progressive *psoriatic arthritis* inadequately responsive to other disease-modifying antirheumatic drugs (see also NICE guidance, p. 721), and for severe *ankylosing spondylitis* inadequately responsive to conventional therapy (see also NICE guidance, p. 721). For the role of etanercept in juvenile idiopathic arthritis see *BNF for Children*. For the role of etanercept in plaque psoriasis, see section 13.5.3.

Golimumab is licensed in combination with methotrexate for the treatment of moderate to severe active *rheumatoid arthritis* when response to disease-modifying antirheumatic drug (DMARD) therapy (including methotrexate) has been inadequate (see also NICE guidance below); it is also licensed in combination with methotrexate for patients with severe, active, and progressive rheumatoid arthritis not previously treated with methotrexate. Golimumab is also licensed for the treatment of active and progressive *psoriatic arthritis*, as monotherapy or in combination with methotrexate, when response to DMARD therapy has been inadequate (see also NICE guidance below); it is also licensed for the treatment of severe active *ankylosing spondylitis* when there is an inadequate response to conventional treatment (see also NICE guidance below).

The *Scotttish Medicines Consortium* (p. 4) has advised (June 2012) that golimumab (*Simponi*®) is accepted for restricted use within NHS Scotland at a dose of 50 mg, alone or in combination with methotrexate, for the treatment of active and progressive psoriatic arthritis in adults whose disease has not responded to adequate trials of at least two standard DMARDs, administered either individually or in combination.

NICE guidance

Golimumab for the treatment of rheumatoid arthritis after the failure of previous disease-modifying antirheumatic drugs (June 2011)

Golimumab, in combination with methotrexate, is an option for the treatment of rheumatoid arthritis in adults who have had an inadequate response to conventional disease-modifying antirheumatic drugs (DMARDs) only, including methotrexate, if:

- golimumab is used as described in the NICE guidance (October 2007) for other tumour necrosis factor (TNF) inhibitors (see Adalimumab, etanercept, and infliximab for the treatment of rheumatoid arthritis, p. 721), *and*
- the manufacturer provides the 100-mg dose of golimumab at the same price as the 50-mg dose

Alternatively, golimumab, in combination with methotrexate, is an option for the treatment of rheumatoid arthritis in adults who have had an inadequate response to DMARDs including a TNF inhibitor, if:

- golimumab is used as described in the NICE guidance (August 2010) for other TNF inhibitors (see Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor, p. 721), *and*
- the manufacturer provides the 100-mg dose of golimumab at the same price as the 50-mg dose

www.nice.org.uk/TA225

NICE guidance

Golimumab for the treatment of psoriatic arthritis (April 2011)

Golimumab is an option for the treatment of active and progressive psoriatic arthritis in adults only if:

- golimumab is used as described in the NICE guidance (August 2010) for other tumour necrosis factor (TNF) inhibitors (see Etanercept, infliximab, and adalimumab for the treatment of psoriatic arthritis, p. 721), *and*
- the manufacturer provides the 100-mg dose of golimumab at the same price as the 50-mg dose

www.nice.org.uk/TA220

NICE guidance

Golimumab for the treatment of ankylosing spondylitis (August 2011)

Golimumab is an option for the treatment of severe, active ankylosing spondylitis in adults only if:

- Golimumab is used as described in the NICE guidance (May 2008) for adalimumab and etanercept (see Adalimumab, etanercept, and infliximab for the treatment of ankylosing spondylitis, p. 721), *and*
- the manufacturer provides the 100-mg dose of golimumab at the same price as the 50-mg dose

Patients who are already receiving golimumab for the treatment of severe, active ankylosing spondylitis who do not fulfil the criteria for treatment with adalimumab and etanercept, described in the NICE guidance (May 2008), can continue treatment until they and their specialist consider it appropriate to stop.

www.nice.org.uk/TA233

Infliximab is licensed for the treatment of active *rheumatoid arthritis* in combination with methotrexate when the response to other disease-modifying antirheumatic drugs, including methotrexate, is inadequate (see also NICE guidance October 2007, p. 721 and August 2010, p. 721); it is also licensed in combination with methotrexate for patients not previously treated with methotrexate or other DMARDs who have severe, active, and progressive rheumatoid arthritis. Infliximab is also licensed for the treatment of *ankylosing spondylitis*, in patients with severe axial symptoms who have not responded adequately to conventional therapy (but see also NICE guidance, p. 721) and in combination with methotrexate (or alone if methotrexate is not tolerated or is contra-indicated) for the treatment of active and progressive *psoriatic arthritis* which has not responded adequately to disease-modifying antirheumatic drugs (see also NICE guidance, p. 721).

Rituximab is licensed in combination with methotrexate for the treatment of severe active *rheumatoid arthritis* in patients whose condition has not responded adequately to other disease-modifying antirheumatic drugs (including one or more tumour necrosis factor inhibitors) or who are intolerant of them (see also NICE guidance, p. 721). For the role of rituximab in malignant disease, see section 8.2.3.

NICE guidance

Adalimumab, etanercept, and infliximab for the treatment of rheumatoid arthritis (October 2007)

The tumour necrosis factor alpha (TNF-α) inhibitors adalimumab, etanercept, and infliximab are options for the treatment of adults with active rheumatoid arthritis who have failed to respond to at least 2 disease-modifying antirheumatic drugs (DMARDs), including methotrexate (unless contra-indicated). TNF-α inhibitors should be given in combination with methotrexate; however, when methotrexate cannot be used because of intolerance or contra-indications, adalimumab or etanercept can be given as monotherapy.

Adalimumab, etanercept, and infliximab should be withdrawn if response is not adequate within 6 months. Response to treatment should be monitored at least every 6 months in patients who respond initially; treatment should be withdrawn if response is not maintained. An alternative TNF-α inhibitor may be considered for patients in whom treatment is withdrawn because of intolerance before the initial 6-month assessment of efficacy.

Use of TNF-α inhibitors for the treatment of severe, active, and progressive rheumatoid arthritis in adults not previously treated with methotrexate or other DMARDs is not recommended.

www.nice.org.uk/TA130

NICE guidance

Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010)

Rituximab, in combination with methotrexate, is an option for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or are intolerant of, other disease-modifying antirheumatic drugs (DMARDs), including at least 1 tumour necrosis factor (TNF) inhibitor. Repeat courses of rituximab should be given no more frequently than every 6 months, and should only be continued if an adequate response is achieved and maintained.

Adalimumab, etanercept, infliximab, or abatacept, in combination with methotrexate, are options for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or have an intolerance of, other DMARDs including at least 1 TNF inhibitor, and who cannot use rituximab because of contra-indications or intolerance. In patients who cannot use methotrexate because of intolerance or contra-indications, adalimumab or etanercept can be given as monotherapy. Treatment should be continued only if there is adequate response. Patients should be monitored at least every 6 months.

www.nice.org.uk/TA195

NICE guidance

Adalimumab, etanercept, and infliximab for the treatment of ankylosing spondylitis (May 2008)

Adalimumab or etanercept are treatment options for adults with severe active ankylosing spondylitis whose disease satisfies specific criteria for diagnosis where there is confirmation of sustained active spinal disease, and where treatment with two or more NSAIDs taken sequentially at maximum tolerated or recommended doses for 4 weeks has failed to control symptoms.

Response to adalimumab or etanercept treatment should be assessed at 12-week intervals and continued only if response is adequate. If response to treatment is not maintained, a repeat assessment should be made after a further 6 weeks and treatment discontinued if there is an inadequate response. Patients who are intolerant of adalimumab or etanercept during the initial 12 weeks may receive the alternative TNF-α inhibitor (adalimumab or etanercept). However an alternative TNF-α inhibitor is not recommended in patients who fail to respond initially or fail to maintain an adequate response.

Infliximab is not recommended for the treatment of ankylosing spondylitis. Patients who are already receiving infliximab for the treatment of ankylosing spondylitis can continue treatment until they and their specialist consider it appropriate to stop.

See full NICE guidance for specific criteria to diagnose severe active ankylosing spondylitis, confirm sustained active spinal disease, and assess response to treatment.

www.nice.org.uk/TA143

NICE guidance

Etanercept, infliximab, and adalimumab for the treatment of psoriatic arthritis (August 2010)

Etanercept, infliximab, or adalimumab are recommended for the treatment of active and progressive psoriatic arthritis in adults who have peripheral arthritis with at least 3 tender joints and at least 3 swollen joints, and who have not responded adequately to at least 2 standard disease-modifying antirheumatic drugs (used alone or in combination).

Etanercept, infliximab, and adalimumab should be discontinued if there is an inadequate response at 12 weeks.

www.nice.org.uk/TA199

Side-effects Adalimumab, certolizumab pegol, etanercept, golimumab, infliximab, and rituximab have been associated with infections, sometimes severe, including tuberculosis, septicaemia, and hepatitis B reactivation. Other side-effects include nausea, abdominal pain, worsening heart failure, hypersensitivity reactions, fever, headache, depression, antibody formation (including lupus erythematosus-like syndrome), pruritus, injection-site reactions, and blood disorders (including anaemia, leucopenia, thrombocytopenia, pancytopenia, and aplastic anaemia).

Abatacept prevents the full activation of T-lymphocytes. It is licensed for moderate to severe active *rheumatoid arthritis* in combination with methotrexate, in

patients unresponsive to other disease-modifying anti-rheumatic drugs (including methotrexate or a tumour necrosis factor (TNF) inhibitor); see also NICE guidance (August 2010), p. 721 and (April 2013), below. For the role of abatacept in juvenile idiopathic arthritis see *BNF for Children*. Abatacept is not recommended for use in combination with TNF inhibitors.

The *Scottish Medicines Consortium* (p. 4) has advised (July 2013) that abatacept (*Orencia*®) is accepted for restricted use within NHS Scotland for adults with severe active rheumatoid arthritis, confirmed on at least two occasions, one month apart. This advice is contingent upon continuing availability of abatacept at the price agreed in the patient access scheme.

NICE guidance
Abatacept for the treatment of rheumatoid arthritis after the failure of conventional disease-modifying antirheumatic drugs (April 2013)

Abatacept, in combination with methotrexate, is an option for the treatment of highly active rheumatoid arthritis in adults who have had an inadequate response to at least two conventional disease-modifying antirheumatic drugs, including methotrexate, if:

- abatacept is used as described in the NICE guidance (October 2007) for other tumour necrosis factor (TNF) inhibitors (see Adalimumab, etanercept, and infliximab for the treatment of rheumatoid arthritis, *and*
- the manufacturer provides abatacept with the discount agreed in the patient access scheme

Patients already receiving abatacept for this indication, who do not fulfil the critera for treatment should continue treatment until they and their specialist consider it appropriate to stop.

www.nice.org.uk/TA280

Anakinra inhibits the activity of interleukin-1. Anakinra (in combination with methotrexate) is licensed for the treatment of *rheumatoid arthritis* which has not responded to methotrexate alone; it is not, however, recommended for routine management of *rheumatoid arthritis*, see NICE guidance below.

The *Scottish Medicines Consortium* (p. 4) has advised (July 2002) that anakinra is **not** recommended for the treatment of rheumatoid arthritis within NHS Scotland.

NICE guidance
Anakinra for the treatment of rheumatoid arthritis (February 2009)

Anakinra is **not** recommended for the treatment of rheumatoid arthritis except when used in a controlled long-term clinical study. Patients who are already receiving anakinra for rheumatoid arthritis should continue treatment until they and their specialist consider it appropriate to stop.

Belimumab inhibits the activity of B-lymphocyte stimulator. Belimumab is licensed as adjunctive therapy in patients with active, autoantibody-positive systemic lupus erythematosus with a high degree of disease activity despite standard therapy. Infusion-related side-effects are reported commonly with belimumab, including severe or life-threatening hypersensitivity and infusion reactions. These occur predominantly during the first 2 infusions. Delay in the onset of acute hypersensitivity reactions has been observed; patients should remain under clinical supervision for several hours following at least the first 2 infusions. Premedication with an antihistamine, with or without an antipyretic, may be considered.

Tocilizumab antagonises the actions of interleukin-6. Tocilizumab is licensed for use in patients with moderate to severe active *rheumatoid arthritis* when response to at least one disease-modifying antirheumatic drug or tumour necrosis factor inhibitor has been inadequate, or in those who are intolerant of these drugs. Tocilizumab can be used in combination with methotrexate, or as monotherapy if methotrexate is not tolerated or is contra-indicated (see also NICE guidance below). For the role of tocilizumab in juvenile idiopathic arthritis see *BNF for Children*.

The *Scottish Medicines Consortium* (p. 4) has advised (August 2012) that tocilizumab (*RoActemra*®) is accepted for restricted use within NHS Scotland as monotherapy in patients who are intolerant to methotrexate or where continued treatment with methotrexate is inappropriate, for the treatment of moderate to severe active rheumatoid arthritis in adults who have either responded inadequately to, or who were intolerant to, previous therapy with one or more disease-modifying anti-rheumatic drugs or tumour necrosis factor inhibitors, in accordance with the British Society for Rhematology guidance on prescribing TNF-α blockers in adults with rheumatoid arthritis (2005).

NICE guidance
Tocilizumab for the treatment of rheumatoid arthritis (February 2012)

Tocilizumab, in combination with methotrexate, is recommended as an option for the treatment of rheumatoid arthritis in adults if:

- the disease has responded inadequately to disease-modifying anti-rheumatic drugs (DMARDs) **and** is used as described for tumour necrosis factor (TNF) inhibitor treatments (specifically the recommendations on disease activity and treatment) in the NICE guidance (October 2007) Adalimumab, etanercept and infliximab for the treatment of rheumatoid arthritis, p. 721 *or*
- the disease has responded inadequately to DMARDs and a TNF inhibitor and the patient cannot receive rituximab beacause of contra-indications or intolerance, **and** tocilizumab is used as described for TNF inhibitor treatments (specifically the recommendations on disease activity) in the NICE guidance (August 2010) Adalimumab, etanercept, infliximab, rituximab and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor, p. 721 *or*
- the disease has responded inadequately to one or more TNF inhibitor treatments and to rituximab
- **and** the manufacturer provides tocilizumab with the discount agreed as part of the patient access scheme.

Patients currently receiving tocilizumab for the treatment of rheumatoid arthritis who do not meet these criteria should have the option to continue treatment until they and their clinicians consider it appropriate to stop.

www.nice.org.uk/TA247

Ustekinumab inhibits the activity of interleukins 12 and 23. It is licensed for the treatment of active *psoriatic arthritis* (in combination with methotrexate or alone) in patients who have had an inadequate response to one or more disease-modifying antirheumatic drugs.

The *Scottish Medicines Consortium* (p. 4) has advised (February 2014) that ustekinumab (*Stelara*®) is accepted for restricted use within NHS Scotland either alone or in combination with methotrexate, for the treatment of active psoriatic arthritis in adults who have responded

inadequately to previous therapy with a non-biological disease-modifying anti-rheumatic drug, and failed on, or are unsuitable for, treatment with a TNF inhibitor.

ABATACEPT

Indications see under Cytokine Modulators, above

Cautions predisposition to infection (screen for latent tuberculosis and viral hepatitis); do not initiate until active infections are controlled; children should be brought up to date with current immunisation schedule (section 14.1) before initiating therapy; progressive multifocal leucoencephalopathy—discontinue treatment if neurological symptoms present; elderly (increased risk of side-effects); **interactions:** Appendix 1 (abatacept)

Contra-indications severe infection (see also Cautions)

Pregnancy manufacturer advises avoid unless essential—effective contraception required during treatment and for 14 weeks after last dose

Breast-feeding present in milk in *animal* studies—manufacturer advises avoid breast-feeding during treatment and for 14 weeks after last dose

Side-effects abdominal pain, diarrhoea, dyspepsia, nausea, vomiting, stomatitis, flushing, hypertension, cough, dizziness, fatigue, headache, paraesthesia, infection, leucopenia, pain in extremities, conjunctivitis; *less commonly* gastritis, tachycardia, bradycardia, palpitation, hypotension, bronchospasm, dyspnoea, hyperhidrosis, weight gain, depression, anxiety, sleep disorder, menstrual disturbances, basal and squamous cell carcinoma, skin papilloma, thrombocytopenia, arthralgia, visual disturbance, dry eye, bruising, alopecia, dry skin, psoriasis; *also reported* lymphoma, lung cancer

Dose

- Rheumatoid arthritis (see notes above), by intravenous infusion, ADULT over 18 years, body-weight less than 60 kg, 500 mg, repeated 2 weeks and 4 weeks after initial infusion, then every 4 weeks; body-weight 60–100 kg, 750 mg repeated 2 weeks and 4 weeks after initial infusion, then every 4 weeks; body-weight over 100 kg, 1 g repeated 2 weeks and 4 weeks after initial infusion, then every 4 weeks; by subcutaneous injection (following intravenous infusion loading dose), ADULT over 18 years, 125 mg given within a day of the loading dose, then 125 mg weekly
  Note Patients who are unable to receive an infusion may initiate subcutaneous abatacept without receiving an intravenous loading dose

  Polyarticular juvenile idiopathic arthritis CHILD 6–17 years, see *BNF for Children*
  Note Review treatment if no response within 6 months

Orencia® (Bristol-Myers Squibb) PoM

Intravenous infusion, powder for reconstitution, abatacept, net price 250-mg vial = £302.40
Electrolytes Na^+ <0.5 mmol/vial

Injection, abatacept, net price 125-mg pre-filled syringe = £302.40

ADALIMUMAB

Indications see under Cytokine Modulators above; inflammatory bowel disease (section 1.5.3); psoriasis (section 13.5.3)

Cautions predisposition to infection; monitor for infection before, during, and for 4 months after treatment (see also Tuberculosis below); do not initiate until active infections are controlled; discontinue if new serious infection develops; hepatitis B virus—monitor for active infection; children should be brought up to date with current immunisation schedule (section 14.1) before initiating therapy; mild heart failure (discontinue if symptoms develop or worsen—avoid in moderate or severe heart failure); demyelinating disorders (risk of exacerbation); history or development of malignancy; monitor for non-melanoma skin cancer before and during treatment, especially in patients with a history of PUVA treatment for psoriasis or extensive immunosuppressant therapy; **interactions:** Appendix 1 (adalimumab)

Tuberculosis Patients should be evaluated for tuberculosis before treatment. Active tuberculosis should be treated with standard treatment (section 5.1.9) for at least 2 months before starting adalimumab. Patients who have previously received adequate treatment for tuberculosis can start adalimumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting adalimumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with adalimumab. Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop

Blood disorders Patients should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop

Contra-indications severe infection (see also Cautions)

Pregnancy avoid; manufacturer advises effective contraception required during treatment and for at least 5 months after last dose

Breast-feeding avoid; manufacturer advises avoid for at least 5 months after last dose

Side-effects see under Cytokine Modulators (p. 721) and Cautions above; also vomiting, dyspepsia, gastrointestinal haemorrhage, dizziness, hyperlipidaemia, hypertension, oedema, flushing, chest pain, tachycardia, cough, dyspnoea, mood changes, sleep disturbances, anxiety, paraesthesia, haematuria, renal impairment, benign tumours, skin cancer, electrolyte disturbances, hyperuricaemia, dehydration, musculoskeletal pain, eye disorders, rash, dermatitis, onycholysis, impaired healing; *less commonly* dysphagia, pancreatitis, cholelithiasis, hepatic steatosis, cholecystitis, arrhythmias, vascular occlusion, aortic aneurysm, interstitial lung disease, pneumonitis, tremor, neuropathy, erectile dysfunction, nocturia, malignancy (including solid tumours, lymphoma, and leukaemia), rhabdomyolysis, hearing loss, tinnitus; *rarely* autoimmune hepatitis, myocardial infarction, demyelinating disorders; *also reported* pulmonary embolism, pleural effusion, sarcoidosis, Stevens-Johnson syndrome, cutaneous vasculitis, new onset or worsening psoriasis

Dose

- By subcutaneous injection, rheumatoid arthritis, ADULT over 18 years, 40 mg on alternate weeks; if necessary increased to 40 mg weekly in patients receiving adalimumab alone; review treatment if no response within 12 weeks

  Psoriatic arthritis, ankylosing spondylitis, severe axial spondyloarthritis, ADULT over 18 years, 40 mg on alternate weeks; discontinue treatment if no response within 12 weeks

  Polyarticular juvenile idiopathic arthritis, CHILD 2–18 years, see *BNF for Children*

Humira® (AbbVie) PoM

Injection, adalimumab, net price 40-mg prefilled pen or prefilled syringe = £352.14; 40 mg/0.8-mL vial = £352.14. Label: 10, alert card, counselling, tuberculosis and blood disorders

ANAKINRA

Indications see under Cytokine Modulators above

Cautions predisposition to infection; history of asthma (risk of serious infection); **interactions:** Appendix 1 (anakinra)

Blood disorders Neutropenia reported commonly. Monitor neutrophil count before treatment, then every month for 6 months, then every 3 months—discontinue if neutropenia develops. Patients should be instructed to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat, infection) develop

Contra-indications neutropenia

Renal impairment caution if eGFR 30–50 mL/minute/1.73 m^2; avoid if eGFR less than 30 mL/minute/1.73 m^2

Pregnancy manufacturer advises avoid; effective contraception must be used during treatment

Breast-feeding manufacturer advises avoid—no information available

Side-effects injection-site reactions; headache; infections, neutropenia (see also Cautions), and antibody formation; *also reported* malignancy

Dose

- By subcutaneous injection, ADULT over 18 years, 100 mg once daily

Kineret® (Swedish Orphan) PoM

Injection, anakinra, net price 100-mg prefilled syringe = £26.23. Counselling, blood disorder symptoms

BELIMUMAB

Indications see under Cytokine Modulators above

Cautions predisposition to infection; do not initiate until active infections controlled; history or development of malignancy; **interactions**: Appendix 1 (belimumab)

Renal impairment caution in severe impairment—no information available

Pregnancy avoid unless essential; manufacturer advises adequate contraception during treatment and for at least 4 months after last dose

Breast-feeding avoid—present in milk in *animal* studies

Side-effects see notes above; also diarrhoea, nausea, hypersensitivity reactions, vomiting, depression, insomnia, migraine, infections, pyrexia, leucopenia, pain in extremities

Dose

- By intravenous infusion, ADULT over 18 years, 10 mg/kg, repeated 2 weeks and 4 weeks after initial infusion, then every 4 weeks; review treatment if no response within 6 months

Benlysta® (GSK) ▼ PoM

Intravenous infusion, powder for reconstitution, belimumab, net price 120-mg vial = £121.50; 400-mg vial = £405.00

CERTOLIZUMAB PEGOL

Indications see under Cytokine Modulators above

Cautions predisposition to infection; monitor for infection before, during, and for 5 months after treatment (see also Tuberculosis below); do not initiate until active infections are controlled; discontinue if new serious infection develops until infection controlled; hepatitis B virus—monitor for active infection; mild heart failure (discontinue if symptoms develop or worsen—avoid in moderate to severe heart failure); demyelinating CNS disorders (risk of exacerbation); history or development of malignancy; **interactions**: Appendix 1 (certolizumab pegol)

Tuberculosis Patients should be evaluated for tuberculosis before treatment. Active tuberculosis should be treated with standard treatment (section 5.1.9) for at least 2 months before starting certolizumab pegol. Patients who have previously received adequate treatment for tuberculosis can start certolizumab pegol but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting certolizumab pegol. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with certolizumab pegol. Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop

Blood disorders Patients should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop

Contra-indications severe active infection (see also Cautions)

Pregnancy avoid; manufacturer advises adequate contraception during treatment and for at least 5 months after last dose

Breast-feeding manufacturer advises use only if potential benefit outweighs risk—no information available

Side-effects see under Cytokine Modulators (p. 721) and Cautions above; hypertension, sensory abnormalities, rash; *less commonly* ascites, cholestasis, gastrointestinal disorders (including perforation and ulcer), hepatic disorders, appetite disorders, cardiomyopathies (including heart failure), dyslipidaemia, syncope, oedema, dizziness, ischaemic coronary artery disorders, arrhythmias, asthma, pleural effusion, cough, peripheral neuropathy, tremor, anxiety, mood disorders, influenza-like illness, menstrual disorders, renal impairment, haematuria, malignancy (including solid tumours, lymphoma, and leukaemia), skin cancer, benign tumours, haemorrhage, electrolyte disorders, muscle disorders, visual disturbance, ocular inflammation, tinnitus, ecchymosis, impaired healing, alopecia, photosensitivity, acne, skin discoloration, nail disorders, new onset or worsening psoriasis, dermatitis; *rarely* cholelithiasis, splenomegaly, atrioventricular block, cerebrovascular accident, Raynaud's phenomenon, interstitial lung disease, impaired coordination, trigeminal neuralgia, seizures, thyroid disorders, sexual dysfunction, nephropathy; *also reported* multiple sclerosis

Dose

- By subcutaneous injection, rheumatoid arthritis, ADULT over 18 years, 400 mg, repeated 2 weeks and 4 weeks after initial injection, then 200 mg every 2 weeks; review treatment if no response within 12 weeks

  Severe ankylosing spondylitis, severe axial spondyloarthritis, ADULT over 18 years, 400 mg, repeated 2 weeks and 4 weeks after initial injection, then 200 mg

every 2 weeks *or* 400 mg every 4 weeks; review treatment if no response within 12 weeks

Cimzia® (UCB Pharma) PoM

Injection, certolizumab pegol, net price 200-mg prefilled syringe = £357.50. Label: 10, alert card, counselling, tuberculosis and blood disorders

ETANERCEPT

Indications see under Cytokine Modulators above

Cautions predisposition to infection (avoid if predisposition to septicaemia); significant exposure to herpes zoster virus—interrupt treatment and consider varicella–zoster immunoglobulin; hepatitis B virus—monitor for active infection; monitor for worsening hepatitis C infection; children should be brought up to date with current immunisation schedule (section 14.1) before initiating therapy; heart failure (risk of exacerbation); history or increased risk of demyelinating disorders; history or development of malignancy; monitor for skin cancer before and during treatment, particularly in those at risk (including patients with psoriasis or a history of PUVA treatment); history of blood disorders; diabetes mellitus; **interactions:** Appendix 1 (etanercept)

Tuberculosis Patients should be evaluated for tuberculosis before treatment. Active tuberculosis should be treated with standard treatment (section 5.1.9) for at least 2 months before starting etanercept. Patients who have previously received adequate treatment for tuberculosis can start etanercept but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting etanercept. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with etanercept. Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop

Blood disorders Patients should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop

Contra-indications active infection; avoid injections containing benzyl alcohol in neonates (see preparations below)

Hepatic impairment use with caution in moderate to severe alcoholic hepatitis

Pregnancy avoid—limited information available; manufacturer advises effective contraception required during treatment and for 3 weeks after last dose

Breast-feeding manufacturer advises avoid—present in milk in *animal* studies

Side-effects see under Cytokine Modulators (p. 721); also *less commonly* interstitial lung disease, skin cancer, uveitis, rash, new onset or worsening psoriasis; *rarely* demyelinating disorders, seizures, lymphoma, Stevens-Johnson syndrome, vasculitis; *very rarely* toxic epidermal necrolysis; *also reported* appendicitis, gastritis, oesophagitis, inflammatory bowel disease, vomiting, diabetes mellitus, malignancy (including solid tumours and leukaemia), macrophage activation syndrome, and cutaneous ulcer

Dose

- By subcutaneous injection, rheumatoid arthritis, psoriatic arthritis, ankylosing spondylitis, ADULT over 18 years, 25 mg twice weekly *or* 50 mg once weekly
  Juvenile idiopathic arthritis, CHILD 2–17 years, see *BNF for Children*

Enbrel® (Pfizer) PoM

Injection, powder for reconstitution, etanercept, net price 25-mg vial (with solvent) = £89.38. Label: 10, alert card, counselling, tuberculosis and blood disorders

Paediatric injection, powder for reconstitution, etanercept, net price 10-mg vial (with solvent) = £35.75; 25-mg vial (with solvent) = £89.38. Label: 10, alert card, counselling, tuberculosis and blood disorders

Excipients include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

Injection, etanercept, net price 25-mg prefilled syringe = £89.38; 50-mg prefilled pen or prefilled syringe = £178.75. Label: 10, alert card, counselling, tuberculosis and blood disorders

GOLIMUMAB

Indications see under Cytokine Modulators above; ulcerative colitis (section 1.5.3)

Cautions predisposition to infection; monitor for infection before, during, and for 5 months after treatment (see also Tuberculosis below); do not initiate until active infections are controlled; discontinue if new serious infection develops until infection controlled; hepatitis B virus—monitor for active infection; mild heart failure (discontinue if symptoms develop or worsen); demyelinating disorders (risk of exacerbation); history or development of malignancy; **interactions**: Appendix 1 (golimumab)

Tuberculosis Patients should be evaluated for tuberculosis before treatment. Active tuberculosis should be treated with standard treatment (section 5.1.9) for at least 2 months before starting golimumab. Patients who have previously received adequate treatment for tuberculosis can start golimumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting golimumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with golimumab. Patients who have tested negative for latent tuberculosis, and those who are receiving or who have completed treatment for latent tuberculosis, should be monitored closely for symptoms of active infection. All patients should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop

Blood disorders Patients should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop

Contra-indications severe active infection (see also Cautions); moderate or severe heart failure

Hepatic impairment manufacturer advises caution—no information available

Pregnancy use only if essential; manufacturer advises adequate contraception during treatment and for at least 6 months after last dose

Breast-feeding manufacturer advises avoid during and for at least 6 months after treatment—present in milk in *animal* studies

Side-effects see under Cytokine Modulators (p. 721) and under Cautions above; also dyspepsia, hypertension, dizziness, asthenia; *less commonly* constipation, taste disturbance, gastritis, colitis, stomatitis, gastro-oesophageal reflux disease, cholelithiasis, hepatic disorders, hyperlipidaemia, arrhythmia, ischaemic coronary artery disorders, Raynaud's syndrome, heart failure, thrombosis, flushing, bronchospasm, interstitial lung disease, demyelinating disorders, insomnia, paraesthesia, hyperglycaemia,

thyroid disorders, menstrual disorders, malignancy (including lymphoma, melanoma), bone fractures, visual disturbance, eye irritation, new onset or worsening psoriasis, alopecia, dermatitis; *rarely* impaired wound healing

Dose

- By subcutaneous injection, ADULT over 18 years, 50 mg once a month on the same date each month, review treatment if no response after 3–4 doses; body-weight over 100 kg, if inadequate response to 3–4 doses of 50 mg once a month, dose can be increased to 100 mg once a month, review treatment if inadequate response to this higher dose after 3–4 doses

  Note If dose administered more than 2 weeks late, subsequent doses should be administered on the new monthly due date

Simponi® (MSD) PoM

Injection, golimumab, net price 50-mg prefilled pen or prefilled syringe = £762.97; 100-mg prefilled pen = £1525.94. Label: 10, alert card, counselling, tuberculosis and blood disorders

INFLIXIMAB
