Figure 2398.-2. – Chromatogram for the test for composition of fatty acids of farmed cod-liver oil

Repeat the extraction 3 times and discard the lower layer after complete separation. Wash the combined upper layers with 4 quantities, each of 50 mL, of *water R*, and evaporate to dryness under a gentle current of *nitrogen R* at a temperature not exceeding 30 °C or in a rotary evaporator at a temperature not exceeding 30 °C under reduced pressure (water ejector). Dissolve the residue in sufficient *2-propanol R1* to give an expected concentration of vitamin A equivalent to 10-15 IU/mL.

Measure the absorbances of the solution at 300 nm, 310 nm, 325 nm and 334 nm and at the wavelength of maximum absorption with a suitable spectrophotometer in 1 cm specially matched cells, using *2-propanol R1* as the compensation liquid.

Calculate the content of vitamin A, as all-*trans*-retinol, in International Units per gram, using the following expression:

$$A_{325} \times \frac{1821}{100m} \times V$$

$A_{325}$  = absorbance at 325 nm;

$m$  = mass of the substance to be examined, in grams;

$V$  = total volume of solution containing 10-15 IU of vitamin A per millilitre;

1821 = conversion factor for the specific absorbance of all-*trans*-retinol, in International Units.

The above expression can be used only if  $A_{325}$  has a value of not greater than  $A_{325, \text{corr}}/0.970$ , where  $A_{325, \text{corr}}$  is the corrected absorbance at 325 nm and is given by the following equation:

$$A_{325, \text{corr}} = 6.815A_{325} - 2.555A_{310} - 4.260A_{334}$$

$A$  designates the absorbance at the wavelength indicated by the subscript.

If  $A_{325}$  has a value greater than  $A_{325, \text{corr}}/0.970$ , calculate the content of vitamin A using the following expression:

$$A_{325, \text{corr}} \times \frac{1821}{100m} \times V$$

The assay is not valid unless:

- the wavelength of maximum absorption lies between 323 nm and 327 nm;
- the absorbance at 300 nm relative to that at 325 nm is at most 0.73.

#### METHOD B

Liquid chromatography (2.2.29).

**Test solution.** Prepare duplicates. To 2.00 g in a round-bottomed flask, add 5 mL of a freshly prepared 100 g/L solution of *ascorbic acid R*, 10 mL of a freshly prepared 800 g/L solution of *potassium hydroxide R* and 100 mL of *anhydrous ethanol R*. Boil under a reflux condenser on a water-bath for 15 min. Add 100 mL of a 10 g/L solution of *sodium chloride R* and cool. Transfer the solution to a 500 mL separating funnel, rinsing the round-bottomed flask with about 75 mL of a 10 g/L solution of *sodium chloride R* and then with 150 mL of a mixture of equal volumes of *light petroleum R1* and *ether R*. Shake for 1 min. When the layers have separated completely, discard the lower layer and wash the upper layer, first with 50 mL of a 30 g/L solution of *potassium hydroxide R* in a 10 per cent *V/V* solution of *anhydrous ethanol R* and then with 3 quantities, each of 50 mL, of a 10 g/L solution of *sodium chloride R*. Filter the upper layer through 5 g of *anhydrous sodium sulfate R* on a fast filter paper into a 250 mL flask suitable for a rotary evaporator. Wash the funnel with 10 mL of fresh extraction mixture, filter and combine the upper layers. Distil them at

a temperature not exceeding 30 °C under reduced pressure (water ejector) and fill with *nitrogen R* when evaporation is completed. Alternatively, evaporate the solvent under a gentle current of *nitrogen R* at a temperature not exceeding 30 °C. Dissolve the residue in *2-propanol R*, transfer to a 25 mL volumetric flask and dilute to 25 mL with *2-propanol R*. Gentle heating in an ultrasonic bath may be required. *A large fraction of the white residue is cholesterol, constituting approximately 50 per cent m/m of the unsaponifiable matter of cod-liver oil.*

**Reference solution (a).** Prepare a solution of *retinol acetate CRS* in *2-propanol RI* so that 1 mL contains about 1000 IU of all-*trans*-retinol.

The exact concentration of reference solution (a) is assessed by ultraviolet absorption spectrophotometry (2.2.25). Dilute reference solution (a) with *2-propanol RI* to a presumed concentration of 10-15 IU/mL and measure the absorbance at 326 nm in matched 1 cm cells using *2-propanol RI* as the compensation liquid.

Calculate the content of vitamin A in International Units per millilitre of reference solution (a) using the following expression, taking into account the assigned content of *retinol acetate CRS*:

$A_{326}$  = absorbance at 326 nm;

$V_1$  = volume of reference solution (a) used;

$V_2$  = volume of the diluted solution;

1900 = conversion factor for the specific absorbance of *retinol acetate CRS*, in International Units.

**Reference solution (b).** Proceed as described for the test solution but using 2.00 mL of reference solution (a) in place of the substance to be examined.

The exact concentration of reference solution (b) is assessed by ultraviolet absorption spectrophotometry (2.2.25). Dilute reference solution (b) with *2-propanol RI* to a presumed all-*trans*-retinol concentration of 10-15 IU/mL and measure the absorbance at 325 nm in matched 1 cm cells using *2-propanol RI* as the compensation liquid.

Calculate the content of all-*trans*-retinol in International Units per millilitre of reference solution (b), using the following expression:

$$A_{325} \times \frac{1821 \times V_3}{100 \times V_4}$$

$A_1$  = area of the peak due to all-*trans*-retinol in the chromatogram obtained with the test solution;

$A_2$  = area of the peak due to all-*trans*-retinol in the chromatogram obtained with reference solution (b);

$V$  = volume of reference solution (a) treated (2.00 mL);

$m$  = mass of the substance to be examined in the test solution (2.00 g).

Boil under a reflux condenser on a water-bath for 30 min. Add 100 mL of a 10 g/L solution of *sodium chloride R* and cool the solution to room temperature. Shake for 1 min. When the layers have separated completely, discard the lower layer and wash the upper layer, first with 50 mL of a 30 g/L solution of *potassium hydroxide R* in a 10 per cent V/V solution of *anhydrous ethanol R*, and then with 3 quantities, each of 50 mL, of a 10 g/L solution of *sodium chloride R*. Column	0 - 55	170 → 225
	55 - 75	225
Injection port		250
Detector		280

**Detection:** flame ionisation.

**Injection:** 1  $\mu$ L, twice.

**System suitability:**

- the 15 fatty acids to be tested are satisfactorily identified from the chromatogram shown in Figure 1192.-1;
- injection of a mixture of equal amounts of *methyl palmitate R*, *methyl stearate R*, *methyl arachidate R* and *methyl behenate R* gives area percentages of 24.4, 24.8, 25.2 and 25.6 ( $\pm 0.5$  per cent), respectively;
- *resolution:* minimum 1.3 between the peaks due to methyl oleate and methyl *cis*-vaccenate; the resolution between the pair due to methyl gadoleate and methyl gondoate is sufficient for purposes of identification and area measurement.

Calculate the area per cent for each fatty acid methyl ester using the following expression:

$$\frac{A_x}{A_t} \times 100$$

$A_x$  = peak area of fatty acid  $x$ ;

$A_t$  = sum of the peak areas (up to C22:6 n-3).

The calculation is not valid unless:

- the total area is based only on peaks due solely to fatty acid methyl esters;
- the number of fatty acid methyl ester peaks exceeding 0.05 per cent of the total area is at least 24;

Figure 1192.-1. – Chromatogram for the test for composition of fatty acids of cod-liver oil (type A)

- the 24 largest peaks of the methyl esters account for more than 90 per cent of the total area. (These correspond to, in common elution order: 14:0, 15:0, 16:0, 16:1 n-7, 16:4 n-1, 18:0, 18:1 n-9, 18:1 n-7, 18:2 n-6, 18:3 n-3, 18:4 n-3, 20:1 n-11, 20:1 n-9, 20:1 n-7, 20:2 n-6, 20:4 n-6, 20:3 n-3, 20:4 n-3, 20:5 n-3, 22:1 n-11, 22:1 n-9, 21:5 n-3, 22:5 n-3, 22:6 n-3).

## ASSAY

**Vitamin A.** Carry out the test as rapidly as possible, avoiding exposure to actinic light and air, oxidising agents, oxidation catalysts (for example, copper and iron) and acids.

Use method A. If method A is found not to be valid, use method B.

## METHOD A

Ultraviolet absorption spectrophotometry (2.2.25).

**Test solution.** To 1.00 g in a round-bottomed flask, add 3 mL of a freshly prepared 50 per cent *m/m* solution of *potassium hydroxide R* and 30 mL of *anhydrous ethanol R*. Boil under reflux in a current of *nitrogen R* for 30 min. Cool rapidly and add 30 mL of *water R*. Extract with 50 mL of *ether R*. Repeat the extraction 3 times and discard the lower layer after complete separation. Wash the combined upper layers with 4 quantities, each of 50 mL, of *water R*, and evaporate to dryness under a gentle current of *nitrogen R* at a temperature not exceeding 30 °C or in a rotary evaporator at a temperature not exceeding 30 °C under reduced pressure (water ejector). Dissolve the residue in sufficient *2-propanol RI* to give an expected concentration of vitamin A equivalent to 10-15 IU/mL.

Measure the absorbances of the solution at 300 nm, 310 nm, 325 nm and 334 nm and at the wavelength of maximum absorption with a suitable spectrophotometer in 1 cm specially matched cells, using *2-propanol RI* as the compensation liquid.

Calculate the content of vitamin A, as *all-trans-retinol*, in International Units per gram, using the following expression:

$$A_{325} \times \frac{1821}{100m} \times V$$

$A_{325}$  = absorbance at 325 nm;

$m$  = mass of the substance to be examined, in grams;

$V$  = total volume of solution containing 10-15 IU of vitamin A per millilitre;

1821 = conversion factor for the specific absorbance of *all-trans-retinol*, in International Units.

The above expression can be used only if  $A_{325}$  has a value of not greater than  $A_{325, \text{corr}}/0.970$ , where  $A_{325, \text{corr}}$  is the corrected absorbance at 325 nm and is given by the following equation:

$$A_{325, \text{corr}} = 6.815A_{325} - 2.555A_{310} - 4.260A_{334}$$

$A$  designates the absorbance at the wavelength indicated by the subscript.

If  $A_{325}$  has a value greater than  $A_{325, \text{corr}}/0.970$ , calculate the content of vitamin A using the following expression:

$$A_{325, \text{corr}} \times \frac{1821}{100m} \times V$$

The assay is not valid unless:

- the wavelength of the maximum absorption lies between 323 nm and 327 nm;
- the absorbance at 300 nm relative to that at 325 nm is at most 0.73.

## METHOD B

Liquid chromatography (2.2.29).

**Test solution.** Prepare duplicates. To 2.00 g in a round-bottomed flask, add 5 mL of a freshly prepared 100 g/L solution of *ascorbic acid R*, 10 mL of a freshly prepared 800 g/L solution of *potassium hydroxide R* and 100 mL of *anhydrous ethanol R*. Boil under a reflux condenser on a water-bath for 15 min. Add 100 mL of a 10 g/L solution of *sodium chloride R* and cool.

Transfer the solution to a 500 mL separating funnel, rinsing the round-bottomed flask with about 75 mL of a 10 g/L solution of *sodium chloride R* and then with 150 mL of a mixture of equal volumes of *light petroleum RI* and *ether R*. Shake for 1 min. When the layers have separated completely, discard the lower layer and wash the upper layer, first with 50 mL of a 30 g/L solution of *potassium hydroxide R* in a 10 per cent *V/V* solution of *anhydrous ethanol R* and then with 3 quantities, each of 50 mL, of a 10 g/L solution of *sodium chloride R*. Filter the upper layer through 5 g of *anhydrous sodium sulfate R* on a fast filter paper into a 250 mL flask suitable for a rotary evaporator. Wash the funnel with 10 mL of fresh extraction mixture, filter and combine the upper layers. Distil them at a temperature not exceeding 30 °C under reduced pressure (water ejector) and fill with *nitrogen R* when evaporation is completed. Alternatively, evaporate the solvent under a gentle current of *nitrogen R* at a temperature not exceeding 30 °C. Dissolve the residue in *2-propanol R*, transfer to a 25 mL volumetric flask and dilute to 25 mL with *2-propanol R*. Gentle heating in an ultrasonic bath may be required. A large fraction of the white residue is *cholesterol*, constituting approximately 50 per cent *m/m* of the unsaponifiable matter of cod-liver oil.

**Reference solution (a).** Prepare a solution of *retinol acetate CRS* in *2-propanol RI* so that 1 mL contains about 1000 IU of *all-trans-retinol*.

The exact concentration of reference solution (a) is assessed by ultraviolet absorption spectrophotometry (2.2.25). Dilute reference solution (a) with *2-propanol RI* to a presumed concentration of 10-15 IU/mL and measure the absorbance at 326 nm in matched 1 cm cells using *2-propanol RI* as the compensation liquid.

Calculate the content of vitamin A in International Units per millilitre of reference solution (a) using the following expression, taking into account the assigned content of *retinol acetate CRS*:

$$A_{326} \times \frac{1900 \times V_2}{100 \times V_1}$$

$A_{326}$  = absorbance at 326 nm;

$V_1$  = volume of reference solution (a) used;

$V_2$  = volume of the diluted solution;

1900 = conversion factor for the specific absorbance of *retinol acetate CRS*, in International Units.

**Reference solution (b).** Proceed as described for the test solution but using 2.00 mL of reference solution (a) in place of the substance to be examined.

The exact concentration of reference solution (b) is assessed by ultraviolet absorption spectrophotometry (2.2.25). Dilute reference solution (b) with *2-propanol RI* to a presumed *all-trans-retinol* concentration of 10-15 IU/mL and measure the absorbance at 325 nm in matched 1 cm cells using *2-propanol RI* as the compensation liquid.

Calculate the content of *all-trans-retinol* in International Units per millilitre of reference solution (b), using the following expression:

$$A_{325} \times \frac{1821 \times V_3}{100 \times V_4}$$

$A_{325}$  = absorbance at 325 nm;

$V_3$  = volume of the diluted solution;

$V_4$  = volume of reference solution (b) used;

1821 = conversion factor for the specific absorbance of *all-trans-retinol*, in International Units.

**Column:**

– stationary phase: *octadecylsilyl silica gel for chromatography R* (5-10  $\mu\text{m}$ ).

*Mobile phase:* water R, methanol R (3:97 V/V).

*Flow rate:* 1 mL/min.

*Detection:* spectrophotometer at 325 nm.

*Injection:* 10 µL; inject in triplicate the test solution and reference solution (b).

*Retention time:* all-*trans*-retinol = 5 ± 1 min.

*System suitability:*

- the chromatogram obtained with the test solution shows a peak that corresponds to the peak due to all-*trans*-retinol in the chromatogram obtained with reference solution (b);
- the results obtained with the duplicate test solutions do not differ by more than 5 per cent;
- the recovery of all-*trans*-retinol in reference solution (b) as assessed by direct absorption spectrophotometry is greater than 95 per cent.

Calculate the content of vitamin A using the following expression:

$$A_1 \times \frac{C \times V}{A_2} \times \frac{1}{m}$$

- $A_1$  = area of the peak due to all-*trans*-retinol in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to all-*trans*-retinol in the chromatogram obtained with reference solution (b);
- $C$  = concentration of *retinol acetate CRS* in reference solution (a) as assessed prior to the saponification, in International Units per millilitre (= 1000 IU/mL);
- $V$  = volume of reference solution (a) treated (2.00 mL);
- $m$  = mass of the substance to be examined in the test solution (2.00 g).

**Vitamin D<sub>3</sub>.** Liquid chromatography (2.2.29). Carry out the assay as rapidly as possible, avoiding exposure to actinic light and air.

*Internal standard solution.* Dissolve 0.50 mg of *ergocalciferol CRS* in 100 mL of *anhydrous ethanol R*.

*Test solution (a).* To 4.00 g in a round-bottomed flask, add 5 mL of a freshly prepared 100 g/L solution of *ascorbic acid R*, 10 mL of a freshly prepared 800 g/L solution of *potassium hydroxide R* and 100 mL of *anhydrous ethanol R*. Boil under a reflux condenser on a water-bath for 30 min. Add 100 mL of a 10 g/L solution of *sodium chloride R* and cool the solution to room temperature. Transfer the solution to a 500 mL separating funnel, rinsing the round-bottomed flask with about 75 mL of a 10 g/L solution of *sodium chloride R* and then with 150 mL of a mixture of equal volumes of *light petroleum R1* and *ether R*. Shake for 1 min. When the layers have separated completely, discard the lower layer and wash the upper layer, first with 50 mL of a 30 g/L solution of *potassium hydroxide R* in a 10 per cent V/V solution of *anhydrous ethanol R*, and then with 3 quantities, each of 50 mL, of a 10 g/L solution of *sodium chloride R*. Filter the upper layer through 5 g of *anhydrous sodium sulfate R* on a fast filter paper into a 250 mL flask suitable for a rotary evaporator. Wash the funnel with 10 mL of fresh extraction mixture, filter and combine the upper layers. Distil them at a temperature not exceeding 30 °C under reduced pressure (water ejector) and fill with *nitrogen R* when evaporation is completed. Alternatively, evaporate the solvent under a gentle current of *nitrogen R* at a temperature not exceeding 30 °C. Dissolve the residue in 1.5 mL of the mobile phase described under Purification. Gentle heating in an ultrasonic bath may be required. A large fraction of the white residue is cholesterol, constituting approximately 50 per cent m/m of the unsaponifiable matter of cod-liver oil.

*Test solution (b).* Prepare duplicates. To 4.00 g add 2.0 mL of the internal standard solution and proceed as described for test solution (a).

## System suitability:

- the 15 fatty acids to be tested are satisfactorily identified from the chromatogram shown in Figure 1193.-1;
- injection of a mixture of equal amounts of *methyl palmitate R*, *methyl stearate R*, *methyl arachidate R*, and *methyl behenate R* give area percentages of 24.4, 24.8, 25.2 and 25.6 (± 0.5 per cent), respectively;
- *resolution*: minimum of 1.3 between the peaks due to methyl oleate and methyl *cis*-vaccenate; the resolution between the pair due to methyl gadoleate and methyl gondoate is sufficient for purposes of identification and area measurement.

Calculate the area per cent for each fatty acid methyl ester using the following expression:

$$\frac{A_x}{A_t} \times 100$$

$A_x$  = peak area of fatty acid  $x$ ;

$A_t$  = sum of the peak areas (up to C22:6 n-3).

The calculation is not valid unless:

- the total area is based only on peaks due to solely fatty acids methyl esters;
- the number of fatty acid methyl ester peaks exceeding 0.05 per cent of the total area is at least 24;
- the 24 largest peaks of the methyl esters account for more than 90 per cent of the total area. (These correspond to, in common elution order: 14:0, 15:0, 16:0, 16:1 n-7, 16:4 n-1, 18:0, 18:1 n-9, 18:1 n-7, 18:2 n-6, 18:3 n-3, 18:4 n-3, 20:1 n-11, 20:1 n-9, 20:1 n-7, 20:2 n-6, 20:4 n-6, 20:3 n-3, 20:4 n-3, 20:5 n-3, 22:1 n-11, 22:1 n-9, 21:5 n-3, 22:5 n-3, 22:6 n-3).

## ASSAY

**Vitamin A.** Carry out the test as rapidly as possible, avoiding exposure to actinic light and air, oxidising agents, oxidation catalysts (for example, copper and iron) and acids.

Use method A. If method A is found not to be valid, use method B.

## METHOD A

Ultraviolet absorption spectrophotometry (2.2.25).

**Test solution.** To 1.00 g in a round-bottomed flask, add 3 mL of a freshly prepared 50 per cent *m/m* solution of *potassium hydroxide R* and 30 mL of *anhydrous ethanol R*. Boil under reflux in a current of *nitrogen R* for 30 min. Cool rapidly and add 30 mL of *water R*. Extract with 50 mL of *ether R*. Repeat the extraction 3 times and discard the lower layer after complete separation. Wash the combined upper layers with 4 quantities, each of 50 mL, of *water R* and evaporate to dryness under a gentle current of *nitrogen R* at a temperature not exceeding 30 °C or in a rotary evaporator at a temperature not exceeding 30 °C under reduced pressure (water ejector). Dissolve the residue in sufficient *2-propanol R1* to give an expected concentration of vitamin A equivalent to 10-15 IU/mL. Measure the absorbances of the solution at 300 nm, 310 nm, 325 nm and 334 nm and at the wavelength of maximum absorption with a suitable spectrophotometer in 1 cm specially matched cells, using *2-propanol R1* as the compensation liquid. Calculate the content of vitamin A, as all-*trans*-retinol, in International Units per gram using the following expression:

$$A_{325} \times \frac{1821}{100m} \times V$$

$A_{325}$  = absorbance at 325 nm;

$m$  = mass of the substance to be examined, in grams;

$V$  = total volume of solution containing 10-15 IU of vitamin A per millilitre;

1821 = conversion factor for the specific absorbance of all-*trans*-retinol, in International Units.

The above expression can be used only if  $A_{325}$  has a value of not greater than  $A_{325,corr}/0.970$  where  $A_{325,corr}$  is the corrected absorbance at 325 nm and is given by the equation:

$$A_{325,corr} = 6.815A_{325} - 2.555A_{310} - 4.260A_{334}$$

$A$  designates the absorbance at the wavelength indicated by the subscript.

Figure 1193.-1. – Chromatogram for the test for composition of fatty acids of cod-liver oil (type B)

If  $A_{325}$  has a value greater than  $A_{325, \text{corr}}/0.970$ , calculate the content of vitamin A using the following expression:

$$A_{325, \text{corr}} \times \frac{1821}{100m} \times V$$

The assay is not valid unless:

- the wavelength of maximum absorption lies between 323 nm and 327 nm;
- the absorbance at 300 nm relative to that at 325 nm is at most 0.73.

#### METHOD B

Liquid chromatography (2.2.29).

**Test solution.** Prepare duplicates. To 2.00 g in a round-bottomed flask, add 5 mL of a freshly prepared 100 g/L solution of *ascorbic acid R* and 10 mL of a freshly prepared 800 g/L solution of *potassium hydroxide R* and 100 mL of *anhydrous ethanol R*. Boil under a reflux condenser on a water-bath for 15 min. Add 100 mL of a 10 g/L solution of *sodium chloride R* and cool. Transfer the solution to a 500 mL separating funnel rinsing the round-bottomed flask with about 75 mL of a 10 g/L solution of *sodium chloride R* and then with 150 mL of a mixture of equal volumes of *ether R* and *light petroleum RI*. Shake for 1 min. When the layers have separated completely, discard the lower layer and wash the upper layer, first with 50 mL of a 30 g/L solution of *potassium hydroxide R* in a 10 per cent V/V solution of *anhydrous ethanol R* and then with 3 quantities, each of 50 mL, of a 10 g/L solution of *sodium chloride R*. Filter the upper layer through 5 g of *anhydrous sodium sulfate R* on a fast filter paper into a 250 mL flask suitable for a rotary evaporator. Wash the funnel with 10 mL of fresh extraction mixture, filter and combine the upper layers. Distil them at a temperature not exceeding 30 °C under reduced pressure (water ejector) and fill with *nitrogen R* when evaporation is completed. Alternatively evaporate the solvent under a gentle current of *nitrogen R* at a temperature not exceeding 30 °C. Dissolve the residue in *2-propanol R*, transfer to a 25 mL volumetric flask and dilute to 25 mL with *2-propanol R*. Gentle heating in an ultrasonic bath may be required. (A large fraction of the white residue is cholesterol, constituting approximately 50 per cent of the unsaponifiable matter of cod-liver oil).

**Reference solution (a).** Prepare a solution of *retinol acetate CRS* in *2-propanol RI* so that 1 mL contains about 1000 IU of all-*trans*-retinol.

The exact concentration of reference solution (a) is assessed by ultraviolet absorption spectrophotometry (2.2.25). Dilute reference solution (a) with *2-propanol RI* to a presumed concentration of 10-15 IU/mL and measure the absorbance at 326 nm in matched 1 cm cells using *2-propanol RI* as the compensation liquid.

Calculate the content of vitamin A in International Units per millilitre of reference solution (a) using the following expression, taking into account the assigned content of *retinol acetate CRS*:

$$A_{326} \times \frac{1900 \times V_2}{100 \times V_1}$$

$A_{326}$  = absorbance at 326 nm;

$V_1$  = volume of reference solution (a) used;

$V_2$  = volume of the diluted solution;

1900 = conversion factor for the specific absorbance of *retinol acetate CRS*, in International Units.

**Reference solution (b).** Proceed as described for the test solution but using 2.00 mL of reference solution (a) in place of the substance to be examined.

The exact concentration of reference solution (b) is assessed by ultraviolet absorption spectrophotometry (2.2.25). Dilute reference solution (b) with *2-propanol RI* to a presumed

concentration of 10-15 IU/mL of all-*trans*-retinol and measure the absorbance at 325 nm in matched 1 cm cells using *2-propanol RI* as the compensation liquid.

Calculate the content of all-*trans*-retinol in International Units per millilitre of reference solution (b) from the expression:

$$A_{325} \times \frac{1821 \times V_3}{100 \times V_4}$$

$A_{325}$  = absorbance at 325 nm;

$V_3$  = volume of the diluted solution;

$V_4$  = volume of reference solution (b) used;

1821 = conversion factor for the specific absorbance of all-*trans*-retinol, in International Units.

**Column:**

– size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;

– stationary phase: *octadecylsilyl silica gel for chromatography R* (5-10  $\mu\text{m}$ ).

**Mobile phase:** *water R*, *methanol R* (3:97 V/V).

**Flow rate:** 1 mL/min.

**Detection:** spectrophotometer at 325 nm.

**Injection:** 10  $\mu\text{L}$ ; inject in triplicate the test solution and reference solution (b).

**Retention time:** all-*trans*-retinol =  $5 \pm 1$  min.

**System suitability:**

- the chromatogram obtained with the test solution shows a peak due to that of all-*trans*-retinol in the chromatogram obtained with reference solution (b);
- the results obtained with the duplicate test solutions do not differ by more than 5 per cent;
- the recovery of all-*trans*-retinol in reference solution (b) as assessed by direct absorption spectrophotometry is greater than 95 per cent.

Calculate the content of vitamin A using the following expression:

$$A_1 \times \frac{C \times V}{A_2} \times \frac{1}{m}$$

$A_1$  = area of the peak due to all-*trans*-retinol in the chromatogram obtained with the test solution;

$A_2$  = area of the peak due to all-*trans*-retinol in the chromatogram obtained with reference solution (b);

$C$  = concentration of *retinol acetate CRS* in reference solution (a) as assessed prior to the saponification, in International Units per millilitre (= 1000 IU/mL);

$V$  = volume of reference solution (a) treated (2.00 mL);

$m$  = mass of the substance to be examined in the test solution (2.00 g).

**Vitamin D<sub>3</sub>.** Liquid chromatography (2.2.29). Carry out the assay as rapidly as possible, avoiding exposure to actinic light and air.

**Internal standard solution.** Dissolve 0.50 mg of *ergocalciferol CRS* in 100 mL of *anhydrous ethanol R*.

**Test solution (a).** To 4.00 g in a round-bottomed flask, add 5 mL of a freshly prepared 100 g/L solution of *ascorbic acid R*, 10 mL of a freshly prepared 800 g/L solution of *potassium hydroxide R* and 100 mL of *anhydrous ethanol R*. Boil under a reflux condenser on a water-bath for 30 min. Add 100 mL of a 10 g/L solution of *sodium chloride R* and cool the solution to room temperature. Transfer the solution to a 500 mL separating funnel rinsing the round-bottomed flask with about 75 mL of a 10 g/L solution of *sodium chloride R* and then with 150 mL of a mixture of equal volumes of *ether R* and *light petroleum RI*. Shake for 1 min. When the layers have separated completely, discard the lower layer and wash the upper layer, first with 50 mL of a 30 g/L solution of *potassium hydroxide R* in a 10 per cent V/V solution of *anhydrous ethanol R*, and then

with 3 quantities, each of 50 mL, of a 10 g/L solution of *sodium chloride R*. Filter the upper layer through 5 g of *anhydrous sodium sulfate R* on a fast filter paper into a 250 mL flask suitable for a rotary evaporator. Wash the funnel with 10 mL of fresh extraction mixture, filter and combine the upper layers. Distil them at a temperature not exceeding 30 °C under reduced pressure (water ejector) and fill with *nitrogen R* when evaporation is completed. Alternatively evaporate the solvent under a gentle current of *nitrogen R* at a temperature not exceeding 30 °C. Dissolve the residue in 1.5 mL of the mobile phase described under Purification. Gentle heating in an ultrasonic bath may be required. (A large fraction of the white residue is cholesterol, constituting approximately 50 per cent *m/m* of the unsaponifiable matter of cod-liver oil).

**Test solution (b).** Prepare duplicates. To 4.00 g add 2.0 mL of the internal standard solution and proceed as described for test solution (a).

**Reference solution (a).** Dissolve 0.50 mg of *cholecalciferol CRS* in 100.0 mL of *anhydrous ethanol R*.

**Reference solution (b).** In a round-bottomed flask, add 2.0 mL of reference solution (a) and 2.0 mL of the internal standard solution and proceed as described for test solution (a).

## COTTON, ABSORBENT

### Lanugo gossypii absorbens

#### DEFINITION

Absorbent cotton consists of new fibres or good quality combers obtained from the seed-coat of various species of the genus *Gossypium* L., cleaned, purified, bleached and carefully carded. It may not contain any compensatory colouring matter.

#### CHARACTERS

It is white or almost white and is composed of fibres of average length not less than 10 mm, determined by a suitable method, and contains not more than traces of leaf residue, pericarp, seed-coat or other impurities. It offers appreciable resistance when pulled. It does not shed any appreciable quantity of dust when gently shaken.

#### IDENTIFICATION

- A. Examined under a microscope, each fibre is seen to consist of a single cell, up to about 4 cm long and up to 40  $\mu$ m wide, in the form of a flattened tube with thick and rounded walls and often twisted.
- B. When treated with *iodinated zinc chloride solution R*, the fibres become violet.
- C. To 0.1 g add 10 mL of *zinc chloride-formic acid solution R*. Heat to 40 °C and allow to stand for 2 h 30 min, shaking occasionally. It does not dissolve.

#### TESTS

**Solution S.** Place 15.0 g in a suitable vessel, add 150 mL of *water R*, close the vessel and allow to macerate for 2 h. Decant the solution, squeeze the residual liquid carefully from the sample with a glass rod and mix. Reserve 10 mL of the solution for the test for surface-active substances and filter the remainder.

**Acidity or alkalinity.** To 25 mL of solution S add 0.1 mL of *phenolphthalein solution R* and to another 25 mL add 0.05 mL of *methyl orange solution R*. Neither solution is pink.

**Foreign fibres.** Examined under a microscope, it is seen to consist exclusively of typical cotton fibres, except that occasionally a few isolated foreign fibres may be present.

**Fluorescence.** Examine a layer about 5 mm in thickness under ultraviolet light at 365 nm. It displays only a slight brownish-violet fluorescence and a few yellow particles. It shows no intense blue fluorescence, apart from that which may be shown by a few isolated fibres.

**Neps.** Spread about 1 g evenly between 2 colourless transparent plates each 10 cm square. Examine for neps by transmitted light and compare with *Cotton wool standard for neps CRS*. The product to be examined is not more neppy than the standard.

#### Absorbency

**Apparatus.** A dry cylindrical copper wire basket 8.0 cm high and 5.0 cm in diameter. The wire of which the basket is constructed is about 0.4 mm in diameter, the mesh is 1.5 cm to 2.0 cm wide and the mass of the basket is  $2.7 \pm 0.3$  g.

01/2008:1305  
corrected 7.0

**Sinking time.** Not more than 10 s. Weigh the basket to the nearest centigram ( $m_1$ ). Take a total of 5.00 g in approximately equal quantities from 5 different places in the product to be examined, place loosely in the basket and weigh the filled basket to the nearest centigram ( $m_2$ ). Fill a beaker 11 cm to 12 cm in diameter to a depth of 10 cm with water at about 20 °C. Hold the basket horizontally and drop it from a height of about 10 mm into the water. Measure with a stopwatch the time taken for the basket to sink below the surface of the water. Calculate the result as the average of 3 tests.

**Water-holding capacity.** Not less than 23.0 g of water per gram. After the sinking time has been measured, remove the basket from the water, allow it to drain for exactly 30 s suspended in a horizontal position over the beaker, transfer it to a tared beaker ( $m_3$ ) and weigh to the nearest centigram ( $m_4$ ). Calculate the water-holding capacity per gram of absorbent cotton using the following expression:

$$\frac{m_4 - (m_2 + m_3)}{m_2 - m_1}$$

Calculate the result as the average of 3 tests.

**Ether-soluble substances.** Not more than 0.50 per cent. In an extraction apparatus, extract 5.00 g with *ether R* for 4 h at a rate of at least 4 extractions per hour. Evaporate the ether extract and dry the residue to constant mass at 100 °C to 105 °C.

**Extractable colouring matter.** In a narrow percolator, slowly extract 10.0 g with *alcohol R* until 50 mL of extract is obtained. The liquid obtained is not more intensely coloured (2.2.2, *Method II*) than reference solution  $Y_5$ ,  $GY_6$  or a reference solution prepared as follows: to 3.0 mL of blue primary solution add 7.0 mL of hydrochloric acid (10 g/L HCl). Dilute 0.5 mL of this solution to 10.0 mL with hydrochloric acid (10 g/L HCl).

**Surface-active substances.** Introduce the 10 mL portion of solution S reserved before filtration into a 25 mL graduated ground-glass-stoppered cylinder with an external diameter of 20 mm and a wall thickness of not greater than 1.5 mm, previously rinsed 3 times with *sulfuric acid R* and then with *water R*. Shake vigorously 30 times in 10 s, allow to stand for 1 min and repeat the shaking. After 5 min, any foam present must not cover the entire surface of the liquid.

**Water-soluble substances.** Not more than 0.50 per cent. Boil 5.000 g in 500 mL of *water R* for 30 min, stirring frequently. Replace the water lost by evaporation. Decant the liquid, squeeze the residual liquid carefully from the sample with a glass rod and mix. Filter the liquid whilst hot. Evaporate 400 mL of the filtrate (corresponding to 4/5 of the mass of the sample taken) and dry the residue to constant mass at 100 °C to 105 °C.

**Loss on drying (2.2.32).** Not more than 8.0 per cent, determined on 5.000 g by drying in an oven at 105 °C.

**Sulfated ash (2.4.14).** Not more than 0.40 per cent. Introduce 5.00 g into a previously heated and cooled, tared crucible. Heat cautiously over a naked flame and then carefully to dull redness at 600 °C. Allow to cool, add a few drops of *dilute sulfuric acid R*, then heat and incinerate until all the black particles have disappeared. Allow to cool. Add a few drops of *ammonium carbonate solution R*. Evaporate and incinerate carefully, allow to cool and weigh again. Repeat the incineration for periods of 5 min to constant mass.

## STORAGE

Store in a dust-proof package in a dry place.

## CROSCARMELLOSE SODIUM

### Carmellosum natricum conexum

**DEFINITION**

Cross-linked sodium carboxymethylcellulose.

Sodium salt of a cross-linked, partly *O*-carboxymethylated cellulose.

**CHARACTERS**

**Appearance:** white or greyish-white powder.

**Solubility:** practically insoluble in acetone, in anhydrous ethanol and in toluene.

**IDENTIFICATION**

- Mix 1 g with 100 mL of a solution containing 4 ppm of *methylene blue R*, stir the mixture and allow it to settle. The substance to be examined absorbs the methylene blue and settles as a blue, fibrous mass.
- Mix 1 g with 50 mL of *water R*. Transfer 1 mL of the mixture to a small test-tube and add 1 mL of *water R* and 0.05 mL of a freshly prepared 40 g/L solution of *α-naphthol R* in *methanol R*. Incline the test-tube and carefully add 2 mL of *sulfuric acid R* down the side so that it forms a lower layer. A reddish-violet colour develops at the interface.
- The solution prepared from the sulfated ash in the test for heavy metals (see Tests) gives reaction (a) of sodium (2.3.1).

**TESTS**

**pH (2.2.3):** 5.0 to 7.0 for the suspension.

Shake 1 g with 100 mL of *carbon dioxide-free water R* for 5 min.

**Sodium chloride and sodium glycollate:** maximum 0.5 per cent (dried substance) for the sum of the percentage contents of sodium chloride and sodium glycollate.

**Sodium chloride.** Place 5.00 g in a 250 mL conical flask, add 50 mL of *water R* and 5 mL of *strong hydrogen peroxide solution R* and heat on a water-bath for 20 min, stirring occasionally to ensure total hydration. Cool, add 100 mL of *water R* and 10 mL of *nitric acid R*. Titrate with 0.05 M *silver nitrate*, determining the end-point potentiometrically (2.2.20) using a silver indicator electrode and a double-junction reference electrode containing a 100 g/L solution of *potassium nitrate R* in the outer jacket and a standard filling solution in the inner jacket, and stirring constantly.

1 mL of 0.05 M *silver nitrate* is equivalent to 2.922 mg of NaCl.

**Sodium glycollate.** Place a quantity of the substance to be examined equivalent to 0.500 g of the dried substance in a 100 mL beaker. Add 5 mL of *glacial acetic acid R* and 5 mL of *water R* and stir to ensure total hydration (about 15 min). Add 50 mL of *acetone R* and 1 g of *sodium chloride R*. Stir for several minutes to ensure complete precipitation of the carboxymethylcellulose. Filter through a fast filter paper impregnated with *acetone R* into a volumetric flask, rinse the beaker and the filter with 30 mL of *acetone R* and dilute the filtrate to 100.0 mL with the same solvent. Allow to stand for 24 h without shaking. Use the clear supernatant to prepare the test solution.

Prepare the reference solutions as follows: in a 100 mL volumetric flask, dissolve 0.100 g of *glycollic acid R*, previously dried *in vacuo* over *diphosphorus pentoxide R* at room

temperature overnight, in *water R* and dilute to 100.0 mL with the same solvent; use the solution within 30 days; transfer 1.0 mL, 2.0 mL, 3.0 mL and 4.0 mL of the solution to separate volumetric flasks, dilute the contents of each flask to 5.0 mL with *water R*, add 5 mL of *glacial acetic acid R*, dilute to 100.0 mL with *acetone R* and mix.

Transfer 2.0 mL of the test solution and 2.0 mL of each of the reference solutions to separate 25 mL volumetric flasks. Heat the uncovered flasks for 20 min on a water-bath to eliminate acetone. Allow to cool and add 5.0 mL of *2,7-dihydroxynaphthalene solution R* to each flask. Mix, add a further 15.0 mL of *2,7-dihydroxynaphthalene solution R* and mix again. Close the flasks with aluminium foil and heat on a water-bath for 20 min. Cool and dilute to 25.0 mL with *sulfuric acid R*.

Measure the absorbance (2.2.25) of each solution at 540 nm. Prepare a blank using 2.0 mL of a solution containing 5 per cent *V/V* each of *glacial acetic acid R* and *water R* in *acetone R*. Prepare a standard curve using the absorbances obtained with the reference solutions. From the standard curve and the absorbance of the test solution, determine the mass (*a*) of glycollic acid in the substance to be examined, in milligrams, and calculate the content of sodium glycollate using the following expression:

$$\frac{10 \times 1.29 \times a}{(100 - b) m}$$

- 1.29 = the factor converting glycollic acid to sodium glycollate;  
*b* = loss on drying as a percentage;

Disperse 10.00 g in 800.0 mL of *water R* and stir for 1 min every 10 min during the first 30 min. Allow to stand for 1 h and centrifuge if necessary. Decant 200.0 mL of the supernatant liquid onto a fast filter paper in a vacuum filtration funnel, apply vacuum and collect 150.0 mL of the filtrate. Evaporate to dryness and dry the residue at 100-105 °C for 4 h.

TYMC: acceptance criterion 10<sup>2</sup> CFU/g (2.6.12).

Absence of *Escherichia coli* (2.6.13).

#### FUNCTIONALITY-RELATED CHARACTERISTICS

*This section provides information on characteristics that are recognised as being relevant control parameters for one or more functions of the substance when used as an excipient (see chapter 5.15). This section is a non-mandatory part of the monograph and it is not necessary to verify the characteristics to demonstrate compliance. Control of these characteristics can however contribute to the quality of a medicinal product by improving the consistency of the manufacturing process and the performance of the medicinal product during use. Where control methods are cited, they are recognised as being suitable for the purpose, but other methods can also be used. Wherever results for a particular characteristic are reported, the control method must be indicated.*

*The following characteristics may be relevant for croscarmellose sodium used as disintegrant.*

**Settling volume.** Place 75 mL of *water R* in a 100 mL graduated cylinder and add 1.5 g of the substance to be examined in 0.5 g portions, shaking vigorously after each addition. Dilute to 100.0 mL with *water R* and shake again until the substance is homogeneously distributed. Allow to stand for 4 h. The settling volume is between 10.0 mL and 30.0 mL.

**Degree of substitution:** 0.60 to 0.85 (dried substance).

Place 1.000 g in a 500 mL conical flask, add 300 mL of a 100 g/L solution of *sodium chloride R* and 25.0 mL of *0.1 M sodium hydroxide*, stopper the flask and allow to stand for 5 min, shaking occasionally. Add 0.05 mL of *m-cresol purple solution R* and about 15 mL of *0.1 M hydrochloric acid* from a burette. Insert the stopper and shake. If the solution is violet, add *0.1 M hydrochloric acid* in 1 mL portions until the solution becomes yellow, shaking after each addition. Titrate with *0.1 M sodium hydroxide* until the colour turns to violet.

Calculate the number of milliequivalents (*M*) of base required to neutralise the equivalent of 1 g of dried substance.

Calculate the degree of acid carboxymethyl substitution (*A*) using the following expression:

$$\frac{1150M}{(7102 - 412M - 80C)}$$

*C* = sulfated ash as a percentage.

Calculate the degree of sodium carboxymethyl substitution (*S*) using the following expression:

$$\frac{(162 + 58A) C}{(7102 - 80C)}$$

The degree of substitution is the sum of *A* and *S*.

## ASSAY

Place 100.0 mg of the substance to be examined ( $m$  mg) in a combustion flask and add 5 g of a mixture of 1 g of *copper sulfate R*, 1 g of *titanium dioxide R* and 33 g of *dipotassium sulfate R*, and 3 glass beads. Wash any adhering particles from the neck into the flask with a small quantity of *water R*. Add 7 mL of *sulfuric acid R*, allowing it to run down the insides of the flask, and mix the contents by rotation. Close the mouth of the flask loosely, for example by means of a glass bulb with a short stem, to avoid excessive loss of sulfuric acid. Heat gradually at first, then increase the temperature until there is vigorous boiling with condensation of sulfuric acid in the neck of the flask; precautions are to be taken to prevent the upper part of the flask from becoming overheated. Continue the heating for 45 min. Cool, dissolve the solid material by cautiously adding 20 mL of *water R* to the mixture, cool again and place in a steam-distillation apparatus. Add 30 mL of *strong sodium hydroxide solution R* through the funnel, rinse the funnel cautiously with 10 mL of *water R* and distil immediately by passing steam through the mixture. Collect 80-100 mL of distillate in a mixture of 30 mL of a 40 g/L solution of *boric acid R* and 0.05 mL of *bromocresol green-methyl red solution R* and enough *water R* to cover the tip of the condenser. Towards the end of the distillation lower the receiver so that the tip of the condenser is above the surface of the acid solution and rinse the end part of the condenser with a small quantity of *water R*. Titrate the distillate with 0.025 M *sulfuric acid* until the colour of the solution changes from green through pale greyish-blue to pale greyish-red-purple ( $n_1$  mL of 0.025 M *sulfuric acid*).

Repeat the test using about 100 mg of *glucose R* in place of the substance to be examined ( $n_2$  mL of 0.025 M *sulfuric acid*).

Percentage content of nitrogen:

$$\frac{0.7004(n_1 - n_2)}{m} \times 100$$

- the number of theoretical plates calculated for the nitrite peak is at least 7000 per metre per column (dalteparin sodium will block the binding sites of the stationary phase, which will cause shorter retention times and lower separation efficiency for the analyte; the initial performance of the column may be partially restored using a 58 g/L solution of *sodium chloride R* at a flow rate of 1.0 mL/min for 1 h; after regeneration the column is rinsed with 200 mL to 400 mL of *water R*);

## DANAPAROID SODIUM

### Danaparoidum natricum

## DEFINITION

Preparation containing the sodium salts of a mixture of sulfated glycosaminoglycans present in porcine tissues. Danaparoid sodium is prepared from the intestinal mucosa of pigs. Its major constituents are heparan sulfate and dermatan sulfate. On complete hydrolysis it liberates D-glucosamine, D-galactosamine, D-glucuronic acid, L-iduronic acid, acetic acid and sulfuric acid. To each tube in 1 set of tubes add 75 µL of chondroitinase ABC solution. To each tube add 1.25 mL of *tris-sodium acetate buffer solution pH 7.4 R* and 150 µL of the test solutions, chondroitin sulfate reference solutions or *water R*. Add 75 µL of chondroitinase AC solution to each tube. Mix the contents of the tubes using a vortex mixer, cover with appropriate stoppers and incubate at 37 °C for at least 24 h. After the incubation period mix the contents of the tubes using a vortex mixer and dilute to 12 times with *water R*. Measure the absorbances (2.2.25) of the diluted solutions at 234 nm against *water R* using a suitable spectrophotometer.

**Calculation:** calculate the mean blank absorbance of each reference solution, i.e. the mean of the absorbances of the reference solutions to which no chondroitinase ABC has been added. Subtract the mean blank absorbance value from the individual absorbance of each reference solution. Calculate linear regression curves for the 2 chondroitin sulfate reference and the dermatan sulfate reference by plotting the blank-corrected absorbances against the concentrations.

$$\frac{A_2 - A_1 - \frac{(A_3 - A_1 - I_1) \times B_2}{B_1} - I_2 - I_3}{B_3 \times C} \times 100$$

- $A_1$  = blank absorbance of the test solution;  
 $A_2$  = absorbance of the test solution with chondroitinase ABC;  
 $A_3$  = absorbance of the test solution with chondroitinase AC;  
 $B_1$  = gradient of the curve obtained with the chondroitin sulfate reference solutions with chondroitinase AC;  
 $B_2$  = gradient of the curve obtained with the chondroitin sulfate reference solutions with chondroitinase ABC;  
 $B_3$  = gradient of the curve obtained with the dermatan sulfate reference solutions with chondroitinase ABC;

## FUNCTIONALITY-RELATED CHARACTERISTICS

*This section provides information on characteristics that are recognised as being relevant control parameters for one or more functions of the substance when used as an excipient (see chapter 5.15). This section is a non-mandatory part of the monograph and it is not necessary to verify the characteristics to demonstrate compliance. Control of these characteristics can however contribute to the quality of a medicinal product by improving the consistency of the manufacturing process and the performance of the medicinal product during use. Where control methods are cited, they are recognised as being suitable for the purpose, but other methods can also be used. Wherever results for a particular characteristic are reported, the control method must be indicated.*

*The following characteristics may be relevant for dextrin used as filler and binder, in tablets and capsules.*

**Particle-size distribution** (2.9.31 or 2.9.38).

**Powder flow** (2.9.36).

*The following characteristic may be relevant for dextrin used as viscosity-increasing agent.*

**Apparent viscosity** (2.2.10): typically 100 mPa·s to 350 mPa·s (dried substance), depending on the grade of dextrin.

In a beaker, prepare a 10-50 per cent slurry so that the viscosity value ranges from 100 mPa·s to 350 mPa·s. The total mass of the sample plus water must be 600 g. Mix with a plastic rod to obtain a homogeneous slurry. Place the beaker in a water-bath at 100 ± 1 °C. Introduce the paddle of a stirrer into the beaker and close the beaker with a lid. Start agitation at 250 r/min as rapidly as possible and carry on for exactly 30 min. Transfer the paste immediately to the beaker to be used for viscosity

*Content*: 98.0 per cent to 101.0 per cent (dried substance).

## PRODUCTION

## DIMETICONE

### Dimeticonum

[9006-65-9]

#### DEFINITION

Poly(dimethylsiloxane) obtained by hydrolysis and polycondensation of dichlorodimethylsilane and chlorotrimethylsilane. Different grades of dimeticone exist which are distinguished by a number indicating the nominal kinematic viscosity placed after the name.

Their degree of polymerisation ( $n = 20$  to 400) is such that their kinematic viscosities are nominally between 20 mm<sup>2</sup>·s<sup>-1</sup> and 1300 mm<sup>2</sup>·s<sup>-1</sup>.

*Dimeticones with a nominal viscosity of 50 mm<sup>2</sup>·s<sup>-1</sup> or lower are intended for external use only.*

#### CHARACTERS

**Appearance**: clear, colourless liquid of various viscosities.

**Solubility**: practically insoluble in water, very slightly soluble or practically insoluble in anhydrous ethanol, miscible with ethyl acetate, with methyl ethyl ketone and with toluene.

#### IDENTIFICATION

A. It is identified by its kinematic viscosity at 25 °C (see Tests).

B. Infrared absorption spectrophotometry (2.2.24).

*Comparison: dimeticone CRS.*

The region of the spectrum from 850 cm<sup>-1</sup> to 750 cm<sup>-1</sup> is not taken into account.

C. Heat 0.5 g in a test-tube over a small flame until white fumes begin to appear. Invert the tube over a 2<sup>nd</sup> tube containing 1 mL of a 1 g/L solution of *chromotropic acid, sodium*

*salt R* in *sulfuric acid R* so that the fumes reach the solution. Shake the 2<sup>nd</sup> tube for about 10 s and heat on a water-bath for 5 min. The solution is violet.

D. In a platinum crucible, prepare the sulfated ash (2.4.14) using 50 mg. The residue is a white powder that gives the reaction of silicates (2.3.1).

#### TESTS

**Acidity**. To 2.0 g add 25 mL of a mixture of equal volumes of *anhydrous ethanol R* and *ether R*, previously neutralised to 0.2 mL of *bromothymol blue solution R1* and shake. Not more than 0.15 mL of 0.01 M *sodium hydroxide* is required to change the colour of the solution to blue.

**Viscosity** (2.2.9): 90 per cent to 110 per cent of the nominal kinematic viscosity stated on the label, determined at 25 °C.

**Mineral oils**. Place 2 g in a test-tube and examine in ultraviolet light at 365 nm. The fluorescence is not more intense than that of a solution containing 0.1 ppm of *quinine sulfate R* in 0.005 M *sulfuric acid* examined in the same conditions.

**Phenylated compounds**. Dissolve 5.0 g with shaking in 10 mL of *cyclohexane R*. At wavelengths from 250 nm to 270 nm, the absorbance (2.2.25) of the solution is not greater than 0.2.

**Heavy metals**: maximum 5 ppm.

Mix 1.0 g with *methylene chloride R* and dilute to 20 mL with the same solvent. Add 1.0 mL of a freshly prepared 0.02 g/L solution of *dithizone R* in *methylene chloride R*, 0.5 mL of *water R* and 0.5 mL of a mixture of 1 volume of *dilute ammonia R2* and 9 volumes of a 2 g/L solution of *hydroxylamine hydrochloride R*. At the same time, prepare a reference solution as follows: to 20 mL of *methylene chloride R* add 1.0 mL of a freshly prepared 0.02 g/L solution of *dithizone R* in *methylene chloride R*, 0.5 mL of *lead standard solution (10 ppm Pb) R* and 0.5 mL of a mixture of 1 volume of *dilute ammonia R2* and 9 volumes of a 2 g/L solution of *hydroxylamine hydrochloride R*. Immediately shake each solution vigorously for 1 min. Any red colour in the test solution is not more intense than that in the reference solution.

**Volatile matter**: maximum 0.3 per cent, for dimeticones with a nominal viscosity greater than 50 mm<sup>2</sup>·s<sup>-1</sup>, determined on 1.00 g by heating in an oven at 150 °C for 2 h. Carry out the test using a dish 60 mm in diameter and 10 mm deep.

#### LABELLING

The label states:

- the nominal kinematic viscosity by a number placed after the name of the product,
- where applicable, that the product is intended for external use.

## ENOXAPARIN SODIUM

### Enoxaparinum natrium

#### DEFINITION

Enoxaparin sodium is the sodium salt of a low-molecular-mass heparin that is obtained by alkaline depolymerisation of the benzyl ester derivative of heparin from porcine intestinal mucosa. Enoxaparin consists of a complex set of oligosaccharides that have not yet been completely characterised. Based on current knowledge, the majority of the components have a 4-enopyranose uronate structure at the non-reducing end of their chain. 15 per cent to 25 per cent of the components have a 1,6-anhydro structure at the reducing end of their chain.

*Enoxaparin sodium complies with the monograph Low-molecular-mass heparins (0828) with the modifications and additional requirements below.*

The mass-average relative molecular mass ranges between 3800 and 5000, with a characteristic value of about 4500.

The degree of sulfatation is about 2 per disaccharide unit.

The potency is not less than 90 IU and not more than 125 IU of anti-factor Xa activity per milligram, calculated with reference to the dried substance. The anti-factor IIa activity is not less than 20.0 IU and not more than 35.0 IU per milligram, calculated with reference to the dried substance. The ratio of anti-factor Xa activity to anti-factor IIa activity is between 3.3 and 5.3.

#### PRODUCTION

Enoxaparin is produced by alkaline depolymerisation of benzyl ester derivatives of heparin from porcine intestinal mucosa under conditions that yield a product complying with the structural requirements stated under Definition.

[50-14-6]

$M_r$  396.7

#### DEFINITION

Ergocalciferol contains not less than 97.0 per cent and not more than the equivalent of 103.0 per cent of (5*Z*,7*E*,22*E*)-9,10-secoergosta-5,7,10(19),22-tetraen-3 $\beta$ -ol.

#### CHARACTERS

A white or slightly yellowish, crystalline powder or white or almost white crystals, practically insoluble in water, freely soluble in alcohol, soluble in fatty oils. It is sensitive to air, heat and light. Solutions in volatile solvents are unstable and are to be used immediately.

#### TESTS

**Specific optical rotation** (2.2.7). Dissolve 0.200 g rapidly and without heating in *aldehyde-free alcohol R* and dilute to 25.0 mL with the same solvent. The specific optical rotation, determined within 30 min of preparing the solution, is + 103 to + 107.

**Reducing substances.** Dissolve 0.1 g in *aldehyde-free alcohol R* and dilute to 10.0 mL with the same solvent. Add 0.5 mL of a 5 g/L solution of *tetrazolium blue R* in *aldehyde-free alcohol R* and 0.5 mL of *dilute tetramethylammonium hydroxide solution R*. Allow to stand for exactly 5 min and add 1.0 mL of *glacial acetic acid R*. Prepare a reference solution at the same time and in the same manner using 10.0 mL of a solution containing 0.2  $\mu$ g/mL of *hydroquinone R* in *aldehyde-free alcohol R*. Measure the absorbance (2.2.25) of the two solutions at 525 nm using as the compensation liquid 10.0 mL of *aldehyde-free alcohol R* treated in the same manner. **Reference solution (a).** Dissolve 0.10 g of *ergocalciferol CRS* in *ethylene chloride R* containing 10 g/L of *squalane R* and 0.1 g/L of *butylhydroxytoluene R* and dilute to 2 mL with the same solvent. Prepare immediately before use.

**Reference solution (b).** Dissolve 5 mg of *ergosterol CRS* in *ethylene chloride R* containing 10 g/L of *squalane R* and 0.1 g/L of *butylhydroxytoluene R* and dilute to 50 mL with the same solvent. Prepare immediately before use.

Apply to the plate 10 µL of the test solution, 10 µL of reference solution (a), 10 µL of reference solution (b) and 20 µL of reference solution (c). Develop immediately, protected from light, over a path of 15 cm using a mixture of equal volumes of *cyclohexane R* and *peroxide-free ether R*, the mixture containing 0.1 g/L of *butylhydroxytoluene R*. Allow the plate to dry in air and spray three times with *antimony trichloride solution RI*. Examine the chromatograms for 3 min to 4 min after spraying. There is no spot in the chromatogram obtained with the test solution that does not correspond to one of the spots in the chromatograms obtained with reference solutions (a) and (b). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

#### ASSAY

Carry out the operations as rapidly as possible, avoiding exposure to actinic light and air.

Examine by liquid chromatography (2.2.29).

**Test solution.** Dissolve 10.0 mg of the substance to be examined without heating in 10.0 mL of *toluene R* and dilute to 100.0 mL with the mobile phase.

**Reference solution (a).** Dissolve 10.0 mg of *ergocalciferol CRS* without heating in 10.0 mL of *toluene R* and dilute to 100.0 mL with the mobile phase.

**Reference solution (b).** Dilute 1.0 mL of *cholecalciferol for system suitability CRS* to 5.0 mL with the mobile phase. Heat in a water-bath at 90 °C under a reflux condenser for 45 min and cool.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with a suitable silica gel (5 µm),
- as mobile phase at a flow rate of 2 mL/min a mixture of 3 volumes of *pentanol R* and 997 volumes of *hexane R*,
- as detector a spectrophotometer set at 254 nm.

An automatic injection device or a sample loop is recommended. Inject a suitable volume of reference solution (b). Adjust the sensitivity of the system so that the height of the principal peak is at least 50 per cent of the full scale of the recorder. Inject reference solution (b) 6 times. When the chromatograms are recorded in the prescribed conditions, the approximate relative retention times with reference to cholecalciferol are 0.4 for pre-cholecalciferol and 0.5 for *trans*-cholecalciferol. The relative standard deviation of the response for cholecalciferol is not greater than 1 per cent and the resolution between the peaks corresponding to pre-cholecalciferol and *trans*-cholecalciferol is not less than 1.0. If necessary adjust the proportions of the constituents and the flow rate of the mobile phase to obtain this resolution.

Inject a suitable volume of reference solution (a). Adjust the sensitivity of the system so that the height of the principal peak is at least 50 per cent of the full scale of the recorder. Inject the same volume of the test solution and record the chromatogram in the same manner.

Calculate the percentage content of ergocalciferol from the expression:

$$\frac{m'}{m} \times \frac{S_D}{S'_D} \times 100$$

- $m$  = mass of the substance to be examined in the test solution, in milligrams;
- $m'$  = mass of *ergocalciferol CRS* in reference solution (a), in milligrams;
- $S_D$  = area (or height) of the peak due to ergocalciferol in the chromatogram obtained with the test solution;
- $S'_D$  = area (or height) of the peak due to ergocalciferol in the chromatogram obtained with reference solution (a).

### Ergotamini tartras

$C_{70}H_{76}N_{10}O_{16}$   
[379-79-3]

$M_r$  1313

#### DEFINITION

Ergotamine tartrate contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of bis[(6aR,9R)-N-[(2R,5S,10aS,10bS)-5-benzyl-10b-hydroxy-2-methyl-3,6-dioxo-octahydro-8H-oxazolo[3,2-a]pyrrolo[2,1-c]pyrazin-2-yl]-7-methyl-4,6,6a,7,8,9-hexahydroindolo[4,3-fg]quinoline-9-carboxamide] tartrate, calculated with reference to the dried substance. It may contain two molecules of methanol of crystallisation.

#### CHARACTERS

A white or almost white, crystalline powder or colourless crystals, slightly hygroscopic, slightly soluble in alcohol. Aqueous solutions slowly become cloudy owing to hydrolysis; this may be prevented by the addition of tartaric acid.

#### IDENTIFICATION

First identification: B, C.

Second identification: A, C, D, E.

- A. Dissolve 50 mg in 0.01 M hydrochloric acid and dilute to 100.0 mL with the same acid. Dilute 10.0 mL of the solution to 100.0 mL with 0.01 M hydrochloric acid. Examined between 250 nm and 360 nm (2.2.25), the solution shows an absorption maximum at 311 nm to 321 nm and a minimum at 265 nm to 275 nm. The specific absorbance at the maximum is 118 to 128, calculated with reference to the dried substance.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with ergotamine tartrate CRS. Examine the substances as discs prepared as follows: triturate the substance to be examined and the reference substance separately with 0.2 mL of methanol R and then with potassium bromide R as prescribed in the general method.
- C. Examine for not more than 1 min in ultraviolet light at 365 nm the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position and fluorescence to the principal spot in the chromatogram obtained with reference solution (a). After spraying with dimethylaminobenzaldehyde solution R7, examine in daylight. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- D. To 0.1 mL of solution S (see Tests) add 1 mL of glacial acetic acid R, 0.05 mL of ferric chloride solution R1 and 1 mL of phosphoric acid R and heat in a water-bath at 80 °C. After about 10 min, a blue or violet colour develops which becomes more intense on standing.
- E. Dissolve about 10 mg in 1.0 mL of 0.1 M sodium hydroxide. Transfer to a separating funnel and shake with 5 mL of methylene chloride R. Discard the organic layer. Neutralise the aqueous layer with a few drops of dilute hydrochloric acid R. 0.1 mL of this solution gives reaction (b) of tartrates (2.3.1). Pour the reaction mixture into 1 mL of water R to observe the colour change to red or brownish-red.

## DEFINITION

Erythropoietin concentrated solution is a solution containing a family of closely-related glycoproteins which are indistinguishable from the naturally occurring human erythropoietin (urinary erythropoietin) in terms of amino acid sequence (165 amino acids) and average glycosylation pattern, at a concentration of 0.5-10 mg/mL. It may also contain buffer salts and other excipients. It has a potency of not less than 100 000 IU/mg of active substance determined using the conditions described under Assay and in the test for protein.

## PRODUCTION

Erythropoietin is produced in rodent cells *in vitro* by a method based on recombinant DNA technology.

Prior to batch release, the following tests are carried out on each batch of the final product, unless exemption has been granted by the competent authority.

**Host cell-derived proteins:** the limit is approved by the competent authority.

**Host cell- and vector-derived DNA:** the limit is approved by the competent authority.

Carry out the determination of potency by Method A or B.

##### A. In polycythaemic mice

The activity of the preparation is estimated by examining, under given conditions, its effect in stimulating the incorporation of  $^{59}\text{Fe}$  into circulating red blood cells of mice made polycythaemic by exposure to reduced atmospheric pressure.

The following schedule, using treatment in a hypobaric chamber, has been found to be suitable.

Induce polycythaemia in female mice of the same strain, weighing 16–18 g. Place the mice in a hypoxic chamber and reduce the pressure to 0.6 atmospheres. After 3 days at 0.6 atmospheres, further reduce the pressure to 0.4–0.5 atmospheres and maintain the animals at this pressure for a further 11 days (the partial vacuum is interrupted daily for a maximum of 1 h at about 11:00 a.m., in order to clean the cages and feed the animals). At the end of the specified period, return the mice to normal atmospheric conditions. Randomly distribute the mice into cages, each containing 6 animals, and mark them.

*Test solution (a).* Dilute the substance to be examined in *phosphate-albumin buffered saline pH 7.2 R1* to obtain a concentration of 0.2 IU/mL.

*Test solution (b).* Mix equal volumes of test solution (a) and *phosphate-albumin buffered saline pH 7.2 R1*.

*Test solution (c).* Mix equal volumes of test solution (b) and *phosphate-albumin buffered saline pH 7.2 R1*.

*Reference solution (a).* Dissolve *erythropoietin BRP* in *phosphate-albumin buffered saline pH 7.2 R1* to obtain a concentration of 0.2 IU/mL.

*Reference solution (b).* Mix equal volumes of reference solution (a) and *phosphate-albumin buffered saline pH 7.2 R1*.

*Reference solution (c).* Mix equal volumes of reference solution (b) and *phosphate-albumin buffered saline pH 7.2 R1*.

*Radiolabelled ferric [ $^{59}\text{Fe}$ ] chloride solution, concentrated.* Use a commercially available solution of [ $^{59}\text{Fe}$ ]ferric chloride (approximate specific activity: 100–1000 MBq/mg of Fe).

*Radiolabelled [ $^{59}\text{Fe}$ ]ferric chloride solution.* Dilute the concentrated radiolabelled [ $^{59}\text{Fe}$ ]ferric chloride solution in *sodium citrate buffer solution pH 7.8 R* to obtain a solution with an activity of  $3.7 \times 10^4$  Bq/mL.

The concentrations of the test solutions and reference solutions may need to be modified, based on the response range of the animals used.

3 days after returning the animals to atmospheric pressure, inject each animal subcutaneously with 0.2 mL of one of the solutions. The 6 animals in each cage must each receive one of the 6 different treatments (3 test solutions and 3 reference solutions), and the order of injection must be separately randomised for each cage. A minimum of 8 cages is recommended. 2 days after injection of the test or reference solution, inject each animal intraperitoneally with 0.2 mL of radiolabelled [ $^{59}\text{Fe}$ ]ferric chloride solution. The order of the injections must be the same as that of the erythropoietin injections, and the time interval between administration of the erythropoietin and the radiolabelled ferric chloride solution must be the same for each animal. After a further 48 h, anaesthetise each animal by injection of a suitable anaesthetic, record body weights and withdraw blood samples (0.65 mL) into haematocrit capillaries from the bifurcation of the aorta. After determining the packed cell volume for each sample, measure the radioactivity.

Calculate the response (percentage of iron-59 in total circulating blood) for each mouse using the expression:

$$\frac{A_s \times M \times 7.5}{A_t \times V_s}$$

$A_s$  = radioactivity in the sample;

$A_t$  = total radioactivity injected;

7.5 = total blood volume as per cent body weight;

$M$  = body weight, in grams;

$V_s$  = sample volume.

Calculate the potency by the usual statistical methods for a parallel line assay. Eliminate from the calculation any animal where the packed cell volume is less than 54 per cent, or where the body weight is more than 24 g.

##### B. In normocythaemic mice

The assay is based on the measurement of stimulation of reticulocyte production in normocythaemic mice.

The assay may be carried out using the following procedure:

*Test solution (a).* Dilute the preparation to be examined in *phosphate-albumin buffered saline pH 7.2 R1* to obtain a concentration of 80 IU/mL.

*Test solution (b).* Mix equal volumes of test solution (a) and *phosphate-albumin buffered saline pH 7.2 R1*.

*Test solution (c).* Mix equal volumes of test solution (b) and *phosphate-albumin buffered saline pH 7.2 R1*.

*Reference solution (a).* Dissolve *erythropoietin BRP* in *phosphate-albumin buffered saline pH 7.2 R1* to obtain a concentration of 80 IU/mL.

*Reference solution (b).* Mix equal volumes of reference solution (a) and *phosphate-albumin buffered saline pH 7.2 R1*.

*Reference solution (c).* Mix equal volumes of reference solution (b) and *phosphate-albumin buffered saline pH 7.2 R1*.

The exact concentrations of the test solutions and reference solutions may need to be modified, based on the response range of the animals used.

At the beginning of the assay procedure, randomly distribute mice of a suitable age and strain (8-week old B6D2F1 mice are suitable) into 6 cages. A minimum of 8 mice per cage is

recommended. Inject each animal subcutaneously with 0.5 mL of the appropriate treatment (one solution per cage) and put the animal in a new cage. Combine the mice in such a way that each cage housing the treated mice contains one mouse out of the 6 different treatments (3 test solutions and 3 reference solutions, 6 mice per cage). 4 days after the injections, collect blood samples from the animals and determine the number of reticulocytes using a suitable procedure.

The following method may be employed:

*The volume of blood, dilution procedure and fluorescent reagent may need to be modified to ensure maximum development and stability of fluorescence.*

*Colorant solution, concentrated.* Use a solution of thiazole orange suitable for the determination of reticulocytes. Prepare at a concentration twice that necessary for the analysis.

Proceed with the following dilution steps. Dilute whole blood 500-fold in the buffer used to prepare the colorant solution. Dilute this solution 2-fold in the concentrated colorant solution. After staining for 3-10 min, determine the reticulocyte count microfluorometrically in a flow cytometer. The percentage of reticulocytes is determined using a biparametric histogram: number of cells/red fluorescence (620 nm).

Calculate the potency by the usual statistical methods for a parallel line assay.

#### STORAGE

In an airtight container at a temperature below  $-20\text{ }^{\circ}\text{C}$ . Avoid repeated freezing and thawing.

#### LABELLING

The label states:

- the erythropoietin content in milligrams per millilitre;
- the activity in International Units per millilitre;
- the name and the concentration of any other excipients.

## FIBRIN SEALANT KIT

### Fibrini glutinum

#### DEFINITION

Fibrin sealant kit is essentially composed of 2 components, namely fibrinogen concentrate (component 1), a protein fraction containing human fibrinogen and a preparation containing human thrombin (component 2). A fibrin clot is rapidly formed when the 2 thawed or reconstituted components are mixed. Other ingredients (for example, human coagulation factor XIII, a fibrinolysis inhibitor or calcium ions) and stabilisers (for example, *Human albumin solution (0255)*) may be added. No antimicrobial preservative is added.

Human constituents are obtained from plasma that complies with the requirements of the monograph on *Human plasma for fractionation (0853)*. No antibiotic is added to the plasma used.

When thawed or reconstituted as stated on the label, component 1 contains not less than 40 g/L of clottable protein; the thrombin activity of component 2 varies over a wide range (approximately 4-1000 IU/mL).

#### PRODUCTION

The method of preparation includes a step or steps that have been shown to remove or to inactivate known agents of infection; if substances are used for inactivation of viruses during production, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to a suitable level and any residues are such as not to compromise the safety of the preparation for patients.

Constituents or mixtures of constituents are passed through a bacteria-retentive filter and distributed aseptically into sterile containers. Containers of freeze-dried constituents are closed under vacuum or filled with oxygen-free nitrogen or other suitable inert gas before being closed. In either case, they are closed so as to exclude micro-organisms.

If the human coagulation factor XIII content in component 1 is greater than 10 units/mL, the assay of factor XIII is carried out.

## CHARACTERS

Freeze-dried constituents are hygroscopic, white or pale yellow powders or friable solids. Frozen constituents are colourless or pale yellow, opaque solids. Liquid constituents are colourless or pale yellow.

*For the freeze-dried or frozen constituents, reconstitute or thaw as stated on the label immediately before carrying out the identification and the tests, except those for solubility and water.*

## Component 1 (fibrinogen concentrate)

## IDENTIFICATION

- A. It complies with the limits of the assay of fibrinogen.  
B. It complies with the limits of the assay of factor XIII (where applicable).

## TESTS

**pH** (2.2.3): 6.5 to 8.0.

**Solubility.** Freeze-dried concentrates dissolve within 20 min in the volume of solvent for reconstitution and at the temperature stated on the label, forming an almost colourless, clear or slightly turbid solution.

**Stability of solution.** No gel formation appears at room temperature during 120 min following thawing or reconstitution.

**Water.** Determined by a suitable method, such as the semi-micro determination (2.5.12), loss on drying (2.2.32) or near infrared spectrophotometry (2.2.40), the water content is within the limits approved by the competent authority.

**Sterility** (2.6.1). It complies with the test for sterility.

## ASSAY

**Fibrinogen (clottable protein).** The estimated content in milligrams of clottable protein is not less than 70 per cent and not more than 130 per cent of the content stated on the label.

Mix 0.2 mL of the reconstituted preparation with 2 mL of a suitable buffer solution (pH 6.6-7.4) containing sufficient *human thrombin R* (approximately 3 IU/mL) and calcium (0.05 mol/L). Maintain at 37 °C for 20 min, separate the precipitate by centrifugation (5000 *g*, 20 min), wash thoroughly with a 9 g/L solution of *sodium chloride R* and determine the protein as nitrogen by sulfuric acid digestion (2.5.9). Calculate the protein content by multiplying the result by 6.0. If for a particular preparation this method cannot be applied, use another validated method for determination of fibrinogen.

**Factor XIII.** Where the label indicates that the human coagulation factor XIII activity is greater than 10 units/mL, the estimated activity is not less than 80 per cent and not more than 120 per cent of the activity stated on the label.

Make at least 3 suitable dilutions of thawed or reconstituted component 1 and of human normal plasma (reference preparation) using as diluent coagulation factor XIII deficient plasma or another suitable diluent. Add to each dilution suitable amounts of the following reagents:

- activator reagent, containing bovine or human thrombin, a suitable buffer, calcium chloride and a suitable inhibitor such as Gly-Pro-Arg-Pro-Ala-NH<sub>2</sub> which inhibits clotting of the sample but does not prevent coagulation factor XIII activation by thrombin,
- detection reagent, containing a suitable factor XIIIa-specific peptide substrate, such as Leu-Gly-Pro-Gly-Glu-Ser-Lys-Val-Ile-Gly-NH<sub>2</sub> and glycine ethyl ester as 2<sup>nd</sup> substrate in a suitable buffer solution,
- NADH reagent, containing glutamate dehydrogenase, α-ketoglutarate and NADH in a suitable buffer solution.

After mixing, the absorbance changes ( $\Delta A/\text{min}$ ) are measured at a wavelength of 340 nm, after the linear phase of the reaction is reached.

1 unit of factor XIII is equal to the activity of 1 mL of human normal plasma.

Calculate the activity of the test preparation by the usual statistical methods (5.3, for example). The confidence limits ( $P = 0.95$ ) are not less than 80 per cent and not more than 125 per cent of the estimated activity.

## Component 2 (thrombin preparation)

## IDENTIFICATION

It complies with the limits of the assay of thrombin.

## TESTS

**pH** (2.2.3): 5.0 to 8.0.

**Solubility.** Freeze-dried preparations dissolve within 5 min in the volume of solvent for reconstitution stated on the label, forming a colourless, clear or slightly turbid solution.

**Water.** Determined by a suitable method, such as the semi-micro determination (2.5.12), loss on drying (2.2.32) or near infrared spectrophotometry (2.2.40), the water content is within the limits approved by the competent authority.

**Sterility** (2.6.1). It complies with the test for sterility.

## ASSAY

**Thrombin.** The estimated activity is not less than 80 per cent and not more than 125 per cent of the activity stated on the label.

If necessary, dilute the reconstituted preparation to be examined to approximately 2-20 IU of thrombin per millilitre using as diluent a suitable buffer pH 7.3-7.5, such as *imidazole buffer solution pH 7.3 R* containing 10 g/L of *human albumin R* or *bovine albumin R*. To a suitable volume of the dilution, add a suitable volume of fibrinogen solution (1 g/L of clottable protein) warmed to 37 °C and start measurement of the clotting time immediately. Repeat the procedure with each of at least 3 dilutions, in the range stated above, of a reference preparation of thrombin, calibrated in International Units. Calculate the activity of the test preparation by the usual statistical methods (5.3, for example). The confidence limits ( $P = 0.95$ ) are not less than 80 per cent and not more than 125 per cent of the estimated activity.

## STORAGE

Protected from light and, for freeze-dried components, in an airtight container.

## LABELLING

The label states:

- the amount of fibrinogen (milligrams of clottable protein), thrombin (International Units) per container, and coagulation factor XIII, if this is greater than 10 units/mL,
- where applicable, the name and volume of solvent to be used to reconstitute the components.

**ASSAY**

**Protein.** Liquid chromatography (2.2.29) as described in the test for related proteins with the following modification.

**Injection:** test solution and reference solution (a).

Calculate the content of filgrastim ( $C_{845}H_{1339}N_{223}O_{243}S_9$ ) from the declared content of  $C_{845}H_{1339}N_{223}O_{243}S_9$  in filgrastim CRS.

**Potency.** The potency of the preparation to be examined is determined by comparison of the dilutions of the test preparation with the dilutions of the International Standard of filgrastim or with a reference preparation calibrated in International Units.

The International Unit is the activity contained in a stated amount of the appropriate International Standard. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

Carry out the assay using a suitable method such as the following, which uses the conversion of a tetrazolium salt (MTS) as a staining method. Alternative methods of quantifying cell proliferation, such as measurement of intracellular ATP by luciferase bioluminescence, have also been found suitable, and may be used as the assay readout, subject to appropriate validation. The assay conditions (for example, cell concentration, incubation time and dilution steps) are then adapted accordingly. Use an established cell line responsive to filgrastim. M-NFS-60 cells (ATCC No. CRL-1838) have been found suitable. Incubate with varying dilutions of test and reference preparations of filgrastim. Then incubate with a solution of *tetrazolium salt R*. This cytochemical stain is converted by cellular dehydrogenases to a coloured formazan product. The formazan is then measured spectrophotometrically.

Add 50 µL of dilution medium to all wells of a 96-well microtitre plate. Add an additional 50 µL of this solution to the wells designed for the blanks. Add 50 µL of each solution to be tested in triplicate (test preparation and reference preparation at a concentration of about 800 IU/mL, plus a series of 10 twofold dilutions to obtain a standard curve). Prepare a suspension of M-NFS-60 cells containing  $7 \times 10^5$  cells per millilitre. Immediately before use, add 2-mercaptoethanol to a final concentration of 0.1 mM, and add 50 µL of the prepared cell suspension to each well, maintaining the cells in a uniform suspension during addition.

Incubate the plate at 36.0-38.0 °C for 44-48 h in a humidified incubator using  $6 \pm 1$  per cent CO<sub>2</sub>. Add 20 µL of a 5.0 g/L sterile solution of *tetrazolium salt R* to each well and reincubate for 4 h. Estimate the quantity of formazan produced using a microtitre well plate reader at 490 nm.

Calculate the potency of the preparation to be examined using a suitable statistical method, for example the parallel line assay (5.3).

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits ( $P = 0.95$ ) are not less than 74 per cent and not more than 136 per cent of the estimated potency.
