**FUNCTIONALITY-RELATED CHARACTERISTICS**

*This section provides information on characteristics that are recognised as being relevant control parameters for one or more functions of the substance when used as an excipient (see chapter 5.15). This section is a non-mandatory part of the monograph and it is not necessary to verify the characteristics to demonstrate compliance. Control of these characteristics can however contribute to the quality of a medicinal product by improving the consistency of the manufacturing process and the performance of the medicinal product during use. Where control methods are cited, they are recognised as being suitable for the purpose, but other methods can also be used. Wherever results for a particular characteristic are reported, the control method must be indicated.*

*The following characteristics may be relevant for methacrylic acid - ethyl acrylate copolymer (1:1) used as gastro-resistant coating agent.*

## METHYLCELLULOSE

### Methylcellulosum

[9004-67-5]

#### DEFINITION

Partly *O*-methylated cellulose.

#### CHARACTERS

**Appearance:** white, yellowish-white or greyish-white powder or granules, hygroscopic after drying.

**Solubility:** practically insoluble in hot water, in acetone, in anhydrous ethanol and in toluene. It dissolves in cold water giving a colloidal solution.

#### IDENTIFICATION

- Evenly distribute 1.0 g onto the surface of 100 mL of *water R* in a beaker, tapping the top of the beaker gently if necessary to ensure a uniform layer on the surface. Allow to stand for 1-2 min: the powdered material aggregates on the surface.
- Evenly distribute 1.0 g into 100 mL of boiling *water R*, and stir the mixture using a magnetic stirrer with a bar 25 mm long: a slurry is formed and the particles do not dissolve. Allow the slurry to cool to 5 °C and stir using a magnetic stirrer: a clear or slightly turbid solution occurs with its thickness dependent on the viscosity grade.
- To 0.1 mL of the solution obtained in identification B add 9 mL of a 90 per cent *V/V* solution of *sulfuric acid R*, shake, heat on a water-bath for exactly 3 min, immediately cool in an ice-bath, carefully add 0.6 mL of a 20 g/L solution of *ninhydrin R*, shake and allow to stand at 25 °C: a red colour develops and does not change to purple within 100 min.
- Place 2-3 mL of the solution obtained in identification B on a glass slide as a thin film and allow the water to evaporate: a coherent, clear film forms on the glass slide.
- Add exactly 50 mL of the solution obtained in identification B to exactly 50 mL of *water R* in a beaker. Insert a thermometer into the solution. Stir the solution on a magnetic stirrer/hot plate and begin heating, increasing the temperature at a rate of 2-5 °C per minute. Determine the temperature at which a turbidity increase begins to occur and designate the temperature as the flocculation temperature: the flocculation temperature is higher than 50 °C.

#### TESTS

**Solution S.** While stirring, introduce a quantity of the substance to be examined equivalent to 1.0 g of the dried substance into 50 g of *carbon dioxide-free water R* heated to 90 °C. Allow to cool, adjust the mass of the solution to 100 g with *carbon dioxide-free water R* and stir until dissolution is complete. Allow to stand at 2-8 °C for 1 h before carrying out the test for appearance of solution.

**Appearance of solution.** Solution S is not more opalescent than reference suspension III (2.2.1) and not more intensely coloured than reference solution  $Y_6$  (2.2.2, *Method II*).

**pH (2.2.3):** 5.0 to 8.0 for the solution prepared as described under Apparent viscosity.

Read the pH after the probe has been immersed for  $5 \pm 0.5$  min.

1.0 g complies with test F. Prepare the reference solution using 2 mL of *lead standard solution (10 ppm Pb) R*.

**Loss on drying (2.2.32):** maximum 5.0 per cent, determined on 1.000 g by drying in an oven at 105 °C for 1 h.

**Sulfated ash (2.4.14):** maximum 1.5 per cent, determined on 1.0 g.

#### FUNCTIONALITY-RELATED CHARACTERISTICS

*This section provides information on characteristics that are recognised as being relevant control parameters for one or more functions of the substance when used as an excipient (see chapter 5.15). This section is a non-mandatory part of the monograph and it is not necessary to verify the characteristics to demonstrate compliance. Control of these characteristics can however contribute to the quality of a medicinal product by improving the consistency of the manufacturing process and the performance of the medicinal product during use. Where control methods are cited, they are recognised as being suitable for the purpose, but other methods can also be used. Wherever results for a particular characteristic are reported, the control method must be indicated.*

*The following characteristics may be relevant for methylcellulose used as binder, viscosity-enhancing agent or film former.*

**Apparent viscosity:** minimum 80 per cent and maximum 120 per cent of the nominal value for samples with a viscosity of less than 600 mPas (Method 1); minimum 75 per cent and maximum 140 per cent of the nominal value for samples with a viscosity of 600 mPas or higher (Method 2).

*Method 1, to be applied to samples with a viscosity of less than 600 mPas.* Weigh accurately a quantity of the substance to be examined equivalent to 4.000 g of the dried substance. Transfer into a wide-mouthed bottle, and adjust the mass to 200.0 g with *water R*. Capping the bottle, stir by mechanical means at  $400 \pm 50$  r/min for 10-20 min until the particles are thoroughly dispersed and wetted. Scrape down the insides of the bottle with a spatula if necessary, to ensure that there is no undissolved material on the sides of the bottle, and continue the stirring in a cooling water-bath maintained at a temperature below 5 °C for another 20-40 min. Adjust the solution mass if necessary to 200.0 g using cold *water R*. Centrifuge the solution if necessary to expel any entrapped air bubbles. Using a spatula remove any foam, if present. Determine the viscosity of this solution using the capillary viscometer method (2.2.9) to obtain the kinematic viscosity ( $\nu$ ). Separately, determine the density ( $\rho$ ) (2.2.5) of the solution and calculate the dynamic viscosity ( $\eta$ ), as  $\eta = \rho\nu$ .

*Method 2, to be applied to samples with a viscosity of 600 mPas or higher.* Weigh accurately a quantity of the substance to be examined equivalent to 10.00 g of the dried substance. Transfer into a wide-mouthed bottle, and adjust the mass to 500.0 g with *water R*. Capping the bottle, stir by mechanical means at  $400 \pm 50$  r/min for 10-20 min until the particles are thoroughly dispersed and wetted. Scrape down the insides of the bottle with a spatula if necessary, to ensure that there is no undissolved material on the sides of the bottle, and continue the stirring in a cooling water-bath maintained at a temperature below 5 °C for another 20-40 min. Adjust the solution mass if necessary to 500.0 g using cold *water R*. Centrifuge the solution if necessary to expel any entrapped air bubbles. Using a spatula, remove any foam, if present. Determine the viscosity (2.2.10) of this solution at  $20 \pm 0.1$  °C using a rotating viscometer.

**Apparatus:** single-cylinder type spindle viscometer.

**Rotor number, revolution and calculation multiplier:** apply the conditions specified in Table 0345.-1.

Table 0345-1.

Nominal viscosity* (mPa·s)	Rotor number	Revolution (r/min)	Calculation multiplier
600 to less than 1400	3	60	20
1400 to less than 3500	3	12	100
3500 to less than 9500	4	60	100
9500 to less than 99 500	4	6	1000
99 500 or more	4	3	2000

\*the nominal viscosity is based on the manufacturer's specifications.

Allow the spindle to rotate for 2 min before taking the measurement. Allow a rest period of 2 min between subsequent measurements. Repeat the measurement twice and determine the mean of the 3 readings.

**Degree of substitution:** 26.0 per cent to 33.0 per cent of methoxy groups (dried substance).

Gas chromatography (2.2.28).

**Apparatus:**

- **reaction vial:** a 5 mL pressure-tight vial, 50 mm in height, 20 mm in external diameter and 13 mm in internal diameter at the mouth, equipped with a pressure-tight butyl rubber membrane stopper coated with polytetrafluoroethylene and secured with an aluminium crimped cap or another sealing system providing a sufficient air-tightness;
- **heater:** a heating module with a square aluminium block having holes 20 mm in diameter and 32 mm in depth, so that the reaction vials fit; mixing of the contents of the vial is effected using a magnetic stirrer equipped in the heating module or using a reciprocal shaker that performs approximately 100 cycles/min.

**Internal standard solution:** 30 g/L solution of *octane R* in *xylene R*.

**Test solution.** Weigh 65.0 mg of the substance to be examined, place in a reaction vial, add 0.06-0.10 g of *adipic acid R*, 2.0 mL of the internal standard solution and 2.0 mL of *hydriodic acid R*, immediately cap and seal the vial, and weigh accurately. Using a magnetic stirrer, mix the contents of the vial continuously for 60 min while heating the block so that the temperature of the contents is maintained at  $130 \pm 2$  °C. If a reciprocal shaker or magnetic stirrer cannot be used, shake the vial well by hand at 5-minute intervals during the initial 30 min of the heating time. Allow the vial to cool, and again weigh accurately. If the loss of mass is less than 0.50 per cent of the contents and there is no evidence of a leak, use the upper layer of the mixture as the test solution.

**Reference solution.** Place 0.06-0.10 g of *adipic acid R*, 2.0 mL of the internal standard solution and 2.0 mL of *hydriodic acid R* in another reaction vial, cap and seal the vial, and weigh accurately. Add 45 µL of *methyl iodide R* through the septum with a syringe, and weigh accurately. Shake the reaction vial well, and use the upper layer as the reference solution.

**Column:**

- **size:**  $l = 1.8-3$  m,  $\varnothing = 3-4$  mm;
- **stationary phase:** *diatomaceous earth for gas chromatography R* impregnated with 10-20 per cent of *poly(dimethyl)(75)(diphenyl)(25)siloxane R* (film thickness 125-150 µm);
- **temperature:** 100 °C.

**Carrier gas:** *helium for chromatography R* (thermal conductivity); *helium for chromatography R* or *nitrogen for chromatography R* (flame ionisation).

**Flow rate:** adjusted so that the retention time of the internal standard is about 10 min.

**Detection:** flame ionisation or thermal conductivity.

**Injection:** 1-2 µL.

**System suitability:** reference solution:

- **resolution:** well-resolved peaks of methyl iodide (1<sup>st</sup> peak) and internal standard (2<sup>nd</sup> peak).

**Calculation:**

- **methoxy groups:** calculate the ratio ( $Q$ ) of the area of the peak due to methyl iodide to the area of the peak due to the internal standard in the chromatogram obtained with the test solution, and the ratio ( $Q_1$ ) of the area of the peak due to methyl iodide to the area of the peak due to the internal standard in the chromatogram obtained with the reference solution.

Calculate the percentage content of methoxy groups using the following expression:

$$\frac{Q \times m_1}{Q_1 \times m} \times 21.864$$

- $m_1$  = mass of methyl iodide in the reference solution, in milligrams;
- $m$  = mass of the sample (dried substance), in milligrams.

## METHYLHYDROXYETHYLCELLULOSE

## Methylhydroxyethylcellulosum

## DEFINITION

Partly *O*-methylated and *O*-(2-hydroxyethylated) cellulose.

## CHARACTERS

*Appearance*: white, yellowish-white or greyish-white powder or granules, hygroscopic after drying.

*Solubility*: practically insoluble in hot water, in acetone, in anhydrous ethanol and in toluene. It dissolves in cold water giving a colloidal solution.

## IDENTIFICATION

- A. Heat 10 mL of solution S (see Tests) in a water-bath while stirring. At a temperature above 50 °C, the solution becomes cloudy or a flocculent precipitate is formed. The solution becomes clear again on cooling.  
 B. To 10 mL of solution S add 0.3 mL of *dilute acetic acid R* and 2.5 mL of a 100 g/L solution of *tannic acid R*. A yellowish-white flocculent precipitate is formed which dissolves in *dilute ammonia R1*.  
 C. In a test-tube about 160 mm long, thoroughly mix 1 g with 2 g of finely powdered *manganese sulfate R*. Introduce to a depth of 2 cm into the upper part of the tube a strip of filter paper impregnated with a freshly prepared mixture of 1 volume of a 20 per cent V/V solution of *diethanolamine R* and 11 volumes of a 50 g/L solution of *sodium nitroprusside R*, adjusted to about pH 9.8 with 1 M *hydrochloric acid*. Insert the tube 8 cm into a silicone-oil bath at 190-200 °C. The filter paper becomes blue within 10 min. Carry out a blank test.  
 D. Dissolve completely 0.2 g without heating in 15 mL of a 70 per cent *m/m* solution of *sulfuric acid R*. Pour the solution with stirring into 100 mL of iced *water R* and dilute to 250 mL with iced *water R*. In a test-tube, mix thoroughly while cooling in iced water 1 mL of this solution with 8 mL of *sulfuric acid R* added dropwise. Heat in a water-bath for exactly 3 min and immediately cool in iced water. While the mixture is cold, carefully add 0.6 mL of *ninhydrin solution R2* and mix well. Allow to stand at 25 °C. A pink colour is produced immediately and does not become violet within 100 min.  
 E. Place 1 mL of solution S on a glass plate. After evaporation of the water a thin film is formed.

*Detection A*: examine in ultraviolet light at 254 nm.

*Results A*: the principal spot in each of the chromatograms obtained with the test solutions is similar in position and size to the principal spot in the chromatogram obtained with the corresponding reference solution.

*Detection B*: spray with alcoholic solution of sulfuric acid R. Heat at 120 °C for 10 min or until the spots appear. Allow to cool. Examine in daylight and in ultraviolet light at 365 nm.

*Results B*: the principal spot in each of the chromatograms obtained with the test solutions is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with the corresponding reference solution. The principal spot in each of the chromatograms obtained with test solution (b) and reference solution (b) has an  $R_f$  value distinctly lower than that of the principal spot in each of the chromatograms obtained with test solution (a) and reference solution (a).

D. Add about 2 mg to 2 mL of sulfuric acid R and shake to dissolve. Within 5 min, an intense red colour develops. When examined in ultraviolet light at 365 nm, a reddish-brown fluorescence is seen. Add this solution to 10 mL of water R and mix. The colour fades and there is a greenish-yellow fluorescence in ultraviolet light at 365 nm.

E. About 10 mg gives the reaction of acetyl (2.3.1).

1 mL of 0.1 M perchloric acid is equivalent to 29.6 mg of carmellose sodium.

## LABELLING

The label states the nominal percentage *m/m* of carmellose sodium.

## FUNCTIONALITY-RELATED CHARACTERISTICS

This section provides information on characteristics that are recognised as being relevant control parameters for one or more functions of the substance when used as an excipient (see chapter 5.15). This section is a non-mandatory part of the monograph and it is not necessary to verify the characteristics to demonstrate compliance. Control of these characteristics can however contribute to the quality of a medicinal product by improving the consistency of the manufacturing process and the performance of the medicinal product during use. Where control methods are cited, they are recognised as being suitable for the purpose, but other methods can also be used. Wherever results for a particular characteristic are reported, the control method must be indicated.

The following characteristics may be relevant for microcrystalline cellulose and carmellose sodium used as a suspending agent.

**Apparent viscosity (2.2.10)** : 60 per cent to 140 per cent of the nominal value.

Calculate the quantity ( $x$  g) needed to prepare exactly 600 g of a dispersion of the stated percentage  $m/m$  (dried substance). To  $(600 - x)$  g of water R at 23-25 °C contained in a 1000 mL high-speed blender bowl add  $x$  g of the substance to be examined and stir at reduced speed, taking care to avoid contacting the sides of the bowl with the powder. Continue stirring at low speed for 15 s after the addition of the powder and then stir at 18 000 r/min for exactly 2 min.

Determine the viscosity with a suitable relative rotational viscometer under the following conditions:

- spindle: as appropriate;
- speed: 20 r/min.

Immerse the spindle into the suspension immediately after preparation, switch on the rotation spindle after 30 s, after a further 30 s take scale readings and calculate the viscosity according to the viscometer manual.

C. Examine the chromatograms obtained in the test for impurity C.

**Results:** the principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (b).

D. Mix 90 mg with 0.30 g of anhydrous sodium carbonate R and ignite in a crucible until an almost white residue is obtained (normally in less than 5 min). Allow to cool and dissolve the residue in 5 mL of dilute nitric acid R. Filter (the filtrate is also used in identification test E). Add 1.0 mL of the filtrate to a freshly prepared mixture of 0.1 mL of alizarin S solution R and 0.1 mL of zirconyl nitrate solution R. Mix, allow to stand for 5 min and compare the colour of the solution with that of a blank prepared in the same manner. The test solution is yellow and the blank solution is red.

E. To 1 mL of the filtrate obtained in identification test D add 1 mL of water R. The solution gives reaction (a) of chlorides (2.3.1).

## TESTS

**Appearance of solution.** The solution is clear (2.2.1) and not more intensely coloured than reference solution Y<sub>6</sub> (2.2.2, Method II).

Dissolve 0.1 g in 0.1 M hydrochloric acid and dilute to 10 mL with the same acid.

**Related substances.** Liquid chromatography (2.2.29).

**Test solution.** Dissolve 50.0 mg of the substance to be examined in methanol R and dilute to 50.0 mL with the same solvent.

**Reference solution (a).** Dilute 1.0 mL of the test solution to 100.0 mL with methanol R. Dilute 1.0 mL of this solution to 10.0 mL with methanol R.

**Reference solution (b).** Dissolve the contents of a vial of midazolam for system suitability CRS (containing impurities A, B, E, G and H) in 1.0 mL of methanol R.

**Column:**

- size:  $l = 0.25$  m,  $\varnothing = 4.0$  mm,
- stationary phase: octylsilyl silica gel for chromatography R (5  $\mu$ m).

**Mobile phase:** prepare a solution containing 7.7 g/L of ammonium acetate R and 10 mL/l of tetrabutylammonium hydroxide solution (400 g/L) R and adjust to pH 5.3 with glacial acetic acid R. Mix 44 volumes of this solution with 56 volumes of methanol R.

**Flow rate:** 1.0 mL/min.

**Detection:** spectrophotometer at 254 nm.

**Injection:** 10  $\mu$ L.

**Run time:** 2.5 times the retention time of midazolam.

**Relative retention** with reference to midazolam (retention time = about 17 min): impurity I = about 0.25; impurity J (2 peaks) = about 0.3; impurity D = about 0.4; impurity E = about 0.5; impurity F = about 0.7; impurity A = about 0.9; impurity G = about 1.2; impurity H = about 1.9; impurity B = about 2.2.

**System suitability:** reference solution (b):

- **peak-to-valley ratio:** minimum 3.0 where  $H_p$  = height above the baseline of the peak due to impurity A and  $H_v$  = height above the baseline of the lowest point of the curve separating this peak from the peak due to midazolam.

**Limits:**

- **correction factors:** for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 2; impurity E = 2; impurity H = 1.7;

Perform the Edman degradation using an automated solid-phase sequencer, operated in accordance with the manufacturer's instructions.

Load about 1 nmol of the test preparation to a sequencing cartridge using the protocol provided by the manufacturer. Run 16 sequencing cycles, noting, if appropriate, the presence of proline at positions 2, 6, 8 and 12.

**Protein.** Liquid chromatography (2.2.29) as described in the test for related proteins.

**Injection:** 150  $\mu$ L of test solution (b) and reference solution (b). Calculate the content of molgramostim using the declared content of molgramostim in molgramostim CRS.

**Potency.** Determination of the biological activity of molgramostim concentrated solution based on the stimulation of proliferation of TF-1 cells by molgramostim.

The following method uses the conversion of tetrazolium bromide (MTT) as a staining method. Validated alternative stains such as Almar blue have also been found suitable.

TF-1 cells are incubated with varying dilutions of test and reference preparations of molgramostim. They are then incubated with a solution of MTT. This cytochemical stain is converted by cellular dehydrogenases to a purple formazan product. The formazan is then measured spectrophotometrically. The potency of the preparation to be examined is determined by comparison of the dilutions of the test preparation with the dilutions of the appropriate International Standard of molgramostim or with a reference preparation calibrated in International Units, which yield the same response (50 per cent maximal stimulation).

The International Unit is the activity contained in a stated amount of the appropriate International Standard. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

Add 50  $\mu$ L of dilution medium to all wells of a 96-well microtitre plate. Add an additional 50  $\mu$ L of this solution to the wells designed for the blanks. Add 50  $\mu$ L of each solution to be tested in triplicate (test preparation and reference preparation at a concentration of about 65 IU/mL, plus a series of 10 twofold dilutions to obtain a standard curve). Then add to each well 50  $\mu$ L of a TF-1 cell suspension containing  $3 \times 10^5$  cells per millilitre, maintaining the cells in a uniform suspension during addition.

Incubate the plate at 36.0-38.0 °C for a minimum of 24 h in a humidified incubator using  $6 \pm 1$  per cent CO<sub>2</sub>. Add 25  $\mu$ L of a 5.0 g/L sterile solution of tetrazolium bromide R to each well. Reincubate for 5 h. Remove the plates from the incubator and add to each well 100  $\mu$ L of a 240 g/L solution of sodium dodecyl sulfate R previously adjusted to pH 2.7 with hydrochloric acid. Reincubate overnight.

Determine the relative quantity of purple formazan product formed in each well by measuring the absorbance (2.2.25) using a 96-well microtitre plate reader. Read each plate at 570 nm and at 690 nm. Subtract the reading at 690 nm from the reading at 570 nm. Analyse the data by fitting a sigmoidal dose-response curve to the data obtained and by using a suitable statistical method, for example the 4-parameter model (see 5.3).

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits ( $P = 0.95$ ) of the estimated potency are not less than 74 per cent and not more than 136 per cent of the stated potency.

**STORAGE**

In an airtight container, protected from light, at a temperature below -65 °C.

**LABELLING**

The label states:

- the content, in milligrams of protein per millilitre,
- the potency, in International Units per milligram of protein.

**Carrier gas:** helium for chromatography R or nitrogen for chromatography R.

**Flow rate:** 30 mL/min.

**Static head-space conditions that may be used:**

- *equilibration temperature:* 90 °C;
- *equilibration time:* 15 min;
- *pressurisation time:* 1 min.

**Temperature:**

- *column:* 150 °C;
- *injection port and detector:* 250 °C.

**Detection:** flame ionisation.

**Identification of peaks:** use the chromatogram obtained with reference solution (b) to identify the peaks due to ethanol and 2-propanol.

**Retention time:** ethanol = about 2.5 min; 2-propanol = about 4 min.

Calculate the content of ethanol (*m/m*) taking its density at 20 °C to be 0.792 g/mL.

**Limit:**

- *ethanol:* maximum 1.0 per cent *m/m*.

**N-NO groups:** maximum 0.25 ppm.

The content of N-NO-groups is determined by cleavage of the N-NO bond with hydrobromic acid in ethyl acetate under a reflux condenser and detection of the released NO by chemiluminescence.

**Description of the apparatus** (Figure 1134.-1). Use a 500 mL borosilicate glass round-bottomed flask, above which is attached a condenser which is equipped with:

- on one side, a torion joint through which a stream of *argon R* can be introduced via a cannula;
- on the other side, a screw joint with a piston equipped with a septum through which the reference solution and test solution will be injected.

The round-bottomed flask is connected in series to 3 bubble traps which are themselves connected to 2 cold traps, which are in turn connected to a chemiluminescence detector. Suitable tubing ensures the junctions are leak-free.

**Preparation of the chemiluminescence detector.** Switch on the chemiluminescence detector 48 h before use and start the vacuum pump. The vacuum must be less than 0.5 mm Hg. 1 h before use, open the oxygen valve at a pressure of 0.2 MPa and a flow rate of 9.4 mL/min.

**Preparation of the bubble trap.** In each bubble trap, place 30 mL of a 300 g/L solution of *sodium hydroxide R* in *water R*.

**Preparation of the cold traps.**

- Trap at –120 °C: Slowly add liquid nitrogen to an isothermic flask containing 250 mL of *anhydrous ethanol R* whilst stirring with a wooden spatula until a paste is obtained. Place the cold trap in the isothermic flask prepared as described.
- Trap at –160 °C: Slowly add liquid nitrogen to an isothermic flask containing 250 mL of *2-methylbutane R* whilst stirring with a wooden spatula until a paste is obtained. Place the cold trap in the isothermic flask prepared as described.

**Drying of the 500 mL borosilicate-glass round-bottomed flask and condenser.** Boil 50 mL of *ethyl acetate R* under reflux for 1 h under *argon R* without connecting the system to the chemiluminescence detector.

**Test solution.** Dry the substance to be examined for 12 h over *diphosphorus pentoxide R* at 60 °C under vacuum. Dissolve 0.10 g of the treated substance to be examined in 1.0 mL of *treated formamide R*. Shake the solution obtained for 30 min.

**Reference solution.** Dilute 0.1 mL of *nitrosodipropylamine solution R* in 6.0 mL of *anhydrous ethanol R*. Dilute 0.1 mL of the solution obtained in 1.0 mL of *treated formamide R*. (This solution is equivalent to 0.05 ppm of N-NO groups).

Place 50 mL of *treated ethyl acetate R* in the dry 500 mL borosilicate glass round-bottomed flask equipped with a septum. Connect the round-bottomed flask to the condenser which has been previously cooled to –15 °C for 2 h.

Connect the *argon R* cannula and adjust the flow rate to 0.1 L/min. Check that the system is leak-free. Only the connector to the chemiluminescence detector remains open in order to avoid excess pressure.

Heat the *treated ethyl acetate R* to boiling.

Evacuate the system by slowly turning the valve of the chemiluminescence detector. At the same time tighten the inlet on the chemiluminescence detector.

When the system is equilibrated, the vacuum reaches 4 mm Hg. The signal of the zero adjuster on the chemiluminescence detector is set to 10 per cent of the full scale of the recorder.

Through the septum of the 500 mL borosilicate glass round-bottomed flask, sequentially inject 0.5 mL of *water R*, 2.0 mL of *dilute hydrobromic acid R* and then another 2.0 mL of *dilute hydrobromic acid R*, making sure that the recorder pen has returned to the baseline between each injection.

Inject 50.0  $\mu\text{L}$  of the reference solution, then 50.0  $\mu\text{L}$  of the test solution after the recorder pen has returned to the baseline.

Calculate the content of N-NO groups of the substance to be examined.

**Free sulfates.** Liquid chromatography (2.2.29).

**Test solution.** Dissolve 30.0 mg of the substance to be examined in *water R* and dilute to 10.0 mL with the same solvent.

**Reference solution.** Dissolve 1.4787 g of *anhydrous sodium sulfate R* in *water R* and dilute to 1000.0 mL with the same solvent. Dilute 1.0 mL of the solution to 200.0 mL with *distilled water R* (5 ppm of sulfate ions).

- *stationary phase:* anion-exchange resin.

0 - 15	100	0
15 - 15.5	100 → 0	0 → 100

**Flow rate:** 1.0 mL/min.

Results: the chromatogram obtained is similar to the corresponding chromatogram shown in Figure 2.3.2.-1. For certain types of olive oil, the difference in the size of spots E and F is less pronounced than in the corresponding chromatogram shown in Figure 2.3.2.-1.

#### TESTS

Acid value (2.5.1): maximum 0.3, determined on 10.0 g.

Peroxide value (2.5.5, Method A): maximum 10.0, or maximum 5.0 if intended for use in the manufacture of parenteral preparations.

Unsaponifiable matter: maximum 1.5 per cent.

Place 5.0 g (*m* g) in a 150 mL flask fitted with a reflux condenser. Add 50 mL of 2 M alcoholic potassium hydroxide R and heat on a water-bath for 1 h, shaking frequently. Add 50 mL of water R through the top of the condenser, shake, allow to cool and transfer the contents of the flask to a separating funnel. Rinse the flask with several portions totalling 50 mL of light petroleum R1 and add the rinsings to the separating funnel. Shake vigorously for 1 min. Allow to separate and transfer the aqueous layer to a 2<sup>nd</sup> separating funnel. If an emulsion forms, add small quantities of ethanol (96 per cent) R or a concentrated solution of potassium hydroxide R. Shake the aqueous layer with 2 quantities, each of 50 mL, of light petroleum R1. Combine the light petroleum layers in a 3<sup>rd</sup> separating funnel and wash with 3 quantities, each of 50 mL, of ethanol (50 per cent V/V) R. Transfer the light petroleum layer to a tared 250 mL flask. Rinse the separating funnel with small quantities of light petroleum R1 and add to the flask. Evaporate the light petroleum on a water-bath and dry the residue at 100-105 °C for 15 min, keeping the flask horizontal. Allow to cool in a desiccator and weigh (*a* g). Repeat the drying for successive periods of 15 min until the loss of mass between 2 successive weighings does not exceed 0.1 per cent. Dissolve the residue in 20 mL of ethanol (96 per cent) R, previously neutralised to 0.1 mL of bromophenol blue solution R. If necessary, titrate with 0.1 M hydrochloric acid (*b* mL).

Calculate the percentage content of unsaponifiable matter using the following expression:

#### CHARACTERS

**Appearance:** clear, transparent, yellow or greenish-yellow liquid.

**Solubility:** practically insoluble in ethanol (96 per cent), miscible with light petroleum (bp: 50-70 °C).

When cooled, it begins to become cloudy at 10 °C and becomes a butter-like mass at about 0 °C.

**Relative density:** about 0.913.

#### IDENTIFICATION

Identification of fatty oils by thin-layer chromatography (2.3.2).

**Results:** the chromatogram obtained is similar to the corresponding chromatogram shown in Figure 2.3.2-1. For certain types of olive oil, the difference in the size of spots E and F is less pronounced than in the corresponding chromatogram shown in Figure 2.3.2-1.

#### TESTS

**Peroxide value (2.5.5, Method A):** maximum 20.0.

**Unsaponifiable matter:** maximum 1.5 per cent.

Place 5.0 g (*m g*) in a 150 mL flask fitted with a reflux condenser. Add 50 mL of 2 *M alcoholic potassium hydroxide R* and heat on a water-bath for 1 h, shaking frequently. Add 50 mL of *water R* through the top of the condenser, shake, allow to cool and transfer the contents of the flask to a separating funnel. Rinse the flask with several portions totalling 50 mL of *light petroleum R1* and add the rinsings to the separating funnel. Shake vigorously for 1 min. Allow to separate and transfer the aqueous layer to a 2<sup>nd</sup> separating funnel. If an emulsion forms, add small quantities of *ethanol (96 per cent) R* or a concentrated solution of *potassium hydroxide R*. Shake the aqueous layer with 2 quantities, each of 50 mL, of *light petroleum R1*. Combine the light petroleum layers in a 3<sup>rd</sup> separating funnel and wash with 3 quantities, each of 50 mL, of *ethanol (50 per cent V/V) R*. Transfer the light petroleum layer to a tared 250 mL flask. Rinse the separating funnel with small quantities of *light petroleum R1* and add to the tared flask. Evaporate the light petroleum on a water-bath and dry the residue at 100-105 °C for 15 min, keeping the flask horizontal. Allow to cool in a desiccator and weigh (*a g*). Repeat the drying for successive periods of 15 min until the loss of mass between

2 successive weighings does not exceed 0.1 per cent. Dissolve the residue in 20 mL of *ethanol (96 per cent) R*, previously neutralised to 0.1 mL of *bromophenol blue solution R*. If necessary, titrate with 0.1 *M hydrochloric acid (b mL)*. Calculate the percentage content of unsaponifiable matter using the following expression:

Absence of *Escherichia coli* (2.6.13).

Absence of *Salmonella* (2.6.13).

**ASSAY**

**Total proteolytic activity.** The total proteolytic activity of pancreas powder is determined by comparing the quantity of peptides non-precipitable by a 50 g/L solution of *trichloroacetic acid R* released per minute from a substrate of casein solution with the quantity of such peptides released by *pancreas powder (protease) BRP* from the same substrate in the same conditions. *Casein solution.* Suspend a quantity of *casein BRP* equivalent to 1.25 g of dried substance in 5 mL of *water R*, add 10 mL of 0.1 M *sodium hydroxide* and stir for 1 min. (Determine the water content of *casein BRP* prior to the test by heating at 60 °C *in vacuo* for 4 h.) Add 60 mL of *water R* and stir with a magnetic stirrer until the solution is practically clear. Adjust to pH 8.0 with 0.1 M *sodium hydroxide* or 0.1 M *hydrochloric acid*. Dilute to 100.0 mL with *water R*. Use the solution on the day of preparation.

*Enterokinase solution.* Dissolve 50 mg of *enterokinase BRP* in 0.02 M *calcium chloride solution R* and dilute to 50.0 mL with the same solvent. Use the solution on the day of preparation.

*For the test suspension and the reference suspension, prepare the suspension and carry out the dilution at 0-4 °C.*

*Test suspension.* Triturate 0.100 g of the substance to be examined for 5 min adding gradually 25 mL of 0.02 M *calcium chloride solution R*. Transfer completely to a volumetric flask and dilute to 100.0 mL with 0.02 M *calcium chloride solution R*. To 10.0 mL of this suspension add 10.0 mL of the enterokinase solution and heat on a water-bath at  $35 \pm 0.5$  °C for 15 min. Cool and dilute with *borate buffer solution pH 7.5 R* at  $5 \pm 3$  °C to a final concentration of about 0.065 Ph. Eur. U. of total proteolytic activity per millilitre calculated on the basis of the stated activity.

*Reference suspension.* Prepare a suspension of *pancreas powder (protease) BRP* as described for the test suspension but without the addition of enterokinase so as to obtain a known final concentration of about 0.065 Ph. Eur. U. per millilitre calculated on the basis of the stated activity.

Designate tubes in duplicate T, T<sub>b</sub>, S<sub>1</sub>, S<sub>1b</sub>, S<sub>2</sub>, S<sub>2b</sub>, S<sub>3</sub>, S<sub>3b</sub>; designate a tube B.

Add *borate buffer solution pH 7.5 R* to the tubes as follows:

B: 3.0 mL,

S<sub>1</sub> and S<sub>1b</sub>: 2.0 mL,

S<sub>2</sub>, S<sub>2b</sub>, T and T<sub>b</sub>: 1.0 mL.

Add the reference suspension to the tubes as follows:

S<sub>1</sub> and S<sub>1b</sub>: 1.0 mL,

S<sub>2</sub> and S<sub>2b</sub>: 2.0 mL,

S<sub>3</sub> and S<sub>3b</sub>: 3.0 mL.

Add 2.0 mL of the test suspension to tubes T and T<sub>b</sub>.

Add 5.0 mL of a 50 g/L solution of *trichloroacetic acid R* to tubes B, S<sub>1b</sub>, S<sub>2b</sub>, S<sub>3b</sub> and T<sub>b</sub>. Mix by shaking.

Place the tubes and the casein solution in a water-bath at  $35 \pm 0.5$  °C. Place a glass rod in each tube. When temperature equilibrium is reached, add 2.0 mL of the casein solution to tubes B, S<sub>1b</sub>, S<sub>2b</sub>, S<sub>3b</sub> and T<sub>b</sub>. Mix. At time zero, add 2.0 mL of casein solution successively and at intervals of 30 s to tubes S<sub>1</sub>, S<sub>2</sub>, S<sub>3</sub> and T. Mix immediately after each addition. Exactly 30 min after addition of the casein solution, taking into account the regular interval adopted, add 5.0 mL of a 50 g/L solution of *trichloroacetic acid R* to tubes S<sub>1</sub>, S<sub>2</sub>, S<sub>3</sub> and T. Mix. Withdraw the tubes from the water-bath and allow to stand at room temperature for 20 min.

Filter the contents of each tube twice through the same suitable filter paper previously washed with a 50 g/L solution of *trichloroacetic acid R*, then with *water R* and dried.

A suitable filter paper complies with the following test: filter 5 mL of a 50 g/L solution of *trichloroacetic acid R* on a 7 cm disc of white filter paper; the absorbance (2.2.25) of the filtrate, measured at 275 nm using unfiltered trichloroacetic acid solution as the compensation liquid, is less than 0.04.

A schematic presentation of the above operations is shown in Table 0350-1.

Measure the absorbance (2.2.25) of the filtrates at 275 nm using the filtrate obtained from tube B as the compensation liquid.

Correct the average absorbance values for the filtrates obtained from tubes S<sub>1</sub>, S<sub>2</sub> and S<sub>3</sub> by subtracting the average values obtained for the filtrates from tubes S<sub>1b</sub>, S<sub>2b</sub> and S<sub>3b</sub> respectively. Draw a calibration curve of the corrected values against the volume of reference suspension used.

Determine the activity of the substance to be examined using the corrected absorbance for the test suspension (T – T<sub>b</sub>) and the calibration curve and taking into account the dilution factors.

The test is not valid unless the corrected absorbance values are between 0.15 and 0.60.

**Lipolytic activity.** The lipolytic activity is determined by comparing the rate at which a suspension of pancreas powder hydrolyses a substrate of olive oil emulsion with the rate at which a suspension of *pancreas powder (amylase and lipase) BRP* hydrolyses the same substrate under the same conditions. *The test is carried out under nitrogen.*

**Olive oil stock emulsion.** In an 800 mL beaker 9 cm in diameter, place 40 mL of *olive oil R*, 330 mL of *acacia solution R* and 30 mL of *water R*. Place an electric mixer at the bottom of the beaker. Place the beaker in a vessel containing *ethanol*

(96 per cent) *R* and a sufficient quantity of ice as a cooling mixture. Emulsify using the mixer at an average speed of 1000-2000 r/min. Cool to 5-10 °C. Increase the mixing speed to 8000 r/min. Mix for 30 min keeping the temperature below 25 °C by the continuous addition of crushed ice into the cooling mixture. (A mixture of calcium chloride and crushed ice is also suitable). Store the stock emulsion in a refrigerator and use within 14 days. The emulsion must not separate into 2 distinct layers. Check the diameter of the globules of the emulsion under a microscope. At least 90 per cent have a diameter below 3 µm and none has a diameter greater than 10 µm. Shake the emulsion thoroughly before preparing the emulsion substrate.

**Olive oil emulsion.** For 10 determinations, mix the following solutions in the order indicated: 100 mL of the stock emulsion, 80 mL of *tris(hydroxymethyl)aminomethane solution R1*, 20 mL of a freshly prepared 80 g/L of *sodium taurocholate BRP* and 95 mL of *water R*. Use on the day of preparation.

**Apparatus.** Use a reaction vessel of about 50 mL capacity provided with:

- a device that will maintain a temperature of  $37 \pm 0.5$  °C;
- a magnetic stirrer;
- a lid with holes for the insertion of electrodes, the tip of a burette, a tube for the admission of nitrogen and the introduction of reagents.

An automatic or manual titration apparatus may be used. In the latter case, the burette is graduated in 0.005 mL and the pH-meter is provided with a wide reading scale and glass-calomel or glass-silver-silver chloride electrodes. After each test the reaction vessel is evacuated by suction and washed several times with *water R*, the washings being removed each time by suction.

**Test suspension.** In a small mortar cooled to 0-4 °C, triturate carefully a quantity of the substance to be examined equivalent to about 2500 Ph. Eur. U. of lipolytic activity with 1 mL of cooled *maleate buffer solution pH 7.0 R* (lipase solvent) until a very fine suspension is obtained. Dilute the suspension with cold *maleate buffer solution pH 7.0 R*, transfer quantitatively to a volumetric flask and dilute to 100.0 mL with the cold buffer solution. Keep the flask containing the test suspension in iced water during the titration.

**Reference suspension.** To avoid absorption of water formed by condensation, allow the reference preparation to reach room temperature before opening the container. Prepare a suspension of *pancreas powder (amylase and lipase) BRP* as described for the test suspension using a quantity equivalent to about 2500 Ph. Eur. U.

Carry out the titrations immediately after preparation of the test suspension and the reference suspension. Place 29.5 mL of olive oil emulsion in the reaction vessel equilibrated at  $37 \pm 0.5$  °C. Fit the vessel with the electrodes, a stirrer and the burette (the tip being immersed in the olive oil emulsion).

Put the lid in place and switch on the apparatus. Carefully add 0.1 M *sodium hydroxide* with stirring to adjust to pH 9.2. Using a rapid-flow graduated pipette transfer about 0.5 mL of the previously homogenised reference suspension, start the chronometer and add continuously 0.1 M *sodium hydroxide* to maintain the pH at 9.0. After exactly 1 min, note the volume of 0.1 M *sodium hydroxide* used. Carry out the measurement a further 4 times. Discard the first reading and determine the average of the 4 others (S<sub>1</sub>). Make 2 further determinations (S<sub>2</sub> and S<sub>3</sub>). Calculate the average of the values S<sub>1</sub>, S<sub>2</sub> and S<sub>3</sub>. The average volume of 0.1 M *sodium hydroxide* used should be about 0.12 mL per minute with limits of 0.08 mL to 0.16 mL.

Carry out 3 determinations in the same manner for the test suspension (T<sub>1</sub>, T<sub>2</sub> and T<sub>3</sub>). If the quantity of 0.1 M *sodium hydroxide* used is outside the limits of 0.08 mL to 0.16 mL per minute, the assay is repeated with a quantity of test suspension that is more suitable but situated between 0.4 mL and 0.6 mL. Otherwise the quantity of the substance to be examined is adjusted to comply with the conditions of the test. Calculate the average of the values T<sub>1</sub>, T<sub>2</sub> and T<sub>3</sub>.

Calculate the activity in European Pharmacopoeia Units per milligram using the following expression:

$$\frac{n \times m_1}{n_1 \times m} \times A$$

- $n$  = average volume of 0.1 M sodium hydroxide used per minute during the titration of the test suspension, in millilitres;
- $n_1$  = average volume of 0.1 M sodium hydroxide used per minute during the titration of the reference suspension, in millilitres;
- $m$  = mass of the substance to be examined, in milligrams;
- $m_1$  = mass of the reference preparation, in milligrams;
- $A$  = activity of pancreas powder (amylase and lipase) BRP, in European Pharmacopoeia Units per milligram.

**Amylolytic activity.** The amylolytic activity is determined by comparing the rate at which a suspension of pancreas powder hydrolyses a substrate of starch solution with the rate at which a suspension of pancreas powder (amylase and lipase) BRP hydrolyses the same substrate under the same conditions.

**Starch solution.** To a quantity of starch BRP equivalent to 2.0 g of the dried substance add 10 mL of water R and mix. (Determine the water content of starch BRP prior to the test by heating at 120 °C for 4 h). Add this suspension, whilst stirring continuously, to 160 mL of boiling water R. Wash the container several times with successive quantities, each of 10 mL, of water R and add the washings to the hot starch solution. Heat to boiling, stirring continuously. Cool to room temperature and dilute to 200 mL with water R. Use the solution on the day of preparation.

For the test suspension and the reference suspension, prepare the suspension and carry out the dilution at 0-4 °C.

**Test suspension.** Triturate a quantity of the substance to be examined equivalent to about 1500 Ph. Eur. U. of amylolytic activity with 60 mL of phosphate buffer solution pH 6.8 R1 for 15 min. Transfer quantitatively to a volumetric flask and dilute to 100.0 mL with phosphate buffer solution pH 6.8 R1.

**Reference suspension.** Prepare a suspension of pancreas powder (amylase and lipase) BRP as described for the test suspension, using a quantity equivalent to about 1500 Ph. Eur. U.

In a test-tube 200 mm long and 22 mm in diameter, fitted with a ground-glass stopper, place 25.0 mL of starch solution, 10.0 mL of phosphate buffer solution pH 6.8 R1 and 1.0 mL of an 11.7 g/L solution of sodium chloride R. Close the tube, shake and place in a water-bath at 25.0 ± 0.1 °C. When the temperature equilibrium has been reached, add 1.0 mL of the test suspension and start the chronometer. Mix and place the tube in the water-bath. After exactly 10 min, add 2 mL of 1 M hydrochloric acid. Transfer the mixture quantitatively to a 300 mL conical flask fitted with a ground-glass stopper. Whilst shaking continuously, add 10.0 mL of 0.05 M iodine immediately followed by 45 mL of 0.1 M sodium hydroxide. Allow to stand in the dark at a temperature between 15 °C and 25 °C for 15 min. Add 4 mL of a mixture of 1 volume of sulfuric acid R and 4 volumes of water R. Titrate the excess of iodine with 0.1 M sodium thiosulfate using a microburette. Carry out a blank titration adding the 2 mL of 1 M hydrochloric acid before introducing the test suspension. Carry out the titration of the reference suspension in the same manner.

Calculate the amylolytic activity in European Pharmacopoeia Units per milligram using the following expression:

$$\frac{(n' - n) m_1}{(n'_1 - n_1) m} \times A$$

- $n$  = volume of 0.1 M sodium thiosulfate used in the titration of the test suspension, in millilitres;
- $n_1$  = volume of 0.1 M sodium thiosulfate used in the titration of the reference suspension, in millilitres;
- $n'$  = volume of 0.1 M sodium thiosulfate used in the blank titration of the test suspension, in millilitres;
- $n'_1$  = volume of 0.1 M sodium thiosulfate used in the blank titration of the reference suspension, in millilitres;
- $m$  = mass of the substance to be examined, in milligrams;
- $m_1$  = mass of the reference preparation, in milligrams;
- $A$  = activity of pancreas powder (amylase and lipase) BRP, in European Pharmacopoeia Units per milligram.

After 2 min, 4 min, 6 min and 8 min, remove the tube from the bath and shake as vigorously as possible, in the longitudinal direction of the tube for 5 s. At the end of 10 min of heating, remove the tube from the water-bath and allow to stand for 10 min. Centrifuge at 2000 *g* for 5 min. #### DEFINITION

Pea starch is obtained from the seeds of *Pisum sativum* L.

#### CHARACTERS

**Appearance:** white or almost white, very fine powder.

**Solubility:** practically insoluble in cold water and in ethanol (96 per cent).

#### IDENTIFICATION

- A. Examined under a microscope using equal volumes of *glycerol R* and *water R*, it presents a majority of large elliptical granules, 25-45  $\mu$ m in size, sometimes irregular, or reniform. Carry out all the operations in a penicillin-free atmosphere and with equipment reserved for this test. Sterilise the equipment at 180 °C for 3 h and the buffer solutions at 121 °C for 20 min before use.

**Test solution (a).** Dissolve 1.000 g in 8 mL of *buffer solution pH 2.5 R* and add 8 mL of *ether R*. Shake vigorously for 1 min. Repeat the extraction and combine the ether layers. Add 8 mL of *buffer solution pH 2.5 R*. Shake for 1 min, allow to settle and quantitatively separate the upper layer, taking care to eliminate the aqueous phase completely (*penicillin is unstable at pH 2.5; carry out operations at this pH within 6-7 min*). Add 8 mL of *phosphate buffer solution pH 6.0 R2* to the ether phase, shake for 5 min, allow to settle, then separate the aqueous layer and check that the pH is 6.0.

**Test solution (b).** To 2 mL of test solution (a) add 20 µL of *penicillinase solution R* and incubate at 37 °C for 1 h.

**Reference solution (a).** Dissolve 5 mg of *benzylpenicillin sodium R* in 500 mL of *phosphate buffer solution pH 6.0 R2*. Dilute 0.25 mL of the solution to 200.0 mL with *buffer solution pH 2.5 R*. Carry out the extraction using 8 mL of this solution as described for test solution (a).

**Reference solution (b).** To 2 mL of reference solution (a) add 20 µL of *penicillinase solution R* and incubate at 37 °C for 1 h.

Liquefy a suitable nutrient medium such as that described below and inoculate it at a suitable temperature with a culture of *Kocuria rhizophila* (ATCC 9341), to give  $5 \times 10^4$  micro-organisms per millilitre or a different quantity if necessary to obtain the required sensitivity and formation of clearly defined inhibition zones of suitable diameter. Immediately pour the inoculated medium into 5 Petri dishes 10 cm in diameter to give uniform layers 2-5 mm deep. The medium may alternatively consist of 2 layers, only the upper layer being inoculated. Store the dishes so that no appreciable growth or death of the micro-organisms occurs before use and so that the surface of the agar is dry at the time of use. In each dish, place 5 stainless steel hollow cylinders 6 mm in diameter on the surface of the agar evenly spaced on a circle with a radius of about 25 mm and concentric with the dish. For each dish, place in separate cylinders 0.15 mL of test solutions (a) and (b), reference solutions (a) and (b) and the blank solution. Maintain at 30 °C for at least 24 h. Measure the diameters of the inhibition zones with a precision of at least 0.1 mm. The test is valid if reference solution (a) gives a clear inhibition zone and if reference solution (b) and the blank solution give no inhibition zone. If test solution (a) gives an inhibition zone, this is caused by penicillin if test solution (b) gives no inhibition zone. If this is so, the average diameter of the inhibition zones given by test solution (a) for the 5 Petri dishes is less than the average diameter of the inhibition zones given by reference solution (a) measured in the same conditions.

Add 10.0 mL of *trichloroacetic acid solution R* to tubes S<sub>1b</sub>, S<sub>2b</sub>, S<sub>3b</sub>, T<sub>b</sub> and B. Mix by shaking.

Place the tubes and *haemoglobin solution R* in a water bath at 25 ± 0.1 °C. When temperature equilibrium is reached, add 5.0 mL of *haemoglobin solution R* to tubes B, S<sub>1b</sub>, S<sub>2b</sub>, S<sub>3b</sub> and T<sub>b</sub>. Mix.

At time zero add 5.0 mL of *haemoglobin solution R* successively and at intervals of 30 s to tubes S<sub>1</sub>, S<sub>2</sub>, S<sub>3</sub> and T.

Mix immediately after each addition.

Exactly 10 min after adding the *haemoglobin solution R*, stop the reaction by adding, at intervals of 30 s, 10.0 mL of *trichloroacetic acid solution R* to tubes S<sub>1</sub>, S<sub>2</sub>, S<sub>3</sub> and T (the use of a fast-flowing or blow-out pipette is recommended) and mix.

Filter the contents of each tube (samples and blanks) twice through the same suitable filter paper previously washed with a 50 g/L solution of *trichloroacetic acid R*, then with *water R* and dried. Discard the first 5 mL of filtrate. Place 3.0 mL of each filtrate separately in a tube containing 20 mL of *water R*. Mix.

A suitable filter paper complies with the following test: filter 5 mL of a 50 g/L solution of *trichloroacetic acid R* through a 7 cm disc of white filter paper: the absorbance (2.2.25) of the filtrate, measured at 275 nm using unfiltered *trichloroacetic acid R* solution as the compensation liquid, is less than 0.04.

Add to each tube 1.0 mL of *sodium hydroxide solution R* and 1.0 mL of *phosphomolybdotungstic reagent R*, beginning with the blanks and then the samples of each set, in a known order.

A schematic presentation of the above operations is shown in Table 0682-1.

After 15 min measure the absorbance (2.2.25) of solutions S<sub>1</sub>, S<sub>2</sub>, S<sub>3</sub>, S<sub>1b</sub>, S<sub>2b</sub>, S<sub>3b</sub> and T at 540 nm using the filtrate obtained from tube B as the compensation liquid. Correct the average absorbance values for the filtrates obtained from tubes S<sub>1</sub>, S<sub>2</sub> and S<sub>3</sub> by subtracting the average values obtained for the filtrates from tubes S<sub>1b</sub>, S<sub>2b</sub>, S<sub>3b</sub> respectively.

Draw a calibration curve of the corrected values against volume of reference solution used. Determine the activity of the substance to be examined using the corrected absorbance for the test solution (T – T<sub>b</sub>) together with the calibration curve and taking into account the dilution factors.

## PERITONEAL DIALYSIS, SOLUTIONS FOR

### Soluciones ad peritonealem dialysim

#### DEFINITION

Preparations for intraperitoneal use containing electrolytes with a concentration close to the electrolytic composition of plasma. They contain glucose in varying concentrations or other suitable osmotic agents.

Solutions for peritoneal dialysis are supplied in:

- rigid or semi-rigid plastic containers;
- flexible plastic containers fitted with a special connecting device; these are generally filled to a volume below their nominal capacity and presented in closed protective envelopes;
- glass containers.

The containers and closures comply with the requirements for containers for preparations for parenteral administration (3.2).

Several formulations are used. The concentrations of the components per litre of solution are usually in the following range (see Table 862.-1):

Table 0862.-1.

	Concentration in mmol/L	Concentration in mEq/L
Sodium	125 - 150	125 - 150
Potassium	0 - 4.5	0 - 4.5
Calcium	0 - 2.5	0 - 5.0
Magnesium	0.25 - 1.5	0.50 - 3.0
Acetate and/or lactate and/or hydrogen carbonate	30 - 60	30 - 60
Chloride	90 - 120	90 - 120
Glucose	25 - 250	

When hydrogen carbonate is present, the solution of sodium hydrogen carbonate is supplied in a container or a separate compartment and is added to the electrolyte solution immediately before use.

Unless otherwise justified and authorised, antioxidants are not added to the solutions.

#### IDENTIFICATION

According to the stated composition, the solution to be examined gives the following identification reactions (2.3.1):

- potassium: reaction (b);
- calcium: reaction (a);
- sodium: reaction (b);
- chlorides: reaction (a);
- acetates: to 5 mL of the solution to be examined add 1 mL of *hydrochloric acid R* in a test-tube fitted with a stopper and a bent tube, heat and collect a few millilitres of distillate; carry out reaction (b) of acetates on the distillate;
- lactates, hydrogen carbonates: the identification is carried out together with the assay;
- magnesium: to 0.1 mL of *titan yellow solution R* add 10 mL of *water R*, 2 mL of the solution to be examined and 1 mL of 1 M *sodium hydroxide*; a pink colour is produced;
- glucose: to 5 mL of the solution to be examined, add 2 mL of *dilute sodium hydroxide solution R* and 0.05 mL of *copper sulfate solution R*; the solution is blue and clear; heat to boiling; an abundant red precipitate is formed.

#### IDENTIFICATION

*First identification:* A, B, E.

*Second identification:* A, C, D, E.

- A. Acidify 10 mL of solution S (see Tests) with *dilute hydrochloric acid R* and shake with 20 mL of *ether R*. Separate the ether layer, wash with 10 mL of *water R*, dry over *anhydrous sodium sulfate R* and filter. Evaporate the filtrate to dryness and dry the residue at 100 °C to 105 °C. Determine the melting point (2.2.14) of the test residue. Mix equal parts of the residue and of *phenobarbital CRS* and determine the melting point of the mixture. The difference between the two melting points (which are about 176 °C) is not greater than 2 °C.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing the residue obtained during identification test A with the spectrum obtained with *phenobarbital CRS*. If the spectra obtained in the solid state show differences, dissolve the test residue and the reference substance separately in *ethanol R*, evaporate to dryness and record the spectra again.
- C. Examine by thin-layer chromatography (2.2.27), using *silica gel GF<sub>254</sub> R* as the coating substance.
- Test solution.* Dissolve 0.10 g of the substance to be examined in *alcohol (50 per cent V/V) R* and dilute to 100 mL with the same solvent.
- Reference solution.* Dissolve 90 mg of *phenobarbital CRS* in *alcohol (50 per cent V/V) R* and dilute to 100 mL with the same solvent.

## POTATO STARCH

### Solani amyllum

#### DEFINITION

Potato starch is obtained from the tuber of *Solanum tuberosum* L.

#### CHARACTERS

*Appearance:* very fine, white or almost white powder which creaks when pressed between the fingers.

*Solubility:* practically insoluble in cold water and in ethanol (96 per cent).

Potato starch does not contain starch grains of any other origin. It may contain a minute quantity, if any, of tissue fragments of the original plant.

#### IDENTIFICATION

- Examined under a microscope using a mixture of equal volumes of *glycerol R* and *water R*, it presents granules, either irregularly shaped, ovoid or pear-shaped, usually 30-100 µm in size but occasionally exceeding 100 µm, or rounded, 10-35 µm in size. There are occasional compound granules having 2-4 components. The ovoid and pear-shaped granules have an eccentric hilum and the rounded granules acentric or slightly eccentric hilum. All granules show clearly visible concentric striations. Between orthogonally orientated polarising plates or prisms, the granules show a distinct black cross intersecting at the hilum.

Mix and allow to stand at 0 °C for 5 min, and then at room temperature for 3 min. No blue colour develops in either tube. Add 1 g of *ammonium sulfate R*, mix and allow to stand for 15 min. A stable, intense pink colour develops in the test solution. A brownish-yellow colour develops in the blank.

## ASSAY

**Test solution (a).** Dissolve 15.0 mg of the substance to be examined in *water R* and dilute to 100.0 mL with the same solvent.

**Test solution (b).** Dilute 2.0 mL of test solution (a) to 3.0 mL with *water R*.

**Test solution (c).** Dilute 1.0 mL of test solution (a) to 3.0 mL with *water R*.

Use as titrant a 6-fold dilution of *heparin sodium BRP* in *water R* (for example, 1.7 mL diluted to 10.0 mL with *water R*). Titrate each test solution in duplicate as follows: introduce an accurately measured volume of the solution to be titrated, for example, 1.5 mL, into the cell of a suitable colorimeter, set the apparatus for measurement at a suitable wavelength (none is critical) in the visible range, add the titrant in small volumes until there is a sharp increase in the absorbance and note the volume of titrant added.

Carry out 3 independent assays. For each individual titration, calculate the number of International Units of heparin in the volume of titrant added at the end-point per milligram of the substance to be examined. Calculate the potency of the substance as the average of the 18 values. Test the linearity of the response by the usual statistical methods (for example, 5.3). ## PROTAMINE SULFATE

### Protamini sulfas

[9009-65-8]

#### DEFINITION

Protamine sulfate consists of the sulfates of basic peptides extracted from the sperm or roe of fish, usually species of *Salmonidae* and *Clupeidae*. It binds with heparin in solution, inhibiting its anticoagulant activity; in the conditions of the assay this binding gives rise to a precipitate. Calculated with reference to the dried substance, 1 mg of protamine sulfate precipitates not less than 100 IU of heparin.

#### PRODUCTION

The animals from which protamine sulfate is derived must fulfil the requirements for the health of animals suitable for human consumption.

The method of manufacture is validated to demonstrate that the product, if tested, would comply with the following test.

**Abnormal toxicity** (2.6.9). Inject into each mouse 0.5 mg dissolved in 0.5 mL of *water for injections R*.

#### CHARACTERS

**Appearance:** white or almost white, hygroscopic powder.

**Solubility:** sparingly soluble in water, practically insoluble in ethanol (96 per cent).

#### IDENTIFICATION
